To ensure that these cities receive the funds necessary to comply with the Act's requirements, we support the establishment of a separate administrative and funding track to address the needs of large metropolitan agencies. Under this approach, qualified, competent grantees could choose to receive their grants directly from the Federal government, thus operating on a more cost-effective and expeditious separate, fast track. Certified agencies under our proposal would draw money directly from the Federal government to meet the requirements of their facilities plans which would give priority to those projects of most benefit in achieving improved water quality.

Under this approach, the Federal government would be able to more efficiently target funds to areas where the most significant water quality benefits would be achieved. In doing so, it would begin to redress the population inequity in the distribution of grant funds since 1972, wherein the majority of funds have gone to a minority of the sewered population. The separate track would be funded based on the specific needs of certified agencies and, if Congress chose not to appropriate adequate funds in any given year, available funds would be allocated on a priority basis. Agencies receiving less funding than called for in their plans would not be subject to enforcement actions by EPA for failure to meet their schedules. The plan would place compliance for certified grantees on an established and clear track to compliance. A copy of a more detailed summary of this proposal, with draft legislative language, is attached to this testimony.

Another key aspect of our plan to accelerate municipal compliance focusses on the need to coordinate municipal enforcement actions with the availability of Federal funds. AMSA strongly favors achievement of municipal compliance through a positive approach, not a negative one which could result in an even greater financial burden on local communities. It would be totally irresponsible on EPA's part to direct communities which do not receive construction grant assistance to capitalize facilities necessary in an unreasonable and unworkable timeframe. There is no room for an enforcement policy that penalizes treatment agencies for circumstances beyond their control or one that threatens municipalities and municipal officials

with more onerous penalties, particularly as the Federal government continues to seek to curtail its financial commitment to the municipal program and as many of the regulatory compliance standards are being revised. In the final analysis, enforcement actions should be initiated only against those dischargers whose record demonstrates that they have been recalcitrant in getting on with the job.

The establishment of a separate funding track for large agencies would enable EPA to formulate a realistic enforcement policy reflecting the unique problems that large cities face. Absent the implementation of such strategy, we would urge the Committee to legislatively direct EPA to give great weight to the availability of Federal funding in determining, case-by-case, the appropriateness of enforcement. Without sufficient Federal funding, which we believe should be $3 billion per year for 10 years, with one half targeted to major metropolitan areas, municipal agencies cannot reasonably be held accountable for failure to complete their projects in a timely fashion.

Project schedules must necessarily take funding into account, and the long-range plans for wastewater facility construction cannot be carried out with severe fluctuations in funding without a corresponding fluctuation in construction. A positive program is critical and our plan to achieve municipal compliance, based on realistic funding needs and compliance schedules, would go a long way toward achieving this goal.

COMMON LAW

We urge the Committee not to amend the Clean Water Act to state that "common law" (either federal or state) may supplement or supersede the requirements of the federal statute. Such an amendment would confuse the obligations of holders of NPDES permits and possibly interfere with the finality of those permits, inhibiting capital expenditures directed toward early environmental improvements.

Some have suggested amending the Clean Water Act (and other federal environmental statutes such as RCRA) to change the rule announced by the Supreme Court in *Milwaukee* v. *Illinois,* 451 U.S. 304 (1981) ("Milwaukee II"). They would provide that "federal common law" could be used by federal judges to impose the judge's own requirements on those who discharge into interstate waters, in addition to—or possibly in substitution for—the pervasive standards and requirements enacted by Congress in the federal statutes and implemented by federal regulation. Such an attempt to create two bodies of supreme federal law would be of doubtful constitutional validity and, in any event, would be both unwise and unnecessary.

In *Milwaukee II,* the Supreme Court reaffirmed a long standing principle that, where Congress has constitutionally spoken specifically and comprehensively on a subject, there is no room for judge-made law on the subject; the act of Congress is supreme and the courts must follow it. In applying that concept, the Supreme Court in *Milwaukee II* exhaustively analyzed the Clean Water Act, together with the regulations adopted pursuant to it, and concluded that the Act was so comprehensive that there are no gaps or "interstices" which could still be filled by judge-made federal common law in interstate water pollution cases.

Regardless of whether one agrees that the Supreme Court was correct in *Milwaukee II,* to now by statute say that the "federal common law" continues to apply would create great confusion. If the federal common law were to be legislatively interposed and the federal statute and regulations adopted thereunder provide that treatment standards must be "X", what does the "common law" do? Is a judge authorized under the preserved "common law" to define that the standards ought to be "2X", "½X" or "5X"?

In the Milwaukee case, the federal district court in Chicago imposed requirements on Milwaukee which were mathematically 6 times more stringent than the effluent standards established under the Clean Water Act and 100 times more stringent than the collection standards for combined sewer overflows contained in the Act and the recommendations under it. These requirements would have cost (in 1983 dollars) approximately $1 billion beyond the $1.7 billion Milwaukee was already spending under its permits for improvements to its wastewater treatment system. The additional requirements were so far out of line with the reality of balancing the environmental benefits against the national economic costs that the EPA in 1978 refused to consider the court-imposed requirements eligible for federal funding. The lower court judge who imposed these requirements admitted his lack of expertise in the complex area of wastewater management when he stated at the trial: "The nature of the subject matter here, however, is such that my own experience and observations in life are of relatively little use to me. It is well known to all of us

that the arcane subject matter of some of the expert testimony in this case was sometimes over the heads of all of us to one height or another."

The Supreme Court recognized this problem in *Milwaukee II:* "Congress has not left the formulation of the appropriate federal standards to the courts through the application of often vague and indeterminate nuisance concepts and maxims of equity jurisprudence, but rather has occupied the field through the establishment of a comprehensive regulatory program supervised by an expert administrative agency." 451 U.S. at 317 (1981).

The availability of complete and exhaustive statutory and administrative remedies was a critical factor in the decision by the Supreme Court in *Milwaukee II.* The Court specifically analysed the Act to find that affected states and private parties have comprehensive administrative remedies available to them under the permit-granting process of the Clean Water Act and its regulations, with opportunity for subsequent judicial review if necessary. The Court also observed that, in addition to the prospective review of proposed discharges, remedies cover emergency situations and the modification or re-opening of permits to deal with potential pollution problems not covered in the initial permit-granting process.

The Supreme Court did not stop at just reviewing remedies. Its exhaustive analysis of the Clean Water Act in *Milwaukee II* found it to be comprehensive and complete in all respects. If Congress disagrees with the Court and determines that some "gap" does exist in the Act, the proper course of action is to "fill the gap" by legislation. Congress should not engage in legislative "overkill" by granting federal judges a "roving commission" to supersede the requirements of the federal statute by applying the "federal common law", whatever that is. Federal common law, if applied, would subject cities located on interstate waters to the unbridled and uncontrolled imposition of what individual judges might dictate. This could occur, as it did in the Milwaukee case, without regard to the economic or political consequences to the affected municipality and their citizens, or to the country as a whole.

Persons who obtain permits under the Federal Act and standards should be entitled to design and operate a sewerage treatment plant in reliance that compliance with the permits means that they have in fact complied with federal standards. Permitting the common law to operate and judges to apply previously unstated, inherently not nationally-uniform collection and treatment standards would create fiscal and practical chaos for permit holders. What is the purpose of a permit if it is not to set forth what the holder of the permit is required to do under federal law.

Under the holdings of the two Supreme Court decisions in the *Milwaukee* cases (*Milwaukee II* and *Milwaukee I, Illinois* v. *Milwaukee,* 406 U.S. 91 (1972)), only the comprehensive federal statutory law embodied in the Clean Water Act and its regulations can now apply in interstate water pollution disputes. However, as to intrastate water disputes, authority exists for the position that state common law is applicable, since these disputes do not involve the interests of federalism, the nature of the parties, and the type of relief sought, all of which were present in the *Milwaukee II* case.

There has been no public outcry that parties in pullution cases do not have adequate remedies available. Much of the discussion which has taken place has dealt with the issue of compensation of parties injured by hazardous waste and toxic chemical pollution. However, these disputes are typically intrastate in nature. In sharp contrast, water disputes are frequently interstate. We agree with the Superfund Section 301 Study Group's report in 1982 which concluded that state common law, in some cases implemented and supplemented by state statute, remains the prime and perhaps exclusive source of determining the nature and adequacy of remedies available to litigants in hazardous waste and toxic chemical pollution cases. *Milwaukee II* does not lead to a conclusion that federal statutes have preempted state common law rights in the area of intrastate, land-based hazardous waste pollution. Therefore, amending the Clean Water Act or other federal environmental statutes such as RCRA to provide that state common law continues to be available is wholly unnecessary.

OCEAN WAIVERS

A number of AMSA coastal and estuarine agencies have applied for modified NPDES permits under subsection 301(h). Accordingly, AMSA is concerned about the proposed changes in 301(h) contained in H.R. 3282.

By way of background, a number of AMSA agencies were involved in the discussions with EPA and Congressional subcommittees and their staffs in the development of 301(h). In its basic and simplest form, 301(h) was intended to reflect a common sense approach to implementation of the Clean Water Act. Local govern-

mental agencies are, of course, responsible to their constituencies and are the foot soldiers in the effort to clean up our nation's water. Initially, an absolute requirement for all municipalities to implement secondary treatment was imposed by virtue of EPA's inflexible definition of secondary treatment, despite the original Public Law 92-500's authorization to EPA that allowed EPA to establish a more flexible definition of this term. This absolute requirement simply made no sense in those coastal and estuarine areas of the country where the impact on the receiving water of effluent with less than secondary treatment resulted in no adverse impact. The underlying concept of 301(h) is that where an agency can demonstrate that its effluent can be disposed of in marine waters without any adverse environmental effects, secondary treatment in unnecessary and wasteful of public funds and should not be required.

Section 301(h) was drafted to include very stringent criteria that must be met before the Administrator could exercise discretion in granting modified permits. The modified permits are for a five-year period and a rigorous monitoring program is required of agencies with modified permits. Although AMSA members were impatient with the length of time EPA took to promulgate the regulations and in processing applications, AMSA is pleased to say that in general the implementation has been fair and reasonable. This is not to say that all AMSA agencies' applications have been tentatively approved by EPA, for in fact a significant number have been tentatively rejected. The agencies that decided to apply for 301(h) permits were compelled by the regulations implementing the section to spend hundreds of thousands of dollars and devote enormous amounts of staff time and resources to preparing applications. The rigorous process for evaluating the applications and acquiring additional information has been a burden, but one that the agencies have accepted as necessary to implement 301(h). These agencies recognize the fundamental requirement that the burden is theirs to demonstrate that in their particular facility the criteria of the subsection are met and that adequate and reasonable monitoring would occur upon issuance of a modified permit. To come along five years after the initiation of this program and impose additional requirements is equivalent to changing the rules when the game is nearly over. If there were convincing and compelling evidence that the initial criteria were inadequate, then there would be at least some basis for the retroactively imposing the criteria proposed in H.R. 3282.

Public Law 92-500 is structured so that a modified permit can be issued by the Administrator, but failing that, the secondary treatment requirement is universal and absolute. Under these conditions, it is clear that any changes in 301(h) that could result in the failure by agencies who would otherwise receive a modified permit to qualify for such a permit would impose a great burden on these agencies and the people they serve. This would be especially painful in instances in which EPA has determined that the project operation, as evaluated by EPA's task force, satisfactorily meets the current stringent criteria of 301(h). In our view, it makes more sense to rely upon the judgment and good sense of the Administrator and EPA experts to negotiate with the agencies to achieve any additional improvement of operation that may be warranted in specific local or regional situations. The existing language of 301(h) grants EPA this discretion. The rigorous 301(h) monitoring program should provide EPA with a significant amount of water quality data which can be used to further evaluate the need for operational improvements. But to restructure the Act at this late date is unfair, unreasonable and unsupportable. We would support a careful and extensive review by the Subcommittee of EPA's implementation of 301(h) and would be pleased to participate in hearings or any other inquiry to assess the manner in which EPA has discharged its obligations under 301(h).

Among the features of the regulations implementing 301(h) is a detailed and comprehensive procedure which affords the public and interested organizations the opportunity to comment upon and participate in hearings in which tentative 301(h) decisions of the EPA Administrator are subject to review and comment. Moreover, 301(h) now requires approval by the appropriate state agency which offers an additional check on EPA. Ultimately, any individual or organization that believes the Administrator improperly exercise his discretion in granting a modified permit has recourse to the courts. Thus, the public has adequate protection by virtue of the procedures adopted by EPA and which AMSA agencies support, accept and have used.

Primary treatment.—The proposal in H.R. 3282 to require a minimum of primary treatment before a 301(h) permit can be issued is reasonable on its face. We must add, however, that we are unaware of any ASMA agency that does not presently provide primary treatment as defined by EPA criteria. We do take exception to the requirement of H.R. 3282 that primary treatment must include chemical treatment to control pathogens. The only chemical treatment process which meets this require-

ment and which is in widespread use is chlorination. While such treatment to reduce pathogens is appropriate and often necessary in areas where the discharge is close to bathing areas or shellfish beds, there is considerable evidence that chlorination of treated effluents significantly increases the concentrations of a number of toxic chlorinated organic compounds in the effluent, some of which are bio-accumulated in marine organisms. the quantity of such toxic chlorinated organics introduced to the environment by chlorination of treated effluents is very small. However, it would serve environmental protection better if chlorination were not required in those instances where it is not needed to protect human health. We would, therefore, suggest that, if the primary treatment is adopted, chemical treatment to control pathogens be required "as appropriate" so that in those areas where no risk to human health exists, the introduction of toxic chlorinated organics can be avoided. Seawater has the natural ability to destroy pathogens, and where no recreational activities or shellfishing take place in the proximity of a discharge, we should rely on this natural ability to treat our waters.

Water quality criteria.—The proposal in H.R. 3282 to require that water quality criteria established under 304(a)1 be met after initial mixing is an extremely troublesome one. 301(h) applications are for discharge to marine waters. The water quality criteria relating to those waters established under 304(a)1 are only advisory criteria and for several chemicals are subject to serious scientific question. The criteria are sestablished on the basis of laboratory tests using artificial seawater which does not contain certain naturally occurring components which detoxify some of the chemicals for which criteria have been established. Coastal and estuarine seawaters from unpolluted areas often naturally have concentrations of certain chemicals which exceed the applicable marine water quality criteria concentrations, and yet are known to support balance biological populations. This is the primary reason that the marine water quality criteria are only advisory. We believe that the existing requirement of the 310(h) application process, that marine water quality criteria be considered, is appropriate. However, to make adherence to these criteria after initial mixing mandatory would in some areas cause great problems without contributing to environmental protection. Indeed, some discharges would need to be "cleaner" than the uncontaminated marine waters they are discharged into to bring the natural marine water into compliance with the criteria.

Estuarine areas.—The current 301(h) regulations recognize that many estuarine areas may be more sensitive to pollutants and to degradation than the open ocean by including additional questions which must be answered to the satisfaction of the Administrator before a modified permit can be issued. If any estuarine area does not properly meet those criteria, the Administrator cannot issue a permit. That this is so is demonstrated by EPA's track record, in which they have recommended against issuing 301(h) permits, primarily in instances in which agencies are discharging into sensitive stressed estuaries. Barring estuaries absolutely, without regard to what actually occurs, is analogous to the original error which established a universal secondary treatment requirement regardless of whether it was necessary. Many estuaries such as Puget Sound are well-flushed deep water bodies and properly designed and controlled less-than-secondary discharge would adequately protect sensitive populations, human health or other uses of the estuary. We are unaware of any instances in which the EPA recommendation ignores or does not properly protect the indigenous aquatic population through the issuance of a permit. We urge that this change be rejected.

Pretreatment.—Including special pretreatment requirements for modified permit recipients is not supportable by any evidence or scientific or technical assessment. As is abundantly clear from other portions of this statement, AMSA and its members are committed to a vigorous and effective pretreatment program. Indeed, most agencies have already initiated their own pretreatment programs not only to meet the requirements of the law, but also to discharge their responsibilities to the communities they serve. There is no basis for imposing extra pretreatment requirements on coastal agencies applying for 301(h) permits. Moreover, as pointed out elsewhere in this statement, the requirements as currently contained in the Act are not capable of being implemented.

The underlying concept for 301(h)—that public funds should not be wasted for unnecessary construction and treatment—is even more important today than when 301(h) was first enacted. With drastic reductions in federal funding for the clean water construction grant program, using the limited funds for the most efficient and effective treatment becomes imperative. In California alone it is estimated that, if modified permits are issued, nearly a billion dollars worth of unnecessary construction to attain secondary treatment will be avoided. This is an important consideration, and one we urge the Congress to consider in contemplating any changes in the

Act. We are not urging that dollars take precedence over public health or environmental concerns. What we are saying is that we all have an obligation to eliminate unnecessary expenditures of funds where that can be done in an environmentally acceptable manner.

ANTIBACKSLIDING

AMSA views the NPDES permitting process as a critical tool in the nation's effort to achieve clean water objectives. Current permitting procedures provide permitting authorities with the flexibility to adjust effluent limitations based on available information with respect to regulated contaminants and their potential impact on receiving waters. In some cases, this may mean reopening a permit to impose more restrictive limitations on the permittee to meet water quality standards. In other cases, it may mean relaxing exisiting requirements without sacrificing environmental considerations.

We believe that this flexibility is imperative and, accordingly, oppose any efforts to unnecessarily and unfairly restrict permitting authorities in their determination of appropriate effluent limitations on a case-by-case basis. Any permitting process that ignores the dynamics of the water quality standard setting process would be inherently unfair and costly to permit holders.

NONPOINT POLLUTION

AMSA appreciates the Committee's interest in controlling non-point sources of pollution as part of the overall national plan to achieve water quality goals. At the same time, however, we caution the Committee to keep in mind the significant point source pollution problems that remain to be addressed. This is especially the case considering the high price tag that we fear will be associated with addressing non-point source pollution controls. In dealing with this very important issue, we urge the Committee to give careful consideration to the potential costs of such a program. We have no objection to the funding of non-point source projects provided that funding is separate and apart from Title II construction grants funding. We further urge the Committee to reconsider the Congressional action in 1981 which made combined sewer overflow projects ineligible for Federal funding. In urban areas throughout the nation, significant pollution loadings and flooding occur during periods of rainfall or snow melt. The water quality impact of these essentially non-point discharges is severe and can persist for relatively long periods of time after the wet weather subsides. A comprehensive non-point source program must address these problems as an important way to improve water quality in many areas of the country.

AMSA is not proposing that funds be indiscriminately allocated to projects for the separation of sanitary and storm sewers. Rather, we believe that funding eligibility for CSO correction should be linked to Category I & II eligibilities and be based on the cost effectiveness of and the need for the project to meet water quality objectives. In many cases, including those representing 23 percent of AMSA member agency needs, CSO projects are necessary to address water quality problems. The construction of treatment facilities will simply not be enough. Eliminating the CSO needs category fails to recognize this approach in meeting clean water objectives. More important, it places local officials in the unenviable position of having to explain backlogged basements to irate citizens who approved substantial bond issues to solve a water quality problem.

In the final analysis, an integrated and rational approach to addressing all aspects of urban water pollution management and control, including CSO correction, is imperative. We believe that our separate track funding approach which I discussed earlier would provide the foundation for such an approach. In the interim, we recommend again that the Committee take note of the continued need for funding of CSOs, and address it in the context of an overall non-point source pollution program.

CONCLUSION

The municipal treatment agencies throughout the country have the ultimate responsibility for insuring the achievement of the Clean Water Act's objectives and goals. We have made a great deal of progress to date and will continue our efforts to achieve clean water goals. We do, however, need continued and enhanced funding support from the Federal government. We also need assurances that Federal enforcement policy is going to reflect the availability of Federal dollars to complete ongoing and begin new projects.

AMSA's Plan to Achieve Municipal Compliance would represent a significant step forward in achieving program goals for major metropolitan agencies. A clear timetable must be set for achieving compliance, linked to a realistic funding program.

With respect to the pretreatment program, we need the flexibility to operate our own cost-effective and environmentally sound programs rather than the existing resource-intensive program premised on national categorical standards. Finally, with respect to common law, ocean waivers, sludge management, permitting, and nonpoint source issues, we implore the Committee to proceed carefully to guard against the enactment of provisions that may result in making it even more difficult for wastewater treatment agencies to comply with the Federal clean water mandates.

This concludes my prepared remarks. I would be pleased to answer any questions you might have at this time.

SUMMARY DATA—1981 NEEDS SURVEY

Totals, by category[1]	Federal dollars needed	Category as percentage of total
Secondary—I	$5,882,823,000	40
Advanced—II	1,887,085,000	13
I/I—IIIa	146,835,000	1
Repl/Rehab.—IIIb	707,669,000	5
New coll.—IVa	604,645,000	4
New inter.—IVb	2,010,124,000	14
CSO—V	3,456,011,000	23
Total	14,695,192,000	100
Grand total[2]	15,128,792,000	

[1] Three agencies did not complete survey.
[2] Total needs for three agencies not completing survey, based on 1980 survey information is $443,600,000.

Total AMSA agency needs (at the 75 percent share level), including 1980 data for threee agencies: $15,128,792,000.
AMSA agency total population: 70,618,769.

AMSA's Separate Track Funding Proposal

A SUMMARY

The Association of Metropolitan Sewerage Agencies (AMSA) has developed a plan to improve the nation's clean water program and end the waste of valuable time, money and manpower at all levels of government. This plan would avoid the inequities of the formula now used to distribute available federal dollars to the states by targeting adequate federal resources to metropolitan areas where the most serious water quality problems exists and where clean-up efforts would benefit the greatest number of people. This plan also would eliminate unnecessary and unproductive delays for state and federal review for the design, construction and operation of facilities funded by the federal government. In effect, the AMSA plan would create two classes of grantees, a class of certified agencies and another class composed of all other grantees that would continue to operate under existing program requirements and procedures.

The heart of the AMSA approach is the certification of qualified wastewater treatment agencies, a concept already developed and promoted by EPA. This would establish an agency's competence to perform on its own, subject to post audit, many of the routine requirements which now must be reviewed by state, regional and national regulators. To achieve certification, an agency would have to demonstrate its legal, administrative and technical competence in these areas to the satisfaction of the state and federal officials.

If an agency chose to seek certification and won approval, it would then consolidate present and future requirements under the Clean Water Act into an integrated Facilities Implementation Plan (FIP) for all design and construction in accordance with local determination of how compliance should be achieved. The development of this plan would be funded by EPA as a Step I facility plan. The plan itself would include a schedule of year by year funding needs. It would also have to conform to regional and state water quality programs adopoted under the requirements of sections 208 and 303 of the Act.

Once EPA approved the plan, the certified agency would be able to draw down funds from a separate national account for certified agencies. Congress would fund this account based on the year by year funding requirements in the approved schedules submitted to EPA by certified agencies.

If Congress did not choose to appropriate enough funds to meet all scheduled needs of certified agencies in a given year, available funds would be prioritized. However, agencies receiving less than their plans called for would not be subject to enforcement actions by EPA for failure to meet their schedules.

By establishing this separate administrative and funding mechanism, AMSA believes that large, sophisticated municipal agencies would be in a stronger position to move forward with pressing projects without the funding uncertainties and bureaucratic snarls that have stalled worthy project in the past. At the same time, the AMSA approach would relieve the states of a massive oversight burden, thus allowing them to concentrate their limited financial and personnel resources on smaller communities and rural areas that are in need of state assistance. Finally, the AMSA approach would enable the Congress for the first time to see the impact of federal appropriations as well as its failure to appropriate.

AMSA PROPOSED SEPARATE TRACK FUNDING BILL

Section 1. Section 207 of the Clean Water Act is amended—

(1) by inserting "(a)" after "Sec. 207.";

(2) by striking "sections 206(e), 208 and 209" and adding in lieu thereof "sections 206(e), 208, 209 and 218,"; and

(3) by adding the following new subsection at the end thereof: "(b) There is authorized to be appropriated to carry out section 218 of this title $1,200,000,000 per fiscal year for fiscal years ending September 30, 1982, September 30, 1983, September 30, 1984, September 30, 1985, September 30, 1986 and September 30, 1987."

Section 2. Title II of the Clean Water Act is amended by adding the following new section at the end thereof:

Section 218. (a)(1) Notwithstanding any other provisions of this Act, the Administrator is authorized to delegate, with concurrence of a state, performance of his responsibilities under title II of this Act and other Federal laws with respect to projects or proposed projects for treatment works by certification of a municipal, intermunicipal, areawide or interstate agency providing wastewater treatment services to a population of not less than 250,000 persons of its capability to perform such responsibilities, subject to post audit of program performance.

(2) Nothing in this section shall affect or discharge any responsibility or obligation of the Administrator under any Federal law.

(b) The Administrator shall not accept any certification provided for in subsection (a) of this section unless he determines that the municipal, intermunicipal, areawide or interstate agency requesting certification has the legal, financial, technical and administrative capability to meet established Federal and, as appropriate, state regulations relating to the construction grant program.

(c) Agencies certified by the Administrator under this section shall prepare and submit to the Administrator for approval a Facilities Implementation Plan consolidating all proposed and ongoing projects for which the certified agency has received grants prior to enactment of this section and specifying design and construction projects, including funding schedules, necessary to meet the enforceable requirements of the Act. Amended plans may be submitted to reflect modified conditions affecting the agency program. Projects specified by a certified agency in a Facilities Implementation Plan shall conform with adopted areawide waste treatment management plans under section 208 of the Act and adopted implementation plans under section 303 of the Act. The Administrator shall act upon such plan as soon as practicable after the same has been submitted and his approval of such plan or plan amendment shall supercede the requirements of section 301(b) (1)(B) and 301(b) (2)(B) and entitle the certified agency agency to funding pursuant to section 207(b) of the Act, subject to appropriations.

(d)(1) To carry out this section, the Administrator shall obligate funds appropriated pursuant to section 207(b) of the Act to certified agencies according to schedules for projects established in Facilities Implementation Plans. In the event the Administrator determines that a certified agency, because of project delays or other causes, is unable to meet the funding schedule established in a Facilities Implementation Plan, he shall reprogram funds obligated to such agency to other certified agencies, as appropriate. Notwithstanding any other provision of this Act, the costs associated with post-construction evaluations, including any required modifications or corrections resulting therefrom, shall be eligible for funding. The amount of any

grant for the implementation of a Facilities Implementation Plan under this section shall be 75 per centum of the cost thereof, provided that projects thereof specified in such Plan utilizing innovative or alternative wastewater treatment processes and techniques referred to in section 201(g)(5) of the Act shall be eligible for funding in the amount of 85 per centum of the costs thereof. In the event that funds appropriated under section 207(b) are not sufficient to implement all Facilities Implementation Plans for a given fiscal year, the Administrator shall obligate available funds to scheduled projects established in such plans in accordance with the following priorities: projects which are necessary to maintain schedules for timely completion of ongoing construction; projects which are ready to go to construction; and projects which will result in the greatest benefit upon receiving waters pursuant to the goals of the Act. Certified agencies with Facilities Implementation Plans which are not funded under this section shall be eligible for grants from funds appropriated under section 207(a) and allotted to the states under section 205(c) of the Act.

(2) The Administrator shall reserve out of funds appropriated under section 205(b) an amount not to exceed five cents per capita or $25,000, whichever is greater, for each eligible agency for grants to cover 100 per centum of the costs of achieving and maintaining the capability to fulfill certification responsibilities under this section.

(e) In the event the U.S. fails to make financial assistance under this Act available in a timely manner to enable a certified agency to complete design and construction projects according to funding schedules established in a Facilities Implementation Plan, the Administrator shall issue a permit pursuant to section 402 of the Act or modify a permit issued pursuant to that section to extend the agency's time for compliance with the requirements of the Act. Such permit shall contain a schedule of compliance for the certified agency based on the earliest date by which financial assistance will be available from the U.S. to complete projects established by the Agency's Facilities Implementation Plan.

(f) If the Administrator determines, after public hearing, that a certified agency fails to meet any of the requirements of this section with regard to a project or proposed project established in the agency's Facilities Implementation Plan, he shall suspend certification authority for such agency.

(g) The Administrator and appropriate state agencies shall conduct interim and final program audits of design and construction projects established by a certified agency's Facilities Implementation Plan.

(h) The Administrator shall promulgate such rules and regulations as may be necessary to carry out this section. The initial rules and regulations necessary to carry out this section shall be promulgated not later than the ninetieth day after date of enactment of this section.

Section-by-Section Analysis

Section 1.—This section amends the present Section 207, which authorizes funds for the Wastewater treatment construction grants program. Subsection (1) makes room for a new subsection, by labelling the present Section 207 as Section 207(a). Subsection (2) adds a reference to the new Section 218 to the list of Sections which are not funded by Section 207(a). Finally, subsection (3) establishes the new funding authorization for the separate track, which at $1.2 billion per year for the next six years, fiscal year 1982-1987.

Section 2.—This section sets up the mechanism for the separate track program for major metropolitan areas, by creating a new Section 218.

Subsection (a)(1) authorizes the Administrator of EPA to delegate to local or metropolitan agencies serving 250,000 or more the authority for planning and building projects under the construction grants program. Such delegation would be with the concurrence of the state. This section means that a grantee, once delegated, would not be required to seek further approval of change orders, plans, design, or programs for public participation or minority business. The grantee delegated these tasks would be cleared to perform on its own, subject only to an audit by the agency of its performance of the program. This program audit (not an accounting exercise) does not affect the timely process of the grantee program, since it comes afterwards, and is the tool for deciding whether certification is to be continued or not (see Subsection (f) below).

Subsection (a)(2) emphasizes that this new section does not abridge any of the requirements of the Clean Water Act or other Federal laws.

Subsection 218(c) establishes the requirement for a Facilities Implementation Plan, which becomes the controlling plan for a grantee to meet its requirements under the Clean Water Act. The plan must provide for meeting requirements established by areawide plans under Section 208 and Section 303, and must also set out

funding schedules for the tasks it lays out, through planning, design and construction. If the grantee proposes a Plan which does not meets the requirements of the Act, i.e., by omitting an AWT facility, the Administrator's approval of the Plan supercedes the requirements under Section 301 for secondary treatment and best practicable waste treatment technology.

Subsection 218(d)(1) requires the Administrator to make funds available to certified grantees according to the schedules of the approved Facility Implementation Plans. If the schedule of the FIP is skewed by events, the Administrator has the flexibility to use the funds for another project. This subsection also establishes eligibility for post-construction evaluations and any correction which must be made to the project as a result of those evaluations.

Funding under this section is set at 75 percent, with innovative elements fundable at 85 percent as in the present law.

If Congress fails to appropriate sufficient funds to cover all the schedules of the approved agency FIPs, provisions is made for dealing with the shortfall: FIP projects are funded in priority order, with ongoing construction having first priority, then projects ready to go to construction, and then projects giving the greatest water quality benefit. This section provides that if a certified agency is not funded under this section, it may seek funds through the existing state priority system.

Subsection 218(d)(2) provides a set-aside of funds from the separate track appropriation, which may be drawn upon by agencies to cover the full cost of developing and maintaining technical and administrative capability required for certification. This includes expenses for technical and administrative training of grantee personnel. A grantee may draw up to the greater of $25,000 or five cents per capita of the population served.

Subsection 218(e) provides that permit conditions shall be modified or extensions of time shall be granted to reflect the unavailability of funds to complete projects as scheduled by the FIP. Modified permits shall contain schedules to reflect dates when funding will be provided.

Subsection 218(f) provides for removal of certified status for grantees which do not meet requirements for projects covered by an FIP. Suspending certification means that an agency will no longer be eligible for funding under the separate track, but must seek funds for its projects through the state priority system, until certification is again granted.

Subsection 218(g) provides for program audits to monitor a grantee's performance of the elements of its FIP. The program audits are not accounting reviews, but are reviews of whether the agency is carrying out the performance of the mandates for which it has been given authority under certification.

Subsection 218(h) gives the Administrator of EPA the authority to establish regulations, and places a deadline of three months for putting the initial rules into effect.

Mr. ROE. Please proceed.

TESTIMONY OF CHARLES B. KAISER, JR., ASSISTANT EXECUTIVE DIRECTOR AND GENERAL COUNSEL, METROPOLITAN ST. LOUIS SEWER DISTRICT AND CHAIRMAN, AMSA LEGISLATIVE COMMITTEE REPRESENTING ASSOCIATION OF METROPOLITAN SEWERAGE AGENCIES, ACCOMPANIED BY LEE C. WHITE, COUNSEL TO AMSA; AND KEN KIRK, ASSISTANT EXECUTIVE DIRECTOR, AMSA

Mr. KAISER. Good morning, Mr. Chairman.

Mr. ROE. Would you identify for the record your colleagues.

Mr. KAISER. Yes, sir. On my right is Mr. Lee White, counsel for AMSA. On my left is Mr. Ken Kirk, assistant executive director of AMSA.

Mr. Chairman, I would like to thank you for making the longer statement a part of the record.

Mr. ROE. Without objection, so ordered.

Mr. KAISER. I have prepared a summary which I would like to read and then I would be available for questions.

My name is Charles B. Kaiser, Jr., and I am the assistant executive director and general counsel of the Metropolitan St. Louis Sewer District and chairman of the Association of Metropolitan Sewerage Agencies' Legislative Committee. I appreciate this opportunity to present the subcommittee with AMSA's views on the major clean water issues of concern to our members. AMSA's members serve more than 77 million people in 94 of the Nation's major urban areas and treat over 50 percent of the wastewater subject to existing Federal pretreatment mandates across the country.

We believe that the pretreatment issue deserves this subcommittee's serious attention and consideration and that any Clean Water Act legislation reported should include provisions authorizing the implementation of alternative pretreatment systems by capable POTW's. Over the past several months we have worked closely with representatives of State and local organizations, as well as other interested parties, to develop an approach that addresses the needs of the sewerage agencies who must implement pretreatment programs, while avoiding the difficulties associated with earlier proposals to modify the pretreatment provisions of the Clean Water Act.

This approach would enable qualified local agencies to operate their own programs in lieu of national categorical standards following a demonstration satisfactory to the State or EPA that the program would achieve the objectives of the national pretreatment program. It would also require these agencies to establish a monitoring program to insure that the program adequately and continuously protected the receiving waters.

This approach would expedite the enforcement of toxic controls at the local level and enhance environmental protection throughout the Nation. By relying on local standards, set at site-specific levels necessary to protect plant operations, we can guard against passthrough, and insure a sludge quality that meets State and Federal requirements. We can then have immediate and effective pretreatment rather than awaiting some undetermined time in the future when national categorical standards are finally promulgated for all of those industries subject to regulation by the national program.

This approach would enable all levels of government to conserve scarce resources. The implementation of such a program, representing a simple extension of what EPA and the States are required to do at the present time in approving local pretreatment programs for approximately 2,000 municipalities, would enable EPA and the States to concentrate their limited resources on problem municipalities while leaving the larger, more capable agencies on their own with a limited annual accounting required.

The pretreatment debate centers on whether the Federal or local level of government is best equipped to develop and implement effective pretreatment controls. There is no question in our minds as to who that is. Pretreatment problems are site specific and require site sensitive solutions.

National categorical standards are not designed to address varying local conditions and are not premised on any water quality, plant protection, or sludge quality considerations. Locally derived standards, which in some cases may have to be more stringent and

in other cases less stringent than applicable national standards, do consider these factors and are, accordingly, easier to justify and enforce because they make sense in the local context. Our approach would provide the same degree of treatment as the existing national categorical standard approach, and it would accomplish this result quicker and in a less costly manner.

We understand that EPA is in the process of establishing a pretreatment task force to address regulatory remedies to the problems faced by the pretreatment program. EPA believes that through this mechanism they will be able to respond to the concerns faced by those attempting to implement the current program.

While such an effort is laudatory, and AMSA will cooperate with the Agency and participate on this task force in an effort to facilitate administration of the existing program, the nature of the program's problems require immediate legislative redress.

AMSA endorses a plan to accelerate municipal compliance which addresses the special needs of major metropolitan sewerage agencies with respect to both Federal funding and enforcement policy. This plan calls for continued Federal grant support at levels necessary to accomplish the objectives of the Clean Water Act, joined to a municipal compliance policy taking into account the availability of Federal funding as well as the complex technical, regulatory, and political considerations that are particularly evident in the large, metropolitan areas of our country.

We wholeheartedly endorse H.R. 3282's provisions increasing the spending authorization for the construction grants program as consistent with this plan. Present levels of authorization and appropriation are woefully inadequate to enable the Nation's communities to achieve the federally mandated requirements within the specified timeframes.

In 1981 we conducted a survey of AMSA member agencies to assess their wastewater treatment facility construction needs. That survey, which is currently being updated, indicated that AMSA members needed roughly $15 billion in Federal grants, or $1.5 billion per year for 10 years, to meet the act's requirements.

This, in our view, is not out of line with current budgetary constraints on the Federal Government. An increase of the current appropriations to $3 billion per year, for example, would enable the large metropolitan centers throughout the country to meet the act's stringent requirements with one-half of the available appropriations.

We support the establishment of a separate administrative and funding track to insure that the needs of the large metropolitan agencies are met. Under this approach, qualified, competent grantees could choose to receive their grants directly from the Federal Government, thus operating on a more cost effective and expeditious separate fast track. The Federal Government would be able to more efficiently target funds to areas where the most significant water quality benefits would be achieved.

The other key aspect of our plan to accelerate municipal compliance focuses on the need to coordinate municipal enforcement actions with the availability of Federal funds. In our view, it would be totally irresponsible on EPA's part to direct communities which

do not receive construction grant assistance to capitalize facilities necessary in an unreasonable and probably unworkable timeframe.

There is no room for an enforcement policy that penalizes treatment agencies for circumstances beyond their control or one that threatens municipal officials with more onerous penalties, particularly as the Federal Government continues to seek to curtail its financial commitment to the municipal program and as many of the regulatory compliance standards are being revised.

The association supports the concept of a single comprehensive sludge management policy within EPA. AMSA has been working closely with EPA's sludge management task force, and we are now eagerly awaiting the initial output of its work effort. We believe that the EPA task force should be allowed to continue its work unhindered by additional statutory directives that would likely only delay completion of a long overdue comprehensive sludge management policy document.

We urge the committee not to amend the Clean Water Act to state that "common law"—either Federal or State—may supplement or supersede the requirements of the Clean Water Act. In *Milwaukee* v. *Illinois,* 451 U.S. 304 (1981) (*"Milwaukee II"*), the Supreme Court concluded that the Clean Water Act was so comprehensive that there are no gaps or "interstices" which could still be filled by judge-made Federal common law.

I found it interesting hearing the chairman and other members talking about the problems of court-made law as related to 404. To now by statute apply the "Federal common law" to interstate water pollution cases would create great confusion and subject cities located on interstate waters to the unbridled and uncontrolled imposition of what individual judges mig dictate. And since the *Milwaukee II* decision does not lead to a conclusion that the Federal statute has preempted State common law rights, amending the Clean Water Act to provide that State common law continues to be available is wholly unnecessary.

AMSA is concerned about the proposed changes in 301(h) contained in H.R. 3282. The AMSA coastal and estuarine agencies that have applied for modified NPDES permits under this subsection recognize the fundamental requirement that the burden is theirs to demonstrate that in their particular facility the criteria of the subsection are met and that adequate and reasonable monitoring would occur upon issuance of a modified permit. To come along 5 years after the initiation of this program and impose additional requirements is equivalent to changing the rules when the game is nearly over.

In lieu of restructuring of the act at this late date, which we view as unfair, unreasonable, and unsupportable, we would support a careful and extensive review by the committee of EPA's implementation of 301(h) and would be pleased to participate in hearings or any other inquiry to assess the manner in which EPA has discharged its obligations under 301(h).

AMSA opposes the antibacksliding provisions that were added to the Senate bill. We believe that current permitting procedures, which enable permitting authorities to adjust effluent limitations based on available information, should be continued. Any permitting process that ignores the dynamics of the water quality stand-

20-955 O—84——170

ard-setting process would be inherently unfair and costly to permitholders.

AMSA also appreciates the committee's interest in controlling nonpoint sources of pollution, and we have no objection to the funding of non-point-source projects provided that funding is separate and apart from title II construction grants funding.

In dealing with this very important issue, we caution the committee to keep in mind the significant point-source pollution problems that remain to be addressed and to reconsider the congressional action in 1981 which made combined sewer overflow projects ineligible for Federal funding. We believe that Congress should renew funding eligibility for CSO correction, based on the cost effectiveness of and the need for the project to meet water quality objectives.

The municipal treatment agencies throughout the country have the ultimate responsibility for insuring the achievement of the Clean Water Act's objectives and goals. AMSA's plan to achieve municipal compliance, with a clear timetable for achieving compliance linked to a realistic funding program, would expedite their achievement.

At the same time, AMSA's pretreatment approach would enable capable POTW's to operate their own cost-effective and environmentally sound programs rather than the existing resource-intensive program premised on national categorical standards.

With regard to other issues, such as common law, ocean waivers, sludge management, antibacksliding, and nonpoint sources, we recommend that the committee proceed carefully to guard against the enactment of provisions that may result in making it even more difficult for wastewater treatment agencies to comply with the Federal clean water mandates.

This concludes my summary, but before I respond to questions, I would like to comment on something I think that is very, very essential to meeting the deadlines and requirements of the Clean Water Act. I would like to be specific about my own agency, where we have secondary treatment everywhere except one major plant. We are now being asked by EPA to come up with a schedule to achieve secondary at that point.

We are not under any criminal prosecution; we are not under any civil prosecution. We have not been asked until now to start talking about signing some form of document. Our relationship with our State and EPA is excellent. We have been cleaning up areas, annexing areas, trying to regionalize, and I think we have an excellent record.

However, we are now faced with one problem. Our State says "We don't think you need secondary on the Mississippi River there. We are going to give it a low priority. And we just don't think that you should have any plant money." The Federal Government says, "Hey, we would like to see you go ahead and make secondary treatment. We are only talking about $300 to $400 million and $25 million operating costs, 75 percent of which is electric and gas."

Missouri gets a large portion of its grant based on the population of St. Louis and our needs for secondary treatment at that large treatment plant. It seems that I am not unreasonable to say that if you are going to put my feet to the fire to meet a goal, then some-

body ought to put the State's feet to the fire and say "You are getting so much money based on the Metropolitan St. Louis area's population and needs, they ought to get a little." I am not even saying we should get 55 percent, but we should get something.

The Federal Government says, "Well, we are not getting into the middle of that." At least region VII says, "You know, we don't like to get into the State. That is a State's right issue."

Here we are between two agencies, one saying "Let's move faster," and the other saying, "We don't think you need it." That is a real problem. I thought maybe I was alone, so I went to Kansas City, and they are getting hammered on the head the same way and are faced with the same thing because they are on the Missouri River. Most members of the AMSA board have projects that are not finished. If you are going to give the State money based on our needs, and if you are going to take us to court, I believe maybe we should get some of that money.

Mr. ROE. Can the gentleman yield?

We are on a second call now. So we are going to have to go vote. Suppose we decide to, because we have a couple of votes coming up, suppose we decide to break now. Then we will continue with the question and answer and return at 1 o'clock.

Mr. KAISER. That would be excellent. Thank you for your attention.

Mr. ROE. The subcommittee will stand in recess until 1 o'clock.

[Whereupon, at 12:10 p.m., the subcommittee recessed until 1 p.m. the same day.]

AFTERNOON SESSION

Mr. ROE. The committee will reconvene.

When we were called to the floor, we were in the middle of the testimony of Mr. Charles Kaiser of the Association of Metropolitan Sewerage Agencies. You were about to express the second point you had in mind.

Mr. KAISER. Yes, sir. The other thought was—had to do with a statement Mr. Ledbetter made. Mr. Ledbetter stated in his testimony, which I read, that State agencies do need Federal grants to keep the program going. I would be the last to deny that. And I would like to wholeheartedly support that. However, in his next breath he said that is fine, yes, he should have a grant, but give us a loan.

I would like to ask him, facetiously, if we gave his Governor a loan at 5 percent how long his program would continue. I don't think loans or privatization are the answers. I think we have got a funding program that is working. I see nothing wrong with the 55 percent. I think that at 55 percent if there has been goldplating it will soon go down to just plain chromeplating. And the 55 percent, we should be getting more work done by 45 coming from State and local interests. In my State we passed a bond issue and they are going to pay maybe 20 to 25 percent.

In any event I definitely feel that the Federal program should continue; others have said for 10 years. We feel that because that program is in place, and is working, that it has to have a little more time and some funding. Not at three times the present level.

Not at four times that. We have said 3 billion for 10 years in our statement. Others have said 10 years at the present level. I don't think they are that far apart.

Last, before I get into it, or maybe I should wait for questions. But if the questions don't deal with pretreatment I would like to deal with that.

Mr. ROE. I prefer you go ahead with the pretreatment because of the problem we are having with time.

Mr. KAISER. I would also like to comment on pretreatment. In St. Louis where we still have one large plant that only has primary treatment, we have done extensive work and spent over $1 million a year in labor alone out of our own pockets in a very enthusiastic pretreatment program.

I would like to add that it has been approved by EPA and the State pretreatment program, office, one of the few agencies that has that. The crux of it is that we feel if we can clean up our own mess and demonstrate that and take the consequences, either civil or criminally, that we will do that, why go on in our case with categorical pretreatment standards?

In St. Louis we have only four of the pollutants out of inorganic, organics, metals, whatever. We have got copper and cadmium and zinc and phenol. We have a very large program spending millions in preparation of our big plant going into operation where he will pretreat. That will get rid of the three heavy metals. Another chemical plant is working on reducing the phenols. All others are within safe drinking water standards.

That shows our dedication to toxic and hazardous. We believe in it. But we don't think we should have industry spend millions and millions of dollars taking piles of hazardous and toxic substances and having them laying all over in sludges that have to be disposed of. It is nice to say, oh, they will be disposed of. But where are you going to put those things?

Every time they have a hazardous waste site it almost ends up with the riot police having to stop it. Why should you make hazardous piles when they can be discharged safely into our source? We can treat it adequately. It is not a problem in our sludge. It is not a problem in our effluent. If it is, we do make them pretreat it.

But to require pretreatment of 2,000 industries in my town when we can regulate 30 and do an excellent job seems to me to be a little overkill. I would welcome the staff, we have invited EPA and the Senate staff, to take a look at our program because we are dedicated to toxic and hazardous. I am afraid any time our agencies talk about out own pretreatment programs you think we are trying to cop out. We are not.

If you have an agency that today is not watching how industries pretreat, they are doing a lousy job with their treatment process. Our pretreatment program is our process control. We control what they put in, so we can control what we put out. If you don't do that, you don't deserve to get any kind of option out of anything.

But just because there are three bad apples that don't require pretreatment now, what makes you think they are going to enforce the Federal categorical pretreatment standard, because you are putting a tremendous onus on them. If we are not doing the job, give us civil penalties, give us criminal penalties. But if we can do

the job, don't make us waste millions and millions of our dollars in policing a program that just puts an onus on the whole clean water industry.

Mr. ROE. I want to thank the gentleman for his very splendid statement.

The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

Mr. Kaiser, on page 2 you speak favorably about locally derived standards as opposed to national categorical standards for pretreatment. You speak of local standards which in some cases may have to be more stringent and in other cases less stringent than applicable national standards.

You then, however, argue that your proposed opt-out approach would provide the same degree of treatment as the national categorical standard. How could a locally derived standard be less stringent than applicable national standards on the one hand and then provide the same level of treatment as the national categorical standards on the other?

Mr. KAISER. I am talking about the end-of-the-pipe effluent. Let us say we have got, for lack of a better industry, a small plater. He puts 5 pounds of, say, copper or 1 pound of copper per day in 1-million or 170-million-gallon effluent. You can't even find it in our sludge. You can't find it in the river. You can't find it in the effluent.

Now, you are going to go in and make him go out of business to put in a high-priced treatment? In other words, what we are saying is start with our effluent. We take your influent at the plant, our effluent at the plant. Anything that will interfere with the treatment process, that is our baby. We have got to treat it. It costs us money not to.

We have already got surcharges and all kinds of regulations. And as I said, an approved program. You may be saying that all that domestic waste may dilute some problem waste, and therefore that dilution is a solution to pollution.

Well, I am not so sure that concentration is the solution to pollution either, because if industry takes it out he has got something there to get rid of. If it is a small industry, he might just slip it in our sewer some night and we don't like those surprises. We would just as soon he put it in there 365 days a year, and we will be sampling him about 300 of those days if we think that particular element he is putting in is a problem.

Instead of telling him that what he puts into the pipe has to meet our effluent standards, we are saying we will police his influent and police our effluent. That way some things will have a less stringent standard. Yes, sir.

Mr. STANGELAND. In both your oral and written statements you argue against amendments to 301(h) of the act and you oppose proposals in H.R. 3282 as being unfair, unreasonable, and unsupportable. Would you explain in a little more detail which provisions you are referring to and why you believe they are unfair, unreasonable, and unsupportable? In your opinion what would be the consequences for your members if the 301(h) amendment proposed in H.R. 3282 were to be signed into law?

Mr. KAISER. I would like Mr. White, who represents that section of the agency, to answer that.

Mr. WHITE. Basically, Congressman, the coastal agencies have already gone through this original evaluation of their applications. If we understand what is in H.R. 3282, it has got an additional set of criteria that have to be met. For example, in the primary treatment. Our people have concluded that that may or may not make sense. But it does not make sense to impose that as a standard that must be met today.

These agencies made their initial applications in 1978. They have spent a lot of their own ratepayers' money for consultants and have elaborate presentations. They think they have already satisfied the criteria; that is, those who have had tentative decisions favoring the issuance of a modified permit. There are a large number of those applications that have tentatively been rejected by EPA.

EPA, in our view, has been handling this rather slowly but rather thoroughly and we believe fairly and effectively. And what the chairman of the full committee's bill would do is to say wait a minute, there are some other problems we think ought to be taken care of. We have been advised by some people that maybe that is only prospective. It doesn't say so in the language of the bill. And to us it is tantamount to changing the rules of the game.

We are not satisfied that the agencies cannot meet those criteria. But we don't know, and we don't think it is necessary. There has been no demonstrated indication that EPA has improperly administered this program. To quote the old phrase: "If it ain't broke, don't fix it." If you people believe there should be an examination, we have said we hope so and we will be glad to participate because we do have a few beefs, not very many, with the manner in which the program has been administered.

But it is that sort of a pulling together of a new group of criteria that has been most troublesome to our coastal agencies.

Mr. STANGELAND. Thank you. Mr. Chairman, I have a number of other questions I would like to ask unanimous consent to submit.

Mr. ROE. Without objection so ordered.

[The questions submitted to Mr. Kaiser by Representative Stangeland and responses received follow:]

ASSOCIATION OF METROPOLITAN SEWERAGE AGENCIES—RESPONSES TO QUESTIONS SUBMITTED BY REPRESENTATIVE STANGELAND

Question 1. On page 5 of your oral statement, you indicate that "We have no objection to the funding of non-point source projects provided that funding is separate and apart from Title II construction grants funding." Assuming that Congress deems it appropriate to provide additional funding authority to address non-point source pollution control, what difference does it make whether that funding is part of or separate from construction grants program funding?

Response. AMSA believes that any change in the focus of Title II can only further jeopardize the objectives of the Clean Water Act. Title II was and is designed to address the water pollution problems associated with point sources. To add an additional cost factor to construction grants funding will invite the Appropriations Committee to force a sharing of the funds.

In 1981, Congress decided to eliminate specific funding for CSO related point source pollution problems. In addition to this limiting move, Congress further eroded the ability to address point source problems, reducing the total available authority to fund point source problem solutions overall and increasing the total cost-sharing burden municipalities must meet to respond to point source problems. Instead of establishing a new program of non-point source control within Title II, we

would urge that Congress consider re-establishing the ability to respond to the significant non-point source problems associated with urban areas. A substantial water pollution control problem could be addressed, for example, if the ability to respond to CSO problems was restored. This would go a long way, in a cost effective manner, to respond to the overall problem of water pollution.

In short, AMSA believes it would be cost-effective, and more important meet an earlier commitment, if Congress provided municipalities the funds to meet urban related non-point source problems. Alternatively, if Congress sees fit to establish a new multi-billion dollar program to respond to non-urban non-point source pollution, we would view this as an abandonment of the commitment by the Federal government to respond to point source water pollution problems.

In our statement to the Committee, AMSA identified the value of controlling non-point sources of water pollution. In fact, AMSA believes that non-point source contamination represents a serious problem to the nation's water quality. However, we believe the single largest threat to water quality, within the discussion of non-point source combination, is found in the nation's metropolitan areas in the form of urban runoff, inadequate reserve capacity and combined sewer systems. In 1981, Congress enacted changes to Title II that reduced the eligibility of certain categories to be funded with Federal grants. Instead, the Governor was provided discretionary authority, in a limited fashion, to fund some of these activities. However, the signal from the Federal government that certain activities no longer deserved separate funding, included urban non-point source issues. Subsequently, the ability to respond to water quality problems has been for all practical purposes denied.

In conjunction with the reduction of eligible construction grant activities, the Congress further reduced the ability to respond to the water pollution control problem by cutting in half the authorization levels for point source pollution control. In addition to reducing the size of the allocation of funds, municipalities suffered another setback in their efforts to respond to water pollution control when the Congress also agreed to reduce the Federal government's level of commitment and shift it to the municipalities and states. This was done by reducing from 75 percent to 55 percent the Federal contribution.

The consequences of these actions have left municipalities with a smaller pool of capital to respond to water pollution problems, and increased financial responsibility for certain activities which the Federal government has deemed unworthy of specific attention, and increased financial commitments from municipalities to shoulder the burden of meeting the requirements of the Clean Water Act. These changes come at precisely the time when municipal budgets are stretched to their fiscal limits.

Funding of non-point source control programs—a laudable goal—represents a multi-billion dollar commitment in the long-term. However, EPA estimates that current municipal needs to the end of the century are approximately $120 billion. This EPA estimate does not consider the needs of the categories that have been eliminated from the eligible categories as the 1981 amendments. Control of point source pollution is critical to preserving and enhancing the progress made to date in water quality. Any encroachment upon the specific purpose of Title II—control of point source pollution through the construction of wastewater treatment plants—would pose an unjustified intrusion upon the efforts to respond to the nation's primary water pollution control issue.

In summary, AMSA urges Congress to avoid further erosion of the ability to respond to water pollution control issues as mandated under the Clean Water Act by establishing a commitment to respond to unrelated non-point source pollution by using funds urgently needed for point source control. Furthermore, in order to address the deleterious effects or urban non-point source problems, AMSA recommends the restoration of pre-1981 eligible funding categories and the re-establishment of a true partnership in funding the construction of wastewater treatment facilities between the Federal government and municipalities.

Question 2. Have the States targeted their allotments to those areas where major pollution or water quality problems exist? What is the record? Could you supply a detailed response to this question by January 1, 1984.

Response: There is no record that the States have targeted their allotments to those areas where major water pollution or water quality problems exist. We have attached data illustrating this significant need which demonstrates the fact that areas with major water quality concerns are in desperate need of funding assistance. It is clear that water quality is a consideration taken into account by states. However, at the same time other factors, which may or may not speak directly to water pollution control, like political decisions, influence the distribution of the allocation.

From our own review of the needs of the major metropolitan wastewater treatment facilities and the timeframes in which this funding is expected, AMSA believes those areas which have the highest priority water pollution problems are a testimony to the real need for greater efficiency in distribution allocations.

For several years, AMSA has urged the states and EPA to include in their consideration on how to distribute funds a population criterion. Unfortunately, the EPA and state groups have not seen fit to apply universally such criteria. The net result has been that some states employ population criteria and others do not. The EPA in reviewing state priority lists does not consider the impact of pollution on funding needs. The result is that actual needs of serviced population centers based upon the demand for such service is not always taken into consideration. In lieu of a nationwide population criterion, as a determinant for funding, AMSA has proposed the establishment of a "separate track" funding mechanism for large metropolitan areas. A copy of this proposal is attached.

With regard to the targeting of funds to those areas with major pollution or water quality problems, AMSA believes that its projections on future funding needs are evidence of the continued need for adequate funding in large metropolitan areas. We have attached copies of the 1981 AMSA needs survey and an update of AMSA member's needs. This material demonstrates on a yearly basis when municipalities expect the need for such funds.

Question 3. In recent years there have been substantial increases in POTW costs, both for construction and O&M. To what extent is there data to support the belief that cities and counties are currently better able to shoulder the burden of municipal compliance than in previous years?

Response. The recent increase in POTW costs for construction and O&M is the direct result of increased water quality standards imposed by Federal law. It is not the result of poor management practices on the part of POTW operators. In fact, when the General Accounting Office and the Environmental Protection Agency have published findings on the number of violations occurring at POTWs, we have challenged the results of these findings. In the large majority of cases, we have found that the only violations were of a procedural nature that did not threaten water quality or human health. Nor have they any relation to O&M capability. AMSA believes that the large metropolitan POTWs compliance with the Clean Water Act's provisions is outstanding, approaching a 90% compliance rate. AMSA further believes that any increased demands to regulate water quality must be accompanied by a commensurate increase in Federal assistance. Failure to achieve such a balance will mean the ability of localities to comply with the Clean Water Act will decrease.

Many of the nation's POTWs are in a state of deterioration as the years of use take their toll. With enactment of the 1981 amendments to the Clean Water Act, municipalities are faced with the monumental task of correcting age related problems while trying to meet the requirements of the law with a decrease in the Federal funding commitment. AMSA believes that any effort to assure municipal compliance with the provisions of the Clean Water Act be inextricably linked to the provision of adequate federal funds to complete the commitment made by the Federal government over the past several decades.

The current data illustrate that costs for O&M, along with basic construction costs, are rising every year. This trend is expected to continue. With regard to O&M costs our data illustrate that the substantial majority of these costs are met through user charges. More important, large municipalities cannot aggregate sufficient capital for major construction projects and must, by necessity, rely on the assistance provided through the Federal grant system. Consequently, the ability to shoulder the burden of municipal compliance hinges upon the availability of sufficient Federal grant assistance to accomplish the fundmental goals and objectives of the Clean Water Act. A copy of our recent report, "Municipal Wastewater Treatment Plant Financing Survey Results", is attached. This should provide the Subcommittee with data on the extent of the rising costs of municipal compliance POTWs will be facing by the end of the decade.

Question 4. To what extent is the construction grants approach the best way to assure adequate funds for addressing our nation's water pollution control needs? To what extent do you feel that other approaches, such as privatization, are available and more appropriate?

Response: It is unlikely that privatization will ever be viewed as a viable alternative for metropolitan areas. AMSA holds this belief because of the overwhelming legal responsibilities that would remain with the public entity despite the privatization of the wastewater treatment facility. In short, the public sector would retain all liabilities for actions taken by another party—an unrealistic circumstance.

Since the beginning days of the Federal commitment to clean up the nation's waters, the response concept has been grounded in the belief that it is a national problem, requiring national assistance. To this end, it was agreed the Federal government would share, in a meaningful manner, the costs associated with the Clean Water Act's requirements. This is the only way to proceed because of the limited ability of the municipality to finance the costs associated with clean water standards. This limited ability is attributable to the fact that a municipality's ability to shoulder the costs depends upon its tax base. Since the tax base and user charges are employed to finance O&M costs, it is unrealistic to assume that the Federal government can renege on its commitments to assist in the construction of wastewater treatment facilities.

Since 1972, Congress has provided substantial resources to construct wastewater treatment plants through the grant process. On the whole, this funding mechanism has proven to be a significant catalyst to promote the objectives and realize the goals of the Clean Water Act.

During the past several years, suggestions have been made to the effect that alternatives to the current funding program be developed to accomplish the construction of wastewater treatment facilities. These suggestions have included privatization, leasing, and phase-out of the current construction grants program on the premise that the program's objectives have been met.

None of these suggestions, as far as AMSA is concerned, holds any merit. In the instance of privatization, a private entity cannot assure the environmental, legal and economic liabilities associated with the administration of a large metropolitan wastewater treatment facility. Even under the terms of a contract for O&M services, the city and not the contractor is ultimately liable for and subject to the penalties associated with permit violations.

Leasing, although financially attractive, no longer remains a viable option for two reasons. First, the Office of Management and Budget has issued a policy stating that no leasing arrangements may be consummated between a public and private entity unless all federal funds used to construct the facility in question have been repaid to the federal government. This requirement means that millions of dollars would have to be generated by the municipality prior to going forward on the leasing arrangement. Second, current leasing legislation pending before Congress would deny the ability to enter into a leasing arrangement unless the municipality and private entity entered into a "service contract". As part of this contract, the municipality would have to relinquish day-to-day control and operation over the facility, instead leaving the operation in the hands of the private entity. AMSA fails to see how the attendant legal and economic liabilities of such an arrangement would lead to an arrangement gaining leasing benefits through the "service contract" by a private entity and the municipality.

Finally, in response to the concept of ending the Federal program and letting the states and localities pick up the total financial responsibilities, AMSA finds this totally unacceptable in light of the current estimate of wastewater funding needs. We have attached this information to these responses for the Subcommittee's review.

AMSA has reportedly urged the EPA and the States to use population as a criterion in the development of any State priority list. Unfortunately, this has not occurred. Thus, population is not uniformly considered throughout the fifty states when priorities for funding of wastewater treatment plans are drawn-up at the State level. Because this situation persists, AMSA believes that Congress should enact legislation that would guarantee the availability of adequate funds to large metropolitan areas who service the majority of the country's sewered population.

AMSA has developed a legislative proposal that would accomplish this objective without hampering the activities of smaller metropolitan areas or the country's rural areas. This policy option, known as "separate track funding", would operate through the creation of two classes of grantees. A class of certified agencies and another class of grantees would continue to receive funding under existing program requirements and procedures.

The heart of the AMSA approach is the certification of qualified wastewater treatment agencies, a concept already developed and promoted by EPA. This would establish an agency's competence to perform on its own, subject to post audit, many of the routine requirements which now must be reviewed by state, regional and national regulators. To achieve certification, an agency would have to demonstrate its legal, administrative and technical competence in these areas to the satisfaction of state and federal officials.

If an agency chose to seek certification and won approval, it would then consolidate present and future requirements under the Clean Water Act into an integrated Facilities Implementation Plan (FIP) for all design and construction in accordance

with local determination of how compliance should be achieved. The development of this plan would be funded by EPA as a Step I facility plan. The plan itself would include a schedule of year-by-year funding needs. It would also have to conform to regional and state water quality programs adopted under the requirements of Sctions 208 and 303 of the Act.

Once EPA approved the plan, the certified agency would also be able to draw down funds from a separate national account for certified agencies. Congress would fund this account based on the year-by-year funding requirements in the approved schedules submitted to EPA by certified agencies.

If Congress did not choose to appropriate sufficient funds to meet all scheduled needs of certified agencies in a given year, available funds would be prioritized. However, agencies receiving less than their plans called for would not be subject to enforcement actions by EPA for failure to meet their schedules.

By establishing this separate administrative and funding mechanism, AMSA believes that large, sophisticated municipal agencies would be in a stronger position to move forward with pressing projects without the funding uncertainties and bureaucratic snarls that have stalled worthy projects in the past. At the same time, the AMSA approach would relieve the states of a massive oversight burden, thus allowing them to concentrate their limited financial and personnel resources on smaller communities and rural areas that are in need of state assistance. Finally, the AMSA approach would enable the Congress for the first time to see the impact of federal appropriations as well as its failure to appropriate. AMSA recommends that Congress give serious consideration to this approach as one way to ensure that the larger metropolitan areas receive the assistance they require to meet the Act's objectives and goals.

Question 5. We have heard from several groups that a pretreatment alternative would only apply to a limited universe of POTWs. In fact, these same groups question the value of setting up a whole new program that only benefits a few large POTWs. Wouldn't it be cost-effective to have only one program—the categorical approach—to assure proper and efficient control of toxics?

Response: No. The pretreatment alternative as advocated by AMSA is not a new program. In fact, quite to the contrary, the proposed alternative is an enhancement on the national categorical approach that benefits a majority of the sewered population by reducing the costs associated with pretreatment of industrial wastewater. It is clear the alternative program enhances the control of toxics by decreasing the program costs of pretreatment to industry and the community, allowing communities to address specific base problems, and increasing the Environmental Protection Agency's resources to address those areas of the country that do not have the sophistication to implement anything other than the basic categorical approach.

Those who voice concern over this alternative approach clearly do not understand the technical issues involving pretreatment of industrial wastewater. The charge that this alternative approach somehow is less efficient, jeopardizing a cost effective program, illustrates the uninformed basis upon which critics of the alternative approach depart. Further, it is not a limited universe per se. Although only 79 to 100 POTWs, out of a universe of 2,000 POTWs are projected to seek final approval for an alternative approach, this represents almost fifty percent of the sewered country or 70 million people. We advocate a solution to a problem that addresses the critical population areas of the country as they relate to water quality.

Many of the eligible municipalities have pretreatment programs already in effect, or about to be implemented, that have been approved by the U.S. EPA under the general pretreatment standards. Second, these programs in several instances specifically address the particular environmental protection needs of the area in question. As a result, implementation of the categorical approach would in some areas reinvent the wheel as it pertains to control of toxic effluent.

Finally, to those who insist that proper control of toxic effluents would be lost under the alternative approach to pretreatment, we categorically reject this position. By all accounts, the categorical approach is a technology driven response to control toxic effluent. Furthermore, the categorical approach is grounded upon a 1976 judicial consent decree that determines the categories of pollutants to be addressed. This approach fails entirely to respond to the specific threats posed to a particular community's environmental circumstance or industrial base. Under the alternative approach, the several years experience that the eligible POTWs have gained controlling and accounting for their industrial base would be incorporated into a program to control the specific threats posed to the community's waters, protecting the receiving waters with greater efficiency.

In summary, the alternative approach to the categorical program is a logical extension from the general standards to control conventional pollutants. Its attractive-

ness lies in the fact that only those municipalities with an ability to control toxic substances would be approved, thereby allowing the EPA to concentrate limited resources on those POTWs that are in need of assistance to comply with the categorical program. We are still talking about a national program that has sufficient flexibility to acknowledge POTW expertise, where appropriate, that is cost-effective, and that is environmentally sound.

Question 6. You mention on page 16 of your written testimony that you take exception to the proposal in H.R. 3282 that primary treatment must include chemical treatment to control pathogens. You also suggest that chlorination should only be required where it is needed to protect human health. Approximately how many coastal communities, in your opinion, that are not currently chlorinating, would be required to do so under the terms of H.R. 3282? Of these, how many do you feel appropriately should not be required to chlorinate?

Response: AMSA does not keep records on the chlorination practices of all coastal POTWs. However many of our members, including the City of Los Angeles and the City and County of Honolulu, fully comply with state and Federally-approved bacteriological standards for effluent discharge without chlorination or other chemical treatment. These facilities, and others under construction, provide for the protection of human health by discharging primary treatment effluent at considerable depth and distance from shore, in some cases with diffusers at the outlet, to provide rapid dilution of pathogens to non hazardous levels. For some discharges such as Orange County, California, chlorination is performed on a seasonal basis due to changes in hydrographic conditions or recreational usage of coastal areas. All POTWs seeking a 301h waiver, including those not now chlorinating, would be required to chlorinate or use some other more hazardous and expensive, and less reliable method of disinfection under the proposed amendment in HR 3283, despite the fact that existing practice provides a high level of protection of human health without, in many cases, the additional use of chlorine as a disinfectant.

The amendment proposed in HR 3282 which would require all 301h dischargers to provide "chemical treatment to control pathogens" is clearly intended to ensure the protection of human health. However, this requirement would mandate treatment in some cases where none is necessary and in addition such treatment would cause the unnecessary discharge of significant qualities of synthetic toxic chlorinated organic compounds to the marine environment. Where existing state and Federally-approved bacteriological standards are met by an outfall design which ensures adequate dilutions of the primary treatment effluent and effective isolation from the human population by locating the discharges in areas distant from shellfishing and recreational areas, additional treatment to control pathogens would provide no benefit, since no gain in human health protection would ensue.

The addition of chlorine to wastes as a disinfectant results in the formation of trihalo-methanes, and chloramines many of which are known to be toxic and mutagenic to marine life. A single facility, such as the Hyperion Treatment Plant in Los Angeles would be required by HR 3282 to use over 200 tons of chlorine per day to destroy pathogens in the effluent, even though the ocean outfall has been shown to ensure the natural inactivation of pathogenic organisms by normal biological processes in the sea, such that no hazard to human health is caused by the discharge.

Where discharges of effluents take place only short distances from beaches or shellfisheries chemical additions to control pathogens are often appropriate in order to protect human health. Indeed many AMSA members with such outfalls, even some of those providing secondary treatment, (including, for example, municipalities discharging to San Francisco Bay) routinely chlorinate their effluent, either throughout the year or seasonally during periods of high beach use, in order to meet water quality standards. However, where the existing discharge is into well flushed deep ocean waters off an open coastline, this type of additional treatment is seldom required. Such well flushed deep ocean waters are, for example, the discharge locations for many west coast, Hawaiian and Alaskan POTWs. The only prudent approach to chlorination would be to allow the decision to chlorinate or not to be made on a case by case basis. The existing 301h regulations impose stringent requirements on the applicant to demonstrate compliance with all bacteriological water quality standards, both before the application is approved and then through monitoring when the modified discharge is in place. These requirements will need to be met through chlorination in some cases. However, imposition of a blanket chlorination requirement would inpose unnecessary environment risks, and economic burdens, on many communities.

Mr. ROE. The gentleman from Pennsylvania.

Mr. CLINGER. Thank you, Mr. Chairman.

Mr. Kaiser, both in your oral statement and in your written testimony you support establishment of a separate funding track for large metropolitan agencies. Would you describe why you believe this approach is appropriate, and how you envision the separate track concept could be structured?

Mr. KAISER. Congress has set up a formula based on need and population by which States are allocated their money. Historically, once the State gets it, it does not distribute it that way. In my State, I have one more large plant needing $300 to $400 million. And the State doesn't think that there is any water quality problem, and they are going to put us at the bottom of the priority list. They are doing the same thing with Kansas City on about a $100 million project.

Yet, much of the State of Missouri's money is derived from our needs and our population. Originally we were hoping for some type of passthrough. If the State was allocated its money that way and the major city that was the cause for the State getting that money had a mandated program, such as secondary treatment at its largest treatment plant, we think it ought to get some of the Federal dollars. I think by your formula you must think so, too. Another example is in Alabama, where the No. 1 and No. 2 projects in the State happened to be in large cities. The State decided to leapfrog those because they would take too much of its money. They have chosen to go ahead with some less-water-quality-effective program.

As an alternative, we looked at the separate-track funding because, while the large agencies represent more than 50 percent of the sewered population in this country we are not getting that percent of revenue.

If we want to clean up the mess, and if we were under mandate to build secondary treatment, and most of our agencies, as I said earlier, are in this same boat, then some method of assuring funding is necessary. I am not sure that it is the only answer. But it is better than not getting anything, and EPA hitting you on the head and saying: "Hey, you have got to go spend $400 million whether you get Federal money or not." That is just to me not the intent of the act.

So, one, I think there is a need. While ours may not be the best solution, we hope it gets some support and serves to encourage the States to start giving money to the large cities. Contrary to what the States think, we are not wealthy and we don't have bulging coffers. We are broke, as you well know.

Mr. ROE. Are there further questions of the distinguished gentleman? We want to thank you very much for your testimony. We appreciate it. It will be given the greatest of attention.

Mr. KAISER. We thank you very much for your attention. Thank you very much.

Mr. ROE. Our next witness for today is the Honorable William D. Ruckelshaus, Administrator of the U.S. Environmental Protection Agency.

Is the Administrator here? Good afternoon, Mr. Administrator. We want to welcome you to our committee. If you would identify for the record your colleague.

Mr. Ruckelshaus, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF WILLIAM D. RUCKELSHAUS, ADMINISTRATOR, U.S. ENVIRONMENTAL PROTECTION AGENCY BEFORE THE SUBCOMMITTEE ON WATER RESOURCES, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, U.S. HOUSE OF REPRESENTATIVES NOVEMBER 15, 1983

Good morning, Mr. Chairman and members of the subcommittee. I am pleased to be here to discuss reauthorization of the Clean Water Act. With me today are Jack Rovan, Assistant Administrator for Water, and Rebecca Hanmer, Deputy Assistant Administrator for Water.

This subcommittee held extensive hearings on the Clean Water Act last year. The breadth and detail of those hearings was impressive. Your 2,300 page report reflects the diligent efforts of both this subcommittee and its staff in considering mid-course modifications to a fundamentally sound piece of legislation.

I understand that the purpose of this series of hearings is to review the concerns and issues that have been raised in connection with reauthorization of the Clean Water Act. I think the most useful thing that I, as Administrator of the Environmental Protection Agency, can do, Mr. Chairman, is to define what I see as the significant problem areas, comment on some of the major proposals before this committee, and offer my own views as to what direction any mid-course corrections should take. I am prepared to provide whatever technical assistance and information you require in addressing the difficult issues facing this subcommittee.

The key issues have been clearly defined in the numerous bills, including H.R. 3182, presently before this subcommittee and the Administration's proposals, a copy of which I have attached to my testimony. I am happy to say that in my own mind, there are some issues on which there is no question.

The Clean Water Act is working. The control strategy formulated by Congress in 1972 and refined in 1977 has proven effective and successful. I have had first hand experience with the background and origins of the legislation and there simply is no doubt that we have seen impressive progress over the past decade. The act's strategic approach of requiring implementation of nationwide technology-based effluent limitations followed by any additional, needed controls based onsite-specific water quality concerns should be continued.

On other issues, our approach to key questions has been significantly strengthened by the useful comments we have received from Congress and the public on our original proposals, and by the other proposals which have been introduced in both Houses of Congress. Over the past several months our analysis of the major issues has continued, and I think we now have a better sense of what is reasonable, workable, and will yield results. Our analysis has also identified four additional issues which this committee may care to review. The most important of these, fundamentally different factors determinations—so called FDF's, are addressed in this statement. Brief explanations and proposed language on all four of these issues have been added to the Administration's proposals for the committee's consideration.

I hope that in discussing the major questions before us today, we can build on the reauthorization process begun last year and quickly complete the development of effective solutions to those problems.

1. CONSTRUCTION GRANTS FUNDING

One issue raised in H.R. 3282 that was not addressed last year is the proposal for increased Construction Grants funding. Under your leadership, Mr. Chairman, redirection and reauthorization of the Construction Grants program was considered in great detail 2 years ago and is reflected in the 1981 amendments to the Clean Water Act. The Administration continues to support the 1981 amendments and believes that the authorization levels set out in them are appropriate.

In 1985 Congress will have to determine whether the program should be continued or modified. After more than 25 years, I believe there should be a fundamental examination of whether the program should be targeted to small municipalities, modified to a loan program or turned over to the States under the Administration's New Federalism concept. Critical to all of these considerations is the need to determine the most appropriate federal role in obtaining expeditious compliance by municipal pollution control facilities with the enforceable requirements of the act.

EPA will be conducting a detailed study of issues related to the reauthorization of the construction grants program. We would be pleased to work with you as we complete the study.

Beyond the construction grants program, the key issues I would like to touch on today include industrial compliance deadlines, pretreatment, fundamentally differ-

ent factors determinations, water quality standards, post-BAT controls, nonpoint source controls and enforcement.

2. INDUSTRIAL COMPLIANCE DEADLINES

Of all these issues, clearly the most urgent in this reauthorization process is the need to extend industrial compliance deadlines. Industrial facilities have less than a year to comply with the current July 1, 1984, deadline for achievement of Best Available Technology [BAT] and Best Conventional Technology [BCT] effluent limitations. In many cases they have not been issued permits upon which even to begin the compliance process due to delays in Agency promulgation of national effluent guidelines. EPA is now in the final stages of completing those guidelines. But the fact remains that the necessary period for permit issuance and compliance that Congress envisioned in 1977 has been drastically reduced.

A number of different proposals have been made to extend industrial deadlines. These proposals differ in terms of the effluent standards to which they would apply and how much additional time they would provide. What each of these proposals clearly recognizes is the need to extend industrial compliance deadlines.

In resolving the question of extensions, Mr. Chairman, I believe there are three objectives that any solution must address. First, any extension must recognize the time necessary to promulgate effluent guidelines, issue permits, and for dischargers to come into compliance. Second, the extension must contain a final compliance date which applies to all BAT/BCT related permits. Third, the language should provide clearly that if compliance can be achieved before the final date, then it must be.

One thing I am very concerned about after reviewing the various proposals is that any final compliance deadline must be realistic. A number of the legislative proposals do not provide adequate time for the regulatory agencies to translate the effluent guidelines into individual permits. The July 1, 1988, deadline contained in the administration proposal reflects, I believe, a realistic assessment of the time needed to complete issuance of the effluent guidelines, write implementing permits, and allow dischargers to come into compliance. Let me emphasize, Mr. Chairman, that the administration's proposal would not allow any additional time for dischargers which could achieve compliance before July 1, 1988. Where compliance could be achieved before July 1, 1988, the implementing permits would contain the earlier deadline.

Finally, the administration proposal does continue the incentive for innovative solutions now embodied in section 301(k) of the act.

There is no question that some form of deadline extension is needed, Mr. Chairman, and I would like to offer whatever assistance the committee may require in determining the most appropriate way to address that need.

3. PRETREATMENT

The toughest issue with which I have dealt thus far in connection with Clean Water Act reauthorization is pretreatment. This is a subject to which EPA has devoted a substantial amount of time, resources and effort. The fundamental objectives of this program under the act are to protect water quality, protect municipal sludge from contamination by industrial toxic wastes, and protect the operation of the POTW itself.

The need to achieve these goals is widely recognized and unquestioned. However, the best means of achieving them has been the subject of extensive debate since 1972. One of my principal concerns is that technology-based categorical pretreatment standards inherently will result in cases of over or under treatment. There may be cases in which full implementation of categorical pretreatment standards may not be necessary or may not be sufficient to achieve the goals of the program. The difficult question we all have been grappling with is how to address instances of potentially unnecessary treatment without opening a Pandora's box of technical difficulties, serious resource demands, administrative problems, and scientific uncertainties, and without delaying the program in those situations that need these controls.

With the gathering momentum of local pretreatment programs, and with the Agency's promulgation of categorical standards well underway, I am reluctant to recommend anything that will entail significant delay or loss of momentum. Of 1,700 POTW's required to develop local pretreatment programs, approximately 60 percent have now submitted some portion of the necessary elements for program approval. Of that group, roughly 370 have already received approval and are now ready to enforce categorical standards. Within this fiscal year, EPA and approved

States are expected to approve an additional 800 local pretreatment programs. In addition, the compliance deadline for one of the major groups affected by categorical standards, the electroplaters, is now less than a year away.

At the same time, I also feel strongly that, where possible, we must avoid the application of categorical pretreatment standards where they are not needed. For this reason I have pursued the concept of a pretreatment waiver. This is the reauthorization issue on which I have spent the most time. I have talked with staff at all levels in the Agency and met with outside groups in an effort to develop a workable approach to this problem.

I must confess, Mr. Chairman, this has been a frustrating effort for me. As attractive as the concept of relying on end-of-pipe effluent limitations to ensure protection of water quality seems, I have come to the difficult conclusion that it just is not feasible to administer such a program without a serious delay of two to three years in the program. The prerequisites of any successful national effort in this area are missing. Most States are only in the early stages of establishing specific ambient water quality criteria and permit effluent limitations for toxic substances. Furthermore, the national sludge disposal and use standards to be established by EPA are still several years away.

We could, of course, wait for the development of these effluent limitations and sludge standards, but I think the pretreatment program has now reached a stage where that would seriously jeopardize the progress that has been made to date. I think the Agency, indirect dischargers, and affected POTWs need to get on with implementing the program in a reasonable, rapid, and effective fashion.

Following my June 14 testimony before the Senate on this same subject, I directed my staff to go back and take a fresh look at the concerns of POTWs and municipalities and the problems associated with implementation of the existing program. After meeting with a number of groups to discuss operational concerns and explore alternatives, I have decided to establish a pretreatment implementation review task force. Its purpose will be to seek solutions to common implementation problems encountered by control and approval authorities. This will include developing equivalent industrial monitoring and municipal enforcement programs, and guidance on implementing production-based categorical standards and, where appropriate, to identify regulatory problems. To ensure a broad base of information, the task force will be made up of representatives of States, municipalities, industry, the environmental community, and EPA. It will include representatives of both large and small municipalities, as well as municipalities with both new and established programs.

It is my hope that as the recommendations of this task force are factored into the implementation process, some of the most significant technical concerns and objections we have heard will be resolved.

Earlier I mentioned the lack of sludge disposal and use criteria. I am pleased to report that we have now established a program for moving aggressively forward in filling the regulatory gaps in that area. The Agency's Sludge Task Force recently presented their findings to a senior-level Policy Committee. These included recommendations on how EPA should structure an integrated sluge regulatory program based upon the joint authority of section 405 of the Act and the appropriate provisions of EPA's other laws. The Committee has endorsed and forwarded those recommendations to me and has directed the Task Force to prepare a detailed workplan for initiating the effort. Although many details remain to be worked out, the broad outline of this program involves a comprehensive effort to develop standards and to formulate a State implementation process. These regulations will be supplemented by a general policy statement and general guidance which we will issue in fiscal year 1984. The regulation development effort will clearly take longer—probably in excess of 2 years—but resources within several key offices have already been redirected to support this undertaking. I am confident that this unified effort will produce a comprehensive sludge management program which will serve to ensure safer, more cost-effective, and more beneficial sludge management, and which can be integrated into the existing pretreatment program.

4. FUNDAMENTALLY DIFFERENT FACTORS DETERMINATIONS

In discussing pretreatment, I have emphasized the need to get on with implementation of the program. Of particular concern in this regard is a recent decision of the Third Circuit Court of Appeals as it relates to applying national effluent guidelines for indirect and, by implication, direct dischargers. Essentially, the Court held that the fundamentally different factors (FDF) determination procedure that EPA has had available for use in the application of national effluent guidelines for toxic pollutants is not authorized by the Act.

I strongly believe, Mr. Chairman, that the FDF determination procedure is an essential adjunct to the national rulemaking process. EPA has traditionally used this procedure as a "safety valve" in developing, implementing and defending effluent guidelines for existing sources. In going through the extraordinarily complex process of a national rulemaking, the FDF determination procedure permitted EPA to focus its data gathering and analysis on the more typical facilities and defer to subsequent proceedings those plants with unique features. This has resulted in both major cost savings and reductions in the time necessary for guideline development. By providing an administrative remedy for facilities that may not be able to meet national standards due to unique factors not considered in rulemaking, the FDF determination procedure reduces the legal vulnerability of the national standards.

There may be some concern that the administrative remedy provided by FDF determinations is somehow a regulatory "loophole". This simply is not the case. It should be noted that the FDF determination procedure may be used to develop requirements more stringent than those contained in the national effluent guidelines. Let me review very briefly how the FDF determination procedure works. A facility must first submit a petition demonstrating that there is some factor in its situation that is fundamentally different from those considered in establishing the national regulation. Only information not previously considered can be the basis for an FDF determination petition. In other words, this procedure cannot be used as a backdoor means of challenging and rearguing the regulation itself. Second, to establish a "fundamental difference", a facility must show that compliance with the national limits would result in either a removal cost wholly out of proportion to the removal cost considered by the Agency during the development of the national regulation or a fundamentally more adverse non-water quality impact. This is a very tough test to meet. Third, any alternative technology based limits may reflect only the degree of modification actually required by the fundamental difference. Fourth, in order to ensure that all points of view are considered, the public is informed of applications for FDF determinations and given the opportunity to participate in the proceeding.

The FDF determination procedure is not a waiver procedure, and in particular, is not an economic waiver procedure. Rather it is a procedure through which a facility receives an individualized determination of its technology-based effluent requirements. As such, it is analogous to the Agency's use of best professional judgement permit determinations to establish effluent limitations for industrial facilities whose national effluent guidelines have not been issued.

My point is very simple, Mr. Chairman. There are two approaches for responding to a facility with valid grounds for arguing that it is fundamentally different from other facilities in its category. One possibility is to develop a separate subcategory within the regulation, undertake a separate data collection and analysis effort, and then repropose and issue the final rule. The other alternative is to leave the national rule in place and use the FDF determination procedure to establish alternative technology-based limitations for the facility that accurately reflect its situation.

Let me emphasize that both of these approaches reflect the exercise of the Agency's regulatory expertise. Both of these approaches will involve a review of the same set of facts. Both involve the public. And both of these processes will end up with the same decision. So what is the difference?

Our major concern is that the subcategorization substantial additional time in developing what are already extraordinarily complex and detailed national regulations. In essence, this approach would require us to handle through modifications to nationally applicable regulations the special situations of single facilities. This simply is not efficient. By contrast, the FDF determination procedure allows both implementation of the national rule and consideration of individual petitions claiming unique factors.

For these reasons, I urge careful consideration of the attached draft language to clarify and confirm EPA's authority in this area.

5. WATER QUALITY STANDARDS POST-BAT

With the completion of the remaining effluent guidelines over the next year and the implementation of pretreatment and direct discharge standards, a reasonable question remains: What if these technology-based limitations are not stringent enough to protect designated water uses? In accordance with the Act's fundamental pollution control approach, reliance on strengthened and more sophisticated water quality standards will form the basis of EPA's post-BAT strategy.

Two issues come up in assessing any post-BAT strategy. The first is the adequacy of the water quality standards upon which control strategies will be based. Second is the strategy itself. Taking water quality standards first, I have read your letter of

March 14, Mr. Chairman, and understand that one of the main reasons for the current widespread concern over these standards has been the Agency's October 1982 proposed rulemaking to revise the existing water quality standards regulation. As I understand it, one of the principal purposes of this proposal was to make the standards setting process a better and more effective decisionmaking tool. Regardless of the Agency's intent, the proposed revisions apparently were viewed by the public as a retreat from the goals and objective of the Act in the areas of anti-degradation, downgrading and cost-benefit analysis.

In response to numerous comments we have received on this issue, and the major concern indicated by both the House and Senate, we have recently made further revisions to and promulgated the Agency's water quality standards regulation. Copies of our redrafted preamble and regulatory provisions have been provided to this Subcommittee for its information and use. I believe these additional revisions meet the concerns and objections that have been raised and both strengthen and clarify our national water quality standards program. Since our revised regulations will yield the same environmental results, I strongly urge that these provisions be deleted. Also, I would note that the Senate Committee on Environment and Public Works has agreed to delete the anti-degradation and downgrading provisions of their bill.

Section 6 of H.R. 3282 would address the issues of downgrading and anti-degradation by codifying a revised version of the existing water quality standards regulation. Both of these provisions would hamper the ability of EPA and the States to deal with site-specific problems.

H.R. 3282 would also add a provision requiring the use of numerical water quality criteria. This provision, requiring States to adopt numerical criteria for toxic pollutants, would essentially preclude States from using alternative means, such as biological criteria, of establishing water quality benchmarks. Under EPA's revised regulation, States must identify specific water bodies where toxic pollutants are causing problems, and must adopt criteria sufficient to protect the designated use. These criteria may be numerical or narrative and may be used singly or in combination, as needed. For example, where an effluent contains a few, readily identifiable toxic chemicals, then pollutant-specific criteria and effluent limitations will be used. In situations involving discharges of complex effluents, it may neither be feasible nor environmentally protective to use a numerical, pollutant-by-pollutant approach. In those cases, I believe it is more effective to use biological testing as the basis for setting aquatic toxicity limits. Because our revised regulations provide a more effective, flexible approach which we have adequate authority to implement, I recommend that this provision be deleted, or at least modified to provide the flexibility to use either approach.

With respect to a post-BAT control strategy, H.R. 3282 would require EPA to inventory nonattainment waters existing after the installation of technology-based controls, and then develop and implement in cooperation with the States an individual point source control strategy for each nonattainment waterbody.

EPA has been studying the need for toxic pollutant controls beyond BAT for some time. The Agency has also been very hard at work developing the methods, especially biological assessments, necessary to determine where toxic pollutants are causing problems and to determine necessary levels of control. While much work remains to be done, I am confident that the Agency is in a position to make these methods generally available during this fiscal year.

Where EPA or a State determines that BAT is not sufficient to protect the designated uses of the receiving waters, it issues permits which include more stringent effluent limitations. Where the data are not available or not conclusive to support such a determination, the source's permit will be written in incorporate BAT effluent limitations but will contain monitoring requirements that become effective once the BAT effluent limits are achieved. If this monitoring shows that the BAT effluent limitations do not protect designated water body uses, the permit will be reopened and additional requirements incorporated. All of this is currently authorized by the existing statute.

So while I support establishing controls beyond BAT when necessary, I feel that the Agency already has the authority to accomplish this. Therefore I believe statutory changes are neither necessary nor desirable. I would be happy to work with you in further explaining our concerns and reservations on this issue.

6. NONPOINT SOURCE POLLUTION CONTROL

Next, I would like to address the control of nonpoint sources of pollution. H.R. 4037 proposes a national program to assist State implementation of nonpoint source

20-355 O—84——171

pollution controls. With the establishment of technology-based standards well underway for point sources, it is now time to turn our attention to the control of pollution from nonpoint sources. I believe there is no question that pollution from nonpoint sources is having significant adverse impacts on water quality in certain areas across the United States. The 1982 State water quality assessments report prepared under section 305(b) of the Act describes the nature of this problem: (1) in one-fifth of the States, nonpoint sources are now the most important cause of water degradation in those waters not meeting designated uses; (2) agricultural nonpoint sources are the major nutrient sources in lakes with eutrophication problems; and (3) of the 20 States which specifically quantified their progress towards the 1983 Clean Water Act goals, 15 (75 percent) list nonpoint sources as significant sources in their remaining problem waters.

Attainment and maintenance of water quality standards is our fundamental objective under the Clean Water Act. We all recognize that achieving this depends on controlling both point and nonpoint sources. My concern is that while tremendous public and private investments have been made to control point sources, we have thus far been remiss in addressing the continuing problem of nonpoint source pollution. This condition is of major importance both because it affects the total amount of pollution control achieved and because it dilutes and dissipates the environmental return on the time, resources, and effort we have already expended.

Just as there is general agreement about the significance of nonpoint source pollution control problems, there is basic consensus on what needs to be done. Each State must identify specific problem waterbodies and contributing nonpoint sources, develop tailored controls, and proceed with implementation. To date, most States have generally identified their nonpoint source problem waters, the nonpoint sources affecting these waters, and proposed control approaches. Much of this was accomplished as part of the broader 208 planning effort. In some cases, there may be a need to go beyond this initial planning and identify specific problem activities and appropriate site-specific controls. Once the site-specific control approaches are identified, the crucial next step will be to ensure that the parties responsible put those controls into practice.

My discussion on nonpoint sources indicates two basic areas of agreement on implementing the necessary controls. One area of agreement is that State and local governments have the major planning, program development, and implementation responsibilities. They unquestionably have a broader range of authorities and more detailed knowledge of site-specific conditions than we have at the Federal level. Therefore, they are able to tailor nonpoint source control programs to meet their specific needs.

The other area of agreement is that, while States must have the primary responsibility for nonpoint source program development and implementation, the Federal Government will reemphasize its efforts to address this problem. The Agency also has the responsibility to provide technical expertise and disseminate knowledge gained at the Federal, State, and local level to other communities with similar problems.

I believe that a number of steps can be taken now to ensure that the Federal Government effectively meets its responsibilities in this area. First, under existing Clean Water Act authorities, EPA will provide clear guidance under which States will update or develop nonpoint source programs for specific waterbodies where nonpoint sources substantially impact desired water uses. States can use or refine existing water quality management plans to accomplish this.

Second, Secretary of Agriculture Block and I have discussed how we can best coordinate our efforts to address priority nonpoint source control needs in each State. We have agreed that after EPA issues its nonpoint source guidance, USDA will support EPA's priority on this subject as part of their ongoing National Conservation program. USDA's technical assistance delivery systems can help many farmers in this country to understand the impact their activities can have on water quality, and how they can modify their own farming practices to protect water quality.

USDA has a long and successful history of working at the grass roots level to develop conservation practices, to educate the farmers on these practices and to provide technical assistance in applying them. At the county level, the Agricultural Stabilization and Conservation Service, the Soil Conservation Service, and the Extension Service all work together to provide support and assistance to farmers needing or requesting help.

EPA will continue to encourage States to use funds available under Section 205(j) and 106 of the Act for nonpoint source needs and provide Agency technical and program support. In addition, EPA will use $2 million in appropriated fiscal year 1984 extramural funds for a nonpoint source report to Congress, development and dis-

semination of information on control strategies, and technical transfer on NPS methodologies. EPA will maintain Headquarters and EPA Regional Office personnel to support State and local government nonpoint source control efforts in fiscal year 1984. Finally, the Agency, together with other federal agencies, will be working to examine their fiscal year 1985 needs.

I believe H.R. 4037 and EPA's strategy for nonpoint source pollution control are basically consistent in terms of the need to identify specific problem areas and control needs. However, I am concerned that a Federal cost-sharing program would create disincentives to voluntary action by anyone not receiving Federal funds and therefore would slow the implementation of nonpoint source controls. I believe the federal role should not infringe on sensitive State and local decisions concerning land use. I was pleased to note that the recent Senate committee modifications to their nonpoint source control provision include elimination of the disincentives to voluntary action.

7. ENFORCEMENT

The Clean Water Act will not work unless EPA and State enforcement efforts are vigorous and effective. Toward that end, there are two provisions of the administration's proposal that I would like to emphasize this morning: administrative civil penalties and criminal sanctions.

a. Civil enforcement

Presently the Clean Water Act provides two civil enforcement options. When faced with a violation of the act, the Administrator may issue an order requiring compliance by the violator or the Administrator may bring a civil action in the appropriate United States District Court for penalties and injunctive relief.

Section 7 of the Administration's proposed legislation allows the Administrator a third option, to administratively assess civil penalties of up to $10,000 per day (not to exceed $75,000 total) for clear and well documented violations of the Act. Under this approach, a violator would be given notice and an opportunity for a hearing, and if dissatisfied with the final assessment, he would be able to seek review in a United States District Court. The court review would be appellate in nature and not a de novo trial proceeding.

The addition of administratively assessed civil penalties as an enforcement tool would give the Agency more flexibility to deal with noncompliance situations. A non-penalty administrative order may be ineffective in resolving the problems, and yet the option of taking judicial action may be unreasonably costly, burdensome, and time consuming for all the parties involved, given the nature of the violation.

The Agency's experience to date with assessing similar civil penalties existing under other environmental statutes (CAA, FIFRA, TSCA, RCRA) indicates that this option will give EPA more enforcement flexibility, lead to speedier compliance, and assure due process without the expense and delay of a judicial enforcement action.

Section 8 of H.R. 3282 addresses the area of civil enforcement as well. It proposes to increase the daily maximum civil penalty provided for under section 309(d) of the Clean Water Act from $10,000 per day to $20,000 per day. Although this is slightly less than the equivalent provisions of the Clean Air Act and the Resource Conservation and Recovery Act, it strengthens existing enforcement mechanisms, and, therefore, I support it. I would also support increasing the maximum civil penalty to $25,000 per day so as to be fully consistent with the provisions of these other statutes.

b. Criminal enforcement

Knowing violations of the Clean Water Act have caused serious environmental harm and millions of dollars of damage to private and public property. In some cases, they have raised the clear potential for loss of life and serious personal injury. A stronger criminal sanction is needed under the Act to deter these violations.

The proposal we are recommending elevates penalties for knowing violations of the Act to the felony level and adds criminal sanctions to the Act for persons who knowingly introduce into a sewer system a pollutant or hazardous substance which causes or can reasonably be anticipated to cause personal injury or property damage. For those defendants who have complied with all applicable Federal, State and local requirements, an affirmative defense is provided.

The addition of these criminal penalties to the Act will put violations on the same level as violations under RCRA. Currently, a knowing discharge onto the ground of harzardous wastes could subject the discharger to felony sanctions under RCRA.

However, the same discharge into a sewer system would only subject the discharger to the misdemeanor provisions of the Clean Water Act. The result is an unintentional incentive to dump hazardous substances into sewer systems. The addition of these criminal sanctions will aid in protecting sewer system and POTWs in which substantial Federal monies are invested.

Strong public support exists for aggressive enforcement action in cases of deliberate environmental misconduct. The addition of criminal sanctions to the Act for knowing, intentional violations of the Act will reflect this public concern and should dispel any perceptions that the intentional violation of the Act is not a serious offense.

8. CONCLUSION

In conclusion, Mr. Chairman, I have focused my remarks on what I believe are the key reauthorization issues. I have not discussed a number of other issues raised in both the Administration's and other proposals before this Subcommittee. Clearly, these need to be addressed in this reauthorization process. I hope that today we have begun what will be a continuing dialogue to address these remaining issues as well as the ones I have highlighted this morning.

This concludes may prepared statement. I would be happy to answer any questions you may have.

SUMMARY OF ADMINISTRATION PROPOSALS FOR CLEAN WATER ACT REAUTHORIZATION

1. *Authorization* [sections 104(u), 106(a) and 517] 5 year reauthorization of funding to 1988.

2. *BAT/BAT compliance deadline extension.*—[sections 301 (b)(2) and (k)] Extend Section BAT/BCT compliance deadlines from July 1, 1984 to not later than July 1, 1988.

3. *Municipal deadline extension.*—[section 301(i)] Allow all POTWs not in compliance with secondary treatment or water quality standards to apply for an extension to 1988.

4. *Environmental modification fees.*—[section 301(n)—new subsection] Allow Administrator authority to charge fees for waiver or exemption processing.

5. *New source performance standards.*—[section 306(a)] Make new source performance standards applicable only after *final* regulations are issued (instead of proposed).

6. *Pretreatment.*—[section 307(e)—new subsection] Allow local POTW's to apply on behalf of indirect dischargers for modification of categorical pretreatment standards.

7. *Administrative civil penalties.*—[section 307(g)—new subsection] Allow Administrator authority to *administratively* assess civil penalties for clear, well-documented violations of the Act—analogous to parking ticket concept. Appeal to district court provided.

8. *Criminal sanctions.*—[section 309(c)] Modify enforcement provisions of section 309—(penalties of up to $50,000/day and/or 2 years imprisonment—basically to parallel RCRA.)

9. *Thermal dischargers.*—[section 316(a), (b), and (c)] Base modification of technology-based thermal standards on either 1) protection of balanced population of aquatic life ("indigenous" deleted) or 2) attainment of State thermal water quality criteria. Allow alternative measures to mitigate the impacts of cooling water intake structures.

10. *NPDES permit term extension.*—[section 402(b)] Extend NPDES permit life from 5 to 10 years for permits with no modifications.

11. *Partial NPDES program approval.*—[section 402(b) and (c)] Allow State administration of selected parts of permit program.

12. *Munitions.*—[section 502(6)] Exclude conventional munitions from Act's definition of "pollutant."

13. *Criminal investigations.*—[section 501(g)—new subsection] Provide confirmation of EPA's criminal investigative authority.

14. *Fundamentally different factor determination.*—[section 301(l)] Confirm the Administrator's authority to determine alternative effluent limitations for an existing direct or indirect discharger which is fundamentally different from those dischargers considered in developing national effluent guidelines.

15. *Conflict of interest.*—[section 304(i)] Modify the conflict of interest requirements applicable to state permitting bodies to generally parallel those of the Clean Air Act.

16. *Report to Congress.*—[section 6 of FWPCA of 1972] Repeal requirement for the Secretary of Commerce to submit to Congress an annual report on the international trade effects of water pollution control expenditures.

17. *Commonwealth of the Northern Mariana Islands.*—[section 502(3)] Modify the definition of "State" to include the Commonwealth of the Northern Mariana Islands.

SECTION-BY-SECTION ANALYSIS

AUTHORIZATION

Section 1 of the bill amends sections 104(u), 106(a) and 517 to extend funding authority for 5 years, through fiscal year 1988. Funding for fiscal year 1984 is based on the President's budget, and for subsequent years such sums as may be necessary are authorized. A technical amendment has also been made to section 517 to authorize funds for section 304 information and guidelines.

These funds will support the development of information on pollution prevention, reduction and elimination through a program of research, investigation and demonstration (section 104(u)); grants for State and interstate agency pollution control programs (section 106(a)); and the general implementation of the Act (section 517).

BAT/BCT COMPLIANCE DEADLINE EXTENSION

Section 2 of the bill amends section 301 of the Act to extend the current deadline for industrial compliance with BAT and BCT effluent guidelines from July 1, 1984, to July 1, 1988; and for industrial BAT/BCT permit limitations based on best professional judgment (BPJ), to provide three years from date of issuance in which to achieve compliance. This section also continues the present 3 year deadline extension for dischargers using innovative technologies to achieve compliance with BAT.

Delays experienced by the Agency in promulgating BAT/BCT effluent guidelines leave very little lead time for industry to meet present compliance deadlines. The purpose of this revision, therefore, is to provide industry with sufficient time to construct the necessary treatment facilities to come into compliance with BCT and BAT effluent guidelines.

MUNICIPAL DEADLINE EXTENSION

Section 3 amends section 301 of the Act to allow all publicly owned treatment works (POTW's) not in compliance with applicable secondary treatment or water quality based effluent limitations to apply for an extension to 1988.

In 1977, extensions of compliance deadlines under the Act were authorized to no later than 1983. In the recent 1981 municipal construction grant amendments (P.L. 97-117), the extension date was changed to 1988, but only POTW's that already had extensions were eligible. The purpose of this revision is to allow all POTW's not in compliance the opportunity to apply for that extension. To receive an extension a POTW must meet the same tests and conditions set forth under the 1977 Act.

ENVIRONMENTAL MODIFICATION FEES

Section 4 adds a new subsection to section 301 of the Act. This subsection provides the Administrator with the authority to charge fees for processing and reviewing applications to modify or exempt certain effluent limitations, standards, and requirements under sections 301 (c), (g), (h), 307(b), and 316(a) of the Act. Under this revision, fees collected by EPA would be used solely for the purposes of processing and reviewing such applications.

NEW SOURCE PERFORMANCE STANDARDS

Section 5 amends section 306 to redefine "new source" to make new source performance standards (NSPS) applicable after issuance of final rather than proposed regulations.

Presently, facilities may be considered to be new sources if construction is begun after issuance of proposed new source performance standards. The difficulty with this definition is that in practice, it may take over a year between the issuance of a proposed regulation and the promulgation of final binding standards. The purpose of this revision is to ensure that final NSPS standards will be available and applicable as new construction is begun.

PRETREATMENT

Section 6 amends section 307 to allow modification of certain categorical pretreatment requirements for industrial facilities discharging into a POTW if it can be demonstrated to the satisfaction of the Administrator and the State that the modification will not interfere with meeting the State designated uses for the receiving water body.

For an industrial facility to receive a modification, the POTW must apply on its behalf. The POTW must have an approved general pretreatment program and show that it is either achieving secondary treatment or on a compliance schedule to achieve it. Among other things, the POTW must also develop for itself end-of-pipe numerical effluent limitations for each of the pollutants that would otherwise be limited by the categorical standard. These end-of-pipe limitations must be adequate to ensure that attainment of local water quality objectives will not be interfered with. In addition, a monitoring program must be in place to ensure that these limitations in fact will not be exceeded.

ADMINISTRATIVE CIVIL PENALTIES

Section 7 amends section 309 of this Act to provide the Administrator with authority to administratively assess civil penalties of up to $10,000/day for clear and well-documented violations of the Clean Water Act which may not be serious enough to require judicial enforcement.

Presently, civil penalties under the Act can only be imposed through judicial enforcement. By providing authority for administrative penalty assessment and resolution of actual issues before a neutral hearing officer, this revision will allow institution of an enforcement mechanism which would minimize protracted litigation while ensuring due process and resolving issues to the satisfaction of all parties more efficiently and expeditiously.

CRIMINAL SANCTIONS

Section 8 amends section 309 to provide that dischargers or individuals who knowingly violate or cause the violation of certain Clean Water Act requirements would be subject to criminal penalties of up to $50,000/day and/or imprisonment for up to 2 years. Existing misdemeanor penalties would be retained to address those violations which do not merit extraordinary punishment.

Presently the Clean Water Act has no provision that deals with knowing violations of major statutory or regulatory requiremments. This provision is intended to address intentional violations of the Act occurring on a regular basis over an extended period of time that result in significant harm to public health or the environment and provide for the imposition of correspondingly stiffer penalties for such actions. This provision is not directed or intended to apply to isolated instances of either unpermitted discharges or discharges exceeding permit limitations.

THERMAL DISCHARGES

Section 9 amends section 316 to modify the environmental tests for thermal discharge modifications from a test based on balanced, indigenous population to either the attainment and maintenance of thermal water quality criteria or a test based on a balanced population of shellfish, fish, and wildlife. Such modifications would be conditioned on the establishment of a monitoring program to ensure compliance.

The present provision may require protection for uses which do not exist in the receiving waters of the discharger and which may exceed existing State standards.

Section 316 is also amended to allow the use of alternative measures, such as construction and operation of a fish hatchery restocking program, to mitigate the adverse environmental effects of intake structures if the alternative measures are equal in effect to the Best Technology Available for intake structures.

NPDES PERMIT TERM EXTENSION

Section 10 amends section 402 of the Act to extend the present NPDES permit term under the Act from 5 to no more than 10 years for permits with no modifications.

For the State and Federal agencies assigned the responsibility for issuing discharge permits, the extension of the permit term will reduce the annual permitting workload and serve as a management tool to ensure that large backlogs do not accumulate in the future. For the permittee, the longer term should generally provide

more certainty over the longer period of time, thereby making investments in pollution control more economical.

PARTIAL NPDES PROGRAM APPROVAL

Section 11 amends section 402 to allow EPA to approve partial State administration of permit programs. Currently, States wishing to administer the NPDES Program must assume all major components of the program before EPA is authorized to approve State assumption.

Allowing partial program approvals would provide the States flexibility in seeking approval for those parts of the program which they can administer immediately. While a State with a fully approved program could return the entire program to EPA , it could not return any part or parts.

MUNITIONS

Section 12 amends section 502 to exclude munitions used in the course of conventional military weapons training and testing from the definition of pollutants controlled under the Act. The purpose of this revision is to permit the military to conduct training activities without the necessity of obtaining an NPDES permit for the intentional or accidental discharge of projectiles into waters near or surrounding targets.

CRIMINAL INVESTIGATIONS

Section 13 amends section 501 of the Act to affirm the existing authority of EPA to investigate and refer cases under the criminal provisions of the statute. The need for this provision arises from the absence of specific statutory language pertaining to criminal investigative jurisdiction under the Act.

In January 1981, as a result of specific challenges to the Agency's independent authority to conduct criminal investigation, Attorney General Civiletti issued a confirmation of criminal investigative jurisdiction in a letter to the Administrator of EPA. Litigants continue to resist, however, due to the absence of specific statutory language confirming this authority.

Enactment of section 13 will confirm and clarify the Agency's authority to initiate and conduct investigations of potential criminal violations of the Clean Water Act and to refer the results of these investigations to the Attorney General for prosecution.

FUNDAMENTALLY DIFFERENT FACTORS DETERMINATION

Section 14 amends section 301(1) of the act to confirm the agency's authority to adopt an administrative procedure which may be used to determine alternative technology-based effluent limitations and standards for existing direct and indirect discharges which are fundamentally different from dischargers considered in the development of national effluent guidelines. EPA has traditionally relied on the fundamentally different factors (FDF) determination procedure as a "safety valve" in developing, implementing and defending effluent guidelines and standards for existing sources. The FDF determination procedure has permitted EPA to focus its data gathering and analysis during the national rulemaking on the more typical facilities and defer to subsequent proceedings those plants with unique features.

CONFLICT OF INTEREST

Section 15 amends section 304(i) of the Act to modify the conflict of interest requirements applicable to state permitting boards along the lines of the Clean Air Act. This provision would eliminate the current prohibition on state permitting boards employing any person who receives, or has received during the previous two years, a significant portion of his income directly or indirectly from permit holders or applicants for a permit. It would also require state permitting boards to have at least a majority of members who represent the public interest and for any potential conflicts of interest to be adequately disclosed.

REPORT TO CONGRESS

Section 16 repeals section 6 of the Federal Water Pollution Control Act Amendments of 1972 (33 U.S.C. 1251 nt.) which requires the Secretary of Commerce to report annually to Congress on the international trade impacts of water pollution control expenditures. The Department of Commerce has found it extremely difficult,

and often impossible, to obtain from foreign countries the detailed data needed to prepare the reports. Only the 1976 and 1979 reports have included cost data from foreign countries, and then only for three industries. Accordingly, the reports have not been very useful and do not justify their costs.

COMMONWEALTH OF THE NORTHERN MARIANA ISLANDS

Section 17 amends the definition of "State" to include the Commonwealth of the Northern Mariana Islands. Since the Act was last reauthorized in 1977, a portion of the Trust Territory of the Pacific Islands has been redesignated as the Commonwealth of the Northern Mariana Islands. Expansion of the term "state" to include them would conform the Act to reflect their new status.

AUTHORIZATION

Sec. 1. (a) Section 104(u)(1) is amended by deleting the word "and" following "1981," and by inserting "not to exceed $12,533,600 for the fiscal year ending September 30, 1984, and such sums as may be necessary for the fiscal years ending September 30, 1985, September 30, 1986, September 30, 1987, and September 30, 1988" immediately following "1982".

(b) Section 106(a) is amended by deleting the word "and" following "1973", by inserting "; and" immediately following "1982", and by adding a new paragraph (3) as follows:

"$24,000,000 for the fiscal year 1984, and such sums as may be necessary for the fiscal years 1985, 1986, 1987 and 1988".

(c) Section 517 is amended by striking "and" immediately following "1981," and by inserting ", $91,589,300 for the fiscal year 1984 and such sums as may be necessary for the fiscal years 1985, 1986, 1987, and 1988" immediately before the period at the end thereof.

(d) Section 517 is further amended by inserting "304(k)" in place of "304".

BAT/BCT COMPLIANCE DEADLINE EXTENSION

Sec. 2. (a) Section 301(b)(2)(C) is amended to read as follows: "With respect to all toxic pollutants referred to in table 1 of Committee Print Numbered 95-30 of the Committee on Public Works and Transportation of the House of Representatives, compliance with those effluent limitations established in regulations issued under sections 301(b)(2) and 304(b)(2) of this Act no later than July 1, 1988, and for all other limitations established to carry out the provisions of this subparagraph compliance no later than 3 years after the date such limitations are established;".

(b) Section 301(b)(2)(E) is amended to read as follows: "With respect to pollutants identified pursuant to section 304(a)(4) of this Act for categories and classes of point sources, other than publicly owned treatment works, compliance with those effluent limitations established in regulations issued under sections 301(b)(2)(E) and 304(b)(4) of this Act no later than July 1, 1988, and for all other limitations established to carry out the provisions of this subparagraph compliance no later than 3 years after the date such limitations are established;".

(c) Section 301(b)(2)(F) is amended to read as follows: "For all pollutants (other than those subject to subparagraphs (C), (D), or (E) of this paragraph) compliance with those effluent limitations established in regulations issued under sections 301(b)(2) and 304(b)(2) of this Act no later than July 1, 1988, and for all other limitations established to carry out the provisions of this subparagraph compliance no later than 3 years after the date such limitations are established.".

(d)(1) Section 301(k) is amended by deleting the words "July 1, 1987," and inserting in lieu thereof the words "July 1, 1991,".

(2) Section 301(k) is further amended by deleting the letter "(A)" from "(b)(2)(A)" wherever it appears.

MUNICIPAL DEADLINE

Sec. 3. Section 301(i)(1) is amended by deleting the words "within 180 days after the date of enactment of this subsection" and inserting in lieu thereof the following: "within 12 months after enactment of the Clean Water Act Amendments of 1983.".

ENVIRONMENTAL MODIFICATION FEES

Sec. 4. Section 301 is amended by adding a new subsection (n) as follows:

"The Administrator may prescribe such processing fees for applications for modifications and exemptions submitted to the Administrator pursuant to sections 301(c),

(g), (h), (m), 307(e), and 316(a) of this Act as he deems appropriate. All amounts collected by the Administrator under this subsection shall be used solely for application processing purposes; provided that these amounts shall be credited to the appropriation that incurs the costs and shall be available only in such amounts as are included in appropriations acts.".

NEW SOURCE PERFORMANCE STANDARDS

Sec. 5. Section 306(a)(2) is amended by adding a sentence at the end thereof to read as follows:

"For the purposes of any regulation proposed after the date of enactment of the Clean Water Act Amendments of 1983, the term "new source" shall mean any source, the construction of which is commenced after the publication of final regulations prescribing a standard of performance under this section which is applicable to such source.".

PRETREATMENT

Sec. 6. (a) Section 307 is amended by adding a new subsection (e) as follows:

"(1) The Administrator, with the concurrence of the State (or, if appropriate, the State), may issue a permit under section 402 for a treatment works (as defined in section 212 of this Act) which is publicly owned, which modifies applicable industrial categorical standards established under sections 307(b)(1) and (c) of this Act for industrial sources introducing pollutants into such works upon a showing, satisfactory to the Administrator (or, if appropriate, the State) that—

(A) the treatment works is in compliance with the requirements of section 402(b)(8) of this Act;

(B) the treatment works is in compliance or subject to a schedule for achieving compliance with effluent limitations based upon secondary treatment (as defined pursuant to section 304(d)(1) of this Act or as may be modified pursuant to section 301(h) of this Act) and with the requirements of section 403 of this Act;

(C) there are applicable numerical effluent limitations for the treatment works specific to the pollutants for which the modification is requested to ensure that such pollutants do not pass through the treatment works in quantities sufficient to interfere with the attainment or maintenance of the designated uses (established pursuant to section 303(c) of this Act) of the body of water into which such works discharge, and that the works is in compliance or subject to a schedule for achieving compliance with such limitations as expeditiously as possible and with the requirements of section 403 of this Act;

(D) such modification will not result in any pollutant interfering with the operation of such works or impairing current or planned future sludge use or disposal by such works;

(E) there exists adequate legal, financial, technical, analytical, administrative, and enforcement authority, as well as resources and a system of enforceable limitations to ensure compliance with the requirements of this subsection;

(F) a monitoring program will be established in accordance with section 402 of this Act to ensure continued compliance with the requirements of this subsection; and

(G) an annual report will be submitted to the Administrator (or, if appropriate, the State) to document continued compliance with the requirements of this subsection.

(2) Upon a finding that any of the applicable requirements of this subsection are not being met by the treatment works to which a modified permit was granted, and after notice and consultation with State and local authorities (or, if appropriate, the Administrator), the Administrator (or, if appropriate, the State) shall modify or rescind such modification, and may establish such effluent limitations for the treatment works as may be necessary to achieve the purposes of subsections (b) and (c) of this section.

(3)(A) Any application for a modification filed by a treatment works under this subsection shall not operate to stay any requirement of subsection (b) or (c) of this section unless such works submits a letter of intent to the Administrator (or, if appropriate, the State) within 120 days of the promulgation date of the industrial categorical standard for which the modification is requested, or within 120 days of the date of enactment of this bill if the applicable standards was promulgated prior to such date.

(B) The letter of intent shall include, but not be limited to, a demonstration satisfactory to the Administrator (or, if appropriate, the State) that (i) the treatment works is in compliance with the requirements of section 402(b)(8) of this Act or with

effluent limitations based upon secondary treatment (as defined pursuant to section 304(d)(1) of this Act or as may be modified under section 301(h) of this Act), and (ii) both an achievable schedule containing planning, development, and performance dates by which all the requirements of paragraph (1) will be met, and a workplan specifying the scientific, technological, and administrative methodologies to be relied on in meeting the schedule have been established.

(C) Upon receipt of a satisfactory letter of intent, the Administrator (or, if appropriate, the State) may stay the applicable requirements of a categorical standard for which a modification is requested for an industrial source introducing pollutants into the treatment works for no more than two years from the date such letter of intent is received.

(D) The Administrator (or, if appropriate, the State) shall revoke any stay granted under this subsection upon a finding that the dates of the schedule or methodologies of the workplan contained in the letter of intent under subparagraph (B) have been significantly delayed or varied."

(b) Section 402 is amended by adding a new subsection (m) as follows: "In issuing a permit under this section, the Administrator shall not require pretreatment by dischargers of conventional pollutants identified pursuant to section 304(b)(4) of this Act in compliance with all applicable requirements of local pretreatment programs approved under subsection (b)(8) of this section as a substitute for municipal treatment adequate to meet the requirements of a permit issued under this section for a treatment works (as defined in section 212 of this Act) which is publicly owned. Nothing in this subsection shall affect the Administrator's authority under sections 307 and 309 of this Act, affect State and local authority under sections 307(b)(4) and 510 of this Act, relieve such treatment works of its obligations to meet requirements established under this Act, or preclude such works from pursuing whatever feasible options are available to meet its responsibility to comply with its permit issued under this section.".

ADMINISTRATIVE CIVIL PENALTY AUTHORITY

Sec. 7. Section 309 is amended by adding a new subsection (g) as follows:

"(1) In addition to any other relief provided, whenever on the basis of any information available to him the Administrator finds that any person is in violation of section 301, 302, 306, 307, 308, 318, or 405 of this Act, or is in violation of any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by him or by a State, or in a permit issued under section 404 of this Act by a State, he may after consultation with the State in which the violation occurs assess a civil penalty of not than $10,000 per day of violation not to exceed $75,000 in total.

(2) In assessing such penalty, the Administrator shall provide the person in violation with notice and opportunity for a hearing which shall not be subject to the requirements of section 554 or 556 of the Administrative Procedure Act.

(3) In determining the amount of penalty to be assessed, the Administrator shall take into account the nature, circumstances, extent and gravity of the violations, and with respect to the violator, ability to pay, effect on ability to continue in business, any prior history of such violations, the degree of culpability, economic savings, if any, resulting from the violation and such other matters as justice may require.

(4) If any person fails to pay a civil penalty assessed in accordance with paragraphs (1), (2), and (3), the Administrator may request the Attorney General to collect the amount assessed plus interest in an action brought in any appropriate district court in the United State.

(5) Any person aggrieved by a final assessment of the Administrator and who has requested a hearing under paragraph (2) may seek review in the appropriate district court of the United States only by filing an action within 30 days of the date of that assessment.

(6) The Administrator shall have the authority to issue subpoenas ad testificandum and subpoenas duces tecum in connection with hearings under subsection 309(g)(2) of this Act and may request the Attorney General to bring an action to enforce any subpoena under this section. The district courts shall have jurisdiction to enforce such subpoenas and impose sanctions and attorneys fees for failure to comply.

(7) Action taken by the Administrator pursuant to this subsection shall not affect or limit the Administrator's authority to enforce any provision of this Act, provided however, that the discharge of pollutants which is penalized administratively under

this subsection shall not be the subject of a civil penalty under section 309(d) or section 311(b) of this Act.".

CRIMINAL SANCTIONS

Sec. 8. Section 309(c) is amended as follows:

"(1) Any person who (A) negligently violates section 301, 302, 306, 307, 308, 318, or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued section 402 of this Act by the Administrator or by a State, or any requirement imposed in a pretreatment program approved under Section 402(b)(8) of this Act or in a permit issued under section 404 of this Act by the Secretary of the Army or by a State, or who (B) negligently introduces into a sewer system or into publicly owned treatment works any pollutant or hazardous substance which causes or may reasonably be anticipated to cause personel injury or property damage, or causes such treatment works to violate any effluent limitation or condition in any permit issued to the treatment works under section 402 of this Act by the Administrator or a State, shall be punished by a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than one year, or by both.

(2) Any person who (A) knowingly violates section 301, 302, 306, 307, 308, 318, or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by the Administrator or by a State, or any requirement imposed in a pretreatment program approved under section 402(b)(8) of this Act or in a permit issued under section 404 of this Act by the Secretary of the Army or by a State, or who (B) knowingly introduces into a sewer system or into a publicly owned treatment works any pollutant or hazardous substance which causes or may reasonably be anticipated to cause personal injury or property damage, or causes such treatment works to violate any effluent limitation or condition in a permit issued to the treatment works under section 402 of this Act by the Administrator or a State, shall be punished by a fine of not less than $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than two years, or by both.

(3) It shall be an affirmative defense under subsections (c)(1)(B) and (c)(2)(B) of this section that such discharge or introduction was in compliance with all applicable Federal, State, and local requirements which govern the discharge or introduction of a pollutant or hazardous substance into a sewer, or publicly owned treatment works.

(4) Any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under this Act or who knowingly falsifies, tampers with, or renders inaccurate any monitoring device or method required to be maintained under this Act, shall upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than two years, or by both.

(5) If a conviction is for a violation of paragraph (1), (2), or (4) of this subsection committed after a first conviction of such person under the paragraph, the maximum punishment under the respective paragraph shall be doubled with respect to both fine and imprisonment.

(6) For the purpose of paragraphs (1), (2), and (4), the term "person" shall mean, in addition to the definition contained in section 502(5) of this Act, any responsible corporate officer.

(7) For the purpose of paragraphs (1), (2), and (3), the term "hazardous substance" shall mean (A) any substance designated pursuant to section 311(b)(2)(A) of this Act, (B) any element, compound, mixture, solution, or substance designated pursuant to section 102 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, (C) any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act (but not including any waste the regulation of which under the Solid Waste Disposal Act has been suspended by Act of Congress), (D) any toxic pollutant listed under section 307(a) of this Act, and (E) any imminently hazardous chemical substance or mixture with respect to which the Administrator has taken action pursuant to section 7 of the Toxic Substances Control Act.".

THERMAL DISCHARGES

Sec. 9. (a) Section 316(a) is amended as follows:

"The Administrator (or, if appropriate, the State) may issue a permit under section 402 of this Act which modifies the requirements of sections 301 or 306 of this Act with respect to any effluent limitation proposed for the control of the thermal

component of any discharge from a point source, upon a showing by the applicant satisfactory to the Administrator (or, if appropriate, the State) that such modified limitation will assure (1) the attainment and maintenance of thermal water quality criteria adopted under section 303 and compliance with the requirements of section 403 of this Act, or (2) the protection and propagation of a balanced population of shellfish, fish, and wildlife in and on that body of water as determined by the State (or, if appropriate, the Administrator). Before the Administrator (or, if appropriate, the State) may impose such a modified limitation, the applicant must also show that a monitoring program will be established in accordance with section 402 of this Act to ensure continued compliance with the requirements of this subsection."

(b) Section 316(b) is amended as follows:

"Any standard established pursuant to section 301 of this Act and appliccable to a point source shall require (1) that the location, design, construction, and capacity of cooling water intake structures reflect the best technology available for minimizing adverse environmental impacts, or (2) that other equally effective measures be applied either alone, or in combination with best technology available, to minimize adverse environmental impacts. Any standard established pursuant to section 306 of this Act and applicable to a point source shall require that the location, design, construction, and capacity of cooling water intake structures reflect the best technology available for minimizing adverse environmental impacts."

(c) Section 316(c) is amended as follows:

"Notwithstanding any other provision of this Act, any point source of a discharge having a thermal component, the modification of which point source is commenced after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972 and which, as modified, meets (i) effluent limitations established under section 301, or, if more stringent, effluent limitations established under section 303 or (ii) the requirements of paragraphs (a) (1) or (2) of this section, shall not be subject to any more stringent effluent limitation with respect to the thermal component of its discharge during a ten year period beginning on the date of completion of such modification or during the period of depreciation or amortization of such facility for the purpose of section 167 or 169 (or both) of the Internal Revenue Code of 1954, whichever period ends first."

NPDES PERMIT TERM EXTENSION

Sec. 10. Section 402(b)(1)(B) is amended as follows: "are for fixed terms not exceeding 10 years, except for permits which reflect modifications under section 301 (c), (g), (h), (m), or 307(e) of this Act which shall be for fixed terms not exceeding 5 years;".

PARTIAL NPDES PROGRAM APPROVAL

Sec. 11. (a) Section 402(b) is amended by inserting the following after the first full sentence: "In the event the Governor submits a plan to administer part of a permit program, the Administrator may approve such submission upon a showing that the plan provides for administration of permit program components which represent a significant and identifiable part of the State program authorized by this section.".

(b) Section 402(c) is amended by deleting the words "as to those navigable waters" and inserting in lieu thereof the words "as to those activities and discharges".

(c) Section 402(c) is further amended by adding a new paragraph (4) as follows:

"In the event a determination is made (A) by a State to return administration of the program to the Administrator or (B) by the Administrator to withdraw approval pursuant to paragraph (3) of this subsection, return of administration or withdrawal of approval may only be made of the entire program currently being administered by the State."

MUNITIONS

Sec. 12. Section 502(6) is amended by deleting the word "or" where it appears before the letter "(B)", and inserting a comma in place of the period, and adding the following to the end thereof:

"or (C) munitions expended in the course of conventional weapons testing or training exercises by the Armed Forces of the United States, or by its allies in joint training exercises.".

CRIMINAL INVESTIGATIONS

Sec. 13. Section 501 is amended by adding a new subsection (g) as follows:

"In carrying out the provisions of this Act, the Administrator, and duly-designated agents and employees of the Environmental Protection Agency, are authorized to

initiate and conduct investigations under the criminal provisions of the Act, and to refer the results of these investigations to the Attorney General for prosecution in the appropriate cases.".

FUNDAMENTALLY DIFFERENT FACTORS DETERMINATION

Sec. 14. Section 301(1) is amended to read as follows:

"(1) The Administrator may not modify any requirement of this section as it applies to any specific pollutant which is on the toxic pollutant list under section 307(a)(1) of this Act, except that the Administrator may modify such a requirement to the extent justified by the fact that a direct or indirect discharger is, in terms of the factors specified in Section 304(b), fundamentally different from the direct and indirect dischargers considered in developing applicable effluent limitations guidelines and pretreatment standards under this section and section 307(b).".

CONFLICT OF INTEREST

Sec. 15. Section 304(i)(2)(D) is amended to read as follows:

"(D) funding, personnel qualifications, and manpower requirements (including a requirement that any board or body which approves permit applications or portions thereof shall have at least a majority of members who represent the public interest and do not derive a significant portion of their income directly or indirectly from permit holders or applicants for a permit. Any potential conflicts of interest by members of such a board or body must be adequately disclosed).".

REPORT TO CONGRESS

Sec. 16. Section 6 of the Federal Water Pollution Control Act Amendments of 1972 (33 U.S.C. 1251 nt.) is hereby repealed.

COMMONWEALTH OF THE NORTHERN MARIANA ISLANDS

Sec. 17. Section 502(3) is amended to read as follows:

"(3) The term 'State' means a State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, the Trust Territory of the Pacific Islands, and the Commonwealth of the Northern Mariana Islands.".

Mr. ROE. Please proceed.

TESTIMONY OF HON. WILLIAM D. RUCKELSHAUS, ADMINISTRATOR, U.S. ENVIRONMENTAL PROTECTION AGENCY, ACCOMPANIED BY JACK RAVAN, ASSISTANT ADMINISTRATOR FOR WATER; AND REBECCA HANMER, DEPUTY ASSISTANT ADMINISTRATOR FOR WATER

Mr. RUCKELSHAUS. Thank you very much, Mr. Chairman. Accompanying me is Jack Ravan, the new Assistant Administrator for the Office of Water; and Rebecca Hanmer, Acting Assistant Administrator for Water over the last several months, who is most knowledgeable about all the issues the committee is addressing.

Mr. ROE. Before you begin, let me defer to Mr. Stangeland.

Mr. STANGELAND. Thank you, Mr. Chairman. I would just like to take a moment to welcome Mr. Ruckelshaus to this committee. We are all aware of the circumstances that have brought him back to the agency that in many ways he helped form. I can't imagine a better choice for this critical position.

The water, air, and hazardous waste issues confronting our Nation are very real. It is imperative that these issues be kept in a nonpartisan perspective. We should not play politics with the Nation's environment and public health. That is why Bill Ruckelshaus, with his experience and character, provides a very real opportunity to apply true expertise to meet the environmental needs of our Nation. I do not doubt for a minute the Administrator's

knowledge of the existing clean water program and of needed improvements. His knowledge and assistance to the committee are invaluable as we review the law and consider amendments to the Clean Water Act.

Mr. ROE. The Chair recognizes the Administrator.

Mr. RUCKELSHAUS. Mr. Chairman, I have already introduced Mr. Ravan and Ms. Hanmer. As I suggested, over the last several months Rebecca Hanmer has really done an outstanding job for us as the Acting Assistant Administrator for the Office of Water. She has been very helpful in steering through the legislation to the point it currently is in the Senate.

I want to emphasize at the outset how important I think the work this committee is doing for the country and for the cause of clean water. In my Senate testimony back in June, we offered to help the Senate committee any way we could—give technical assistance with the staff and work closely with the committee in its efforts to develop sound amendments for the reauthorization of the Clean Water Act. We certainly make that same offer to this committee regardless of whether we ultimately agree or disagree on precisely what the wording or provisions ought to be in the law.

Certainly, all of the collective expertise and wisdom that the Agency has ought to be made available to the Congress. We certainly want to make that promise, and we want to cooperate in any way that we can.

I want to go through my statement, Mr. Chairman. It is lengthier than usual, but in light of the importance of the issues and their complexity, I want to make sure that I am on the record as clearly as possible as to what we think ought to be done.

Mr. ROE. I think it is important.

Mr. RUCKELSHAUS. The committee has already held extensive hearings on the Clean Water Act last year and the breadth and detail of those hearings was very impressive. Your 2,300-page report reflects the diligent efforts of both this subcommittee and its staff in considering midcourse modifications to what I think we all agree is a fundamentally sound piece of legislation.

I understand that the purpose of this series of hearings is to review the concerns and issues that have been raised in connection with reauthorization of the Clean Water Act. I think the most useful thing that I, as Administrator of the Environmental Protection Agency, can do, Mr. Chairman, is to define what I see as the significant problem areas, comment on some of the major proposals before this committee, and offer my own views as to what direction any midcourse corrections should take. As I said, I am prepared to provide whatever technical assistance and information you require in addressing the difficult issues facing this subcommittee.

The key issues have been clearly defined in the numerous bills, including H.R. 3282 which is presently before this subcommittee and the administration's proposals, a copy of which I have attached to my testimony. I am happy to say that in my own mind, there are some issues on which there is no question.

The Clean Water Act is working. The control strategy formulated by Congress in 1972 and refined in 1977 has proven effective and successful. I have had firsthand experience with the background and origins of this legislation and there simply is no doubt that we

have seen impressive progress over the past decade. The act's strategic approach of requiring implementation of nationwide technology based effluent limitations followed by any additional, needed controls based on site-specific water quality concerns should be continued.

On other issues, our approach to the key questions has been significantly strengthened by the useful comments we have received from Congress and the public on our original proposals, and by the other proposals which have been introduced in both Houses of Congress. Over the past several months our analysis of the major issues has continued, and I think we now have a better sense of what is reasonable, workable, and will yield results.

Our analysis has also identified four additional issues which this committee may care to review. The most important of these, fundamentally different factors determinations, so-called FDF's, are addressed in this statement. The other three are attached as part of the administration proposals. Brief explanations and proposed language on all four of these issues have been added to the administration's proposals for the committee's consideration.

I hope that in discussing the major questions before us today, we can build on the reauthorization process begun last year and quickly complete the development of effective solutions to those problems.

Now, as to the construction grants funding issue, one issue raised in H.R. 3282 that was not addressed last year is the proposal for increased construction grants funding. Under your leadership, Mr. Chairman, redirection and reauthorization of the construction grants program was considered in great detail 2 years ago and is reflected in the 1981 amendments to the Clean Water Act. The administration continues to support the 1981 amendments and believes that the authorization levels set out in them are appropriate.

In 1985 Congress will have to determine whether the program should be continued or modified. After more than 25 years, I believe there should be a fundamental examination of whether the program should be targeted to small municipalities, modified to a loan program or turned over to the States under the administration's New Federalism concept. Critical to all of these considerations is the need to determine the most appropriate Federal role in obtaining expeditious compliance by municipal pollution control facilities with the enforceable requirements of the act.

EPA will be conducting a detailed study of issues related to the reauthorization of the construction grants program. We would be pleased to work with you as we complete the study.

Beyond the construction grants program, the key issues I would like to touch on today include industrial compliance deadlines, pretreatment, fundamentally different factors determinations, water quality standards, post-BAT controls, nonpoint source controls, and the enforcement of compliance deadlines.

Of all the issues, clearly the most urgent in this reauthorization process is the need to extend industrial compliance deadlines. Industrial facilities have less than a year to comply with the current July 1, 1984, deadline for achievement of best available technology and best conventional technology effluent limitations. In many cases they have not been issued permits upon which even to begin

the compliance process due to delays in agency promulgation of national effluent guidelines. EPA is now in the final stages of completing those guidelines. But the fact remains that the necessary period for permit issuance and compliance that Congress envisioned in 1977 has been drastically reduced.

A number of different proposals have been made to extend industrial deadlines. These proposals differ in terms of the effluent standards to which they would apply and how much additional time they would provide. What each of these proposals clearly recognizes is the need to extend industrial compliance deadlines.

In resolving the question of extensions, Mr. Chairman, I believe there are three objectives that any solution must address. First, any extension must recognize the time necessary to promulgate effluent guidelines, issue permits, and for dischargers to come into compliance. Second, the extension must contain a final compliance date which applies to all BAT/BCT-related permits. Third, the language should provide clearly that if compliance can be achieved before the final date, then it must be.

One thing I am very concerned about after reviewing the various proposals is that any final compliance deadline must be realistic. A number of the legislative proposals do not provide adequate time for the regulatory agencies to translate the effluent guidelines into individual permits. The July 1, 1988, deadline contained in the administration proposal reflects, I believe, a realistic assessment of the time needed to complete issuance of the effluent guidelines, write implementing permits, and allow dischargers to come into compliance.

Let me emphasize, Mr. Chairman, that the administration's proposal would not allow any additional time for dischargers which could achieve compliance before July 1, 1988. Where compliance could be achieved before July 1, 1988, the implementing permits would contain the earlier deadline.

Finally, the administration proposal does continue the incentive for innovative solutions now embodied in section 301(k) of the act.

There is no question that some form of deadline extension is needed, Mr. Chairman, and I would like to offer whatever assistance the committee may require in determining the most appropriate way to address that need.

Pretreatment: The toughest issue with which I have dealt thus far in connection with Clean Water Act reauthorization is pretreatment. This is a subject to which EPA has devoted a substantial amount of time, resources, and effort. The fundamental objectives of this program under the act are to protect water quality, protect municipal sludge from contamination by industrial toxic wastes, and protect the operation of the POTW itself.

The need to achieve these goals is widely recognized and unquestioned. However, the best means of achieving them has been the subject of extensive debate since 1972. One of my principal concerns is that technology based categorical pretreatment standards inherently will result in cases of over or under treatment. There may be cases in which full implementation of categorical pretreatment standards may not be necessary or may not be sufficient to achieve the goals of the program.

The difficult question we all have been grappling with is how to address instances of potentially unnecessary treatment without opening a Pandora's box of technical difficulties, serious resource demands, administrative problems, and scientific uncertainties, and without delaying the program in those situations that need these controls.

With the gathering momentum of local pretreatment programs, and with the Agency's promulgation of categorical standards well underway, I am reluctant to recommend anything that will entail significant delay or loss of momentum. Of 1,700 POTW's required to develop local pretreatment programs, approximately 60 percent have now submitted some portion of the necessary elements for program approval. Of that group, roughly 370 have already received approval and are now ready to enforce categorical standards. Within this fiscal year, EPA and approved States are expected to approve an additional 800 local pretreatment programs. In addition, the compliance deadline for one of the major groups affected by categorical standards, the electroplaters, is now less than a year away.

At the same time, I also feel strongly that, where possible, we must avoid the application of categorical pretreatment standards where they are not needed. For this reason, I have pursued the concept of a pretreatment waiver. This is the reauthorization issue on which I have spent the most time over the last several months. I have talked with staff at all levels in the Agency and met with outside groups in an effort to develop a workable approach to this problem.

I must confess, Mr. Chairman, this has been a frustrating effort for me. As attractive as the concept of relying on end-of-pipe effluent limitations to insure protection of water quality seems, I have come to the difficult conclusion that it just is not feasible to administer such a program without a serious delay of 2 to 3 years in the program. The prerequisites of any successful national effort in this area are missing. Most States are only in the early stages of establishing specific ambient water quality criteria and permit effluent limitations for toxic substances. Furthermore, the national sludge disposal and use standards to be established by EPA are still several years away.

We could, of course, wait for the development of these effluent limitations and sludge standards, but I think the pretreatment program has now reached a stage where that would seriously jeopardize the progress that has been made to date. I think the Agency, indirect dischargers, and affected POTW's need to get on with implementing the program in a reasonable, rapid, and effective fashion.

Following my June 14 testimony before the Senate on this same subject, I directed my staff to go back and take a fresh look at the concerns of POTW's and municipalities and the problems associated with implementation of the existing program. After meeting with a number of groups to discuss operational concerns and explore alternatives, I have decided to establish a pretreatment implementation review task force. Its purpose will be to seek solutions to common implementation problems encountered by control and approval authorities. This will include developing equivalent

20-955 O—84——172

industrial monitoring and municipal enforcement programs, and guidance on implementing production-based categorical standards and, where appropriate, to identify regulatory problems. To insure a broad base of information, the task force will be made up of representatives of States, municipalities, industry, the environmental community, and EPA. It will include representatives of both large and small municipalities, as well as municipalities with both new and established programs.

It is my hope that as the recommendations of this task force are factored into the implementation process, some of the most significant technical concerns and objections we have heard will be resolved.

Earlier I mentioned the lack of sludge disposal and use criteria. I am pleased to report that we have now established a program for moving aggressively forward in filling the regulatory gaps in that area. The Agency's sludge task force recently presented their findings to a senior-level policy committee. These included recommendations on how EPA should structure an integrated sludge regulatory program based upon the joint authority of section 405 of the act and the appropriate provisions of EPA's other laws. The committee has endorsed and forwarded those recommendations to me and has directed the task force to prepare a detailed work plan for initiating the effort.

Although many details remain to be worked out, the broad outline of this program involves a comprehensive effort to develop standards and to formulate a State implementation process. These regulations will be supplemented by a general policy statement and general guidance which we will issue this fiscal year. The regulation development effort will clearly take longer—probably in excess of 2 years—but resources within several key offices have already been redirected to support this undertaking. I am confident that this unified effort will produce a comprehensive sludge management program which will serve to insure safer, more cost-effective, and more beneficial sludge management, and which can be integrated into the existing pretreatment program.

In discussing pretreatment, I have emphasized the need to get on with implementation of the program. Of particular concern in this regard is a recent decision of the Third Circuit Court of Appeals as it relates to applying national effluent guidelines for indirect and, by implication, direct dischargers. Essentially, the court held that the fundamentally different factors determination procedure that EPA has had available for use in the application of national effluent guidelines for toxic pollutants is not authorized by the act.

I strongly believe, Mr. Chairman, that the FDF determination procedure is an essential adjunct to the national rulemaking process. EPA has traditionally used this procedure as a safety valve in developing, implementing, and defending effluent guidelines for existing sources. In going through the extraordinarily complex process of a national rulemaking, the FDF determination procedure permitted EPA to focus its data gathering and analysis on the more typical facilities and to defer to subsequent proceedings those plants with unique features.

This has resulted in both major cost savings and reductions in the time necessary for guideline development. By providing an ad-

ministrative remedy for facilities that may not be able to meet national standards due to unique factors not considered in rulemaking, the FDF determination procedure reduces the legal vulnerability of the national standards.

There may be some concern that the administrative remedy provided by FDF determinations is somehow a regulatory loophole. This simply is not the case. It should be noted that the FDF determination procedure may be used to develop requirements more stringent than those contained in the national effluent guidelines.

Let me review very briefly how the FDF determination procedure works. A facility must first submit a petition demonstrating that there is some factor in its situation that is fundamentally different from those considered in establishing the national regulation. Only information not previously considered can be the basis for an FDF determination petition. In other words, this procedure cannot be used as a backdoor means of challenging and rearguing the regulation itself.

Second, to establish a fundamental difference, a facility must show that compliance with the national limits would result in either a removal cost wholly out of proportion to the removal cost considered by the Agency during the development of the national regulation or a fundamentally more adverse non-water-quality impact. This is a very tough test to meet.

Third, any alternative technology based limits may reflect only the degree of modification actually required by the fundamental difference.

Fourth, in order to insure that all points of view are considered, the public is informed of applications for FDF determinations and given the opportunity to participate in the proceeding.

The FDF determination procedure is not a waiver procedure, and, in particular, is not an economic waiver procedure. Rather it is a procedure through which a facility receives an individualized determination of its technology-based effluent requirements. As such, it is analogous to the Agency's use of best professional judgment permit determinations to establish effluent limitations for industrial facilities whose national effluent guidelines have not been issued.

My point is very simply, Mr. Chairman: There are two approaches for responding to a facility with valid grounds for arguing that it is fundamentally different from other facilities in its category. One possibility is to develop a separate subcategory within the regulation, undertake a separate data collection and analysis effort and then repropose and issue the final rule. The other alternative is to leave the national rule in place and use the FDF determination procedure to establish alternative technology-based limitations for the facility that accurately reflect its situation.

Let me emphasize that both of these approaches reflect the exercise of the Agency's regulatory expertise. Both of these approaches will involve a review of the same set of facts. Both involve the public. And both of these processes will end up with the same decision. So what is the difference?

Our major concern is that the subcategorization approach will add further complications and require potentially substantial additional time in developing what are already extraordinarily complex

and detailed national regulations. In essence, this approach would require us to handle through modifications to nationally applicable regulations the special situations of single facilities. This simply is not efficient. By contrast, the FDF determination procedure allows both implementation of the national rule and consideration of individual petitions claiming unique factors.

For these reasons, I urge careful consideration of the attached draft language to clarify and confirm EPA's authority in this area.

With the completion of the remaining effluent guidelines over the next year and the implementation of pretreatment and direct discharge standards, a reasonable question remains: What if these technology-based limitations are not stringent enough to protect designated water uses? In accordance with the act's fundamental pollution control approach, reliance on strengthened and more sophisticated water quality standards will form the basis of EPA's post-BAT strategy.

Two issues come up in assessing any post-BAT strategy. The first is the adequacy of the water quality standards upon which control strategies will be based. The second is the strategy itself. Taking water quality standards first, I have read your letter of March 14, Mr. Chairman, and understand that one of the main reasons for the current widespread concern over these standards has been the Agency's October 1982 proposed rulemaking to revise the existing water quality standards regulation.

As I understand it, one of the principal purposes of this proposal was to make the standards-setting process a better and more effective decisionmaking tool. Regardless of the Agency's intent, the proposed revisions apparently were viewed by the public as a retreat from the goals and objective of the act in the areas of antidegradation, downgrading and cost-benefit analysis.

In response to numerous comments we have received on this issue, and the major concern indicated by both the House and Senate, we have recently made further revisions to and promulgated the Agency's water quality standards regulation. Copies of our redrafted preamble and regulatory provisions have been provided to this subcommittee for its information and use. I believe these additional revisions meet the concerns and objections that have been raised and both strengthen and clarify our national water quality standards program.

Section 6 of H.R. 3282 would address the issues of downgrading and antidegradation by codifying a revised version of the existing water quality standards regulation. Both of these provisions would hamper the ability of EPA and the States to deal with site-specific problems.

Since our revised regulation will yield the same environmental results, I strongly urge these provisions be deleted. Also, I would note that the Senate Committee on Environment and Public Works has agreed to delete the antidegradation and downgrading provisions in their bill.

H.R. 3282 would also add a provision requiring the use of numerical water quality criteria. This provision, requiring States to adopt numerical criteria for toxic pollutants, would essentially preclude States from using alternative means, such as biological criteria, of establishing water quality benchmarks. Under EPA's revised

regulation, States must identify specific water bodies where toxic pollutants are causing problems, and must adopt criteria sufficient to protect the designated use. These criteria may be numerical or narrative and may be used singly or in combination, as needed.

For example, where an effluent contains a few, readily identifiable toxic chemicals, then pollutant-specific criteria and effluent limitations will be used. In situations involving discharges of complex effluents, it may neither be feasible nor environmentally protective to use a numerical, pollutant-by-pollutant approach. In those cases, I believe it is more effective to use biological testing as the basis for setting aquatic toxicity limits. Because our revised regulations provide a more effective, flexible approach which we have adequate authority to implement, I recommend that this provision be deleted, or at least modified to provide the flexibility to use either approach.

With respect to a post-BAT control strategy, H.R. 3282 would require EPA to inventory nonattainment waters existing after the installation of technology-based controls, and then develop and implement in cooperation with the States an individual point source control strategy for each nonattainment water body.

EPA has been studying the need for toxic pollutant controls beyond BAT for some time. The Agency has also been very hard at work developing the methods, especially biological assessments, necessary to determine where toxic pollutants are causing problems and to determine necessary levels of control. While much work remains to be done, I am confident that the Agency is in a position to make these methods generally available during this fiscal year.

Where EPA or a State determines that BAT is not sufficient to protect the designated uses of the receiving waters, it issues permits which include more stringent effluent limitations. Where the data are not available or not conclusive to support such a determination, the source's permit will be written to incorporate BAT effluent limitations but will contain monitoring requirements that become effective once the BAT effluent limits are achieved. If this monitoring shows that the BAT effluent limitations do not protect designated water body uses, the permit will be reopened and additional requirements incorporated. All of this is currently authorized by the existing statute.

So while I support establishing controls beyond BAT when necessary, I feel that the Agency already has the authority to accomplish this. And I believe, therefore, that statutory changes are neither necessary nor desirable. I would be happy to work with you and the committee in further explaining our concerns and reservations on this issue.

Next I would like to address the control of nonpoint sources of pollution. H.R. 4037 proposes a national program to assist State implementation of nonpoint source pollution controls. With the establishment of technology-based standards well underway for point sources, it is now time to turn our attention to the control of pollution from nonpoint sources. I believe there is no question that pollution from nonpoint sources is having significant adverse impacts on water quality in certain areas across the United States.

The 1982 State water quality assessments report prepared under section 305(b) of the act describes the nature of this problem: (1) in one-fifth of the States, nonpoint sources are now the most important cause of water degradation in those waters not meeting designated uses; (2) agricultural nonpoint sources are the major nutrient sources in lakes with eutrophication problems; and (3) of the 20 States which specifically quantified their progress toward the 1983 Clean Water Act goals, 15—or 75 percent—list nonpoint sources as significant sources in their remaining pollution problem waters.

Attainment and maintenance of water quality standards is our fundamental objective under the Clean Water Act. We all recognize that achieving this depends on controlling both point and nonpoint sources. My concern is that while tremendous public and private investments have been made to control point sources, we have thus far been remiss in addressing the continuing problem of nonpoint sources pollution. This condition is of major importance both because it affects the total amount of pollution control achieved and because it dilutes and dissipates the environmental return on the time, resources, and effort we have already expended.

Just as there is general agreement about the significance of nonpoint sources pollution control problems, there is a basic consensus on what needs to be done. Each State must identify specific problem water bodies and contributing nonpoint sources, develop tailored controls, and proceed with implementation. To date, most States have generally identified their nonpoint sources problem waters, the nonpoint source affecting those waters, and proposed control approaches.

Much of this was accomplished as part of the broader 208 planning effort. In some cases, there may be a need to go beyond this initial planning and identify specific problem activities and appropriate site-specific controls. Once the site-specific control approaches are identified, the crucial next step will be to insure that the parties responsible for those controls put them into practice.

My discussion on nonpoint sources indicates two basic areas of agreement on implementing the necessary controls. One area of agreement is that State and local governments have the major planning, program development, and implementation responsibilities. They unquestionably have a broader range of authorities and more detailed knowledge of site-specific conditions than we have at the Federal level. Therefore, they are able to tailor nonpoint source control programs to meet their specific needs.

The other area of agreement is that, while States must have the primary responsibility for nonpoint source program development and implementation, the Federal Government will reemphasize its efforts to address this problem. The Agency also has the responsibility to provide technical expertise and disseminate knowledge gained at the Federal, State, and local level to other communities, with similar problems.

I believe that a number of steps can be taken now to ensure that the Federal Government effectively meets its responsibilities in this area. First, under existing Clean Water Act authorities, EPA will provide clear guidance under which States will update or develop nonpoint source programs for specific water bodies where nonpoint sources substantially impact desired water uses. States

can use or refine existing water quality management plans to accomplish this.

Second, Secretary of Agriculture Block and I have discussed how we can best coordinate our efforts to address priority nonpoint source control needs in each State. We have agreed that after EPA issues its nonpoint source guidance, USDA will support EPA's priority on this subject as part of their ongoing national conservation program. USDA's technical assistance delivery systems can help many farmers in this country to understand the impact their activities can have on water quality, and how they can modify their own farming practices to protect water quality.

USDA has a long and successful history of working at the grassroots level to develop conservation practices, to educate the farmers on these practices and to provide technical assistance in applying them. At the county level, the agricultural stabilization and conservation service, the soil conservation service, and the extension service all work together to provide support and assistance to farmers needing or requesting help.

EPA will continue to encourage States to use funds available under section 205(j) and 106 of the act for nonpoint source needs and provide Agency technical and program support. In addition, EPA will use $2 million in appropriated fiscal year 1984 extramural funds for a nonpoint source report to Congress, development and dissemination of information on control strategies, and technical transfer of NPS methodologies.

EPA will maintain headquarters and EPA regional office personnel to support State and local government nonpoint source control efforts in fiscal year 1984. Finally, the agency, together with other Federal agencies, will be working to examine their fiscal year 1985 needs.

I believe H.R. 4037 and EPA's strategy for nonpoint source pollution control are basically consistent in terms of the need to identify specific problem areas and control needs. However, I am concerned that a Federal cost-sharing program would create disincentives to voluntary action by anyone not receiving Federal funds and therefore would slow the implementation of nonpoint source controls.

I believe the Federal role should not infringe on sensitive State and local decisions concerning land use. I was pleased to note that the recent Senate Committee modifications to their nonpoint source control provision include elimination of the disincentives to voluntary action.

Enforcement: The Clean Water Act will not work unless EPA and State enforcement efforts are vigorous and effective. Toward that end, there are two provisions of the administration's proposal that I would like to emphasize this afternoon—administrative civil penalties and criminal sanctions.

Civil enforcement: Presently, the Clean Water Act provides two civil enforcement options. When faced with a violation of the act, the administrator may bring a civil action in the appropriate U.S. district court for penalties and injunctive relief.

Section 7 of the administration's proposed legislation allows the administrator a third option, to administratively assess civil penalties of up to $10,000 per day—not to exceed $75,000 total—for clear and well-documented violations of the act. Under this approach, a

violator would be given notice and an opportunity for a hearing, and if dissatisfied with the final assessment, he would be able to seek review in a U.S. district court. The court review would be appellate in nature and not a de novo trial proceeding.

The addition of administratively assessed civil penalties as an enforcement tool would give the Agency more flexibility to deal with noncompliance situations. A nonpenalty administrative order may be ineffective in resolving the problems, and yet the option of taking judicial action may be unreasonably costly, burdensome, and time consuming for all the parties involved, given the nature of the violation.

The Agency's experience to date with assessing similar civil penalties existing under other environmental statutes—CAA, FIFRA, TSCA, RCRA—indicates that this option will give EPA more enforcement flexibility, lead to speedier compliance, and assure due process without the expense and delay of a judicial enforcement action.

Section 8 of H.R. 3282 addresses the area of civil enforcement as well. It proposes to increase the daily maximum civil penalty provided for under section 309(d) of the Clean Water Act from $10,000 per day to $20,000 per day. Although this is slightly less than the equivalent provisions of the Clean Air Act and the Resource Conservation and Recovery Act, it strengthens existing enforcement mechanisms, and, therefore, I support it.

I would even support a maximum civil penalty of $25,000 a day to make it consistent with these other statutes. As to the criminal enforcement, knowing violations of the Clean Water Act have caused serious environmental harm and millions of dollars of damage to private and public property. In some cases, they have raised the clear potential for loss of life and serious personal injury. A stronger criminal sanction is needed under the act to deter these violations.

The proposal we are recommending elevates penalties for knowing violations of the act to the felony level and adds criminal sanctions to the act for persons who knowingly introduce into a sewer system a pollutant or hazardous substance which causes or can reasonably be anticipated to cause personal injury or property damage. For those defendants who have complied with all applicable Federal, State, and local requirements, an affirmative defense is provided.

The addition of these criminal penalties to the act will put violations on the same level as violations under RCRA. Currently, a knowing discharge onto the ground of hazardous wastes could subject the discharger to felony sanctions under RCRA. However, the same discharge into a sewer system would only subject the discharger to the misdemeanor provisions of the Clean Water Act. The result is an unintentional incentive to dump hazardous substances into sewer systems. The addition of these criminal sanctions will aid in protecting sewer systems and POTW's in which substantial Federal moneys are invested.

Strong public support exists for aggressive enforcement action in cases of deliberate environmental misconduct. The addition of criminal sanctions to the act for knowing, intentional violations of the act will reflect this public concern and should dispel any per-

ceptions that the intentional violation of the act is not a serious offense.

In conclusion, Mr. Chairman, I have focused my remarks on what I believe are the key reauthorization issues. I have not discussed a number of other issues raised in both the administration's and other proposals before this subcommittee. Clearly, these need to be addressed in this reauthorization process. I hope that today we have begun what will be a continuing dialog to address these remaining issues as well as the ones I have highlighted.

This concludes my prepared statement. I would be happy to answer any questions you may have.

Mr. ROE. I want to thank you, Mr. Administrator, for a concise and precise statement.

The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

I inadvertantly scheduled a meeting in my office for the hour of 2. I am going to have to ask to be excused. I will make every effort to be back to ask the Administrator some questions.

I want to compliment him on an excellent statement. If I do not arrive back, I would like to have permission to submit questions in writing.

Mr. ROE. Without objection, so ordered.

[Subsequent to the hearing, supplemental questions were submitted to Mr. Ruckelshaus by Representatives Stangeland, Oberstar, and Edgar. The questions and responses follow:]

U.S. ENVIRONMENTAL PROTECTION AGENCY,
OFFICE OF EXTERNAL AFFAIRS,
Washington, D.C., February 17, 1984.

Hon. ARLAN STANGELAND,
House of Representatives,
Washington, D.C.

DEAR MR. STANGELAND: Enclosed are the Environmental Protection Agency's responses to the questions you recently submitted to Administrator William D. Ruckelshaus following his testimony before the Subcommittee on Water Resources.

I apologize for the delay in getting our responses to you. If I can be of further assistance, please feel free to contact me.

Sincerely yours,

STEADMAN M. OVERMAN,
Director, Office of Legislative Analysis.

Enclosure.

Question. "On the top of page 2, and elsewhere in your statement, you discuss 'The Administration's Proposals'. During the 97th Congress, the Administration formally transmitted recommended Clean Water Act Amendments to the Congress. This year, no such formal transmittal has been made. In light of this situation, what is the official status of the proposals which you have attached to your testimony?"

Response. The attachment to my November 15, 1983 testimony before the Water Resources Subcommittee represents the Administration's 1983 recommendations for Clean Water Act Amendments.

Question. "The 1976 NRDC Consent Decree, later incorporated into the Clean Water Act, called for EPA promulgation of BAT regulations by 1980. The Decree was modified in 1979, extending the promulgation deadlines into 1980. Subsequent EPA motions to modify the Consent Decree have resulted, I believe, in a requirement for all BAT regulations covered by the Decree to be promulgated by the end of June of next year. What is the current status of this effort?"

Response. The current status of our effort to promulgate the effluent guidelines as covered by the modified Consent Decree (October 26, 1982; August 2, 1983; and January 6, 1984) is as follows: regulations for 20 industrial categories have been promul-

gated; regulations for 8 other industrial categories have been proposed and remain to be promulgated; and regulations for 1 industrial category remain to be both proposed and promulgated/(See attached schedule). Regulations for 9 other industrial categories covered by the Consent Decree have been excluded from regulation under provisions in Paragraph 8 of the consent Decree/(See attached schedule).

STATUS OF THE RULEMAKING SCHEDULES

	Proposal [1]	Promulgation [1]
20 projects are promulgated:		
Aluminum forming	November 1982	September 1983
Coal mining	December 1980	September 1982 [2]
Coil coating (phase I)	December 1980	November 1982
Coil coating (phase II)	January 1983	November 1983
Copper forming	October 1982	July 1983
Electroplating (pretreatment)	January 1978	August 1979
Electrical/electronic components (phase I)	August 1982	March 1983
Electrical and electronic components (phase II)	February 1983	November 1983
Inorganic chemicals (phase I)	July 1980	June 1982
Iron and steel manufacture	December 1980	May 1982
Leather tanning and finishing	June 1979	November 1982
Metal finishing	August 1982	June 1983
Ore mining	May 1982	November 1982 [2]
Petroleum refining	November 1979	September 1982
Pharmaceuticals	November 1982	September 1983
Porcelain enameling	January 1981	November 1982
Pulp and paper	December 1980	October 1982
Steam-electric	October 1980	November 1982
Textile mills	October 1979	August 1982
Timber	October 1979	January 1981
8 projects to be promulgated:		
Battery manufacturing	October 1982	January 1984
Foundries	October 1982	June 1984 [3]
Inorganic chemicals (phase II)	September 1983	June 1984
Nonferrous metals (phase I)	January 1983	January 1984
Nonferrous metals forming	February 1982	October 1983 [3]
Organic chemicals and plastics and synthetic fibers	February 1983	February 1985 [3]
Pesticides	November 1982	November 1984 [3]
Plastics molding and forming	February 1984	September 1984 [2] [3]
1 project to be proposed and promulgated:		
Nonferrous metals (phase II)	February 1984	November 1984

[1] Date signed by the Administrator.
[2] Industries not subject to categorical pretreatment regulations.
[3] Revised schedule, as approved by the court (August 1983, January 1984).

Note. The ink formulation, paint formulation, and adhesive and sealants projects have been excluded under paragraph 8 of the NRDC consent decree and therefore are not listed above.

Question. "For which industries will EPA not have final BAT regulations by June 30, 1984? (1) When will these regulations be promulgated? (2) In each instance, why was the June 1984 deadline not able to be met?"

Response: There are currently five industries which will not have final BAT regulations issued by June 30, 1984. These are: Plastics Molding and Forming; Nonferrous Metals Phase II; Nonferrous Metals Forming; Organic Chemicals and Plastics and Synthetic Fibers; and Pesticides.

The following attachment identifies the current promulgation schedules for these industries and divides these five industries into 2 generic groups to explain why the June 1984 deadline could not be met.

ATTACHMENT—GROUP I—OTHER REGULATIONS TO BE PROMULGATED

(1) Plastics molding and forming, September 1984.
(2) Nonferrous metals forming, October 1984.
(3) Nonferrous metals phase II, November 1984.

Originating as subparts to other major categories (i.e., the Nonferrous Phase I and the Machinery and Mechanical Products Manufacturing) the above categories were

formed so that the Agency's rulemaking emphasis could concentrate on the more environmentally significant problems associated with the major portions of the industry. As a result, separate studies or rulemaking activities weree initiated for 3 categories or portions of these categories. On may 7, 1982 the Court ordered EPA to prepare a schedule for these industries. The Agency developed schedules for these three categories recognizing that studies of these industries were in the early stages of development and that each industrial category regulation remained to be proposed and promulgated. EPA's May, 1982 schedules took into account the need to conduct industry-wide data collection activities for each of these categories before regulations could be proposed. The Agency had not previously studied the Nonferrous Metals Forming industry and therefore had no technical nor economic information; some preliminary data from a limited number of plants in the Nonferrous Metals (Phase II) category did exist, however, the information was inadequate for developing national regulations; and the 1977 and 1978 data gathered on the Plastics Molding and Forming category needed more extensive sampling data and technical verification. Because of additional delays of 4–6 months in the data gathering process, the Agency could not propose and promulgate legally defensible regulations for these industries in conformance with the 1982 court-ordered schedules. As a result, on August 2, 1983 the Court modified its order to establish the above promulgation schedules.

ATTACHMENT—GROUP II—PROPOSED REGULATIONS REMAINING TO BE PROMULGATED

(1) Pesticides, November 1984.[1]

(2) Organic chemicals and Plastic and synthetic fibers, February 1985.[1]

These two categories have been proposed. These are the most complex and controversial industrial regulations on which the Agency is working. As the result of public comments which have been received, the Agency has identified previously unanticipated technical issues which have required additional data collection and analysis.

Pesticides.—In compliance with the Court's October 26, 1982 Order, the proposed regulations for the Pesticides industry were signed by the Administrator in November 1982 (47 FR 53994, November 30 1982). Guidelines for establishing test procedures to analyze the nonconventional pesticide pollutants covered by these regulation were proposed in February 1983 (48 FR 8250, February 10, 1983). This guideline for establishing analytical methods will be combined and promulgated in one rulemaking package with the effluent limitations guidelines and standards. In response to the concerns and request of the public, EPA extended the comment period an additional 30 days to provide time for the public to adequately comment on the proposed regulations and to provide additional data. Many of the comments received have raised fundamental questions with respect to the proposed regulation for both the manufacturing and the formulator/packager segments of the industry indicating a need for EPA to re-analyze the existing data and collect additional data prior to establishing standards. Regulations for this industry address not only the toxic pollutants covered by the Consent Decree by 137 "nonconventional" pesticides being discharged which are not covered by the Decree. The Act requires the Agency to develop BAT effluent limitations for nonconventional pollutants which are discharged in significant amounts in an industrial category. The Court was notified in the June 1983 Affidavit about the potential delay in meeting the Court orderd promulgation schedule. The Court approved the Agency's revised schedule in January, 1984. The Agency has begun to analyze and validate all acceptable new data and review in its entirety the data base underlying the proposed effluent limitations guidelines and standards. Effluent guidelines for the pesticides industry will be promulgated in November 1984.

Organic Chemicals and Plastic and Synthetic Fibers (OPCF).—In compliance with the Court's October 26, 1982 Order, the proposed regulations for the OPCF industry were signed by the Administrator in February 1982 (48 FR 11828, March 21, 1982). The Agency has received over 4,000 pages of comments from the regulated industry, environmental groups, governmental agencies, and citizens. Many of these commenters contend that the existing data base needs substantial improvement. The Court has already been informed that EPA believes that a substantial new data gathering effort is required to supplement the existing data base. Major steps have already been taken to gather the necessary data and sampling activities at 6 plants have been completed. The Agency is currently conducting pre-sampling activities at 4 additional plants and is scheduling 9 more sampling visits to be conducted during

[1] EPA's motion to change the promulgation dates was approved in January 1984.

the next few months. EPA will promulgate effluent guidelines for organic chemicals and plastic and synthetic fibers in February 1985.

Question."Of the regulations which have been promulgated, how many have been challenged in Court, (1) In each instance, on what grounds were the regulations challenged, (2) What is the current litigation status of each of these challenges?"

Response. Eleven of the BAT/PSES/NSPS/PSNS regulations issued under the Consent Decree have been involved in litigation. These include: Timber, Coal Mining, Coil Coating Phase I, Copper Forming, Iron and Steel Manufacturing, Leather Tanning and Finishing, Petroleum Refining, Porcelain Enameling, Steam Electric, Inorganic Chemicals Phase I, and Metal Finishing. Petitions against the Coil Coating Phase I and the Inorganic Chemicals Phase I categories were voluntarily withdrawn; negotiated settlements have been reached for the Coal Mining, Iron and Steel Manufacturing, and the Porcelain Enameling categories. The Steam Electric case was voluntarily dismissed with the Agency agreeing to provide guidance to all EPA Regions. The Timber petition was dismissed after EPA amended the NSPS applicability. Negotiations, involving industry and NRDC, are currently underway for Petroleum Refining; and negotiations between industry and the Agency are continuing for Leather Tanning. More recently, members of the the Copper Forming and Metal Finishing industries have have also filed petitions to review their respective regulations; we do not know if these cases will result in settlement, be dismissed, or be litigated. By and large the petitions for review have raised technical issues posed by the regulations.

The period for filing for judicial review has not expired for some of the other categories, i.e., Aluminum Forming, Coil Coating Phase II, and Electrical and Electronic Components Phase II.

The BPT Electroplating pretreatment standards originally issued under Paragraph 13 of the Consent Decree were also challenged in the Third Circuit. On September 20, 1983, the Court upheld these standards in their entirety. The Ford Motor Company and General Motors are still pursuing a challenge to EPA's denial of a petition to amend the compliance deadline for integrated facilities.

Analysis.—The attached table covers the industrial categories addressed in the Consent Decree for which effluent guidelines have been promulgated and involved in litigation.

EFFLUENT GUIDELINES DIVISION POST PROMULGATION ACTIVITIES, DECEMBER 1983

Projects promulgated	Promulgation signature date	Litigation		Status of settlement
		Date the petion filed	Date of settlement	
Petitions received:				
Coal mining	September/1982	October/1982	August/1983	Negotiated settlement: Agency Reproposal to be prepared by the Agency.
Coil coating (phase I)	November/1982	March/1983	NA	Petition voluntarily withdrawn November/1983.
Copper forming	August/1983	December/1983		Discussions have not started.
Electroplating (pretreatment).	August/1979	1979 (2) [1] 1980 (1) [1]	September/1983	Court upheld regulation on September 20, 1983: Decision covered all 8 petitions that were filed.
Amendment	January/1981	1981 (4) [1]		
Denial of petition to 1979 regulations.	January/1981	1981 (1) [1]		
Inorganic chemicals (phase I).	June/1982	October/1982	NA	Petition voluntarly withdrawn February/1983.
Iron and steel manufacturing	May/1983	August/1982	February/1983	Negotiated settlement: Amendment/Reproposal/ and Interim Final were published in the Federal Register September 29, 1983.
Leather tanning and finishing.	November/1982	March/1983		Negotiations continuing.
Metal finishing	July/1983	October/1983		Discussions have not started.
Petroleum refining	September/1982	November/1983		Negotiations continuing.

Porcelain enameling	November/1982	December/1982	August/1983	Negotiated settlement: Reproposal RMP to be prepared by the Agency.
Steam-electric	November/1982	March/1983	July/1983	Case voluntarily dismissed: Agency agreed to send a memorandum to all EPA Regions—completed July/1983.
Timber	January/1981	June/1982	December/1982	Petition was dismissed after EPA amended NSPS applicability.

[1] Number of petitions filed.

NA = not applicable.

Question. "Of the regulations which have been promulgated to date, to what extent do the regulations set BAT equal to BPT."

Response. The majority of BAT regulations issued are more stringent than BPT. In most cases BAT standards are based on additional technology, reducing water flows, and process changes. A summary of the 19 industrial categories identifying the relative stringency of BAT vs BPT appears on the attached table. This table indicates that 12 of the 19 industrial categories have guidelines where BAT is more stringent than BPT.

BAT STANDARDS FOR CONSENT DECREE INDUSTRIES (PROMULGATED)

Industry	Status	BAT	Comment
Aluminum forming	Final	> =	
Coal mining	do	>	
Coil coating (phase I)	do	>	
Coil coating (phase II)	do	>	
Cooper forming	do	>	
Electroplating	do	NA	Only addresses pretreatment standards.
Electronics (phase I)	do	>	
Electronics (phase II)		NA	RPT-BAT excluded.
Inorganic chemicals (phase I)	do	>	
Iron and steel	do	>	Phase I is equal; Phase II is more stringent.
Leather tanning	do	>	
Metal finishing	do	=	
Ore mining	do	=	
Petroleum refining	do	=	Under litigation—may become more stringent.
Pharmaceuticals	do	=	
Porcelain enameling	do	>	
Pulp and paper	do	>	
Steam-electric	do	>	
Textile mills	do	=	
Timber	do	>	3 subcategories are more stringent.

NA equals not applicable.

Regarding 301(h) (next three questions):

Question. "What is the current status of waiver applications submitted under the 1977 Amendments and the Agency's June 1979 regulations?

Response. The Agency received 70 301(h) applications under the original 1979 deadline and an additional 137 new applications were filed in response to the December 1981 statutory amendments, which extended the application deadline to December 29, 1982.

Responsibility for 301(h) decisionmaking originally was retained by EPA Headquarters, with tentative decisions being signed by the Administrator. Headquarters has made 25 tentative decisions on the 30 largest applications filed under the original statutory deadline. Headquarters also will make the tentative decisions on the remaining 5 of these 30 applicants; these 5 are now undergoing review. Responsibility for 301(h) decisionmaking has now been delegated to EPA's Regional Offices, and all EPA Regions with 301(h) applicants had accepted delegation by June 1983. The

Regions have made 48 tentative decisions and 18 final decisions following delegation.

Of the 73 tentative decisions made Agency-wide, 25 were approvals and 48 were denials. Of the 18 final decisions made, 4 were approvals and 14 were denials. The table below presents a breakdown of these decisions according to whether the application was filed under the original 1979 deadline or the new 1982 deadline. The applications for which decisions have not yet been made are in various stages of the review process.

	Tentative approval	Tentative denial	Final approval	Final denial
1979 applications	22	10	4	1
1982 applications	3	[1] 38	0	[1] 13
Totals	25	48	4	14

[1] Most of these denials were based on State nonconcurrence with the application or because the discharge would be into waters exhibiting freshwater characteristics.

Question. "What has been the result to date of the changes to section 301(h) which were made by section 22 of the 1981 Municipal Wastewater Treatment Construction Grant Amendments?"

Response. The 1981 statutory amendments extended the deadline for filing 301(h) applications to December 29, 1982. As a result, 137 new applications were filed, which are in addition to the 70 applications received under the original statutory deadline.

Agency regulations responding to the 1981 statutory amendments and to the decision in *NRDC* v. *EPA*, 656 F. 2d 768 (D.C. Cir. 1981) were promulgated in June 1982 (47 FR 24918). In addition, building on the June 1982 amendments, simplified requirements, especially for small applicants, were promulgated in November 1982 (47 FR 53666) based on the Agency's experience in implementing the 301(h) program.

Question. "What approximate investment—in terms of time, personnel, and dollars—must the Agency dedicate to evaluating a typical 301(h) application and reaching a decision on whether or not to grant the requested modification?"

Response. Based on our experience with reviewing 301(h) applications, we estimate that the average processing cost per application will continue at the current average of approximately $50,000 in contract costs and to require about one person-year. The average contract costs have been reduced by about one-half from our initial costs for reviewing the first 30 largest applications as a result of streamlining regulatory requirements, increased staff experience, delegations to Regional Offices, and reduced average project size. There may be considerable variation from the average figures for a particular application depending on such things as the size of the discharge, sensitivity of the receiving waters, and complexity of the issues raised. The actual calendar time to complete review of an application depends on whether the application contains all necessary data and whether EPA's decisions are appealed.

We believe that this is an efficient system given our objective to assure effective community participation in the waiver application and review process and standard permit issuance regulatory requirements.

Question. "An April 1981 general accounting office report was highly critical of water quality monitoring techniques being used to assess the quality of our rivers and streams. How would you evaluate current water quality monitoring efforts?

(A) What are the major weaknesses of our current water quality monitoring program?

(B) What more can and should be done at current funding levels?

(C) To what extent do we currently have the necessary detection capabilities, testing protocols, analytical techniques, and quality control in connection with quality monitoring of (1) conventional pollutants, (2) the priority toxic pollutants, and (3) other toxic pollutants?"

Response. The General Accounting Office (GAO) recommended termination of three national stream quality monitoring networks. EPA, other Federal agencies, and States disagreed with this recommendation, since fixed station networks are a valuable part of State and EPA programs to assess the nation's water quality. Nevertheless, we did agree with and have implemented other recommendations in the GAO report.

As you know, most water quality monitoring under the Clean Water Act is carried out by the States, with assistance from EPA. Our ability to conduct national

assessments has been limited by the fact that data and analyses have not been consistent from State to State. Furthermore, State programs have tended to emphasize monitoring of conventional pollutants, and only recently have begun to focus on toxic pollutants and biomonitoring. In addition, we have lacked techniques for developing national estimates that are statistically sound.

Our programs at current funding levels are making improvements in three areas: national assessments of water quality, monitoring needed for program evaluation, and monitoring required in setting water quality-based limits. First, with regard to national assessments, EPA is working with the States to improve the ways States convey their knowledge of water quality to EPA. EPA has recently completed a joint project with the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) to develop uniform reporting procedures that will result in better use of existing data. In regard to statistical estimates, we have completed the Aquatic Life Survey, the first national assessment of water quality to provide statistically sound estimates of water quality. We will also be developing recommendations for longer longer-term improvements in monitoring programs as part of the Deputy Administrator's Task Force on Monitoring. As part of this effort, we will develop a program strategy for water monitoring this spring for consideration by the Agency. Also, with regard to the lack of data on toxics, we have tested an approach to collecting existing data on biological conditions and we have emphasized biological and toxics data collection for the 1984 Section 305(b) report.

With regard to program evaluation, our efforts are to quantify information instead of using existing information which is anecdotal in nature, e.g., "success stories" which do not provide an overall look at the natural effect of control programs. To strengthen our capabilities in this area, we have carried out a study of the water quality effects of a number of construction grant projects. In addition, we will be addressing these needs in the Monitoring Strategy mention above.

Our concerns in setting water-quality based limits, at least for conventional pollutants, are primarily related to a need for better technical assistance for the Regions and States. In addition, in order to help strengthen State and EPA capabilities in the toxics area:

We have issued a policy which encourages the use of biomonitoring and screening techniques as part of an integrated approach to developing water quality-based effluent limitations for toxic pollutants.

We are developing key technical guidance for those steps in the standards-to-permits process where the lack of technical tools is critical. The most important gaps today are in the biomonitoring area, as well as design conditions and toxic pollutant methodologies for wasteload allocations.

We are initiating a more active program of technical assistance not only covering the critical gaps noted above, but also seeking to bring the weaker States up to the technical levels necessary to carry out these programs.

With regard to the specific concern about analytical techniques, the States and EPA have the appropriate equipment and procedures to collect most chemical, physical, and biological data, particularly for conventional pollutants, metals and pesticides on the priority pollutant list. However, States are limited to some extent in their ability to measure some of the other organic chemicals (priority pollutants and others), and the biological effects, both acute and chronic toxicity, associated with some of these chemicals. For instance, only about half of the States can measure levels of the full range of organic chemicals contained on the Section 307(a)(1) priority pollutants list. In many cases, chemicals are toxic at levels below chemical analytical detection limits. In other cases, methods may not yet be sophisticated enough to measure sublethal toxic effects. However, we are concentrating our efforts in these areas and new procedures are being developed and tested that should help fill this void.

Question. "Mr. Ruckelshaus, We note that the Administration included amendments to Section 316(a), the Clean Water Act's thermal discharge variance provision, in its legislative proposal for last year. Section 9 of the proposals which you attached to your testimony likewise would amend the Act's current thermal discharge variance provision. Does this reflect the Agency's judgment that there is now sufficient evidence that heat is not the serious environmental concern Congress once thought it might be, and thus that thermal variances would be made more readily available for new power plants, by allowing them where thermal water quality standards are met by such plants?"

Response. The Agency still considers thermal pollution an environmental problem in certain situations. The thermal variance is intended to give new and existing power plants relief from national effluent limitation guidelines and State thermal standards, provided a balanced aquatic population is maintained. At present no na-

tional technology-based thermal BAT requirements have been promulgated and to our knowledge no technology-based best professional judgment permits have been based on established State water quality standards. Our present analysis is that it is unlikely that future permits will incorporate technology-based thermal requirements based on effluent guidelines or best professional judgment.

Question. "Mr. Ruckelshaus, the administration's proposal includes a suggestion that the word "indigenous" be dropped from the balanced indigenous population test in Section 316(a). Does this suggestion reflect the Agency's judgment that the exact type of "balanced population" of shellfish, fish and wildlife to be protected under Section 301(a) is a State resource management decision and should not be prejudged by Congress in the Act?"

Response. The purpose of the term "indigenous" is to preclude basing 316(a) decisions only on the presence of pollution-tolerant species. EPA has broadly interpreted this term and has not required unduly rigid tests. For example, EPA's draft 316(a) technical guidance manual (distributed in May, 1977) establishes the framework for determining Representative Important Species (RIS) which may include species which are benefitting from the thermal discharge, and that were not historically native to the area. In addition, the appropriate State and federal wildlife authorities are consulted on the RIS list to ensure that the species selected are representative of "indigenous" forms including those species protected by State water quality standards or the Endangered Species Act.

Question. "How does the Agency currently perform the balanced indigenous population test in Section 316(a)? How proximate to the point of discharge is the test applied? Alternatively, for what distance from the discharge point is the test considered to be relevant and applicable?"

Response. In reviewing a 316(a) demonstration the Agency relies on the Representative Important Species (RIS) rationale developed by the applicant in consultation with State and federal wildlife authorities. The RIS serves as the benchmark for assessing thermal impacts on the balanced indigenous populations of aquatic organisms. In most cases, State designated mixing zones which allow a rise in temperature above State water quality standards, determine where the test is applied. In these situations, the balanced indigenous population test applies at the edge of a mixing zone which can vary from feet to several hundred yards from the point of discharge.

Question. "Which States currently have thermal water quality standards?"

Response. All States have thermal water quality standards, which vary in specificity. Thermal standards may apply State-wide; others may use specific (e.g., warmwater or coldwater fisheries; or stream specific). All States have thermal standards for: (1) a maximum temperature not to be exceeded as a result of the impact of the thermal discharge, and (2) a maximum rise in temperature above natural conditions as a result of the impact of the thermal discharge.

Question. "A number of witnesses in our hearings have addressed the special problems faced by "integrated facilties," that is, plants which must comply with two or more sets of BAT and/or pretreatment regulations. Some have testified in support of the position that, for compliance purposes, discharging integrated facilities should have three years after promulgation of the last set of regulations applicable to the facility. Others take the position that EPA's combined wastestream formula is adequate to deal with the problem faced by integrated facilities. Would you please comment on this matter? Would you be willing to work with the Committee in an effort to attempt to appropriately resolve this problem?"

Response. The combined wastestream formula certainly has been one of the more controversial provisions of the General Pretreatment Regulations. Within the Agency, the formula has been the object of lengthy and intense scrutiny and reviews. It also was one of the regulatory provisions challenged in the pretreatment litigation and upheld by the Third Circuit. I believe the combined wastestream formula is a sound and reasonable tool for applying multiple categorical pretreatment standard to integrated industrial facilities.

Under existing law, EPA cannot extend deadlines for compliance with pretreatment standards, and the Agency believes that further delay of compliance dates by integrated facilities is unwarranted and unnecessary. Section 307(b) of the Clean Water Act requires compliance with a categorical standard no later than three years from the date of its promulgation. Therefore, existing law prohibits deferring compliance with pretreatment standards until the last one applicable to an integrated facility is promulgated. Integrated facilities should be treating only compatible wastes in a single treatment system. If that is the case only minor adjustments, if any, to the treatment system would be necessary to achieve compliance with changing standards as new standards for additional compatible wastes become applicable

to the integrated facility. Incompatible wastestreams need to be segregated and treated separately. In any event, the greatest change to a facility's wastestreams will occur when the first standard is applicable to that facility; the greatest reduction in pollutant loading will be from raw discharge down to the level in the categorical standard. As other pretreatment standards become applicable, EPA expects the new limits derived from the combined wastestream formula to be within the range already required to achieve compliance with the first applicable categorical standard.

EPA is aware of the treatment technology relied upon in previous regulations when it promulgates subsequent standards; thus we seek to avoid a significant problem because of staggered promulgation of standards. If commenters believe the Agency has not properly considered the impact of a regulation on an integrated facility, this would be an appropriate area for comment during the rulemaking process of a subsequent standard, and might provide cause for adjusting the proposed standards before their final promulgation.

I will be glad to talk to the Committee further on this issue but I do not believe that the problem warrants any major changes.

Question. "Some have suggested that a new industrial category should be established for integrated facilities. What are your thoughts concerning this proposal?"

Response. I believe that a separate industrial category estabished for integrated plants is unnecessary. As discussed in my previous answer, the combined wastestream formula is an appropriate mechanism for determining discharge limits for such facilities, as it takes into account the mix of processes which are present at a given plant site.

Additionally, it would be impossible to establish a separate category for integrated facilities. American industry is extremely diverse and does not always fit neatly into standard industrial classifications. Steel plants, for instance, perform a number of industrial operations aside from steel. Porcelain enamel manufacturers often engage in plastics manufacturing. Auto manufacturers perform a multitude of operations. Given the extreme diversity of processes performed by most industries, the concept of regulating a whole plant would be a recipe for plant-by-plant regulation. This approach, however, was rejected by Congress under the approach contemplated in the Clean Water Act.

Finally, establishing a separate category for integrated facilities would delay the ongoing implementation of the pretreatment program at a time when program momentum is building.

Question. "To what extent does the Agency have data describing number and variety of plants or facilities which are integrated facilities?"

Response. The Agency has a substantial amount of technical and economical data that describes the number and variety of plants or facilities which are integrated facilities within the specific industrial categories. During a national industry-wide data collection activity the Agency collects data through literature searches, specific plant sampling and analysis, and extensive surveys of the industry via technical questionnaires. Additionally, during the comment period for a proposed regulation the industry may voluntarily submit new data and information. Examples of industries for which the Agency has recognized the existence of plants or facilities as being integrated facilities include the following industrial categories: over 200 for Petroleum Refining; over 200 for Iron and Steel Manufacturing; over 700 for Metal Finishing; over 40 for Aluminum Forming; 25 for Nonferrous Metals; 500 for Organic Chemicals and Plastics and Synthetic Fibers; and 230 for Pulp, Paper, and <: perboard.

Question. "For purposes of Clean Water Act regulatory responsibilities and authority, what status do Indian Tribes have and what role do they play in implementing the Clean Water Act? Where a State in which an Indian Tribe is located has stricter water quality standards than might be required by U.S. EPA, which standards are the Tribe held to?"

Response. Since the Act defines Tribes as "municipalities" they are eligible to receive Section 201 construction grants if they are placed on the States' priority lists. The problem of delegation and authorities under other sections of the Clean Water Act is subject to legal debate as Tribes are not expressly mentioned.

"The respective roles of the Indian Tribes and the states to establish water quality standards for waters lying within tribal reservations is presently at issue in *Pyramid Lake Paiute Tribe* v. *EPA*, No. 82-89 (D. Nev.). There plaintiff has challenged water quality standards adopted by the State of Nevada on the grounds, among others, that the State lacked jurisdiction to set standards for the Truckee River within the Tribe's reservation.

The government's position in the litigation on this issue has not yet been formulated and will require further close consultation among the Department of Justice, EPA and other Federal agencies."

EPA is also developing an Agency policy which will address a variety of related issues regarding the administration of reservation programs. This policy is expected to call for an enhanced Tribal role in decisions and programs affecting the quality of reservation environments.

Question. "In your testimony, you mention the recent Third Circuit decision denying EPA's legal authority to issue fundamentally different factor variances. Does the Agency intend to appeal the Third Circuit's decision? What impact will the decision have on Agency programs? How broad is the reach of the decision, in your opinion? To what extent has the Agency, in the course of implementing the Act since 1972, employed fundamentally different factor variances in implementing the Clean Water Act? How many variances have been issued? For what types of pollutants and which industrial categories? (Please provide a detailed response for the record)?"

Response. The Agency believes that the fundamentally different factors (FDF) determination procedure is an appropriate mechanism to provide a safety valve for those facilities that may not be able to meet the categorical pretreatment standard limitations applicable to such facilities due to their unique factors. The mere availability of FDF determinations has been an important safety-valve which has been instrumental in defending national regulations against judicial challenges. In some instances courts have expressly relied on the FDF determination mechanism to uphold the national rule, *see*, e.g., *Kennecott Copper Corp.* v. *EPA*, 612 F.2d 1232 (10th Cir. 1979); *AISI* v. *EPA*, 526 F.2d 1027, 1061 (3rd Cir. 1975); *Weyerhaeuser Co.* v. *Costle*, 590 F.2d 1011, 1040–1041 (D.C. Cir. 1978).

The United States Court of Appeals for the Third Circuit stated that "FDF variances for toxic pollutants are forbidden by the (Clean Water) Act." *NAMF* v. *EPA*, 719 F.2d 624 (1983). Therefore, EPA cannot grant a request for an FDF determination for a toxic pollutent regulated in a categorical pretreatment standard. However, since the opinion only addressed the availability of FDF determinations for toxic pollutants, such determinations for conventional and non-conventional pollutants regulated in a categorical standard remain available for facilities subject to pretreatment limitations. EPA will amend 40 CFR § 403.13 to comply with the Court's opinion in the near future.

EPA requested that the Solicitor General seek Supreme Court review of the Third Circuit's FDF decision. The Solicitor General has agreed to seek a review of this decision. The Chemical Manufacturers Association has filed its own petition seeking Supreme Court review.

Until the Clean Water Act can be amended to confirm the Agency's authority to make FDF determinations for toxic pollutants, or the Supreme Court remands the Third Circuit decision, EPA has suggested another mechanism to address those existing indirect dischargers who would previously have been eligible to apply for FDF determinations from pretreatment standards. This mechanism has been discussed in the preamble of every effluent guideline promulgated since the date of the Court's decision. The alternative mechanism involves a rulemaking petition to the Administrator by the indirect discharger or other affected party to examine the factors and determine whether the pretreatment standard is properly applicable to the specific case or should be revised. The Agency will consider these rulemaking petitions and determine whether a rulemaking should be initiated.

At present the Agency does not have exact data available on the number of indirect dischargers that have applied for FDF determinations. Before the decision EPA had received approximately 50 applications, but this does not include those received for review by delegated States. However, we expect few applications to be submitted in the future because the Third Circuit decision limits the Agency FDF authority to non-toxic pollutants only. Few of the categorical standards for indirect dischargers contain limits for non-toxic pollutants.

Since the promulgation of effluent limitations guidelines regulations (guidelines) and the implementation of these guidelines in NPDES permits, there have been 53 FDF determination requests for direct dischargers submitted to EPA Headquarters for approval; there have been four approved, 14 denied, 16 withdrawn and 19 pending requests.

The information requested on the four FDF determination requests for direct dischargers that have been approved appears on the next page.

Facility	Date of approval	Point source category	Pollutants
Southern California Edison:			
Huntington Beach Generating Station.	February 22, 1977	Steam Electric Generating (40 CFR & 423.32(b)(6) (1974)—Boiler Blowdown.	Total Suspended Solids, Oil & Grease, Total Iron, Total Copper.
San Onofre Nuclear Generating Station.	do	Steam Electric Generating (40 CFR & 423.32(b)(6) (1974)—Boiler Blowdown.	Total Suspended Solids, Oil & Grease, Total Iron, Total Copper.
Birdsall Sand and Gravel, Oral, S. Dak.	July 10, 1978	Construction Sand and Gravel Subcategory of Mineral Mining and Processing.	Total Suspended Solids.
Freeport Chemical Co., Uncle Sam, La.	June 3, 1981	Phosphate Subcategory of Fertilizer Manufacturing.	Total Phosphorus, Fluoride, Total Suspended Solids.

Question. "The Committee has received a great deal of testimony concerning the alleged unworkability of EPA's removal credit approach. Is the question of removal credits, while logically sound, too administratively complex to be meaningfully implemented?

Response. EPA believes that the removal credit approach is fundamentally sound. Indeed, a recent court decision has upheld the Agency removal credits regulations against allegations that they are unworkable. However, EPA recognizes that some simplification of the process would be appropriate.

EPA is taking measures to simplify the process which allows POTWs to adjust categorical pretreatment standards to reflect the reduction in toxic pollutants achieved at municipal treatment facilities. The Agency published proposed changes to the removal credits provision of the General Pretreatment Regulations in September, 1982. These changes include several measures which would make it easier for POTWs to qualify for the issuance of removal credits.

First, the Agency proposed to expand the range of sampling methods and analytical protocols permitted for demonstrating pollutant removal at POTWs. Second, the Agency proposed to eliminate a complex adjustment to removal rates for combined sewer overflows and bypasses. The Agency has also proposed to allow the use of historical and other data where sufficient data is not available for calculating removal rates. As these changes show, the Agency is committed to streamlining the removal credits provision. A final rule on removal credits should be published in the Federal Register in the near future.

The Agency is committed to implementing the pretreatment program and the removal credit provision. The Agency has conducted POTW workshops and seminars which explain the pretreatment program, including removal credits, and is planning guidance materials for developing and approving removal credits. The removal credit provision will be a topic for discussion in the Pretreatment Implementation Review Task Force.

Question. "On page 4 of your statement, you mention an EPA study of construction grants issues. Would you outline in more detail the scope and purposes of the study and schedule for its completion?"

Response. Given the changes in construction grants eligibilities and the federal share that begin in FY 1985 and the termination of the current authorization for the grants program at the end of FY 1985, the Agency believes it is prudent that we begin to examine feasible alternatives for the construction, proper operation, and eventual replacement of needed municipal wastewater treatment facilities. In initiating this study, we feel that critical consideration must be given to the appropriate federal role in obtaining expeditious municipal compliance and long-term local self-sufficiency.

Along these lines, we feel that viable federal alternatives (which may include non-financial as well as financial components) must not only represent an effective and wise-use of federal resources, but must also provide a suitable environment for fostering local initiatives in providing needed services. The issue areas we expect to address include local self-sufficiency (financial, managerial, technical and institutional requirements and competing infrastructure needs), State programs (existing and planned) for assisting municipalities, and alternative federal funding, compliance and technical assistance strategies that might fill the gap for identified unmet needs and address specific problem areas.

We expect to publish a Federal Register notice in February 1984 to solicit public comment on the Agency options and the study. We will keep your staff informed of

progress made on this study and its recommendations, which we expect to complete by November 1984.

Question. "One of the recommendations of the Administration calls for a change in the conflict of interest requirements. Would you discuss the kinds of difficulties that have led to this recommendation, including examples of which you may be aware?"

Response. EPA has found that some States have been unable to meet the current statutory conflict of interest requirement in Section 304(i)(2) of the Clean Water Act, which is a prerequisite to EPA approval of a State NPDES program. State statutes sometimes require a State Board to be represented by the industries or municipalities they must regulate as board members. Historically, this has been a problem in the review of many State programs.

Although most States apparently can meet the current requirement, at least two States, Oklahoma and Texas, cannot now be approved by EPA to run the NPDES program since they cannot ensure that all board members will not have a conflict of interest. By statute, the Oklahoma Water Resources Board must consist in part of industrial and agricultural representatives. The Texas Railroad Commission is selected through State-wide elections, and often included persons who would fall within the current prohibition. In addition, compliance with the conflict of interest requirement has become a problem in already approved NPDES States.

The Administrator's Clean Water Act proposed amendment, which tracks the current Clean Air Act provision, would still prohibit a majority of Board members from having a conflict of interest. In addition, any member with a conflict must disclose that conflict. This requirement, coupled with the existing statutory safeguard authorizing EPA to object to a proposed State permit, should minimize the chance that a State Board member will give particular permit applicants favorable treatment.

Question. "On page 19, you mention a nonpoint source Report to Congress. Would you describe the scope of this report, its schedule for submission and to which committees you are submitting the report?"

Response. In the House Report on the FY 1984 Appropriations Act for the Environmental Protection Agency, EPA was requested to "analyze the extensive body of past research in nonpoint source problems to identify and rank the highest payoff problem areas and submit a report by January 1, 1984, outlining specific strategies and approaches recommended for addressing nonpoint sources in a cost-effective manner."

The report was submitted on January 23, 1984. Copies were sent to the following Committees: Senate Environment and Public Works, Senate Appropriations, House Public Works and Transportation, and House Appropriations. We will be glad to share the Report with other Committees and individuals as requested.

Question. "Some have suggested that innovative treatment technologies in the pretreatment area should be treated as they are for direct dischargers, that is, additional time for compliance where better results and more efficiency results from these methods. We even heard examples in the electroplating/metal finishing area. Would you give us your views on this proposal?"

Response. The Agency is not currently pursuing any change that would allow an innovative technology delay for indirect industrial dischargers. We are aware of only one municipality, one State and three industries which have expressed any interest in this possibility. However, it may be a subject of discussion in the Pretreatment Implementation Review Task Force, which met for the first time February 14 and 15, 1984.

Question. "You discuss a new task force on pretreatment. Their input could be helpful to the committee's work as well as to EPA as you carry out the pretreatment program. Is there a schedule for their recommendations?"

Response. The Agency has established the Pretreatment Implementation Review Task Force. The purpose of the Task Force is to identify issues and seek solutions to problems experienced by municipalities, industries and States in the implementation of the program. The Task Force has been approved by the General Services Administration.

The first meeting of the task force was held February 14 and 15, 1984. The Task Force has been established for an 11 month period. Initial recommendations are expected this Summer with additional recommendations due by the end of fiscal year 1984.

Periodic reports will be issued on the Task Force activities and we will welcome any specific comments and questions you may have on the Task Force proceedings.

Question. "The 1981 amendments contained changes in municipal compliance dates and the definition of secondary treatment, among others. The EPA has not yet

announced policy decisions in carrying out these changes. What has delayed getting the municipal compliance policy and secondary treatment regulations out? Also, what is your schedule to have these out?

Response. Municipal compliance—Final publication of the National Municipal Policy was delayed for a number of reasons: 1) the need for a thorough internal policy review by the new leadership of the Agency; 2) the desire to resolve the redefinition of secondary treatment so that municipalities would have more certainty regarding their applicable effluent limits; and 3) the importance of having implementation guidance available for use by the Regions and States. The proposed redefinition was published in the November 16, 1983 Federal Register, and the guidance is now ready for distribution. The National Municipal Policy was published in the Federal Register on January 30, 1984. Guidance for implementing the policy will be distributed during the week of February 13, 1984.

Secondary Treatment—Work had already begun on development of the regulations to redefine secondary treatment prior to the 1981 amendments to the Act. As a result of the 1981 amendments, additional issues had to be addressed in the regulations which required the undertaking of a large data collection and analysis effort. Daily monitoring data on over 300 POTWs was collected and statistically analyzed to support the conclusions in the proposed secondary treatment regulations. These proposals were published in the November 16, 1983 Federal Register. The public comment period extends to January 16, 1984, and the regulations are expected to be published in September 1984.

Question. "Testimony presented earlier in these hearings made the point that implementing Federal categorical pretreatment standards in lieu of the City of Chicago's (Metropolitan Sanitary District of Greater Chicago) existing pretreatment program "could result in a net reduction in control reuirements for industrial facilities at a substantially greater program cost for operations." If this situation is true with respect to Chicago, and other publicly owned treatment works, wouldn't the most environmentally responsible and fiscally sound public policy be to allow the stricter and more cost effective locally established program to be implemented?"

Response. The General Pretreatment Regulations clearly affirm the authority of Publicly Owned Treatment Works (POTWs) to establish local pretreatment limits more stringent than the categorical pretreatment standards where necessary. Furthermore, the regulations require POTWs to establish specific limits to control industrial discharges which jeopardize public health or safety, interfere with the operation of the POTW or cause violation of applicable environmental controls, such as NPDES permit limits or water quality standards. Categorical standards do not supersede these local limits when the local limits are more stringent, therefore, "net reductions in control requirements" will not occur. It is theroretically possible that a municipality could withdraw its local limits (which are more stringent than categorical standards) and cause a net reduction in control requirements. This situation is unlikely because local limits may still be required to protect against pass through, inteference or prevent a water quality problem. If the stringent limits set by the municipality are truly necessary, then local limits in addition to categorical standards will be needed to satisfy the 403 regulations.

The national pretreatment program is now at a critical point. More than 400 POTWs have approved local programs in place. Many more are well along in developing approval programs. Nineteen technology-based categorical guidelines containing pretreatment standards have been issued and eight more are under development. Any major shift away from the present program would raise serious questions of fair treatment and undoubtedly would delay the implementation of a national effort to control toxic industrial discharges to municipal sewerage systems by at least two years.

The Agency has, however, taken measures to increase the flexibility of the national pretreatment program. We will publish shortly final regulations which streamline the procedure by which POTW's can modify categorical pretreatment standards to reflect the removal of toxic pollutants which is achieved at the municipal treatment facility. I have formed the Pretreatment Implementation Review Task Force, which includes representatives of States, municipalities, industries, the environmental community, and EPA. I hope that this task force will resolve at least some of the concerns that we have heard about the program.

U.S. ENVIRONMENTAL PROTECTION AGENCY,
OFFICE OF EXTERNAL AFFAIRS,
Washington, D.C., February 17, 1984.

Hon. JAMES L. OBERSTAR,
House of Representatives,
Washington, D.C.

DEAR MR. OBERSTAR: Enclosed are the Environmental Protection Agency's responses to the questions you recently submitted to Administrator William D. Ruckelshaus following his testimony before the Subcommittee on Water Resources. Please be advised that we consider these to be responses to technical questions regarding H.R. 4037, and they are not to be construed as administration support for this bill.

I apologize for the delay in getting our responses to you. If I can be of further assistance, please feel free to contact me.

Sincerely yours,

STEADMAN M. OVERMAN,
Director, Office of Legislative Analysis.

Enclosure.

Question. "H.R. 4037 requires States to submit certain information, and a completed implementation plan, within 270 days of enactment. Is this timeframe adequate for most States. How should we handle those States which cannot meet that deadline? Approximately how many States, in your judgement, would be able to meet the 270 day deadline?"

Response. We believe that 270 days is more than adequate for States to submit the information required in Section 319(b)(1)(B). We believe that those States with identified NPS problems could submit a plan in 270 days.

Question. "How long does EPA need to review these plans? H.R. 4037 now provides 6 months. Is this adequate? Is it too long?"

Response. The 6 months provided by H.R. 4037 is adequate for EPA to review completed State implementation plans.

Question. "What agencies, within USDA, have been involved or would be included in, future interagency agreement? What other Federal agencies will be, or should be included in similar agreements?"

Response. The agencies within USDA which have been involved, or would be included, in future interagency agreements are: the Agricultural Research Service (ARS), the Agricultural Stabilization and Conservation Service (ASCA), the Economic Research Service (ERS), the Extension Service (ES), the Farmers Home Administration (FHA), the Forest Service (FS) and the Soil Conservation Service (SCS).

Other Federal agencies which could be considered for similar agreements are:

(a) The Department of the Interior: The Office of Surface Mining (OSM), the Bureau of Mines (BM), the Bureau of Indian Affairs (BIA), the Bureau of Reclamation (BR), the National Park Service (NPS), the Fish and Wildlife Service (FWS) and the Geological Survey.

(b) The Department of Housing and Urban Development: The Federal Housing Administration (FHA).

(c) The Department of Transportation: the Federal Highway Administration (FHA), the Federal Aviation Administration (FAA), the Federal Railroad Administration (FRA) and the Urban Mass Transit Administration (UMTA).

(d) The Department of Commerce: the National Oceanic and Atmospheric Administration (NOAA).

(e) The Tennessee Valley Authority (TVA).

(f) The Appalachian Regional Commission (ARC).

Question. "What timeframes should we consider, what measurements should we use to evaluate a nonpoint source program? Congress has so far generally given the Clean Water Act 5-year reauthorizations; but it will most probably take longer to measure improvement in water quality. What should a realistic timeframe for a nonpoint source control program (the State of Wisconsin, for instance, uses a 20-year program), and by what shorter-term (4-5 years) criteria should we evaluate the program, for administrative and legislative purposes?"

Response. In your question regarding timeframes for evaluating nonpoint source programs, you correctly note that it takes a long time to measure improvements in water quality. Yet Congress must have some way to evaluate the effectiveness of nonpoint source programs in a shorter timeframe for administrative and legislative purposes.

Experiences in the State of Wisconsin's Nonpoint Source Water Pollution Abatement Program indicate that it takes up to 9 years for a nonpoint source watershed

implementation project to be completed, with projects including the following implementation states:

	Time (in years)
a. Project selection, watershed evaluations, and development of a detailed implementation plan	1
b. Landowners enter into cost sharing agreements for implementation of best management practices	2
c. Best management practices installed	6
	9

Based on Wisconsin's experience, within 5 years of initiation of an implementation project, one should be able to obtain quantitative data on the number and type of best management practices implemented in particular projects. There should be some limited data on WQ effects within 5 years, but more significant and meaningful data on the WQ effects will probably require 7 years.

As a point of clarification, the State of Wisconsin estimates that it will take 25 years to complete implementation of best management practices in 120 watersheds in the State. As discussed above, each of these watershed projects takes about 9 years to complete.

Question. "What information will we need four years from now, that we should begin gathering in this initial program? It is critically important that we view this first four years as not only an implementation program, but also as a means to fill in the gaps in our present knowledge so that whatever program is enacted in 1988 will be fully effective."

Response. The Agency currently has mechanisms to collect information on NPS. If the proposed amendment was enacted, 4 years from now we could have the following information available:

(a) Verified, prioritized lists, by States, of waters where designated uses are impaired or threatened by NPS pollutant contributions.

(b) Specific implementation schedules, including starting and ending dates and resource estimates, for abating such NPS pollution.

(c) Hard, baseline data on water quality in selected portions of such waters before implementation of NPS controls so that the change in water quality after implementation of controls can be clearly and conclusively evaluated.

(d) The successes and limitations of different types of institutional arrangements and management approaches (e.g. technical assistance, education, Best Management Practices (BMP) demonstration, regulation, cost sharing) in achieving BMP implementation with respect to different types of NPS pollution (e.g. agriculture, silviculture, urban runoff).

(e) Clear documentation of initial water quality changes/improvements in selected instances where States or localities have had control programs in place long enough to produce such changes/improvements.

(f) Clearly and fully documented costs for the BMPs utilized in connection with the water quality changes/improvements referenced in (e) above so that we can begin to associate control costs with water quality improvements.

With regard to the draft Nonpoint Source Control Policy (next 6 ques.):

Question. "You state the Agency will use existing resources to implement this policy. Which are these? How are these resources presently committed, and what other activities, if any, will have to be curtailed in favor of nonpoint source control activities?"

Response. The existing resources are contained in the Water Quality State Programs Management budget. These resources are associated with overall State grants and water quality management oversight, planning and implementation, including nonpoint source control.

We foresee no need to curtail other activities. The Administrator allocated resources from the 1984 Congressional add-on for nonpoint source (NPS) control activities. With these resources, the Agency has prepared the NPS report requested by Congress (submitted January 1984), completed development of a proposed EPA NPS policy, is revising the interagency agreement on NPS control with the Department of Agriculture, is completing the Nationwide Urban Runoff Program final report, is overseeing NPS projects funded under § 205(j), and is providing technical assistance to States, localities, and other Federal agencies working on NPS control program development.

Question. "At the State level, what activities currently performed under Secs. 106 and 205(j) are most likely to be curtailed in order to comply with the Agency's new

Policy and Program? What will be the impact of this curtailment on ongoing State programs?"

Response. To the extent that such curtailment is necessary, the States will delay problem assessments and control program development and implementation for lower priority water bodies. Curtailment of major point source control activities, primarily permitting and enforcement, will not be necessary.

Question. "How many States have not yet submitted adequate information called for by the March 31, 1984 deadline? How many will, in your estimation, not be able to meet that deadline?"

Response. As a point of clarification, the deadline for submission of the 1984 305(b) reports has been extended from March 31, 1984 to June 1, 1984. Most States have not yet submitted the information called for by Section 305(b) of the Clean Water Act.

EPA issued guidance in September 1983 to States on information requested in the 1984 305(b) reports (EPA Office of Water Regulation and Standards, "Guidance: 1984 State Section 305(b) reports"). This guidance calls for the State's to report more information than they have in the past on nonpoint source pollution. It is likely that only a limited number of States will be able to provide a detailed list of water bodies impacted by nonpoint sources and needing implementation of additional controls. We anticipate that the remaining States will submit information of varying quality and EPA will need to continue to work with those States to improve the identification of water bodies impacted by nonpoint source pollution.

Question. "How many States will not readily be able to develop a nonpoint source Pollution Management Program? (This question obviously relates to the ability of States to comply with the requirements of proposed legislation.)"

Response. We expect that the States which have identified their NPS problems will readily develop a program if proposed legislation is enacted. Many States have identified nonpoint sources as a major priority water pollution control problem, and have already completed a substantial amount of the problem identification and planning work necessary to comply with proposed Pollution Management Program requirements. States not readily able to meet proposed requirements will, most likely, be those where nonpoint sources have not been perceived to be a priority problem compared to remaining major point source problems.

Question. "Are authorities under the existing Act adequate to assure participation in this new initiative, absent new resource incentives to States? How many States do you anticipate will participate?"

Response. Yes, authorities under Sections 106 and 205(j) are adequate. EPA has the authority to negotiate a State's proposed program to ensure that a reasonable portion of the State's 106 and 205(j) allocations are devoted to nonpoint source activities.

Question. "Can you accomplish the goals of 304(k) with existing resources?"

Response. We can negotiate or renegotiate the necessary interagency agreements over time. We can achieve that with existing resources but it might be necessary to extend the implementation period over several years.

U.S. ENVIRONMENTAL PROTECTION AGENCY,
Washington, D.C.

Hon. ROBERT W. EDGAR,
House of Representatives,
Washington, D.C.

Dear Mr. Edgar: Enclosed are the Environmental Protection Agency's responses to the questions you recently submitted to Administrator William D. Ruckelshaus following his testimony before the Subcommittee on Water Resources.

If I can be of further assistance, please feel free to contact me.

Sincerely yours,

GREGG WARD,
Director, Office of Congressional Liaison.

Enclosure.

Question. EPA's present rules contain a complex mechanism (40 CFR 403.7) which allows the Agency to grant "removal credits" to an industrial discharger to reflect that portion of treatment done by a POTW on a given industrial discharge regulated by categorical pretreatment standards. In theory, this should prevent duplicate treatment by the industry and the POTW. How many POTW's have applied for "removal credits"? How many applications have been approved? What improvements,

either administrative or legislative, could be made in the "removal credits" process to help ensure that unnecessary duplicate treatment is not required?

Response. EPA is taking measures to simplify the process which allows POTWs to relax categorical pretreatment standards to reflect the reduction in toxic pollutants achieved at municipal treatment facilities. The Agency published proposed changes to the removal credits provision of the General Pretreatment Regulations in September, 1982. These changes include several measures which would make it easier for POTWs to qualify for the issuance of removal credits.

First, the Agency has expanded the range of sampling methods and analytical protocols permitted for demonstrating pollutant removal at POTWs. Second, the Agency has eliminated a complex adjustment to removal rates for combined sewer overflows and bypasses. The Agency has also allowed the use of historical and other data where sufficient data is not available for calculating removal rates. The Agency is considering another change—extending the effective date of the removal rates. By making removal rates effective for the life of the POTW permit, the POTW and its industrial users will have the same pretreatment standards for at least five years. As these changes show, the Agency is committed to streamlining the removal credits provision.

The Agency is also committed to implementing the pretreatment program and the removal credit provision. The Agency has conducted POTW workshops and seminars which explain the pretreatment program including removal credits and is planning guidance materials for developing and approving removal credits.

In reply to your question about the number of POTWs which have applied for removal credit authority, we do not have ready access to this information, since these applications are reviewed by States which have approved pretreatment programs or by EPA Regional Offices. However, Region V in Chicago reports that they have received two removal credit applications and are aware of 38 other POTWs which are preparing applications. To the best of our knowledge, no POTW has yet received approval to grant removal credits.

It should be noted that even where removal credit approval procedures are streamlined, there are many POTWs, especially those involved in some form of sludge utilization program, which are not likely to grant removal credits for heavy metals and other pollutants which might adversely affect sludge quality and thereby restrict the POTW's sludge disposal options.

Question. The Third Circuit Court of Appeals has struck down the "fundamentally different factors" variance of 40 CFR 403.13. How does EPA plan to operate the categorical pretreatment program without some means to allow for conditions that are fundamentally different from those considered during the writing of the general regulations.

Response. The Agency believes the procedure to determine the fundamentally different factors (FDF) variance is an appropriate mechanism to provide a safety valve for those facilities that may not be able to meet the categorical pretreatment standard applicable to such facilities due to their unique factors. The U.S. Court of Appeals for the Third Circuit, however, remanded to EPA the FDF determination provision in the General Pretreatment Regulations (40 CFR § 403.13). The Court stated that "FDF variances for toxic pollutants are forbidden by the [Clean Water] Act." Therefore, EPA cannot grant a request for an FDF determination for a toxic pollutant regulated in a categorical pretreatment standard. However, since the opinion only addressed the availability of FDF determinations for toxic pollutants, such determinations for conventional and non-conventional pollutants regulated in a categorical standard remain available for facilities subject to pretreatment limitations. EPA will amend 40 CFR § 403.13 to comply with the Court's opinion in the near future.

Until the Clean Water Act can be amended to confirm the Agency's authority to make FDF determinations for toxic pollutants, EPA has another mechanism to address those existing indirect dischargers who would previously have been eligible to apply for FDF determinations from pretreatment standards. This mechanism has been discussed in the preamble of every effluent guideline promulgated since the date of the Court's decision. The alternative mechanism involves a rulemaking petition to the Administrator by the indirect discharger of other affected party to examine the factors and determine whether the pretreatment standard is properly applicable to the specific case or should be revised. The Administrator will consider these rulemaking petitions and determine whether a rulemaking should be initiated. If rulemaking is initiated, specific categorical standards could be issued for the specific facility as a separate subcategory. This mechanism involving a petition for rulemaking has always been available, but in the past EPA attempted to deal with such requests through FDF determinations.

The FDF determination regulations for direct dischargers, which are contained in 40 CFR Part 125, Subpart D were not affected by the Court's decision and still allow FDF determination requests for toxic, conventional and non-conventional pollutants. However, these provisions have been challenged, on similar grounds, in the U.S. Court of Appeals for the District of Columbia Circuit.

Question. Industry representatives have asserted to me that E.P.A.'s definition of pretreatment of pollutants which "pass through" a waste treatment plant (under Section 307 of the Clean Water Act, 40 CFR 403.3(n)) effectively guarantees that industry must duplicate a P.O.T.W.'s treatment. This is said to be the case under proposed Pesticide Effluent Guidelines (Federal Register Nov. 30, 1982, p. 54004) and proposed Plastic Industries Effluent Guidelines (Federal Register, March 21, 1983, p. 11841). Can you comment on the justification for E.P.A.'s definition of "pass through".

Response. The Third Circuit Court of Appeals, in its decision in the pretreatment litigation (*NAMF et al.* v. *EPA*, Nos. 79-2256, September 20, 1983), remanded to the Agency the regulatory definition of the term pass through (40 CFR § 403.3(n)). EPA had conceded that the challenged definition was promulgated without adequate notice and opportunity to comment. Thus, the Court remanded the definition on those procedural grounds, and declined to substantively comment on the definition. In accordance with this decision, EPA will publish a Federal Register notice announcing the suspension of the existing pass through definition. The Agency will then propose a new definition for comment, and subsequently promulgate it in final form.

Section 307(b)(1) of the Clean Water Act specifically prohibits the discharge of any pollutant that "passes through" a POTW. EPA's General Pretreatment Regulations, in implementing this statutory requirement, therefore included a general prohibition against pass through (40 CFR § 403.5(a)), and language defining what would constitute a pass through violation (40 CFR § 403.3(n)). This definition did not require industrial users discharging into POTWs to duplicate a POTW's treatment. A pass through violation would result only where an industry discharged a pollutant through a POTW into navigable waters in quantities that caused a violation of any requirement of the POTW's NPDES permit. In any event, most POTWs are not designed to remove toxic pollutants, whereas in contrast, pretreatment systems operated by industrial users of POTWs are designed to remove the toxic pollutants in that industry. Whatever removal is obtained by POTWs for toxics is only incidental to the POTW's treatment capability.

Question. The proposed pretreatment standards for the organic and plastics industries do not require pretreatment for toluene because POTWs adequately treat this material (Federal Register, March 21, 1983, p. 11853). Why then do the pretreatment standards for the pesticide industry require 99 percent pretreatment on the same chemicals?

Response. The proposed pretreatment standards for the pesticide industry and the organic chemicals plastics and synthetic fibers (OCPSF) industry were developed through independent analyses of the data from each industry. Pretreatment standards less stringent than direct discharge standards were proposed for toluene in the pesticides industry because of its use as a solvent in that industry and the resulting possibility that it could be discharged in very high concentrations. Pretreatment standards for toluene were not proposed for the OCPSF industry because our analysis indicated that POTWs could adequately control this pollutant.

The selection of pollutant parameters for pretreatment standards was based on information available at the time that these regulations were proposed. Since proposal, the Agency has been gathering additional data related to toluene as well as to other toxic pollutants for use in our analysis for final regulations. We will be reassessing the selection of pollutant parameters for both industries to ensure that we develop regulations which are consistent and reflect the pollutants of concern and the performance of treatment technology within each industry.

Question. Turning to the subject of groundwater protection, as you may know, I have introduced legislation on this subject in the form of a bill, H.R. 565, which would create a national groundwater commission. The commission bill now has been attached as an amendment H.R. 2867 the RCRA reauthorization act which recently passed the House. The 19-member commission would assemble and coordinate basic information on groundwater and make recommendations to Congress and the federal and state agencies on measures needed to adequately protect this vital resource. In testimony on May 26, 1982, E.P.A. Assistant Administrator for Solid Waste and Emergency Response Rita Lavelle testified that the groundwater commission was a "good objective but one that is already being effectively addressed." Ms. Lavelle then explained, "The Agency has determined that a groundwater policy is required,

and this policy will include a review of major regulatory activities to insure that federal regulations are properly protecting groundwater . . . ." However, the E.P.A. has been promising to produce a groundwater policy since 1981, and still has not done so.

My question is what has the E.P.A. been doing, and what is the Agency doing now, on the broad issue of groundwater protection? Also, would it not, in fact, be helpful to the agency to have the recommendations of a broad-based commission on a sound, comprehensive policy to protect groundwater? (It should be noted that it has always been my intention that the work of a groundwater commission should complement, rather than hamper or delay, the work the E.P.A. is doing to produce a policy on this seemingly intractable issue.)

Response. With respect to your proposal of a national ground-water commission, part of your motivation appears to be concern about EPA's Ground Water Protection Strategy. I can give you Mr. Ruckelshaus' personal assurance that our efforts in this area are coming to fruition in the very near future. In fact, we expect to start briefing Congressional staff shortly. In this context, I would suggest that the Congress assess our Strategy and the public reaction to it to decide whether a commission would be worthwhile—commissions can sometimes be very useful in developing a national consensus, but all too often just produce voluminous unread reports. Of course, if a ground-water commission is established, EPA will do everything possible to help it in its work.

Mr. ROE. The gentleman from Louisiana.

Mr. BREAUX. Thank you very much, Mr. Chairman.

I apologize for not being able to be here this morning.

I was particularly interested in your testimony. It is incredibly extensive—22 pages, plus about 15 pages of attachments. A great deal of work has gone into it.

However, I cannot find anything on my favorite section, section 404. Is it not high enough in importance to have made the statement?

Mr. RUCKELSHAUS. No; it is a very important section, Mr. Breaux.

Mr. BREAUX. Why wasn't it mentioned at all in the testimony?

Mr. RUCKELSHAUS. Well, we are not making any recommendations for changes in that section. I did testify on that in the Senate. I would be glad to try to respond to any questions that you or other members of the committee might have about section 404.

Mr. BREAUX. What did you say over there?

Mr. RUCKELSHAUS. The same thing I just told you. We are not making any recommendations for changes. There were a number of questions about it which I responded to.

My basic view on 404 is that we are having some problems, as I think you heard this morning from the Assistant Secretary of the Army, with some responsibilities in this area.

Mr. BREAUX. I missed that.

Mr. RUCKELSHAUS. In implementing that section. I don't believe those are problems that cannot be overcome if both agencies, in fact, all the agencies with responsibility for some administration of 404, work cooperatively together, and do the best we can to resolve whatever differences we have.

It is a difficult task to give an agency like the corps of engineers and an agency like EPA joint responsibility for the administration of a sensitive statute or section like section 404. But as I say, I do believe that whatever differences we have can be worked out and ought to be worked out between the two agencies in order to make this section of the statute function properly.

Mr. PACKARD. Would the gentleman yield, please?

I think the gentleman may not be aware that the entire presentation this morning by the Assistant Secretary Gianelli was on section 404.

Mr. BREAUX. That is a different department, right?

Mr. PACKARD. I didn't understand.

Mr. BREAUX. I appreciate the fact that the corps said something about it. But I am disappointed EPA did not say anything about it. Their role in it is quite extensive and the conflict between the two is one of the problem areas for many.

A principal area of disagreement is between EPA's role and jurisdiction and Gianelli's position with regard to the corps.

Mr. EDGAR. Would the gentleman yield?

I did sit through most of this morning's presentation. There was one question that was raised this morning that we should get some clarification on. That is they showed the whole process of procedures for 404, including EPA's right to veto a particular application. And testimony this morning indicated there was only one veto by EPA that they could remember.

Is that your understanding?

Mr. BREAUX. Is this out of my time?

Mr. RUCKELSHAUS. I think that is right, Mr. Edgar. That is my understand.

Mr. EDGAR. And if the gentleman would yield further, there was at least in the tone of the statement this morning the strong feeling, at least that I received, that most of the problems with the process of 404 were interagency problems, and administrative and regulatory problems.

They did not come armed with lots of legislative changes.

Mr. RUCKELSHAUS. I don't think the administration at this point is making any recommendations for changes in section 404.

Mr. EDGAR. I thank the gentleman for yielding.

Mr. BREAUX. I forgot what I wanted to ask now.

How much time do I have left?

OK. One of the points: although EPA has made probably only one veto in 18,000 permit applications, the fact that EPA has the right to veto an application certainly is going to affect it in its process toward a final decision. If I know somebody is going to veto it if I don't change it, the chances are I am likely going to change it according to what I think is appropriate before I submit it.

So the fact that there has only been one veto does not indicate the extensive operations that EPA has had. That is one of the things I want to focus on.

My area is probably more affected by the 404 permitting section than any other congressional district in the United States. Twenty-five percent of all the wetlands in North America are in Louisiana, my entire congressional district is a wetland under the definition.

So everything that is dredged and filled is affected by the need for a 404 permit. One of the things that I have always been concerned about in the 12 years I have been here is the fact that some have tried to make the 404 permit a wetlands management protection act.

It was never intended to do that. I think it is not designed to do it, and therefore, we have all these problems when people try and use it for that particular purpose.

One of the things I am concerned with is that EPA is really the only agency that reviews the permit applications that are submitted to the corps. Congress has given your agency, in effect, a veto right over that application.

The other agencies are required to comment if it affects their particular area of jurisdiction. But we have not given them a veto right.

Some of the areas that you are required to look at, with regard to that permit application, are areas that I am concerned EPA does not have a great deal of expertise in, by design. For instance, the Administrator is authorized to prohibit the specification, which is, in other words, the veto of a permit, whenever he determines after notice an opportunity for public hearings that the discharge of the materials in such area would have an unacceptable adverse effect on municipal water supplies, certainly something your agency has expertise in.

But shellfish beds is the another area. Then it goes on: fishing areas, which are as extensive as all the waters of the United States; wildlife areas, which, of course, are throughout the United States; recreational areas, of course, again, throughout the United States.

Is it not correct that your agency does not have a lot of expertise, by design, in wildlife areas, in fishing areas, and shellfish bed areas?

And if you feel that you do, please describe to the committee the type of people you have reviewing these permit applications in those particular areas, and what would their expertise be?

Mr. RUCKELSHAUS. Well, we have both at the headquarters and regional level people with backgrounds in the effects of pollution on wildlife, on shellfish, on fish. I think there are two kinds of questions you are asking.

One is do we have the kind of experience that we need to carry out the responsibilities assigned to us under the act. And second, should we be assigned those responsibilities.

I think there are two different questions. I do think we have people in the agency with the kind of expertise to look at those sort of issues. Recreation areas may be a somewhat different kind of——

Mr. BREAUX. If we assume, for the sake of argument, the Department of Interior is the agency responsible for wildlife management for instance, and if we assume that the National Marine and Fisheries Service is the agency presumably designed to regulate fish matters, would it not be more preferable to have those agencies looking at these particular areas as regards the potential effect of permit application than, say, EPA, which is not noted for that area?

Mr. RUCKELSHAUS. I think, in fact, they do that now. I think they comment on those.

Mr. BREAUX. The difference is they are asked to look at it. You are given authority to say, "we object to it, we are going to veto it." Your work in this area is significantly more involved and higher as far as effect than, say, National Marine Fisheries Service or, say, the Department of Interior.

Mr. RUCKELSHAUS. Well, presumably, our comments would have more effect to the extent that they might lead toward some administrative review and ultimate veto by the Agency. So to that extent, you are right.

They probably do have more——

Mr. BREAUX. I am not trying to be argumentative with you. I am just trying to point out some problems that I have long perceived with the program.

We are telling EPA that you alone of all the agencies have the right to veto a permit application if it affects shellfish beds, or if it affects a wildlife area, or if it affects fishing resources.

We don't give that right to the agency that we charge with authorization and responsibility for managing those areas. I am asking you, isn't it more preferable to give them that perspective on the problem than, say, your agency?

Mr. RUCKELSHAUS. Well——

Mr. BREAUX. And if not, why not?

Mr. RUCKELSHAUS. It may be, except we might then have four agencies with a veto power over the permit.

Mr. BREAUX. As much as I would dislike that, isn't it more appropriate to have the agency charged with having the experts in those particular areas have that all-encompassing authority of a veto over a permit?

Mr. RUCKELSHAUS. I would have to think about it. I don't really quarrel with that. I guess I would quarrel with the question of whether you want to give one agency of the Federal Government the responsibility for issuing a permit and then multiple agencies the right to veto the exercise of that responsibility.

Mr. BREAUX. That is not my argument. I see the point you make. The argument I have is that—and you recognize and I think you apparently agree with me, that your agency is not the agency assigned to be the experts in these particular areas of management and responsibility.

Mr. ROE. Would the gentleman yield?

Mr. BREAUX. I would be glad to.

Mr. ROE. In this morning's testimony, there was a very clear concise statement made by Mr. Gianelli. He made the point of view that in the 404 lead agency situation that they, the corps of engineers, were faced with, that they were responsible initially in the borning of 404.

It was based upon the point of the fill and dredging as it related to the water resources of the Nation. That was the fundamental charge of the corps. When the situation—could equal, I guess, if you have a veto—authority was given to the EPA, as EPA evolved. The point that the gentleman from Louisiana was making earlier, what generated out of that over a period of time has been instead of the filling and dredging issue involved, that the statute has been bent by court decisions and by other interpretations to be wetlands protection act.

Mr. BREAUX. And by Congress.

Mr. ROE. And by Congress, yes. The point was made, half a dozen bills have been introduced and enacted into law which further fortified the permit process we are following. But I think if the gentleman will yield further, you raised a very interesting question.

And I haven't gotten into the issue yet. But from my point of view, if the test of the entire water quality issue is based upon fishable and swimmable waters, then it would be indeed a high presumption that EPA has no expertise whatever in the fishable end of it. Would it not be then proper in that line of logic to say that no decision can be made by EPA if they don't have the expertise in fishable waters when they are not speaking to the fish—and I don't mean to be facetious.

So it seems to me what we are saying, if the underpinning of the EPA law is based upon fishable and swimmable waters, are we saying that some other agency should have a veto authority to determine what is fishable and swimmable?

Mr. RUCKELSHAUS. Mr. Chairman, I think what Mr. Breaux is alluding to was fishery and wildlife management as opposed to the impact of contaminants.

Mr. ROE. It didn't come out that way, or I would not have responded in kind.

Mr. BREAUX. Just one more point. I think what the chairman has said is totally correct. What we are looking at is a problem, at least as I perceive it, that we have tried in many areas to make 404 a wetlands management, a Wetlands Protection Act.

The law continues—when you talk about fishing areas, it also says in parenthesis, "including spawning and breeding areas." That is really a management decision. That is fish biology type of work. The point I make is perhaps we have spread EPA very, very thin in some of these areas.

The other thing I think makes absolutely no sense with dredge and fill—I found out because of an actual situation in my district—and, again, it is Congress fault—is that it is a dredge and fill permit. I had a person, a company, out of State in Louisiana, right in the middle of the wetlands area dredging the hell out of the wetlands, just picking it up by truckload and putting it in another truck and toting it off to California, and putting it in a bag and selling it as fertilizer.

They didn't need a dredge and fill permit because they were not filling; they were just dredging. Makes no sense whatsoever. They were digging a big hole and leaving a canyon in the wetlands.

But because they were not dropping anything down, they were not filling, and therefore, didn't need a 404 permit. It doesn't make any sense at all. Whereas, if one guy took a teaspoon out of the wetland and dumped it on the other side of the canal, he would need a permit. A lot of problems.

Thank you.

Mr. ROE. The gentleman from Pennsylvania.

Mr. CLINGER. Thank you very much, Mr. Chairman.

Thank you, Mr. Ruckelshaus, for some very excellent testimony.

You have given the committee a lot to ponder over and consider. One question I had.

The top of page 2 of your statement, and elsewhere in the statement, you discussed "the administration's proposals." And during the 97th Congress the administration did formally submit to this committee some proposals for the amendments to the Clean Water Act.

But this year so far we have not received any such formal transmittal. I am somewhat uncertain about the situation this year. In your testimony you indicated that you had carefully considered whether to suggest or recommend some sort of pretreatment opt-out or waiver provision and that you rejected the pretreatment opt-out idea. However, in the attachment to your statement there is such a suggestion. I guess my question is: What is the status of the material that is attached to your statement?

Is it, in fact, the administration's proposal?

Mr. RUCKELSHAUS. The administration's proposal, to the extent it is specific, is embodied in my statement. And to the extent that statement conflicts with the original administration proposal, it is the proposal as embodied in my statement.

Simply because I did not address other administration proposals does not mean that those are not still the administration's position. They just were not the ones I wanted to highlight in my statement, because the ones I highlighted seemed to be the most important, and seemed to the administration to be the most important.

They were the ones that evolved out of the discussions we had with the Senate and have already had with Members of the House as being the most important ones for this committee to address.

Mr. CLINGER. So to the extent that provisions are suggested in your statement, that does represent the administration proposal?

Mr. RUCKELSHAUS. Yes. The administration, Mr. Clinger, still is interested, as am I, in some sort of pretreatment provision, to use that as an example. And when I testified earlier in the Senate, I suggested that I had had difficulty over the then 3 or 4 weeks since coming into office, coming up with a pretreatment recommendation that really made sense.

I discussed it with the administration. I discussed it with members of the Senate committee, with my own staff.

We went back after the Senate testimony and tried over again to come up with a proposal for pretreatment that would both achieve the goal of protecting the sludge, protecting the sewage treatment system itself, and of protecting the receiving waters, while at the same time provide some more cost-effective way for indirect dischargers to meet those requirements.

It has been very difficult to do, as I suggested. It has been very frustrating to do. The problem is we do not have the water quality standards from which we can work back from the end of the pipe into the plant, into the sludge, and back to the indirect discharger, and harmonize or fine tune a system that would avoid the over- and undertreatment problem that I mentioned.

Mr. ROE. Would the gentleman yield?

Again, we worked together in 1974, so we don't have to make fidelity relationships. But one of the problems—we are now in the process of writing a piece of legislation that you are going to have to administer in due course, right.

I think what the gentleman is leading up to, what is frustrating us on this pretreatment issue, is that in candor the Agency has not developed the standards.

Now, we have had reams of testimony. We don't go into legislation lightly, as you know.

And there are people here who understand the intricacies and the vicissitudes of this legislation. And one of the issues is how can we say to a manufacturer that you have got to do—let's take the plating industry. You have got to do certain basic things in a time certain, when our regulations are not completed. I know in that area we have done some more advanced work than others.

But, if you like, in that plating industry to take General Motors, or one of the companies that multitudinous types of processes along the line, and the committee is trying to decide do we strengthen everything on pretreatment to get the heavy metals and whatever out of the sludge so the sludge can be used for other organic uses and so forth--is that too expensive? What direction do we go? Or we are concentrating the sludge with the heavy metals and everything into it because we have not perfected the pretreatment issue yet, and consequently we cannot use that material; we cannot dump it in the wetlands or into the ocean for the problems involved.

So we are at a stalemate. One of the projections that has come aboard in part of the testimony has been based upon the point of view maybe what we should do, instead of giving a date certain, 3 years down the road is to say that these standards have to be met and, that as we develop categories, the different standards, the different elements that they be implemented with the time certain, 3 years from that point, if you follow me.

The problem, however, we are faced with is that companies such as General Motors, one of the larger companies, can come back and say we have seven different processes going throughout plants. We are trying to put something into place that is going to affect it and start the process of cleaning up those wastes now, but if we are lacking the information from the Agency, can you force us to go and spend tens of millions of dollars to achieve the goal when we don't have the facts that the Agency wants.

Is that coming along the line you are thinking about?

So I think when we are trying to write a law, we have in candor, we have on this side the environmentalists—they always think I am mad at them. I am not. We are trying to solve some of their problems.

They have been the gadflies. They have been darned important in the whole process. But they are looking for purity here and over here we cannot get the answers to move it. What do we say to the American people?

Do we stop now and wait until the Agency catches up? I don't mean again to be facetious. How are we going to put a law together that is going to deal with these issues if we don't have the facts to deal with.

Mr. RUCKELSHAUS. Well, you have asked a number of questions, Mr. Chairman.

I guess my response in terms of the direct question on pretreatment effluent guidelines is that we are well along the way toward preparing these effluent guidelines. You mentioned electroplaters.

We do have effluent guidelines for electroplaters. There is a problem associated with the so-called integrated plants where they have several processes for which effluent guidelines would be appli-

20-955 O—84——174

cable, where they are staggered in terms of their being finally prepared.

We will just have to work through each one of those facilities, try to avoid jerking those plants around so that they have to meet one set of standards today and another set of standards once the new guidelines come out.

But we have ongoing now under a court decree, under a court order, the preparation of sufficient effluent guidelines to meet all of the requirements of every integrated plant I know of within time.

Now, the question is, do we go forward with that program that has been in place since 1972, or do we shift to a different kind of pretreatment program which, as I suggest, under the best of circumstances would take us 2 or 3 years of additional study, primarily in the toxic substance program and the sludge program, to get in place before we get on with a pretreatment approach.

You have expressed, I think, your own concern about the time which it has taken the Agency to get to this point. I share that frustration. I think the American people have that frustration. What I am suggesting is that we go forward with this current pretreatment program that has been in place now since 1972.

We have to work through this task force that we are creating, involving all of the various people, various publics involved in the equation, and see where we can get with it.

We should not at this point change the law as it relates to pretreatment, but leave it as it is and let us try administratively to work our way through it. The alternative is to delay for a couple of years.

I think under the circumstances that is asking the Congress a lot.

Mr. ROE. The gentleman from Pennsylvania.

Mr. CLINGER. Thank you, Mr. Chairman.

Just following up on that. As I understand it, under the modified consent decree, EPA is under direction to complete all of the pretreatment standards by June 1984. Can you give us either now or for the record an indication for which industries EPA will not have final BAT regulations by that date?

And also, some indication, if there are such industries, why the deadline could not be met in those instances?

Mr. RUCKELSHAUS. Let me make sure I give you accurate information. We will have most all of them by that deadline. November of 1984, I guess, is the date we have had to stretch one or two of them out to.

We can give you a complete list of who those industries are, and where they all stand.

Mr. CLINGER. I would appreciate that, if that could be submitted for the record.

Mr. RUCKELSHAUS. We will do that.

Mr. CLINGER. Thank you.

[The following was received for the record from Mr. Ruckelshaus:]

Question. Status of the effluent guidelines, including categorical pretreatment standards:

Answer: Regulations for 20 industrial categories have been promulgated (18 of these are subject to categorical pretreatment standards); regulations for 6 other industrial categories have been proposed and remain to be promulgatged (all 6 will be subject to categorical pretreatment standards); and regulations for 3 more industrial categories remain to be both proposed and promulgated (2 of these will be subject to the categorical pretreatment standards).

The last category to be promulgated is currently scheduled for November 1984.

Mr. ROE. The gentleman from New York.

Mr. NOWAK. Thank you very much, Mr. Chairman.

Welcome, Mr. Ruckelshaus.

Let me just follow up and be clear about this pretreatment. I take it that your general viewpoint is that there should not be any legislative changes to the Clean Water Act with regard to pretreatment, at least at this time.

And you feel that the pretreatment implementation review task force, which you have mentioned here on page 8, will come forward with those suggestions in the future?

Mr. RUCKELSHAUS. Yes. What we are trying to do is handle all of these problems that have been raised, as many as we can, administratively. It could be that we will find there are simply very large inequities that we cannot handle administratively, and we would have to ask the Congress for some relief.

I don't know of any yet. I don't know of any pretreatment program that everybody is going to buy off on. We have talked to all kinds of different groups about these programs.

They all raise problems depending on the group you are with. And the one we are currently embarked on, the one that has been in place for several years, has many detractors, including me, in the ideal world.

But I think we are far enough down the line toward trying to implement it that we ought to give it a fair shot. And the best way I know how to do it is to convene this group of people representing all of the various groups interested in this, and see if we cannot work our way through it administratively.

Mr. NOWAK. You will have a representative of the municipalities that are involved in the program on that task force, right?

Mr. RUCKELSHAUS. Yes. We will.

Mr. NOWAK. Do you have a date as to when this will be organized and a deadline for any type of report?

Mr. RUCKELSHAUS. The hope is to complete our work by next spring. The group is essentially established now.

Mr. NOWAK. Will they have a formal report that this committee will be able to look at?

Mr. RUCKELSHAUS. We would be glad to share the results of that work with the committee.

Mr. NOWAK. I think it very important.

Let me ask one more question regarding this—I wonder if you could elaborate, if you found that there could be assurances that the so-called alternative local pretreatment program would provide the same level or timeliness of protection for the treatment plant operations themselves, and, of course, the receiving waters?

Mr. RUCKELSHAUS. I am not sure I understood that question.

Mr. NOWAK. There have been suggestions that so-called local standards should be established for a pretreatment program. I am

sure that would be an alternative your task force would be looking at.

Mr. RUCKELSHAUS. The pretreatment waiver provisions.

Mr. NOWAK. Right. I think many people have concerns that there would be different standards in different areas, and about what the results would be, both for the operators of the plant and, of course, the receiving waters.

Mr. RUCKELSHAUS. Well, that was the provision that was originally suggested by Senator Chafee in the Senate and that the administration brought foward. It would take a change in the law as I currently understand it.

We do not have the authority to grant pretreatment waivers under existing law. So the task force, while it may decide to make some recommendation to Congress or to the administration, and through them to the Congress, we do not have any authority to do that administratively.

Mr. NOWAK. But that would be looked at in this review, I take it?

Mr. RUCKELSHAUS. Yes. I am sure—I would hope that this group, if it came to the conclusion that this was a better approach for the country to take in dealing with the problem of pretreatment, that we would feel free to recommend it.

Mr. NOWAK. One other problem area for us, especially in the Northeast and Midwest, has been, since 1981, the elimination of combined sewer overflows as an eligible category. And another area in which there are concerns, one which you talked about later in your testimony, is nonpoint source pollution. There have been some that have suggested this is a big problem. And unless combined sewer overflows become eligible once again, we may have a real problem with taking care of those combined sewers, especially in the older sections of the country where much of it has existed for many, many years.

I was wondering about your position on whether or not that could be considered eligible again.

Mr. RUCKELSHAUS. We are not recommending it at this time, Mr. Nowak. There is the authority, even after October 1 next year. Starting with fiscal year 1985, there is authority for the Governor to use up to 20 percent of his allocated funds for combined sewer overflow problems. With the approval of the EPA Regional Administrator, they can even dip into the allocation more broadly for that purpose.

The total bill, for the combined sewer overflow problem in 1981 was some $37 billion. When the Congress and the Administration at that time looked at the priority needs in the country, while there were some areas where combined sewer overflow would be fairly high up on the priority list, by and large the completion of the sewage treatment facilities was a higher priority. It was, therefore, decided to focus the Federal moneys into the completion of those facilities starting in fiscal year 1985, rather than continue the eligibility of combined sewer overflows.

Mr. ROE. Will the gentleman yield?

Mr. NOWAK. Yes, I will yield.

Mr. ROE. You know, it is so exasperating. We have listened to a year and a half of testimony from people all over this country. And now everybody, even some of our friends, come in and says one of

the things we have to look at is that this nonpoint source situation is creating about 50 percent of the pollution we are affected with. Recognizing it would be an enormous task. Some of the testimony this morning indicated 40 percent of that came from agricultural lands.

What puzzles me, in the city of Paterson, we have combined sewers. If we don't make it mandatory that all people who are producing toxic wastes or heavy metals remove their material, those pollutant materials, at the plant source, take it out before it gets into the system, then we are just absolutely wasting the taxpayers' money, if we don't make that mandatory.

The reason being is that immediately when we have a storm, if they are putting part of that material through the combined sewer lines to go down to the Passaic Valley Sewer Plant, the minute we have a heavy rain, it scours out all of those lines and puts it right back into the Passaic River.

Today we had some testimony given from the people from St. Louis who spoke in that same direction on that issue. They said, "No, we don't think you should go ahead and take those materials out, because the four types of categories we have in St. Louis—we can remove better"—the example the gentleman gave was one plant produces about a pound of copper a day, in 170 million gallons a day—you could not even discern or test for it when it got to the influent of the plant or the effluent from the plant.

It seems to me if we are talking about cleaning up pollution, and I don't quarrel with your $32 billion, or whatever you try to do, all at once. But there ought to be some way we don't kid the American people and tell them we are cleaning it up if we are not, if we are not making those decisions.

There aren't any two places in this country identically the same. Maybe as we are trying to break into ground, we should be more flexible and say to regions of the country, why can't we analyze what this regional problem is to get to the goal we are trying to get at.

Mr. RUCKELSHAUS. Well, I certainly cannot quarrel with that, Mr. Chairman. I think that in fact there is some flexibility for the Governor to use, as I say, up to 20 percent——

Mr. ROE. I sat in on that conference. The battle we fought was extraordinary over that. You know how that came out? There was too much power on one side that came back and said, "We will provide $320 million, and we will work that out so that if those pollutants were to affect necessary tour areas, we can deal with it." But it didn't speak to the issue of when it affects a water supply system. It left that blank. They would not go with that issue.

All I am trying to say to you is from a pragmatic, factual point of view, unless we deal with the combined sewer issue on an equal basis in a system, we are taking the heart out of one area and saying that doesn't count—you cannot deal with that. And we are spending hundreds of millions of dollars, almost $1 billion, on the Passaic Valley sewer plant handling those communities in northern New Jersey, with the ostensible view of cleaning up the pollution in the rivers and the tributary streams of the Passaic River, going out to that bay, and we are not going to cure that unless we legitimately deal with those combined sewers.

All I am simply saying is that if we are willing to spend $800 million to $1 billion to service that area, isn't it only right that we consider a major pollutant being those combined sewers?

Mr. RUCKELSHAUS. Absolutely.

The question is whether we should, therefore, make the combined sewer overflow problem one that is eligible for this $2.4 or however many billions we appropriate every year of Federal money. And are there other ways of getting at the same problem?

I don't for a minute say we should pour money into a treatment plant when the big problem in the area is combined sewers or something else.

Mr. NOWAK. I think the point we are trying to make is that we want to give that flexibility so that the States can start making these kinds of decisions. And if that decision happens to be that in several large cities where they have large amounts of combined sewers, that they wish to do it, without hurting some other part or make the tough decision on the priorities, let's give them at least the way they can do it, so that they can start to accomplish this nonpoint—if they already have taken part of their other problems in building treatment plants ahead of time.

And I think that that is what many of us on the committee are looking for some relief. And I hope that in your study of pretreatment and nonpoint source pollution, you will take another look at that. Because I think it is going to become a bigger and bigger issue, and we have more and more Governors calling about this problem. And I hope that we can look at what it will take, and I think it is legislative changes, or also some commitment by EPA to make sure this problem can also be handled to get the highest quality out there we can.

Thank you very much.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you very much, Mr. Chairman.

It is a pleasure to have Mr. Ruckelshaus with us this afternoon.

Could you please give us an update and a status report on section 301(h), the ocean discharge waiver program. What is the current status of the waiver applications submitted under the 1977 amendments and the Agency's June 1979 regulations?

Mr. RUCKELSHAUS. We have—I can certainly give you the exact—we have received 207 requests. I can give you the exact numbers of those we have acted on, those we have approved, those we have disapproved, those that are still pending. There are a lot of issues involved in the ocean discharge waiver provision, some of which we have resolved, some of which we have not.

Mr. PACKARD. Perhaps you can provide for the record those figures as well as what the results to date have been on the changes to section 301(h), which were made by section 22 of the 1981 Municipal Wastewater Treatment Construction Grant Amendments, as well as the length of time, the personnel, and the dollars that it has taken to process each of these applications on an average. I think that would be helpful for the record.

Mr. RUCKELSHAUS. I would be glad to do that.

[The following was received for the record from Mr. Ruckelshaus:]

Question. What were the results of the 1981 statutory amendments to section 301(h) and what are the resources needed to review an average 301(h) application?

Answer. The 1981 statutory amendments extended the deadline for filing 301(h) applications to December 29, 1982. As a result, 137 new applications were filed, which are in addition to the 70 applications received under the original statutory deadline.

The Agency's original 301(h) regulations were promulgated in 1979 and contained, among other things, prohibitions against 301(h) waivers for 1) the discharge of effluent receiving less-than-primary treatment; 2) the discharge of sewage sludge; and 3) communities already achieving secondary treatment. The 1979 regulations were challenged in court, and the court upheld the regulations with the exception of the three prohibitions referred to above. *Natural Resources Defense Council* v. *EPA*, 656 F.2d 768 (D.C. Cir., 1981).

The 1981 statutory amendments addressed two aspects of the court's decision. First, statutory language was added to section 301(h) confirming that communities achieving secondary treatment were eligible to seek a 301(h) waiver. As a result, communities may now propose in their 301(h) applications to reduce their treatment from the levels currently being achieved. Second, Congress disagreed with the court decision as to sewage sludge by adding statutory language prohibiting waivers for the discharge of sewage sludge. The result of this change is that sewage sludge remains ineligible for a 301(h) waiver. The 1981 statutory amendments did not address the court's decision with regard to less-than-primary treated effluent. As a result, the court's decision on this issue stands, and communities may request a waiver based on a proposal for less-than-primary treatment.

In addition to the above, the 1981 statutory amendments deleted the requirement that applicants have an existing discharge into marine water. As a result, communities which presently discharge into freshwater may submit an application for a 301(h) waiver if they propose to relocate their discharge into marine waters. However, it must be emphasized that this change does not mean that 301(h) waivers apply to freshwater; the proposed discharge to which the 301(h) waiver applies must still be into marine waters. Finally, the 1981 statutory amendments to section 301(h) deleted section 301(h)(8) which dealt with the use of Title II Funds. The legislative history underlying the deletion of section 301(h)(8) indicates that this was done because section 301(h)(8) was believed to be redundant, rather than being a substantive change. See, H.R. Rept. No. 970, 97th Cong., 1st Sess., 16 (1981); 127 Cong. Rec. H9515 (daily ed. Dec. 14, 1981).

Agency regulations responding to the lawsuit results and the 1981 statutory amendments were promulgated in June 1982. In addition, further regulatory amendments simplifying the application and regulatory requirements, especially for small applicants, were promulgated in November 1982 based on the Agency's experience in implementing the 301(h) program.

Based on our past exeperience with reviewing 301(h) applications, we estimate that the average processing cost per application would be $51,000 in contract costs and would require on average about one person/years. These figures do not include post-waiver activities such as compliance monitoring. Of course, there may be considerable variation from this average figure for a particular application depending on such things as the size of the discharge, sensitivity of the receiving waters, and complexity of the issues raised. The actual calendar time to complete review of an application would depend on the resources available for application review, whether the application contains all necessary data, and whether EPA's decisions are appealed.

Question. What is the status of the 301(h) program?

Answer. In response to the December 1981 statutory amendments to section 301(h), the Agency promulgated amended 301(h) regulations in June 1982. Further regulatory amendments were promulgated in November 1982; those changes drew on Agency experience with the 301(h) program and simplified and clarified the regulations, especially for small applicants.

The Agency received 70 301(h) applications under the original 1979 deadline and an additional 137 new applications were filed in response to the December 1981 statutory amendments, which extended the applications deadline to December 29, 1982.

Responsibility for 301(h) decisionmaking originally was retained by EPA Headquarters, with tentative decisions being signed by the Administrator. Headquarters has made 25 tentative decisions on the 30 largest applications filed under the original statutory deadline. Headquarters also will make the tentative decisions on the remaining 5 of these 30 applicants; these 5 are now undergoing review. Responsibility for 301(h) decisionmaking has now been delegated to EPA's Regional Offices, and all EPA Regions with 301(h) applicants had accepted delegation by June 1983. The

Regions have made 40 tentative decisions and 16 final decisions following delegation.

Of the 65 tentative decisions made Agency-wide, 22 were approvals and 43 were denials. Of the 16 final decisions made, 4 were approvals and 12 were denials. Table 1 presents a breakdown of these decisions according to whether the application was filed under the original 1979 deadline or the new 1982 deadline. The applications for which decisions have not yet been made are in various stages of the review process.

The review process involves a careful case-by-case scrutiny to assess compliance with the 301(h) criteria. As part of the review process the Agency has utilized the services of an outside contractor specializing in water resources and the marine sciences to prepare a Technical Evaluation Report (TER) which analyzes in detail the technical and scientific issues presented by the application reviewed. The application and TER are then scrutinized by Agency experts, including highly qualified and experienced personnel from the Office of Research and Development, in order to determine if the proposed discharge meets the applicable statutory and regulatory criteria. Decisions are announced in tentative form, with the opportunity for public comment and involvement prior to final Agency action.

In determining compliance with the balanced indigenous population requirement of section 301(h)(2), EPA carefully considers the potential impacts of toxic pollutants. Section 301(h) requires waiver recipients to control toxics introduced into their treatment works by enforcing applicable pretreatment requirements and by taking steps to control nonindustrial sources of toxics. Tentative waiver approvals announced to date have required as a condition of final approval that these toxics control programs be revised as indicated in the tentative decision document to assure adequate control of toxics. In this process, EPA uses applicable water quality criteria, water quality standards, and Food and Drug Administration action levels in determining, among other things, whether the applicant's discharge will allow for a balanced indigenous population of marine life. In assessing whether water quality criteria will be excessed, we use the critical initial dilution of the proposed discharge, which is, in essence, the "worst case" dilution. In addition this analysis is done utilizing toxics detected in the current discharge and thus does not reflect the additional toxics removal which would result following the applicant's implementation of proposed improvements to the its treatment of categorical pretreatment requirements. Where this conservative analysis indicates the potential for the discharge to exceed water quality criteria, we require as a condition of final waiver approval that the applicant take steps to assure water criteria will not be exceeded. In those instances where toxics cannot be controlled to levels such that marine life would be protected, the application would be denied.

Our 301(h) regulations contain additional criteria for the protection of saline estuaries regarding benthic impacts, bio-accumulation, and migratory pathways (40 CFR 125.61(c)(4). In addition, of the 45 tentative decisions involving estuarine discharges, 36 were tentative denials. Of the nine tentative approvals for proposed estuarine discharges six were in Alaska and all represent very unique conditions.

Section 301(h) applications raise many complex and difficult state-of-the-art issues regarding the fate and effect of pollutants in the marine environment. In addition, because most applicants are proposing changes from their current treatment levels, the review process necessarily requires the use of predictive analyses in determining compliance with the 301(h) criteria. The 301(h) applications present voluminous and complex data on the discharges' potential impacts which must be carefully scrutinized as a whole in order to determine compliance with the 301(h) criteria. For example, because of the wide variety of natural variability associated with each biological parameter, those measurements which can be expected to produce the most sensitive assessment of possible discharge-related impacts may be heavily relied on by the applicant, while others, because of their low sensitivity to impact and/or high natural variability, may not be as important to the overall assessment. Similarly, collection of field data by applicants necessarily relies on sampling of the biological populations selected for study, with the samples being used to represent the condition of the population as a whole. The validity of such sampling will depend on such factors as sampling frequency. location, and collection techniques, and the results obtained may be reported or analyzed in a variety of possible ways. Given the complexity of the real world and the large number of variables involved, there simply is no such thing as absolutely conclusive data. However, by considering all of the data in the application as a whole and by using other available scientific information, it is possible through the application of expert analysis to reach technically sound decisions as to the potential effects of the discharge.

TABLE 1.—NUMBER OF 301(h) DECISIONS TO DATE

	Tentative approval	Tentative denial	Final approval	Final denial
1979 applications	21	10	4	1
1982 applications	1	[1] 33	0	[1] 11
Total	22	43	4	12

[1] Most of these denials were based on State nonconcurrence with the application or because the discharge would be into waters exhibiting freshwater characteristics.

Mr. PACKARD. Also, we note that the administration proposes amendments to section 361(a) of the Clean Water Act's thermal discharge variance provisions. I have several—I have two major powerplants in my district, and they discharge into the ocean, or into waters that ultimately discharge into the ocean. I would be interested in knowing what your attitude is on these variances, whether you feel that thermal discharge is a significant form of pollution and what your recommendations are in terms of dealing with it.

Mr. RUCKELSHAUS. The administration, as you know, suggested deletion of the word "indigenous" from the aquatic populations to be protected. Frankly, the Agency doesn't see—I have discussed it with the staff—that that is that big a problem. The Agency has tried to interpret indigenous in such a way that it would encompass a fairly large population of aquatic life so as to be able to give relief where warranted.

I guess the major problem is with new sources, and whether it is necessary to build cooling towers in the construction of the new sources. But if the Agency issued new source performance standards, that probably would be necessary anyway. I don't know that dropping the term "indigenous," so that you simply have to protect a balanced fish population—which might permit heated water discharges, would give the relief anyway under the new source performance standards.

Mr. PACKARD. Is it your judgment that there are sometimes some pluses and improvements for the fish and wildlife over and above what the original was by thermal discharge?

Mr. RUCKELSHAUS. I suppose that depends on your definition of improvement. If by improvement you mean warmer water fish might be happier near warmer water discharges, yes. On the other hand, if we are trying to preserve the biota of the stream as we find it, then we may change it by changing the temperature of the water that is discharged.

Mr. PACKARD. In regard to EPA's removal credit approach, what is your opinion or your judgment of that whole approach?

Mr. RUCKELSHAUS. Well, I think it is a good approach. And I think that is one of the things that the pretreatment task force really ought to look at—how can we improve that, make that more attractive to people, work better. The idea is to give some sort of credit to the indirect discharger for whatever is removed by the publicly owned treatment work itself.

One of the problems the chairman brought up is what happens in storm periods, if you have storm water sanitary sewer combinations, where if you don't remove the toxics from the indirect dis-

charger, the storm water comes along and you bypass the treatment plant. Even though the treatment plant itself may remove a high percentage of the toxic material through secondary treatment, we still may lose some through the problems of combined sewer overflows.

On the other hand, if, as we have found, well operated secondary treatment plants do remove a high percentage of some kinds of toxics, and if we can translate that back into a removal credit system that gives some credit to the indirect dischargers so they don't have to do more than is necessary to protect the three things we are trying to protect—the sludge, the treatment plant and the receiving water—then we ought to make the removal credit system work. So far it hasn't been very attractive to them.

Mr. PACKARD. Do you see the administrative heartaches inherent within that process as being one of the major stumbling blocks?

Mr. RUCKELSHAUS. It is a problem, yes. I don't know—there are a lot of administrative problems in this whole pretreatment area.

Mr. PACKARD. One last question, Mr. Chairman.

You addressed the nonpoint pollution problem. And that is a major problem we are struggling with.

I think you indicated in your testimony that you have a report that will be prepared and be ready for presentation. Would you give us an update on the scope of that report, when it is scheduled to be released and to whom it will be released?

Mr. RUCKELSHAUS. We would be glad to share with this committee information that we have as a result of work we do on nonpoint source pollution, or for that matter any other problem.

We are well along the way toward developing guidance on nonpoint source problems for the States. We would try to include in our fiscal year 1985 section 106 grants to the State agencies some nonpoint source requirements, so that some of those funds are directed toward nonpoint source problems. That again would be consistent with the guidance that we are about to release this year. We will then be able to work with the States under that guidance to try to have an integrated Federal-State program.

As the results of those studies and efforts are completed, we certainly would share them with the committee or with anyone else.

Mr. PACKARD. Do you sense one of your major problems with that whole process of Federal guidelines is the preservation of local control?

Mr. RUCKELSHAUS. It could be. One of the things that concerns me about a large Federal nonpoint source program is its potential infringement on land use kinds of controls that are traditionally local in nature.

Another thing that concerns me is if we get into a major grant program, the problem of people starting to queue up, line up, waiting for Federal money to become available before they do anything. We have put a fairly large bill on the total nonpoint source program of the country. We could continue the discussion, in my third term as EPA Administrator 12 years from now, of where we are going to get the money to fund solutions to all the nonpoint source problems. We are right where we were in the sewage treatment plant funding issue. The chairman and I had this discussion. 12

years ago on sewage treatment plant funding and here we are again.

Now, we have had some States that moved ahead and are doing some good things on nonpoint source controls. I think we ought to encourage them to continue to do that, to try to get other States to do the same thing, and, to the extent possible, keep the Federal role to a technical advisory kind of position.

Mr. PACKARD. I have no other questions, Mr. Chairman.

Mr. MOODY. Mr. Chairman, I have some questions, but there is a vote on.

Mr. ROE. Do you have time for us to run a vote and come back?

Mr. RUCKELSHAUS. I would be glad to wait.

Mr. ROE. Suppose we recess for 10 minutes while we go and vote. We will come right back.

[Recess to vote.]

Mr. ROE. The committee will reconvene.

We were about to hear from Mr. Moody of Wisconsin.

Mr. MOODY. Thank you, Mr. Chairman.

Mr. Ruckelshaus, during the break, we discussed briefly the subject of CSO's but for the record, I would like to ask you again. If we all agree that we want to maximize the impact of scarce pollution control dollars, and we agree that the effective use of dollars may differ from place to place, why would we want to put any artificial—I will use artificial to editorialize—limits on how a State or local agency spends those dollars? If CSO cleanup yields more bang for the buck than using the money somewhere else then why not free up the local governments, to use the money as it sees fit? This should be particularly the administration that came in on the thesis that local government often knows best.

Mr. RUCKELSHAUS. Let me make two points, Mr. Moody. No. 1, I think the origin of the removal from eligibility of combined sewer overflow funding back in 1981 was the whole issue of how much money is going to be available. When I was first at EPA, combined sewers were not eligible for funding. It was put in as an eligible element for funding during the middle seventies, and then was taken out again in 1981. I think that is the origin of it.

Now, I think your question is a perfectly valid one. Let me tell you the way the program currently works. Each State is allocated a certain amount of money on the basis of a nationwide formula and may use any or all of that money for combined sewer overflows. Beginning in 1985, the Governor, acting usually through his State pollution control agency, can use up to 20 percent of the funds allocated to his State for projects like combined sewer overflow. He is not restricted from using all of that money for combined sewer overflow. In addition, he can go to the EPA regional administrator—usually that is who they would go to—or his State could, and say, "A project for combined sewer overflow is far and away a more cost-effective way of reducing pollution in my State than is allocating this money for sewage treatment plants or whatever," and if the EPA regional administrator agrees with him, he can use additional money over and above the 20 percent.

So there isn't a total restriction now on the use of those allocated funds for combined sewer overflow projects. And whether you would want to make them just as eligible as everything else is the

kind of issue that was addressed by the committee in 1981. It will be the kind of issue we will address in the study we are going to undertake in the next year, leading up to the reauthorization of the sewage treatment plant grant program. And it may be that we would decide there is a better way to get at it.

But on your central premise, which is should we be spending money where we get the most bang for the buck, I can't disagree with that.

Mr. MOODY. All right. So they are not totally restricted, but they are under some handicap at the present time, you would agree.

Mr. RUCKELSHAUS. That is right.

Mr. MOODY. After 1985, the study group you are talking about is addressing the issue of what we do beyond 1982.

Mr. RUCKELSHAUS. That is right, after the current program runs out.

Mr. MOODY. So we have a chance, if people can agree, of widening that window for CSO?

Mr. RUCKELSHAUS. Yes.

Mr. MOODY. My next question has to do with the issue of common lawsuits versus the permit process. We, in Milwaukee, went to the Supreme Court to argue that Clean Water Act was so thorough that it preempted common lawsuits. You are probably familiar with our situation.

Mr. RUCKELSHAUS. Yes.

Mr. MOODY. That decision meant we could get on with a much more rational process of cleaning up our water. Since we were under a previous court order to clean up our water we didn't quarrel with goal. However, we did quarrel with Judge Grady of Illinois' particular interpretation of how we should reach that goal and under what kind of fast track. We felt the common law suit would have imposed a ruinously fast timetable. Now I understand the Senate has attached an amendment to open up this matter again. If passed, people who don't like the permit process could always take their neighbor from an upstream State to court and try to settle it on a common law nuisance basis.

Do you have a position? Although we are very biased on this subject, it seems to me the Senate amendment throws into a cocked hat all the procedural safeguards which the whole clean water permit process is designed to handle.

Mr. RUCKELSHAUS. I can put back on again, Mr. Moody, my Justice Department hat. When I was first in the Government, I was Assistant Attorney General at the Justice Department. It seemed to me as a lawyer that once the country decided that the way it was going to handle water pollution was through the Clean Water Act, for it to then provide another whole set of remedies which invited an individual, municipalities or whoever to get the courts into deciding similar questions along parallel paths using an entirely different set of criteria that have grown up through the common law of the country simply didn't make sense. The Supreme Court correctly interpreted the existing law that the Clean Water Act preempts the field in this area. And that is the way it ought to remain.

We do have a very comprehensive national program for dealing with problems involving pollution and clean water, and that ought

to be the law of the land. We ought not to have a separate, in effect, set of laws or remedies that move up through the courts, often in parallel, sometimes in conflict with that Federal law.

Mr. MOODY. I am very glad to hear you say that. Does the administration have a position similar to what you have just enunciated?

Mr. RUCKELSHAUS. The administration's position is the same as the one I have just announced. It was announced by the assistant attorney general—I don't know whether it was in this House or the Senate—in testimony that was the same as what I said, maybe not quite as eloquent. [Laughter.]

Mr. MOODY. All right. I am glad to hear that. I am hoping, Mr. Chairman, that we will not put that kind of amendment on here because it opens up such a Pandora's box.

The third question, Mr. Ruckelshaus, has to do with the BAT versus BPT issue, which is very much on our minds. We have been hearing a lot of very high-quality testimony on both sides. Both sides can sit where you are sitting and make quite a compelling case. On the one hand, the chemical companies and some others have explained that, in some instances to achieve BAT standards, will be expending inordinate amounts of money.

If I may for the record just read an excerpt from Miller Brewing Company that is in my district, it says "Each Miller waste treatment plant is equivalent to one required for a city of 535,000 people." This is one plant. "The design efficiency to remove solids based on BCT is 97.5 percent and is achieved at a capital cost of $370 per pound of solid removed. The cost under BAT to achieve only 1 percent more, raising it to 98.6 percent solid removal, would cost $3,900 per pound removed."

The punch line is obvious. Thus, the incremental cost to remove additional pollutants has dramatically increased while the pollution removal itself has only marginally increased.

This is just one of, I suppose, many examples. Now, on the other hand, the environmentalists correctly point out that when we are talking about toxics, cost benefit calculations like that may not be applicable. We don't know what downstream costs of some toxics are, particularly when they get into the food chain and the environment. It seems to me this is largely an issue of science.

On the one hand, the chemical companies in some letters and testimony I have seen, say we have the scientific capacity to measure these toxics and remove them. And the environmentalists are basically saying it is still not scientifically that sound. Your testimony indicates in a parallel way that delays might be inordinate if we move to a scientifically case-by-case approach with cost-benefit-type calculations. Can you elaborate your stand on that?

Mr. RUCKELSHAUS. Well, the specific example you mentioned is the kind of example that is often used to argue against moving from BCT-BPT up to a higher level of technology-based treatment. In that particular case I guess I don't know whether we have a BAT standard, or effluent guideline for breweries. It is my understanding we don't. There may be some special circumstance there I am not familiar with.

At any rate, it is possible that moving from one level of treatment to a high level of treatment for toxics can cause very large expenditures for minimal removal. We have attempted to adjust to

those kinds of problems. In many cases, BAT and BPT are the same for toxic removals. Where we get 90 percent out for x dollars, and for 10 times x dollars you get an extra 3 percent out, we really do try to avoid that in adopting BAT standards.

It could be there are some distortions that continue to occur in the development of these technology-based standards as they relate to toxics. And I think the Agency has an obligation to work very hard to avoid those kinds of circumstances. There is the argument for certain kinds of substances—they are sufficiently toxic—that while the actual dollars per pound removed can be relatively high, where we are concerned enough about those particular substances, it may well warrant that kind of expenditure in order to avoid the problem.

But you put your finger on the dilemma--where we really get into these very high expenditures for relatively small removal, and where we can't avoid them under the existing law. I don't know how widespread that problem is, but where that does happen, and the extra removal is hard to justify on the basis of water quality or health-related standards, then it creates difficulties.

Mr. MOODY. Are you suggesting a waiver process there?

Mr. RUCKELSHAUS. The problem with the waiver process is it is very complicated administratively, very resource-intensive. It may be there is some way of addressing it in the law so as to avoid that case-by-case analogy. We do have a fundamentally different factors provision which we have requested in which we can get at some of the really gross distortions that exist within a particular industry classification. We have asked this committee to, and the Senate committee as well, to look and see if we can't get that level of flexibility in dealing with some of the distortions that might occur.

Mr. MOODY. How do we get the balance and flexibility that we all would like in some sense to conserve scarce resources? You don't want to have inflexible standards, where in some cases you spend much more than you are getting back. At the same time, balance that flexibility with this notion of economic achievability. How do you define economic achievability in the BAT?

Mr. RUCKELSHAUS. Very hard to do. Occasionally we define it as an affordability test. I don't frankly like that test.

Mr. MOODY. Would you call in the accountants and ask if the company can afford it?

Mr. RUCKELSHAUS. In the first place, let's assume we can establish who can afford it and who can't. To a certain extent, we are in the economic competitive race, rewarding the losers, the people who don't make it. The people who have taken what they have earned over the years, reinvested in plant and equipment and done everything we want them to do, are then penalized because they can afford to remove something.

So I don't think that is a test I feel particularly comfortable with. On the other hand, certainly a cost-effectiveness test often gets at the problem you mentioned. Namely, if we can get 95 percent out for x dollars, and then the curve breaks, and it costs you 10 times x to get another 2 or 3 percent out, that is a good way of looking at a way of balancing costs against the benefits received from the expenditures made. Benefits start to diminish, get very

slight, in comparison with the cost then. That is one way of striking that balance.

Mr. MOODY. It seems to me that predictability and an agreed upon framework for analysis is awfully important. How are you going to set up that analysis so we know what economically achievable is going to mean?

Mr. RUCKELSHAUS. The Congress, of course, can define it any way it wants and then oversee the Agency's exercise of the power granted to it to insure we are doing what you intended.

A cost-effectiveness test is one we do use in the Agency in a variety of circumstances. We are specifically given the authority to use that test under some statutes. And we do break the requirement for additional technology where we find costs going straight up and the amount of incremental pollution removed being relatively slight.

So we have had experience with using that kind of approach. And the Congress has from time to time reviewed it, and renewed our authority to do that.

Mr. MOODY. Would you recommend that that scope be given to the agency to apply that kind of test for the BAT-BPT.

Mr. RUCKELSHAUS. To a certain extent in adopting BAT standards, we do that now. We also as I say, have attempted in the past where it gets very complicated to subcategorize a particular industrial facility within an industrial class, to use this fundamentally different factors approach, which takes costs into account in determining whether a given national standard should apply to a specific facility.

Mr. MOODY. Is there a method for letting the chemical, or the allegedly polluting industry, get in on the cost of testing and arriving at the necessary information base to do this? The testimony we have had indicates they feel so strongly about it, and feel it is such a waste of resources to not have some flexibility that they would be willing to pay for the tests and participate in developing the data base and analytic base to do this on a case-by-case basis.

Do you have any response to that?

Mr. RUCKELSHAUS. I mean I think we ought to be perfectly open to share information, share methodologies with any industrial group. I don't know that them paying for it is so much the problem. But anybody who is willing to share some of the burden that the Agency has to do work, why, we ought to be amenable to letting them do that. I understand their concern. I guess what we need to do is to get specific about a concern and see how we could address that.

The generality I agree with you on. That if there were a way of avoiding this, where we really get a distortion, if the current law is such that the Agency feels it has to act in such a way that, as to a specific facility, specific plant, we are causing very large costs to be expended for minimal benefits, we ought to try to avoid that. There ought to be sufficient flexibility in the Agency's powers to avoid that kind of distortion.

Mr. MOODY. Will you be suggesting some language we could look at in that regard?

Mr. RUCKELSHAUS. Let me discuss with the staff, and again with you and your staff, and with the committee, where those distor-

tions may be occurring so we can make sure that we understand that we are talking about the same thing, and see if it is possible to address that.

[The following was received for the record from Mr. Ruckelshaus:]

Questions. How does the Agency consider economics in developing effluent guidelines? Can you provide the costs of these BAT and pretreatment guidelines to industry?

Answer. In developing Best Available Treatment Economically Achievable (BATEA) guidelines EPA determines, in accordance with Section 304(b)(2)(B) ". . . the cost of achieving such effluent reduction . . ." Regulations are not normally written on the basis of industrial categories, e.g. iron and steel, plastics molding, but subcategories of those industries. By subcategorizing, for example by size, the Agency can target which technology is "best" from an engineering standpoint and "cost achievable" from an economic standpoint to a much smaller set of facilities than would be covered under a more general requirement. This can, and does, lead to instances where facilities in a more adversely affected condition, e.g. small business, are subjected to less expensive requirements than facilities in other subcategories in the same industry. Our "cost achievability" tests are often undertaken using net present value (NPV) models incorporating such factors as impacts on employment, price effects, the cost of capital, inflation, and foreign competition. Similar studies are undertaken in developing pretreatment requirements.

Projected investment and annual costs of BAT and pretreatment standards for existing sources (PSES) are provided in the attached tables.

CONSENT DECREE INDUSTRIES—BAT INCREMENTAL INVESTMENT AND ANNUAL COSTS

[1982 millions of dollars]

Industry	Status	Investment	Annual
Adhesive and sealants	Preproposal	N/A	N/A

[1] Industry costs not expressed in Federal Register
NA—Estimates not available because regulation is in preproposal stage

Mr. MOODY. I have one last question on nonpoint source pollution. Your testimony, if I can interpret it correctly, says the States should have the predominant role in the nonpoint. Is that a retreat, in essence? I was hoping that you would come out pretty strongly for an aggressive nonpoint source program. The problem it seems to me with letting the States do it is if different States dump into a common receiving body of water, there is going to be a very strong and systematic incentive for a State to do less than its full share.

Mr. RUCKELSHAUS. Well, I don't believe our program on nonpoint sources has been very aggressive in the past. And I think it is time for us to get aggressive. I think what I outlined was an aggressive nonpoint source program. If the only way we can be aggressive is to have some kind of Federal cost-sharing program, then what I am concerned about is that it look aggressive, but it wouldn't be, because we wouldn't have enough money in the program to meet the total national need, and what we will force is everybody lining up and not doing anything until the Federal money is available.

We have projected a very large expenditure for doing this nationwide, just as in the sewage treatment plant grant program. And

then you start adding in a whole lot of other eligible kinds of funding mechanisms. The next thing you know we have a multibillion dollar need out there with everybody waiting until the Federal money is available. We have some examples now in States like Wisconsin, your own State, which have been very aggressive in having their own cost-sharing program. They have made remarkable progress at getting individual farmers to adopt best management practices and addressing them at given watersheds. They have moved that program ahead.

One of the concerns that I have, frankly, about the bill that has been introduced in this committee is that it says in order for any cost-sharing program of the Federal Government to take place, you, the State of Wisconsin, have got to agree to keep it at the same level. Your levels have been much higher than other States around the country. Since you have addressed it and done good work, you have got to stay there in order to be eligible for any Federal funds. Other States wouldn't. That doesn't make any sense to me. If anything, you ought to be rewarded for the work that you have done.

If Wisconsin's experience can be transferred to other States, and they can pick up their share and start moving ahead on a best management practices nonpoint source program, I think we could really get moving. I think we now have the power through the water quality standards to move against nonpoint source problems. Water quality management approach that we adopt with the States. If we put in their specific responsibilities for moving against nonpoint source, and help them adopt either a cost-sharing or some kind of regulatory program, we may really be able to make some progress.

Mr. MOODY. We have to go vote.

Mr. ROE. Two questions. The gentleman from Kentucky, Mr. Snyder.

Mr. SNYDER. Thank you, Mr. Chairman.

I apologize for not being here during your dissertation, which I am sure was delivered with eloquence, but I was interested in a matter on the House floor. I appreciate you being here. I have total confidence not only in your eloquence but in your ability to handle the situation.

Mr. SNYDER. Thank you.

Mr. ROE. The gentleman from Arizona.

Mr. MCNULTY. Mr. Chairman, may I ask two quick questions?

Mr. Ruckelshaus, the Navaho Nation claims that three parts of the Nation fall into three regional EPA offices. Can that be addressed in some fashion so there is only one?

Mr. RUCKELSHAUS. Well, it, I don't see why it can't. I have not addressed this problem. Maybe we could make the assignment of one of those regions to have the responsibility for dealing with the Navaho Nation. I would be glad to request that.

Mr. MCNULTY. Thank you. Second question. The city of Tucson woke up just very recently to find an enormous plume of trichloroethylene in the municipal water system which has required the city to drill 15 wells. Your agency has already drilled 11 wells. Some 20 more are likely to be drilled, many of them perhaps by your agency, which has moved very swiftly on an enormous prob-

lem. Residue of cleaning solvent from the Defense Department activities during and right after World War II. There are a couple million dollars invested in this thing already. All that is to do is to determine the size of the problem, not changing it.

Estimates now run as high as $20 million. Given that and what you told us last week about the Superfund from which much of this money has come, the waste sites, the 1985 deadline, is there enough money in the Superfund to meet these problems nationally?

Mr. RUCKELSHAUS. The example you cite would not, if it were a Defense Department oriented contamination, would not come from the Superfund. That would come from a separate appropriation from the Defense Department itself.

Mr. MCNULTY. The Defense Department has shown a notable reluctance to concede the truth of that, although thus far there is no other rational reason for finding that.

Mr. RUCKELSHAUS. I don't know of that specific instance. But if it were traced back to the Defense Department, it would have to come from their appropriation. If it has presently come out of the Superfund, they would have to reimburse it under existing law. My response to your general question is, we are going to need to address next year the question of reauthorization of the Superfund. There is not enough money in the Superfund to deal with all of the problems associated with these abandoned hazardous waste sites and the Congress and administration is going to have to face them.

Mr. MCNULTY. Perfect finish, Mr. Ruckelshaus. Thank you.

Mr. ROE. Mr. Administrator, we want to thank you and your colleagues for a very splendid presentation.

Mr. RUCKELSHAUS. Thank you, Mr. Chairman.

Mr. ROE. We will recess for 10 minutes and vote. When we resume our witness will be Mr. Frank R. Kiolbassa, professional engineer, director, Department of Public Works, city of San Antonio.

[Recess.]

Mr. ROE. The subcommittee will reconvene.

We have now with us Mr. Frank R. Kiolbassa, director, Department of Public Works, city of San Antonio, on the legislation before us.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT BY MR. FRANK KIOLBASSA, DIRECTOR, DEPARTMENT OF PUBLIC WORKS, CITY OF SAN ANTONIO ON AMENDMENTS TO THE CLEAN WATER ACT BEFORE THE SUBCOMMITTEE ON WATER RESOURCES, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

INTRODUCTION

Mr. Chairman and members of the committee: I am Frank Kiolbassa, Director, Department of Public Works, City of San Antonio. It is indeed a pleasure to appear before you today to present the City of San Antonio's recommendations for amending the Clean Water Act.

The Nation's cities have supported Federal clean water legislation for more than 12 years. In the last five years we have witnessed a disturbing trend towards shifting more of the burden to comply with national goals and requirements to the local cities, counties and other governments. We are concerned that the result of this

shift will be a further weakening of the national resolve to achieve public health and environmental goals.

We therefore strongly recommend two steps to reverse this trend: (1) significantly increasing the authorization for the Wastewater Construction Grants Program; and (2) focusing a portion of that increase on areas with critical water quality problems.

MEETING WATER QUALITY GOALS IS A NATIONAL COMMITMENT

The Federal Water Pollution Control Act of 1972, established a clear and unequivocal "covenant" among the federal, state and local governments. The purpose of that covenant was to reclaim America's rivers, lakes and streams and to improve their quality both for public health, agriculture, recreation, protection of fish and wildlife and enhancement of the natural and manmade environment. The act contained two basic elements to achieve these objectives:

(1) The Federal Government mandated that Publicly Owned Treatment Works must achieve secondary treatment and meet water quality standards issued by the states. For San Antonio, this mandate will require installation of advanced secondary treatment to meet water quality standards established by the Texas Department of Water Resources.

(2) In consideration for meeting mandated requirements, the Federal Government pledged to assist local governments by enacting the Wastewater Construction Grants Program providing up to 75 percent of the cost of construction in federal financial assistance.

In 1981, the Congress reduced the program's authorization, the number of grant eligible items under the federal Wastewater Construction Grants Program, and the federal matching share from 75 to 55 percent beginning with fiscal year 1985.

The national requirements enacted in 1972 imposed new costs on sewer rate payers. Without the federal construction grants program, the entire burden would fall on local rate payers except in a selected number of states. Businesses, recreation areas, farmers and other interests benefit from water clean-up and would never pay for those benefits but for the existence of the federal taxing and spending power.

In recent years, however, the Administration and the Congress have not adequately supported the 1972 "covenant" with respect to financial assistance. Unless the Congress commencing with fiscal year 1984 expands its commitment to the construction of wastewater treatment facilities, the demand for reducing or terminating the federal mandate to achieve public health and environmental objectives will grow ever stronger as we approach the 1988 deadline.

Expanded funding beginning with 1984 is critical because at least 3 years is needed to complete construction on a wastewater facility improvement program such as San Antonio's. While we have initiated our program, San Antonio and other communities have a long way to go in 4 short years. The window of opportunity is open, but we must act now if public health and clean water objectives are to be achieved.

The Congress made major changes in 1981 to reduce the federal participation in the Wastewater Construction Grants Program. Even with those changes, the Federal exposure is far greater than an annual authorization of $2.4 billion would provide in 5 fiscal years.

The administration's own 1982 National Needs Survey reported a total federal "exposure" taking account of the 1981 amendments of $37.5 billion. EPA reports that the federal share of backlog needs for compliance with Federal law and abatement of existing pollution, to be $30.2 billion.

In all probability local governments are less able to meet the costs compliance now than in 1972. Allocating the cost of meeting federal mandates to all beneficiaries is important if cities are to remain strongly supportive of national water quality goals.

Expanded financial assistance is a necessary prerequisite to enactment of anti-backsliding provisions contained in H.R. 3282. This provision would freeze stream use designatioins to those existing on January 1, 1983, except in a few specified instances as provided in H.R. 3282. To comply with current use designations and existing water quality standards, San Antonio must spend an additional $150 million. Without expanded financial assistance, this provision would impose a significant economic burden on our city and we would strongly oppose its enactment.

To meet the federal exposure of $37.5 billion the Congress would need to return the construction program authorization to its historic level of between $6 and $7 billion. At a minimum the Federal Government should provide $5 billion per year for the next 5 years in order to meet the 1988 federally mandated deadline for secondary treatment and achievement of State water quality standards. This recommenda-

tion closely parallels that contained in H.R. 3282 proposed by Chairman Howard. Continuing the wastewater construction program at $2.4 billion per year will not achieve this objective and will further shift the burden to local governments and away from nonrate payer beneficiaries.

Sufficient projects now exist in almost every State to fully obligate appropriated funds. Since this is the last year in which the 75 percent Federal matching share is available to all grantees, it is likely that the unobligated balance will be depleted before the end of fiscal year 1984. With cooperation among local, state and federal agencies, an additional $1.6 billion could be obligated during the next 12 months.

In addition, to further encourage timely obligation of appropriated funds in the out years, we recommend that the Congress authorize an additional 5 percent to the Federal matching share for those states which are able to obligate their previous years allocation within 12 months.

FOCUS ON CRITICAL WATER QUALITY AREAS

In recent years both the administration and the Congress have shown interest in focusing financial assistance on those rivers, lakes and streams where pollution is the greatest and government expenditures can achieve the greatest clean-up. The Environmental Protection Agency's fiscal year 1984 guidance for the office of water provides that "the construction grants program will be closely coordinated with the water quality management and NPDES permit programs and will be directed toward improving water quality and public health in critical water bodies". While EPA's 1982 Needs Survey has not reported the costs associated with meeting requirements in critically polluted areas, most States have identified these areas.

Most critical water quality bodies are in and near major population centers. The San Antonio River for instance has its headquarters near the center of our city and most of its flow immediately south of San Antonio is composed of the discharge from our wastewater treatment facilities.

We have signed a compliance agreement with the Texas Department of Water Resources which requires the city to achieve advanced secondary treatment by 1988. Our program's total cost is $450 million, approximately $350 million of which is federally grant eligible. Since 1980, San Antonio has received $2 million in construction grant funds and expects to receive $25 million in fiscal year 1984. These grants total less than 10 percent of the federally grant eligible portion of our total program. While we may receive more grants in the future, the likelihood that we will ever receive 75 percent or even 55 percent is low under presently authorized levels and the Texas Project Priority List System.

In 1981, Congress in section 216 of the act, declared national policy to provide assistance which in the judgment of the states would achieve "optimum water quality management consistent with public health and water quality goals and requirements of the Act". Presumably this would at least permit States to focus funds on the most polluted areas.

Section 216 also established a state discretionary fund of up to 25 percent of a State's allotment, to finance collector and interceptor sewers, major sewer system rehabilitation and combined sewer overflow. This fund tends to dilute the Congress intention to focus financial assistance on the most critical pollution problem areas.

We recommend that, first, the subcommittee review the states' record in directing funds to the most polluted areas including those in and near metropolitan areas; and second, consider what further direction the Congress should provide to assure that limited resources achieve optimum water quality in the Nation's most polluted river and stream segments.

In this era of tight budgets at all governmental levels, Congress should give serious consideration to further directing assistance to major metropolitan areas where water pollution and public health problems are at their most critical levels.

We recommend, therefore, that Congress consider two approaches:

(1) Establish a separate tract of assistance directed to large metropolitan area projects serving critical water bodies. Funds would be made available based on approved implementation plans for certified major metropolitan area projects. The separate tract should be supported by a separate authorization and appropriation based upon funds needed to fulfill construction schedules for each fiscal year.

This approach would obligate funds more efficiently by reducing the lengthy reviews by State and Federal officials; would produce a dependable schedule for obligating federal appropriations; and would achieve greater results by focusing on those areas with the highest levels of pollution.

This approach has been recommended by the Association of Metropolitan Sewage Agencies and we strongly urge its enactment.

(2) Alternatively, the Congress could require the states to allocate the major portion of their federal funds perhaps no less than 75 percent to metropolitan areas where the greatest amount of clean-up can be achieved. This approach would maintain the current administrative process for reviewing plans and specifications and awarding grants but would require states to target a greater percentage of Federal assistance to major pollution sources.

San Antonio, and I am sure other local governments, would pledge to work with the subcommittee and other interests to develop an approach which would accelerate obligations while concentrating federal dollars on the most polluted streams. We urge your favorable consideration of an approach which would meet these objectives.

PRETREATMENT

We support the control of industrial waste discharges to publically owned treatment works. Many cities, including my own, have approved or nearly approved industrial pretreatment programs under sections 307 and 402 of the act.

The objectives of industrial pretreatment are to: Protect wastewater and sludge quality from industrial toxic wastes; protect the operation of wastewater treatment facilities; and prevent pass-through of industrial pollutants to water bodies.

To these objectives, we would recommend that the Congress add a fourth: enable the adoption of pretreatment programs which would permit local governments to deal more effectively with site specific problems through site specific solutions.

Accordingly we support amending the act to permit local governments to adopt their own pretreatment programs meeting these objectives as an alternative to a single national program. What we are requesting is the flexibility which would enable local governments to develop and implement effective programs to meet local conditions in the most cost effective and environmentally sound manner.

Local plant operators would remain accountable to the State and EPA for meeting their NPDES permit conditions. Those local governments not wishing to devise their own programs would comply with the national program.

CONCLUSION

In closing, Mr. Chairman, further progress toward achieving national water quality goals depends on revitalizing the local, state and federal partnership established in 1972. Clean water is a matter of public health as well as environmental protection. Expanded financial support for the Construction Grants Program must be among the Congress highest priorities.

This concludes my statement. Thank you for the opportunity to present our views and recommendations.

Mr. ROE. Please proceed.

TESTIMONY OF FRANK R. KIOLBASSA, DIRECTOR, DEPARTMENT OF PUBLIC WORKS, CITY OF SAN ANTONIO, ACCOMPANIED BY ROBERT WEAVER, CONSULTING COUNSEL

Mr. KIOLBASSA. Yes. Mr. Robert Weaver, consulting counsel to the city of San Antonio on these matters.

Mr. ROE. Proceed.

Mr. KIOLBASSA. Yes. Thank you very much.

This is my first time to address a committee of Congress like this. I commend you for your deliberations. I learned a great deal here today.

I hope that San Antonio's version will give you some insights into our perspective of the legislation before you, some of our concerns and hopefully it will have a bearing on your decision before you.

I bring the greetings of all the 900,000 people that live in the San Antonio metropolitan area, and 200,000-plus customers.

We are located in south-central Texas, about 150 miles from the Gulf of Mexico. We are probably the 10th largest city in the Nation, and the 36th largest metropolitan area. Unfortunately, we

do not share the same economic fortunes as our population credentials do bear out.

I also want to thank your understanding and attentiveness to Congressman Kazen's remarks that you heard September 20. He represents part of our area. We are most supportive of him, and thank you for your kindness to him.

The Nation's cities have supported Federal clean water legislation for more than 12 years. In the last 5 years we have witnessed a disturbing trend toward shifting more of the burden to comply with national goals and requirements to the local cities, counties, and other governments. We are concerned that the result of this shift will be a further weakening of the national resolve to achieve public health and environmental goals.

It has definitely disturbed all of us in San Antonio, especially when you look at the rise in our sewer rates, fivefold over the next few years, and the majority of those resulting from what we feel are the result of the 1981 amendments and the reduction in funding authorizations.

We, therefore, strongly recommend two steps to reverse this trend: One, significantly increasing the authorization for the waste water construction grants program; and two, focusing a portion of that increase on areas with critical water quality problems.

At this point, of course, we have an extensive statement, Mr. Chairman. I am going to highlight this with another five pages in mind. We would like to enter the entire statement.

Mr. ROE. No objection.

Mr. KIOLBASSA. Meeting water quality goals is a national commitment. The Federal Water Pollution Control Act of 1972, established a clear and unequivocal covenant among Federal, State, and local governments. The purpose of that covenant was to reclaim America's rivers, lakes, and streams and to improve their quality both for public health, agriculture, recreation, protection of fish and wildlife, and enhancement of the natural and manmade environment. Our city leadership did not even challenge the influent designations or the effluent designations the State proposed to us.

We were the first there to say let us go. We knew it would help us and benefit, and particularly the people down the 150 miles of the San Antonio River south of San Antonio, to the Gulf of Mexico. We felt especially confident because of the Federal partnership proposed in the act.

The act contained two basic elements to achieve these objectives. One, the Federal Government mandated that publically owned treatment works must achieve secondary treatment and meet water quality standards issued by the States.

By the way, in San Antonio we had secondary treatment. We were the first in Texas. In 1930 we went to that as our commitment to water quality.

For San Antonio, this mandate will require installation of advanced secondary treatment to meet water quality standards established by the Texas Department of Water Resources. This program was arrived at after following the spirit and intent of the law. Quoting Representative Kazen, San Antonio played by the rules and conducted five major planning steps from regional planning to

an extensive citizen participation program, and has done all it has been asked to do by the Government.

Two, in consideration for meeting mandated requirements, the Federal Government pledged to assist local governments by enacting the waste water construction grants program providing up to 75 percent of the cost of construction in Federal financial assistance.

All our city councils since 1974 supported this financial partnership and it passed four rate increases since 1978 to financially support our waste water part of the program.

The Congress in 1981 reduced the program's authorization, the number of grant eligible items under the Federal waste water construction grants program, and the Federal matching share from 75 percent to 55 percent, beginning with fiscal year 1985.

The national requirements enacted in 1972 imposed new costs on sewer ratepayers. Without the Federal construction grants program, the entire burden would fall on local ratepayers except in a selected number of States. Businesses, recreation areas, farmers, and other interests benefit from water cleanup and would never pay for those benefits but for the existence of the Federal taxing and spending power.

In San Antonio, there are users of the 150-mile stretch of the San Antonio River south to the Gulf of Mexico. The Federal tax dollars collected and paid will be repaid in many-fold by the benefits they will receive from a cleaner San Antonio River south of San Antonio.

Since 1981, the Federal Government has not adequately supported this covenant, we feel. Unless Congress commencing with fiscal year 1984 expands its commitments to the construction of wastewater treatment facilities, the demand for reducing or terminating the Federal mandate to achieve public health and environmental objectives will grow ever stronger as we approach the 1988 deadline.

I think San Antonio is a microscopic case of the national picture.

Expanded funding beginning with 1984 is critical because at least 3 years is needed to complete construction on a waste water facility improvement program such as San Antonio's. While we have initiated our program, San Antonio and other communities have a long way to go in 4 short years. The window of opportunity is open, but we must act now if public health and clean water objectives are to be achieved.

The Congress made major changes in 1981 to reduce the Federal participation in the waste water construction grants program. Even those changes, the Federal exposure is far greater than an annual authorization of $2.4 billion would provide in 5 fiscal years.

The administration's own 1982 National Needs Survey reported a total Federal exposure taking account of the 1981 amendments of $37.5 billion. EPA reports that the Federal share of backlog needs for compliance with Federal law and abatement of existing pollution, to be $30.2 billion.

In all probability, local governments are less able to meet the costs of compliance now than in 1972. I know San Antonio surely is.

Allocating the cost of meeting Federal mandates to all beneficiaries is important if cities are to remain strongly supportive of national water quality goals.

Expanded financial assistance is a necessary prerequisite to enactment of antibacksliding provisions contained in H.R. 3282. This provision would freeze stream use designations to those existing on January 1, 1983, except in a few specified instances as provided in H.R. 3282 and S. 431.

This provision would free stream use designations as those existing on January 1, 1983, except in a few specified instances, as provided in H.R. 3282.

To comply with the current use designation, San Antonio must spend an additional $150 million. Without expanded financial assistance, this provision would impose a significant burden on our city, and we strongly oppose its enactment.

In our humble view, to meet the Federal exposure of $37.5 billion, the Congress would need to return the construction program authorization to its historic level of between $6 and $7 billion. At a minimum, the Federal Government should provide $5 billion per year for the next 5 years in order to meet the 1988 federally mandated deadline for secondary treatment and achievement of State water quality standards.

This recommendation closely parallels that contained in H.R. 3282 proposed by Chairman Howard. Continuing the waste water construction program at $2.4 billion per year will not achieve this objective and will further shift the burden to local governments and away from non-ratepayer beneficiaries.

Sufficient projects now exist in almost every State to fully obligate appropriated funds. Since this is the last year in which the 75 percent Federal matching share is available to all grantees, it is likely that the unobligated balance will be depleted before the end of fiscal year 1984.

With cooperation among local, State, and Federal agencies, an additional $1.6 billion could be obligated during the next 12 months.

In addition, to further encourage timely obligation of appropriated funds in the outyears, we recommend that the Congress authorize an additional 5 percent to the Federal matching share for those States which are able to obligate their previous year's allocation within 12 months.

I would like to focus on critical water quality areas. In recent years, both the administration and the Congress have shown interest in focusing financial assistance on those rivers, lakes, and streams where pollution is the greatest and Government expenditures can achieve the greatest cleanup.

The Environmental Protection Agency's fiscal year 1984 Guidance for the Office of Water provides that "the construction grants program will be closely coordinated with the water quality management and NPDES permit programs and will be directed toward improving water quality and public health in critical water bodies."

While EPA's 1982 Needs Survey has not reported the costs associated with meeting requirements in critically polluted areas, most States have identified these areas.

Most critical water quality bodies are in and near major population centers. The San Antonio River, for instance, has its headquarters near the center of our city and most of its flow immediately south of San Antonio is composed of the discharge from our waste water treatment facilities.

We have signed a compliance agreement with the Texas Department of Water Resources which requires the city to achieve advanced secondary treatment by 1988. Our program's total cost is $450 million, approximately $350 million of which is federally grant eligible.

Since 1980, San Antonio has received $2 million in construction grant funds and expects to receive $25 million in fiscal year 1984. These grants total less than 10 percent of the federally grant eligible portion of our total program.

While we may receive more grants in the future, the likelihood that we will ever receive 75 percent or even 55 percent is low under presently authorized levels and the Texas project priority list system.

In 1981, Congress in section 216 of the act, declared national policy to provide assistance which in the judgment of the States would achieve "optimum water quality management consistent with public health and water quality goals and requirements of the Act." Presumably, this would at least permit States to focus funds on the most polluted areas.

Section 216 also established a State discretionary fund of up to 25 percent of a State's allotment, to finance collector and interceptor sewers, major sewer system rehabilitation, and combined sewer overflow. This fund tends to dilute the Congress intention to focus financial assistance on the most critical pollution problem areas.

We recommend that, first, the subcommittee review the States' record in directing funds to the most polluted areas including those in and near metropolitan areas; and second, consider what further direction the Congress should provide to assure that limited resources achieve optimum water quality in the Nation's most polluted river and stream segments.

In this era of tight budgets at all governmental levels, Congress should give serious consideration to further directing assistance to major metropolitan areas where water pollution and public health problems are at their most critical levels.

We recommend, therefore, that Congress consider two approaches. One, establish a separate tract of assistance directed to large metropolitan area projects serving critical water bodies. Funds would be made available based on approved implementation plans for certified major metropolitan areas projects. The separate tract should be supported by a separate authorization and appropriation based upon funds needed to fulfill construction schedules for each fiscal year.

This approach would obligate funds more efficiently by reducing the lengthy reviews by State and Federal officials; would produce a dependable schedule for obligating Federal appropriations; and would achieve greater results by focusing on those areas with the highest levels of pollution.

This approach has been recommended by the Association of Metropolitan Sewage Agencies and we strongly urge its enactment.

Two, alternatively, the Congress could require the States to allocate the major portion of their Federal funds perhaps no less than 75 percent to metroplitan areas where the greatest amount of cleanup can be achieved.

This approach would maintain the current administrative process for reviewing plans and specifications and awarding grants but would require States to target a greater percentage of Federal assistance to major pollution sources.

San Antonio, and I am sure other local governments, would pledge to work with the subcommittee and other interests to develop an approach which would accelerate obligations while concentrating Federal dollars on the most polluted streams. We urge your favorable consideration of an approach which would meet these objectives.

I think our comments on pretreatment pretty well follow that of AMSA. We, of course, have spent over $1 million in formulating a pretreatment program on the category standards and are now beginning the business of administering this, and we keep our fingers crossed and hope the fears we discussed do not occur in San Antonio.

In conclusion, I personally attend many meetings with citizens of San Antonio and spend many of my evenings discussing issues and problems in the area of public works. One such meeting recently was with a number of senior citizens who for once in their life were seeing some results of government taking actions. They showed me all their sewer bills and tax receipts. One gentleman, about 78 years old, looked at me with tears in his eyes and said, when were we going to get our turn?

It seems like we are also almost there, but never there. I could tell his strong support for government, his conservative views. But really it hurt him. When I tell him we discuss what we are going to do, it really hit me home that the confidence in government without sort of the support of government working together and seeing what happens to San Antonio's funding, he just couldn't believe it.

And that type of reaction I have gotten in San Antonio from many of these groups has really hurt their image of the mandate. The partnership started out in the Clean Water Act of 1972. And just coming up here yesterday evening, I met someone on the plane from San Antonio, and I explained basically in the 20 minutes—did not harass me, but he basically interrogated me thoroughly on this very issue. He could not understand where this partnership, this covenant, as I call it, broke down.

I think this committee is going to consider these appropriations renewing this, particularly with the local governments who day by day have to clean up the waters, who Mr. Ruckelshaus depends on us, who regulates us and the people from the States. We are the ones that deliver it every day.

And I think that your consideration of these things I have told you about today is most important. The people out there who are your constituents, the people I work for on a day-to-day basis are depending on the work you are about here. It is a very serious business with us. It is not just a matter of dollars and cents and clean water. It is a matter of confidence in the government, the Federal and local governments to work together and deliver what they

promise. This has urged me and others in San Antonio to come up here—this motivated me the first time to come up here to express that to you, because it is a very sincere concern, a very sincere need.

I encourage you. I was very pleased by the testimony today. I think we have real strong midcourse corrections. We have had some difficulties in the country. I urge you go about this country's business, the business of clean water, and the additional moneys you can make available will go a long way to saying yes, we were there in 1972, we have some midcourse corrections in 1981, we are back there behind the cities with additional fundings in 1985. And we are not going to let our end of the bargain down.

There is a lot at stake. I want to let you know that. I hear it every day. I think you need to know that. I think you have a great opportunity to set the record straight, or set the Federal Government straight in providing additional funding. To me, it is a great deal of work you have. I encourage you in it. I am behind you. And I stand before you to assist you in whatever way I can, all of us in San Antonio.

I am sure the other cities you will hear from tomorrow and in the days to come will echo my feelings.

That concludes my remarks. I thank you for the privilege of being here with you today.

Mr. ROE. Very well done. We really appreciate your testimony. Do you have any questions, Mr. Moody?

Mr. MOODY. No questions.

Mr. ROE. Mr. Packard?

Mr. PACKARD. Thank you.

I appreciate your coming up from San Antonio and giving us the benefit of your experience and your testimony.

Does the State of Texas have funding programs to supplement Federal and local funding resources for projects, like several other States do?

Mr. KIOLBASSA. No, sir, we have not locally been able to encourage the State. We do not. They are strictly an administrative body that passes on the Federal grants.

Mr. PACKARD. Do you feel that there should be a partnership arrangement? This committee is moving more and more, and I think the administration is moving more and more toward a partnership between or a cost/sharing partnership at the local, State and Federal levels. Do you feel that that is a good approach to the funding process?

Mr. KIOLBASSA. Yes, sir.

Mr. PACKARD. In your testimony you mentioned that the greatest need is where the dollars ought to be pinpointed and targeted.

Do you feel that this would have a penalizing effect upon those areas that have worked hard and devoted a considerable amount of local and other resources toward solving their problems and, therefore, do not have so major a crisis on water quality? Might not this be penalizing them for doing a good job in an effort to try to help those that have not really paid adequate attention to their water quality?

Mr. KIOLBASSA. I think, again, it probably will not. But it is a balance. And I think what we are sharing here is that the funds we

do have available, for the immediate future, that we do concentrate on the major polluters.

And what we need to do on the other side is look at, it is a serious problem, and we may need to look at extending the deadlines or doing other things which would not require, you might say, major funding. If it is a small city, it can be a major polluter, a small area can make a significant contribution to the pollution. It is not saying just because San Antonio, Tex., or other large cities, are not a major problem, we are saying the major polluters can be small, large or in between.

Mr. PACKARD. Along that line, small cities, middle-sized cities, and rural communities have to meet the same requirements and standards that do the larger metropolitan areas. Do you believe that the metropolitan areas ought to be given preferential treatment over some of the smaller cities that are struggling perhaps at a different magnitude, but still struggling?

Mr. KIOLBASSA. I think public health and the environment are the guidelines. The majority of your major metropolitan areas will have the problems. But the smaller communities may have a significant problem, as a major public polluter. Yes, they would be in that high priority category. I do not necessarily say just big cities, though that is more than likely where you will find it. But I am looking at public health and environmental protection as being the guideline, and not necessarily a priority list devised by some magic formula.

In San Antonio's case, sometimes you are a winner, sometimes a loser, depending on the luck of the draw. And that is my concern, and my difficulty.

Mr. PACKARD. I have to assume that San Antonio is not presently meeting the water quality standards.

Mr. KIOLBASSA. Not based upon the stream designations or the effluent guidelines. We do not have advanced secondary treatment now.

Mr. PACKARD. Do you think San Antonio has a possibility of meeting the standards by 1988?

Mr. KIOLBASSA. We voluntarily signed a compliance agreement to arrive at that in a methodical way. We are committed to doing it. We have our construction program on line such that we would be on line producing advanced secondary treatment by July 1, 1988. We are on that goal.

Mr. PACKARD. Assuming there are justifiable reasons—like unavailable funding, unavoidable construction delays, and the like—What would you think would be the alternatives—extending the deadlines? And, if so, how long?

Mr. KIOLBASSA. I would believe basically we would look at extending the deadlines or a combination of raising fundings and extending the deadline. It is a mix. You can say we go 1992, leave the funding as it is, or up the funding level and bring it back to 1988. It is a combination in this case.

On the program, we will be in line with it. I don't know where the political and all the legal processes are going to take us. We are looking at real big jumps in the rates.

Mr. PACKARD. In attempting to improve the water quality of the San Antonio River, do you think that nonpoint sources or upstream sources are creating a problem for San Antonio?

Mr. KIOLBASSA. No, sir. The San Antonio River begins in San Antonio. The water discharge treatment plant, particularly in the summertime, is the San Antonio River.

Mr. PACKARD. I read that in your statement. But I did not understand exactly what you meant.

So your downstream cities probably are blessing San Antonio rather than cursing them for the quality of the San Antonio River.

Mr. KIOLBASSA. We hope they will be. Right now they are not exactly happy.

Mr. PACKARD. Are you saying there would not be a San Antonio River if it was not for the city of San Antonio?

Mr. KIOLBASSA. Yes, sir, basically right. At least it would not be the magnitude it is.

Mr. PACKARD. Where does the water come from?

Mr. KIOLBASSA. Our main source of water supply is an underground aquifer. So we pump all our water through springs. We receive all our fresh water supply and drinking water supply from the Edwards aquifer, which is a several hundred miles long and many miles wide underground limestone aquifer.

Mr. PACKARD. Do you have a replenishment program?

Mr. KIOLBASSA. We do have a recharge program for that. It is not adequate. One of the greatest things we have to face in Texas is our long-term water needs.

Mr. PACKARD. Is the water quality of your aquifer deteriorating?

Mr. KIOLBASSA. We have not noticed any deterioration in the aquifer.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. ROE. I want to thank you very much for your patience and your indulgence. Your testimony will be a big help for us. We will certainly give every consideration to your recommendations.

Thank you very much.

The subcommittee will now recess until tomorrow at 9:30.

[Whereupon, at 4:25 p.m., the subcommittee recessed until 9:30 a.m., Wednesday, November 16, 1983.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

WEDNESDAY, NOVEMBER 16, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to notice, in room 2167, Rayburn House Office Building, at 9:40 a.m., Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. The Committee on Water Resources will reconvene its hearings on the clean water bill.

We have with us this morning the Honorable Bill Coyne from Pennsylvania, who has been a very strong supporter of this legislation.

So, as our distinguished colleague, we want to welcome you here this morning to reeopen this hearing.

The full text of your prepared statement will appear in the recored at this point.

[Statement referred to follows:]

STATEMENT OF REPRESENTATIVE WILLIAM J. COYNE OF PENNSYLVANIA

Mr. Chairman: I appear before this subcommittee today to seek assistance in solving a problem which exists in the city of Pittsburgh, but whose cause lies, for the most part, outside of the city.

Saw Mill Run is a stream which runs through an area south of the city of Pittsburgh and into the city itself. The Saw Mill Run watershed includes portions of 11 other communities: (Baldwin Borough, Baldwin Township, Brentwood, Castle Shannon, Crafton, Dormont, Green Tree, Ingram, Mount Lebanon, Mount Oliver, and Scott Township.) This Drainage Basin (watershed) is an area of approximately 19.5 square miles situated south of the central business district. It is about 7 miles in length and from 2 to 4 miles in width.

This watershed empties into the stream and this, together with the combined storm and sanitary sewer residue, runs into the sewer systems of the city of Pittsburgh. As a sanitary sewer the present system is unable to handle the overload. The original system was designed as a sanitary sewer to serve a population of 186,000; today it serves over 250,000.

Today, over 50 years since the construction of the Saw Mill Run interceptor, the Saw Mill Run Basin is plagued with serious problems involving sewage, pollution, and flooding.

The sewer does not work because of the massive amounts of storm and ground water that enter the pipes. The system was designed to function as a sanitary sewer. The massive amounts of inflow and infiltration have caused the interceptor to function as a combined sewer even though it lacks such capacity.

A study performed by an engineering company in Pittsburgh in 1974, established the allowable infiltration rate (based on a State Department of Environmental Resources design criteria of 500 gallons per day per inch pipe diameter per mile) is 1.3 million gallons per day. Measured infiltration rates were 13.3 million gallons per day—over 10 times the allowable rate.

Since 1925, the city of Pittsburgh and approximately nine townships and boroughs have been involved in efforts to construct an interceptor sewer. The costs were to be apportioned among the several municipalities based on their respective populations, land areas, and taxable valuations. Since that time, areas served by the interceptor have experienced dramatic growth.

Fifty years after the original agreement, the interceptor is now plagued with a host of problems, the most important being the excessive and dangerous amount of storm water that enters the sewer primarily from suburban communities. The Saw Mill Run interceptor was designed as a sanitary sewer not a combined storm and sanitary sewer. Additionally, analysis indicates that fourteen suburban municipalities have neglected the necessary maintenance of their portions of the sewer, while the city has maintained the improved portions of their sewer to the sum of $5 million of city funds.

The result of these failures is that the interceptor which was originally designed to spur development of this area now serves to slow it. At the same time, raw sewage is discharged into Saw Mill Run when the interceptors diversion chambers overflow, and many residents live with constant basement flooding during wet weather.

To solve what is a multi-municipal problem, the city is forced to seek Federal assistance. The Pennsylvania Department of Environmental Resources has continued to cite the city because of the exfiltration from the discharge sewer. This will continue to occur because the city will never be fiscally able to spend the $25 million to rebuild this system.

The city has initiated corrective measures on its own, but these efforts will not succeed unless further action is taken soon. The 55 year-old trunk line cannot handle the traffic.

The consequences of this situation are:

1. The developmental potential of the area is severely restricted by the lack of sewer capacity.
2. Raw sewage is discharged into Saw Mill Run as a result of the failure of the diversion chamber to function because of the excess load; and,
3. City residents are subjected to the unsafe and unhealthy experience of living with raw sewage and storm water in their homes.

The city has tried to seek solutions at its own expense. It has spent $5 million of its own funds to construct a 42-inch parallel sewer, but this is not the long-term answer. The answer is a completely new sewer line to handle the extra run-off from the suburban communities.

The city cannot raise the funds to complete the job—that will cost $25 million.

CONCLUSION

The question then becomes whose responsibility is it to solve this problem and build a new system. The city has done its share. They have spent over $5 million in the last few years. They have also gone to the State of Pennsylvania's Department of Environmental Resources for the last 11 years—each year receiving a low priority rating for this project.

Mr. Chairman, the city is confronted with a problem whose cause lies outside of its jurisdiction. The city, to solve the problem, needs federal assistance. I ask that the subcommittee when marking up the legislation pending before the subcommittee consider language, either statutory or in the committee report, which directly authorizes the expenditure of Environmental Protection Agency funds to solve the problem which I have outlined.

Mr. ROE. Please proceed.

TESTIMONY OF HON. WILLIAM J. COYNE, A REPRESENTATIVE IN CONGRESS FROM PENNSYLVANIA

Mr. COYNE. Thank you, Mr. Chairman. It is a pleasure for me to be here this morning for the people I represent. I appear before this subcommittee today to seek assistance in solving a problem which exists in the city of Pittsburgh, but whose cause lies, for the most part, outside the city.

Saw Mill Run is a stream which runs through an area south of the city of Pittsburgh and into the city itself. The Saw Mill Run watershed includes portions of 11 other communities: Baldwin bor-

ough, Baldwin township, Brentwood, Castle Shannon, Crafton, Dormont, Green Tree, Ingram, Mt. Lebanon, Mt. Oliver, and Scott township.

This drainage basis, watershed, is an area of approximately 19.5 square miles situated south of the central business district. It is about 7 miles in length and from 2 to 4 miles in width.

This watershed empties into the stream and this, together with the combined storm and sanitary sewer residue, runs into the sewer systems of the city of Pittsburgh. As a sanitary sewer, the present system is unable to handle the overload.

The original system was designed as a sanitary sewer to serve a population of 186,000 people. Today it serves over 250,000. Today, over 50 years since the construction of the Sawmill Run interceptor, the Sawmill Run basis is plagued with serious problems involving sewage, pollution, and flooding.

The sewer does not work because of the massive amounts of storm and groundwater that enters the pipes. The system was designed to function as a sanitary sewer. The massive amounts of inflow and infiltration have caused the interceptor to function as a combined sewer, even though it lacks such capacity.

A study performed by an engineering company in Pittsburgh in 1974 established the allowable infiltration rate is 1.3 million gallons a day. Measured infiltration rates were 13.3 million gallons per day, over 10 times the allowable rate.

Since 1925 the city of Pittsburgh and approximately nine townships and borroughs have been involved in efforts to construct an interceptor sewer. The costs were to be apportioned among the several municipalities based on their respective populations, land areas, and taxable valuations.

Since that time areas served by the interceptor have experienced dramatic growth. Fifty years after the original agreement, the interceptor is now plagued with a host of problems, the most important being the excessive and dangerous amount of storm water that enters the sewer, primarily from suburban communities. The Sawmill Run interceptor was designed as a sanitary sewer and not a combined storm sewer and sanitary sewer.

Additionally, analysis indicates that 14 suburban municipalities have neglected the necessary maintenance of their portions of the sewer, while the city has maintained the improved portions of their sewer to the sum of $5 million of city funds.

The result of these failures is that the interceptor which was originally designed to spur development of this area now serves to slow development. At the same time, raw sewage is discharged into the Sawmill Run when the interceptor's diversion chamber overflows, and many residents live with a constant basement flooding during wet weather.

To solve what is a multimunicipal problem, the city is forced to seek Federal assistance. The Pennsylvania Department of Environmental Resources has continued to cite the city because of the exfiltration from the discharge sewer.

This will continue to occur because the city will never be fiscally able to spend the $25 million to rebuild the system. The city has initiated corrective measures on its own, but these efforts will not succeed unless further action is taken soon. The 55-year-old trunk-

20-955 O—84——176

line cannot handle the traffic and the consequences of this situation are the following: No. 1, the developmental potential of the area is severely restricted by the lack of sewer capacity.

No. 2, raw sewage is discharged into Sawmill run as a result of the failure of the diversion chamber to function because of the excess load.

And, No. 3, city residents are subjected to the unsafe and unhealthy experience of living with raw sewage and storm water in their homes.

The city has tried to seek solutions at its own expense. It has spent $5 million of its own funds to construct a 42-inch parallel sewer. But this is not the long-term answer. The answer is a completely new sewer line to handle the extra runoff from the suburban communities. The city cannot raise the funds to complete that job, and that will cost $25 million.

The question then becomes: Whose responsibility is it to solve the problem and build a new system. The city, indeed, has done its share. They have spent over $5 million in the last few years. They have also gone to the State department of environmental resources in Pennsylvania for the last 11 years, each year receiving a low priority rating for this particular project.

Mr. Chairman, the city is confronted with a problem whose cause lies outside of its jurisdiction. The city, to solve the problem, needs federal assistance. I ask that the subcommittee, when marking up the legislation pending before the subcommittee, consider language, either statutory or in the committee report which directly authorizes the expenditure of Environmental Protection Agency funds to solve the problem which I have outlined.

I thank the chairman and the committee for the opportunity to be here today and I would be happy to try and respond to any questions that some of the enlightened members of the committee might have.

Mr. ROE. They are all enlightened members of the committee. The enlightened ones are here.

Mr. COYNE. I see we have one present, Mr. Chairman.

Mr. ROE. Let me ask you this: You refer to a combined sewage situation, which the committee of course is knowledgeable on. And the second thing you are talking about is an interceptor sewer, as I understand it, in the Sawmill Run basis.

Is that correct?

Mr. COYNE. That's correct.

Mr. ROE. Do the communities that contribute the sewage to the interceptor line, have combined sewers within their community, or is it the interceptor line that is the combined sewer line? Do you know offhand?

Mr. COYNE. I am not sure, Mr. Chairman.

Mr. ROE. All right. Well, let me suggest the following: As I recall in our water resources development bill we also had a flood control project for the Sawmill area. Is that not correct?

Mr. COYNE. That is correct.

Mr. ROE. That is right. I would suggest that you might want to arrange to have us meet with the staff and your city engineer to take a look at the interrelationship between the flood control pro-

gram and that combined sewer. That interceptor, has a relationship and you may not be technically aware of that.

But I would suggest that let us do that to see where that lies. I think what you are speaking to is that in the flood control program, the combined sewer, the interceptor combined sewer is contributing to that flood control issue as it relates to the backflooding into the cellars, et cetera. Is that not part of the problem?

Mr. COYNE. That is correct.

Mr. ROE. Well, why do we not get together because we need more detailed facts to see where this would lie. In other words, Pennsylvania has the right to set its own priorities, as you know. I do not know whether Pittsburgh and the surrounding communities have a request in the priority schedule as far as clean water funds. EPA funds are concerned to correct that. I don't know where that lies. So we ought to get that background information to determine. Do you understand what I'm trying to say now?

Mr. COYNE. I do.

Mr. ROE. And I would think that for the committee's point of view, if you let us know that, we will lock that back into the water resources development issue on flood control and see how we can relate that. Because I think there is a relationship between them, which might prove to be very, very helpful to you.

Mr. COYNE. Very good.

Mr. ROE. Are there any other questions for the distinguished gentleman from Pennsylvania?

Mr. EDGAR. Mr. Chairman, I would just like to say that I discussed this at length with the gentleman from Pennsylvania, and I apologize for not being here for your testimony this morning, but I did look through it, and it follows our conversation that we had. And I believe that there are some unique concerns here, particularly with the suburban versus urban relationship of this particular problem and getting all of these jurisdictions to work together on a common solution is very difficult.

So, I support the gentleman's effort and I think the chairman's suggestion about sitting down and working out a strategy where both the interceptor issue the other water related issues be considered is an appropriate direction.

And I want to commend the gentleman for raising this with our committee.

While this focuses primarily on a problem in the greater Pittsburgh area, there are a number of older cities throughout the northeast and midwest regions of the country that were put in place many years ago with boundary lines that are a bit artificial. And they have some unique problems when we start putting definitions together and authority to spend money by certain boundary lines.

And I think what we do in this situation may have some impact on some other areas.

I thank the gentleman for bringing it to our attention.

Mr. ROE. Thank you. The gentleman from Massachusetts.

Mr. DONNELLY. Thank you, Mr. Chairman. Let me echo the words of my friend from Pennsylvania. I think that you have personally lobbied every member of the subcommittee on this issue.

We have similar situations as this in Massachusetts, and as Bob Edgar said, there are old cities like Boston where they have those artificial limits and enormous growth in the suburban communities.

My question is: Is there an adversarial relationship between the city of Pittsburgh and the surrounding townships or are they willing to work together and put up their fair share of the cost of producing the end result in this effort?

Mr. COYNE. Well, for the most part, it is a very good working relationship. Allegheny County in which the city of Pittsburgh is located—Allegheny County itself has 129 separate municipalities, separate governments, of which Pittsburgh is only one.

And so the history has been that it's been a good working relationship except when it comes for putting money in the budgets of the municipalities outside. As I said, Pittsburgh has contributed in the last 5 years at least $5 million to this problem.

Mr. DONNELLY. You have to get 100——

Mr. COYNE. But with the dwindling revenue sharing funds that we have experienced in these communities outside the city, including the city, and with dwindling community development funds, it makes it very difficult for these people to free up money to be able to contribute to this effort.

Mr. DONNELLY. Would every town in Allegheny County have to contribute into the cost-sharing factor here?

Mr. COYNE. No. It would be about 13 municipalities.

Mr. DONNELLY. Thirteen including Pittsburgh?

Mr. COYNE. Pittsburgh would be 14; 13 outside the city.

Mr. DONNELLY. What role has the EPA played in this process up to this point?

Mr. COYNE. The State EPA has given this project a very low priority, and that is why one of my suggestions here today was to possibly, either by statutory language or other language, report language, to make this a priority within the State if that was possible.

But I understand the chairman has a different plan and we would be willing to accede to that.

Mr. DONNELLY. I thank the gentleman for appearing and I thank the chairman for the time.

Mr. ROE. For the benefit of the members, today's testimony in large measure, will be devoted to nonpoint source pollution. And it seems to me that with the battle we have been fighting with the other body on the eligibility of combined sewers being considered as part of the sewer system in respective communities, we cannot seem to break that logjam.

And part of the issue that we are developing on the committee now has to do with the point of view of the combined sewers contributing to the overflow and continuing pollution aspect. And it seems to me that as we take a look further into the Boston situation, the Patterson situation, and other areas, as Bob Edgar knows, we have been discussing for weeks now, the relationship between that overflow as it relates to the flood control issue we may want to think about some new language in the water resources development bill that speaks to this issue. Then we may be able to find a solution to the combined sewer situation as it relates to nonpoint source pollution through that other mechanism. That is what we

have to take a look at. That is why we will have to review with your engineers to see if there is a relationship that we could lock in in either bill. In the other bill we would have a better chance, I think, of mandating it as a possibility as part of that system, if you understand what I am trying to get at.

Are there any further questions for the distinguished gentleman from Pennsylvania?

[No response.]

If not, we want to thank you very much, Bill, for being with us and for your valuable testimony.

Mr. COYNE. Thank you, Mr. Chairman.

Mr. ROE. Our next witness this morning will be Mr. Richard Siegel, Deputy Assistant Secretary of Agriculture for Natural Resources and Environment, representing the Department of Agriculture.

We want to welcome you, Mr. Siegel, to our committee and we are most anxious to hear your testimony this morning because I know you are interested in the same area of resolution to this problem as we are.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF RICHARD D. SIEGEL, DEPUTY ASSISTANT SECRETARY FOR NATURAL RESOURCES AND ENVIRONMENT, U.S. DEPARTMENT OF AGRICULTURE

Mr. Chairman and members of the subcommittee, I am Richard D. Siegel, Deputy Assistant Secretary for Natural Resources and Environment, U.S. Department of Agriculture [USDA]. On behalf of USDA and Secretary Block, I would like to express our appreciation for the opportunity to appear before your subcommittee to discuss the important issue of nonpoint source pollution.

NONPOINT SOURCE POLLUTION FROM AGRICULTURE, SILVICULTURE

Agriculture and silviculture can cause nonpoint source pollution. Surface runoff from farmland, when it reaches surface waters or subsurface aquifers, can deposit soil sediment, as well as fertilizer, pesticides, and animal wastes. Irrigation return flows can be a source of stream pollution and so can runoff from timber activities.

The appraisal of resource conditions and trends carried out under the Soil and Water Resources Conservation Act of 1977 (Public Law 95-192) showed:

That combined soil erosion (sheet, rill, and wind) on nonfederal lands as of 1977 reached 5.3 billion tons per year;

That 15 percent of the fertilizer applied to croplands washes into surface water;

That 25 percent of the livestock operations, such as dairy farms, cattle ranches, and feed lots, have the potential to degrade water quality;

That nearly 100 million tons of salt enters surface waters each year primarily through surface and subsurface return flow of irrigation water; and

That less than 5 percent of all pesticides applied reach surface waters, (but in some locations, sometimes the concentration of a pesticide entering surface waters in the runoff from fields can be of concern).

USDA'S BACKGROUND IN NONPOINT SOURCE POLLUTION

Through programs such as the Agricultural Conservation Program [ACP] and the technical assistance and incentive programs of the Soil Conservation Service, agricultural nonpoint source pollution problems have been identified and treatment developed. The Forest Service manages the National Forest System of 155 forests and 19 grasslands in 41 States covering 191 million acres. Among its management responsibilities are protection of watersheds on National Forests and water quality protection in general on National Forest land. In addition, the Forest Service has provided national leadership for silvicultural nonpoint source pollution control in cooperation with forestry programs of the States and with private forest landowners.

USDA began working cooperatively with EPA in the mid-1970's when Agricultural and Silvicultural Water Quality Management Plans were being developed by States in response to Section 208 of Public Law 92-500 (The Clean Water Act). The 208 process, carried out in many states in cooperation with conservation districts, led to a series of federally funded projects aimed at demonstrating that farm and forest conservation and management could reduce nonpoint source pollution.

In 1978, seven Model Implementation Program [MIP] projects were funded by USDA and EPA using existing program authorities to address the nonpoint source problem. These projects utilized EPA funds from both Section 208, Water Quality Management, and Section 314, the Clean Lakes Program. In addition, there were USDA Agricultural Conservation Program [ACP] incentive payments, technical assistance by the Soil Conservation, research funds from both EPA and the Agricultural Research Service, and funds from a variety of other State and local sources.

The success of this initial effort led USDA to earmark $20 million of the ACP program in 1979 for water quality projects. Congress then responded in 1980 and 1981 with $70 million for the Experimental Rural Clean Water Program which will continue through 1991.

In 1980, USDA identified agricultural nonpoint source pollution as one of eight resource problems to be considered in formulating the national program for soil and water conservation called for in the Soil and Water Resources Conservation Act of 1977 (RCA). However, in the program which the Department of Agriculture completed and President Reagan sent to Congress in December 1982, emphasis was placed on soil erosion control, upstream flood damage reduction, and water conservation in water-short areas with the greatest emphasis going to soil erosion control. Since control of soil erosion has secondary benefits to water quality off the site, we expect improvement in water quality to occur from these intensified erosion control activities, even though their objective is to preserve soil productivity.

As in the past, USDA will still provide assistance in the water quality field through its ongoing program.

GENERAL COMMENTS ON NONPOINT SOURCE POLLUTION

First, water quality problems from nonpoint sources result from the cumulative effect of the pollutants that originate from land in a given drainage area. The pollutants moving off one owner's land are seldom sufficient in themselves to be the sole cause of the problem. It can be difficult, if not impossible, to determine the extent of an individual farmer's responsibility for a water quality problem, especially when the problem will be experienced downstream and off-site from where the pollution originates. Therefore, it would be neither practical nor equitable to force individual agricultural landowners to alter their land management practices under a regulatory program.

USDA's existing conservation programs and some at the State and Federal level make cost-sharing payments available as an incentive for landowners to act voluntarily to prevent nonpoint source pollution from their lands. The experience of both USDA and EPA has demonstrated that this is a cost-effective means of addressing nonpoint source pollution in watersheds where water quality improvement is a high public priority.

While there can be onsite benefits from nonpoint source pollution control measures, such as measures to prevent topsoil erosion, many of the benefits go to society at large in the form of cleaner streams and an improved environment. Estimates of these benefits and the total investments needed to obtain them are still relatively crude.

Second, not all nonpoint source pollution from agricultural or silvicultural land is due to land management practices. Some of the pollution occurs naturally. The Department believes it is necessary to distinguish between natural and human-induced pollution. Nonpoint source control efforts should be focused on the latter. Pollution resulting from human activity may be effectively controlled, while treatment of pollution from natural nonpoint sources may not be economically feasible or even desirable.

For these reasons, we believe that the control strategy for nonpoint sources must necessarily be different that that for point sources. Point source control is focused directly on the discharger, and regulation is based upon effluent limitations that are achieved through treatment and controlled release of effluents. Nonpoint source problems, however, do not allow this measure of control. Nonpoint source pollutants cannot always be captured and treated, nor can they be stopped by closing a valve. An attack on nonpoint source pollution needs to be based on specific Best Management Practices [BMP's] tailored to the physical environment and land use.

We have found that many people still view nonpoint source pollution problems from a point source control perspective. In a revision of the Clean Water Act, we would like to see a distinction between the approach necessary for control of nonpoint source pollution and the approach appropriate for point source control. BMP's should be the central component of a preventive nonpoint source pollution control program, and not categorical standards.

The philosophy of prevention promotes the concept of "Best Management Practices." These are defined in Section 130.2(q) of EPA's original water quality management regulations published on November 28, 1975. The States have based their water quality plans on this definition, which provides for water quality protection while allowing for a consideration of the technical, economic, and practical feasibility of a Best Management Practice. This is a workable definition for BMP's and should be retained.

Finally, in land management, we have found there is no single set of Best Management Practices suitable for the wide range of natural conditions which may be encountered. The individual, often unique characteristics of a site will determine the practice that is best for that site. A site specific evaluation of conditions, such as topography, soils, climate and proposed management activities, is what will lead to the selection of BMP's necessary to meet water quality objectives. Rather than attempt to frame a single list of practices to fit all situations, USDA and EPA shall devote their efforts to delineating the process for choosing Best Management Practices according to the specific conditions of a given site.

CONCERNS WITH POSSIBLE AMENDMENTS

Any amendments to the Federal Water Pollution Control Act that would allow no degradation of high-quality waters would constrain land management activities. To enforce strict nondegradation or "no change" could preclude management activities even when the changes in water quality would be low level, of short duration and of minimal impact. Timber harvesting on public and private lands could be precluded despite the fact that a site may be harvested only two or three times in a given century. We believe the nondegradation objective should be reached by considering long-term effects on a full watershed basis rather than dwelling on nonrecurrent changes to individual stream segments. This concept is of great importance to all land managers, both of public and private lands.

Any proposed amendment that would require States to identify any Federal program or activity which, if carried out, would be inconsistent with implementation of their nonpoint source pollution control plan. We would oppose such an amendment. It could result in serious delay to planned activities of USDA. Agencies such as the Soil Conservation Service and Forest Service have existing regulations that allow adequate public involvement, provide for environmental assessments and impact statements and ensure consultation and cooperation with State and local authorities. Only after State and local concerns with respect to activities proposed or anticipated are resolved are such plans finalized and implemented. We believe that Executive Order 12372, which replaced the A-95 process, is sufficient to ensure consistency between State and Federal projects and program activities.

CONCLUSION

Mr. Chairman, in closing, our Department has experience in addressing nonpoint source water pollution problems resulting from agricultural and forestry activities. Our activities on the National Forests speak for themselves. Our programs in the Soil Conservation Service and Agricultural Stabilization and Conservation Service have provided technical assistance and financial assistance to encourage landowners in proven areas of nonpoint source water pollution hazards to adopt preventive soil conservation measures. In the main, we have seen our programs aid in controlling nonpoint source water pollution. We welcome the opportunity to work with your subcommittee and with EPA in exploring these new legislative concepts, on an issue where we have had so much experience and have so much to contribute due to our expertise on agricultural producers, their methods and their resources.

Mr. ROE. Please proceed.

TESTIMONY OF RICHARD SIEGEL, DEPUTY ASSISTANT SECRETARY OF AGRICULTURE FOR NATURAL RESOURCES AND THE ENVIRONMENT; ACCOMPANIED BY WARREN HARPER, HYDROLOGIST, FOREST SERVICE; AND, PETER MYERS, CHIEF, SOIL CONSERVATION SERVICE

Mr. SIEGEL. I will try to summarize in the interest of time.

I am Richard D. Siegel, Deputy Assistant Secretary for Natural Resources and Environment of the U.S. Department of Agriculture.

In the office of our Assistant Secretary, Mr. John B. Crowell, we supervise policy for the Soil Conservation Service and the Forest Service. My testimony will deal with the interests of both those agencies in the subject at hand, nonpoint source pollution.

With me in the committee room today are Peter Myers, the Chief of the Soil Conservation Service, a number of his associates from that agency, and Mr. Warren Harper and John Currier from the Forest Service.

Mr. ROE. Mr. Siegel, might it not be a good idea to have both those gentlemen join you at the table in case we have a question for them?

Mr. SIEGEL. Well, Chief Myers can join me and so will Mr. Warren Harper of the Forest Service.

Mr. ROE. Mr. Myers, Mr. Harper, OK.

Mr. SIEGEL. Now, as the committee is well aware, agriculture and silviculture are causes of nonpoint source pollution. Surface runoff from farmland when it reaches surface waters or subsurface aquifers can deposit soil sediment as well as fertilizer, pesticides and animal wastes.

Irrigation return flows can be a source of stream pollution and so can runoff from timber activities. Every 5 years the Department of Agriculture conducts a natural resources inventory. The original natural resources inventory was conducted in 1977. A further one was done in 1982, but the data for that is not fully available at the present time. Based on our 1977 data, we have gross amounts of soil erosion from sheet, rill, and wind erosion on non-Federal farmland, reaching 5.3 billion tons a year, a considerable amount of that reaching streams.

Mr. ROE. Will the gentleman yield for a moment?

Mr. SIEGEL. Yes.

Mr. ROE. Could you explain to the committee, because I think it is important, what do you mean by rill?

Mr. SIEGEL. Sheet erosion is a shallow sheet of water crossing the soil. Rills are tiny——

Mr. ROE. Rivulets?

Mr. SIEGEL. Tiny depressions which are formed and then rills, if allowed to continue, become gullies.

Mr. ROE. OK.

Mr. SIEGEL. So a rill is the beginning of a gully situation in topsoil erosion.

We know that considerable amounts of fertilizer are applied in agriculture; 15 percent of the fertilizer that is applied washes into surface waters.

We know that livestock operations are a considerable part of our agricultural scene today, everything from dairy farms to cattle

ranches and feedlots, and 25 percent of those livestock operations have been deemed to be a potential hazard for water quality.

In the western part of the United States where the soils are extremely salty and the dry conditions accentuate the salt problem, we have nearly 100 million tons of salt entering surface waters each year.

A great deal of that is the result of irrigation water returning.

And, finally, a certain amount, 5 percent of all pesticides which are applied to crops, reach surface waters. Now, 5 percent may not seem like a dramatic figure, but we are concerned whenever concentrations of these pesticides in certain specific situations reach serious levels.

Now, the Department of Agriculture has considerable background in addressing nonpoint source pollution. The Agricultural Conservation Program [ACP] is a cost-sharing program administered by the Agricultural Stabilization and Conservation Service.

The Soil Conservation Service affords technical assistance that goes along with this financial assistance, and there are other programs in the Soil Conservation Service, which afford financial help.

All these voluntary programs are available to landowners, and nonpoint source pollution has been one of the objectives of this technical assistance and financial assistance that the Department of Agriculture has been affording to private landowners as part of its overall conservation effort, which began in 1935.

Turning to our public land responsibility, we have the U.S. Forest Service, which manages the national forest system, 155 forests and 19 grasslands in 41 States covering 191 million acres, a considerable part of our public land domain.

Watershed protection; since the founding of the National Forest System, has been one of its principal objectives, and the Forest Service, through its work with State forestry programs and private landowners, has brought the objectives of nonpoint source pollution control to its program in private and State forestry.

Beginning with section 208 of the Clean Water Act in the mid-1970's, USDA began to work actively with the Environmental Protection Agency. States were given the job of planning for nonpoint source pollution control. And in many cases this planning function involved the soil and water conservation districts in various counties throughout the United States and this was where the Department of Agriculture and EPA began to look together at the problem of nonpoint source pollution control and to bring to bear their various individual program resources.

In 1978 we had the initiation of seven model implementation projects, and these used existing authorities, which I have detailed in my statement.

Then in 1979 the ACP program, which I mentioned earlier, earmarked $20 million of its total appropriations for water quality projects.

And in 1980 and again in 1981 there was money funded to the extent of $70 million for the experimental rural clean water program, 21 projects in 22 States. And this today is the principal way that the Department of Agriculture is testing and exploring the potential for nonpoint source pollution control under its various programs.

Now, in 1980, the USDA was completing its appraisal and its program for the national conservation program under the specific legislation called the Soil and Water Resources Conservation Act of 1977, RCA. The RCA is the blueprint which Congress required the Department of Agriculture to prepare for the conduct of its various conservation programs over the next 5 years.

And in this blueprint, water quality was one of the eight resource problems that was identified. The thrust of our program, which President Reagan sent to Congress in 1982, however, was that the top priorities of soil and water conservation were to be sharpened into three main areas. The first area was soil erosion control. The second area was upstream flood damage reduction, and the third area was water conservation measures and water short areas.

Soil erosion control was to get the lion's share of the new priorities. Now, water quality, per se, was not identified in the top three priorities. However, anything we do in an intensive way to combat excess topsoil erosion is going to have an automatic beneficial effect on water quality.

So we feel that while water quality, per se, was not named as one of our three major priorities in our program, the increased emphasis on soil erosion control that we are bringing to bear in the sweep of our various soil conservation programs in the department is going to have an extremely direct and beneficial effect on water quality.

Mr. ROE. Can the gentleman suspend at that point. We will go vote and come right back.

Mr. SIEGEL. I will hold my breath.

Mr. ROE. I do not want to break the continuity.

[Brief recess.]

Mr. ROE. The committee will reconvene. The gentleman will proceed, please.

Mr. SIEGEL. Mr. Chairman, we did break my testimony at a convenient point because I had opened by describing the nature of the nonpoint source pollution problem and a description of the history that the Department of Agriculture has had in carrying nonpoint source pollution along as one of its activities in the soil conservation and in the public land management field.

So I would now like to speak to some of our comments that we would have on nonpoint source pollution as the subcommittee ponders its next legislative steps. The first point that we would like to make is that in the nonpoint source pollution field, the problems of water quality have cumulative causes. The pollution in the stream arises from many different and separate owners' lands, and there are other problems besides agricultural pollution that might result in the situation which actually breaches water quality standards.

It is difficult, if not impossible, to determine the extent of one individual farmer's responsibility in such a case. The effects are noted downstream well off the site, well away from where the pollution originates. Chesapeake Bay is an example of this that I might cite. And we feel, speaking for the Department of Agriculture, that to force an individual landowner to alter a particular land management practice he is carrying on under a regulatory approach is neither practical nor equitable in this type of situation.

The principal tool that the USDA has used, in addition to technical assistance, has been cost sharing payments. In particular, the rural clean water program is one which makes cost sharing payments to landowners to take part voluntarily in efforts to prevent nonpoint source pollution from their lands.

The experience that both USDA and EPA have had has demonstrated that this is cost effective where there is a watershed where a problem of water quality of high public priority has been identified.

The onsite benefits from this type of land treatment are present, but the principal benefits go to society at large in the form of cleaner streams and improved environment. There are estimates of these benefits and costs that can be made, but they are still relatively crude, and so we have not cited any figures in our statement.

Now, another thing is that many of the conditions which appear to be a deviation from water quality in streams from nonpoint source pollution are not all due to the human activity on the land. Some of the levels of sedimentation in a stream arise from purely natural causes. There's nothing that can trace responsibility to human activity. So we feel this has to be borne in mind.

All of these factors, then, I have noted make the control strategy for nonpoint source pollution decidedly different than for point sources. In point source control you focus directly on the discharger and you base your regulation on effluent limitations that can be achieved through treatment and controlled release.

Nonpoint source pollution does not have this measure of control. You cannot always capture the nonpoint source pollutant or treat it, and needless to say, you don't control nonpoint source pollution by shutting off a valve. What we require in nonpoint source pollution are management practices that are extremely site specific. They must be tailored to the physical environment and the land use. Again, they cannot be standardized in a cookie cutter fashion as you could with an industrial point source pollution situation.

We would like to dispel the notion that nonpoint and point source are essentially alike. We would like to see nonpoint source looked at for its differences and a different approach adopted, and this means the "best management practice," the prevention philosophy. This is the philosophy that has governed the efforts of nonpoint source pollution control thus far, and we would like to see the "best management practice" refined and continued.

There is also no single set of best management practices because, as I have noted, the site specific nature of nonpoint source pollution is the most critical factor. There is specific topography, specific soils characteristics, specific climate, and specific kinds of agricultural operations or timber operations that have to be borne in mind.

So it is the task, we feel, of our Department and EPA not to frame a single ideal list of best management practices, but to arrive at a policy and a process for choosing best management practices according to the specific conditions of a given site.

Finally, we have some concerns with amendments that have been talked about for nondegradation and for coordination of Federal activities by the States. We are very concerned with the proposals that there be no degradation of high quality waters. The

Forest Service is very proud of the high quality watersheds that are on the national forests, but to enforce a strict, no threshhold nondegradation or no change could preclude some normal and necessary land management activities, even when the changes in water quality would be at an extremely low level and of short duration and of minimal impact.

It is possible, reading the proposed amendments, to say that timber harvesting could be precluded for its effect on water quality, even if a timber harvest in a particular spot affecting a particular watershed would only happen two or three times in 100 years.

Long term effects should be looked at on a full watershed basis, rather than looking at individual change to a particular segment of the stream that would not recur.

And this is of great importance to owners of private forest land as well as to the U.S. Forest Service.

Now, our second point is that we would oppose any amendment that would require States to identify Federal programs and activities which, if carried out, would be inconsistent with implementation of the State nonpoint source pollution control plan. This is the so-called cross compliance aspect of the legislation from the Senate.

Now, granted, the States would be just identifying the Federal programs and activities rather than moving against the recipients of the Federal program and activity. They would simply be identifying the Federal programs and activities which would be inconsistent with the nonpoint source pollution program of the individual State.

But even in that form we feel that this would lead to serious delay. This would raise questions about many Federal activities. The Soil Conservation Service and the Forest Service, both of which would be affected, do provide in their programs, in their regulations for adequate public involvement. They do perform environmental assessments and environmental impact statements. And Federal, State and local authorities are in full consultation already.

There is an existing process for consultation between Federal programs and State water quality aims, and we feel that an additional layer of control, an additional layer of supervision would not be needed at this time. We feel the problem is a significant one, but we feel it is addressed satisfactorily by the mechanisms we have now.

So, in conclusion, we want to say that we have an active dialog at the moment with the Environmental Protection Agency, and Administrator Ruckelshaus has alluded to that in his statement before this committee yesterday.

We feel we have, whether it is the public land experience of the Forest Service or the private land experience of our soil conservation programs, a great deal to offer on the grounds in our line agencies to the solution of nonpoint source pollution problems. And we are ready to work with EPA and we are ready to work with this subcommittee as we go forward.

Thank you.

Mr. ROE. I think your testimony has been excellent in the sense that it has been very concise and adroit. In fact, it is the best testimony we have had so far on the nonpoint source issue because I think you brought many of the matters of our concern into clear

focus. Early in the morning that is the nicest thing I could say to any witness. But it is good.

Mr. SIEGEL. I want to say that these things are never done by just one person. They are a team effort, and I want to share the credit for your remarks with the many people that have come up with me today.

Mr. ROE. It is very good testimony.

Let me ask you a couple of questions. On page 2 you stated that you have been doing some research work and some studies throughout the years. And you had a report, I think, in 1977. And I assume that these figures are coming out of that report when we talk about the 15 percent of the fertilizer applied lands, we talk about 100 million tons of soil. Is that coming out of the latest report?

Mr. SIEGEL. No, these come out of the 1977 report. Now, our 1982 data is not released yet in this precise form.

Mr. ROE. When do you think that will be available?

Mr. SIEGEL. January or February.

Mr. ROE. January or February.

Mr. SIEGEL. That is right.

Mr. ROE. May I suggest that you give us a copy for our records of your 1977 report and then as soon as the 1982 report is ready, we would like to get a copy of that because we will be writing this legislation, as you know, within the next couple of months.

And it would be very, very helpful because what comes to my mind is a part of the dialog that we have been hearing from different witnesses—and I am looking for the sources of their statements, not the veracity. But where is the research, where are the sources? Is that roughly 50 percent of the pollution that we are faced with in the Nation comes from nonpoint sources?

That has been the general tone of the testimony, and there has not been too much corroborative evidence to that effect. In fact, it seems to come out of the air someplace, if you will pardon the euphemism.

So if you would be kind enough to give us the 1977 report, because that, I assume, fortifies the testimony that you have given here on these elements involved.

Mr. SIEGEL. The data we have is on the non-Federal lands and streams of the United States.

Mr. ROE. Non-Federal.

Mr. SIEGEL. Non-Federal.

[The following was received from Mr. Siegel:]

The relevant information from the 1977 NRI that pertains to nonpoint source pollution is contained in the RCA appraisal, parts I and II. That appraisal is enclosed. (U.S. Department of Agriculture, Soil and Water Resources Conservation Act, 1980 Appraisal: Part I: Soil, Water, and Related Resources in the United States: Status, Condition, and Trends, Issued March 1981. Part II: Soil, Water, and Related Resources in the United States: Analysis of Resource Trends, Issued August 1981, retained in subcommittee files.)

Mr. ROE. Now, let me ask you the next question: I think what sticks out here pretty firmly is the 100 million tons of soil that enters surface waters each year primarily through surface and subsurface return flow of irrigation.

Can you elucidate further on that?

Mr. SIEGEL. Yes; there is a Federal program called the Colorado River salinity control program.

Mr. ROE. That is what gives rise to my question.

Mr. SIEGEL. Right. I do not believe that is handled in this subcommittee.

Mr. ROE. Yes, it is.

Mr. SIEGEL. In the jurisdiction of your subcommittee?

Mr. ROE. Well, no. Interior has that, but we have—there are a number of projects that we are dealing with that do have soil relationships. That is why I am interested in the issue. I assume what you are saying is, if the gentleman would yield, that the soil that goes back into the receiving streams after irrigation—that is what this speaks to——

Mr. SIEGEL. Yes.

Mr. ROE [contining]. Is natural salting that takes place it would have to be, I guess.

Mr. SIEGEL. Like nonpoint source pollution, in the case of salinity the sum total of all the salt that is of concern in the Colorado River does not come exclusively from agricultural activities.

About 37 percent of the excess salinity in the Colorado River is coming from agricultural origins, from irrigation.

The principal culprit is overirrigation.

Mr. ROE. OK.

Mr. SIEGEL. Too much water is used in too many fields by irrigators.

Mr. ROE. But they are natural chlorides.

Mr. SIEGEL. The water seeps down below the root zone of the crops. It percolates down into the subsurface layers of soil, which are below the root zone. The excess water goes below the topsoil, below the root zone into the most saline types of soil layers.

Then it seeps out into streams. So if irrigation can be lessened, if less water is put on the fields, the plants will take what they need from the root zone and there will not be an excess to percolate down into the salty layers.

Mr. ROE. I think your department has been doing some work, as I recall——

Mr. SIEGEL. That is right.

Mr. ROE [continuing]. Reports, on trickling irrigation and much lesser quantities.

Mr. SIEGEL. That is right. We install pipelines and we line irrigation ditches so that there is no seepage and we instruct farmers in the correct amount of irrigation water that they need, neither too much nor too little.

Mr. ROE. What type of chlorides? Are they sodium chlorides or chlorine? What are they? All types of chlorides? Do you know offhand. Is there some—has any analysis been made or do you just put it all in one category?

Mr. SIEGEL. We call it salt.

Mr. ROE. Well, not necessarily.

Mr. SIEGEL. But we can furnish an answer to that question.

Mr. ROE. See if you have done any work on that and the types of chlorides, because you speak in your testimony later on, of the cumulative effects, which I think is a very important point you made there. We have been aware of that, too.

So I would like to know if you have done any work on it, any research work, what type of chlorides, if that has a bearing in combination with other materials that are released.

Mr. SIEGEL. I am sure we have the answer. We will be happy to look into that for you.

[The following was received from Mr. Siegel.]

Committee request: Identify the principal salts present in the irrigation water in the Colorado River Basin.

Response: The principal salts in surface and subsurface irrigation return flows in the Colorado River Basin are calcium, magnesium and sodium chlorides, sulfates, and bicarbonates. The salts exist naturally in the geologic formations including the topsoil. They are readily dissolved and carried by rainfall and irrigation water into the stream system.

Salinity is generally expressed in terms of total dissolved solids [TDS] in tons for salt concentration in terms of milligram per liter (mg/1) or parts per million (ppm).

The Environmental Protection Agency [EPA] has established 500 mg/1 as a safe drinking water standard. When the salinity level reacnes 700-800 mg/1 it begins to adversely effect plant growth and crop yields.

Mr. ROE. And we are requesting you to give us a copy as soon as available of your 1982 re-review of that whole situation.

Mr. SIEGEL. Fine.

Mr. ROE. It will give us a comparative relationship at that point.

Let me ask you this question: You speak of only 5 percent of all pesticides applied reach surface waters. Have you determined that by testing or what? Where does that come from?

That is considerably less than has been reported. That's what I am trying to get at.

Mr. SIEGEL. In preparing the document which we call the RCA appraisal, part 2, EPA studies were relied on for that conclusion.

Mr. ROE. EPA studies?

Mr. SIEGEL. EPA studies.

Mr. ROE. Do you have copies? Could you identify for us in supplement information where the source of that information comes from in EPA?

Mr. SIEGEL. Certainly, yes.

Mr. ROE. We would like to have that added to the record at this point. I think it is a very important figure. It is considerably lesser than other people have spoken to in testimony.

[The following was received from Mr. Siegel:]

Committee Request. Provide the basis for your statement "less than 5 percent of all pesticides applied to the land reach surface waters".

Response. Many investigations of the losses of various agriculture pesticides in runoff from treated land have been reported. Though amounts of pesticides loss in runoff may vary among specific treatments, it is almost always true that the gross loss over the course of the year following application will represent a small percent of the amount of the chemical applied. Results of watershed and field plot experiments reported in the literature (see table 7 of the enclosed document "Control of Water Pollution from Cropland Volume II—An Overview") show the wide applicability of this relationship. In general, total amounts of pesticide lost in runoff water and sediment were less than 5 percent of the amount applied.

(The document referred to: "Control of Water Pollution from cropland", Volume II—An Overview, June 1976 was retained in the subcommittee files.)

Table 7, referred to follows:

TABLE 7.—PERCENTAGES OF APPLIED PESTICIDES LOST IN RUNOFF[1] IN FIELD EXPERIMENTS

Pesticide	Incorporated depth (inches)	Soil texture	Slope (percent)	Pesticide in runoff (percent of application)	Citation
Attazine	0	Silty clay loam	14	4.8–5.0	Hall (80).
Atrazine	0	do	14	2.6	Hall, Pawlus and Higgins (81).
Atrazine	0	Silt loam	10–15	2.5–15.9	Ritter et al (134).
Carbaryl	2	do	10	0.1	Caro, Freeman, and Truner (36).
Carbofuran	3	do	9	.9	Caro et al (35).
Carbofuran	2	do	10	1.9	Caro et al (35).
DDT	0	Loamy sand	2–4	1.0–2.8	Bradley, Sheets, and Jackson (27).
DDT	0	Gravelly loam	8	.7	Epstein and Grant (63).
Dieldrin	3	Silt loam	14	2.3	Caro et al (34).
Dieldrin	3	do	10	.02	Caro et al (34).
Endosulfan	0	Gravelly loam	8	.25–0.35	Epstein and Grant (63).
Endrin	0	do	8	.01–1.0	Epstein and Grant (63).
Endrin	0	Silty clay loam	0.2	.1	Willis and Hamilton (169).
Fluometuron	0	Various	1–4	<3.0	Wiese (167).
Methyl parathion	0	Loamy sand	4	.01–0.02	Sheets, Bradley, and Jackson (142).
Methyl parathion	0	Sandy loam	2	.13–0.25	Sheets, Bradley and Jackson (142).
Propachlor	0	Silt loam	10–15	3.1	Ritter et al (134).
Toxaphene	0	Loamy sand	2–4	.4–0.6	Bradley, Sheets and Jackson (27).
Trifluralin	6	do	4	.3–0.5	Sheets, Bradley, and Jackson (142).
Trifluralin	6	sandy loam	2	.5–0.8	Sheets, Bradley and Jackson (142).

[1] Both water and sediment.

Mr. SIEGEL. But as I hasten to point out, 5 percent still means that in certain cases there could be a concentration.

Mr. ROE. I know. We are aware of that, hot spots.

Mr. SIEGEL. That is right.

Mr. ROE. All of the people who have testified, including the environmentalists and others, have come back and said they have recognized that nonpoint source pollution is a major factor we have to deal with.

But then again when we listened to Mr. Ruckelshaus testimony yesterday, to what degree? And you are tempering your observations, as I observe it, in your statement. That let us not throw away—if you will pardon the euphemism—the baby with the bathwater. Let us not get all kinds of regulations involved when we have certain things going that are effective.

And that is something that we have to fortify in our determination process so we do not go off half-cocked or others do not go off half-cocked with amendments, et cetera, if you understand the point I am trying to get at.

So it seems to me that we would like to identify for the record if you use the source of EPA on that 5 percent on pesticides. I think that is an extraordinarily important issue. I mean, we know we have hot spots, and you may have more—you are talking on an average basis. We understand that. But then again we come back and say, well, if it is 38 percent in a particular area, for some

reason we ought to know why or what, if anything, we should be doing there in view of what your study is beginning to point out.

Now, when you spoke in your USDA's background on nonpoint source pollution, you spoke to the issue of the agricultural conservation program—ACP. And you also spoke to the issue as an incentive program, technical assistance as an incentive program.

And what kind of matching funds are involved there?

Mr. SIEGEL. The ACP program is a program administered by the Agricultural Stabilization and Conservation Service—ASCS.

It is a program that is administered in almost 3,000 counties, and the funds are made available on a county basis through county committee for cost-sharing for various conservation practices.

Mr. ROE. All right. Then there is a Federal appropriation through Agriculture for that use?

Mr. SIEGEL. Yes; the ACP is the basic cost sharing program in the Department of Agriculture for farm conservation measures.

The RCWP then was an add-on to the ACP. It was a program called "Experimental Rural Clean Water." It was a separate account.

Mr. ROE. OK. Could you give us a summary on that for the record? What you are doing in that account? In other words, what we want to do is to be able to demonstrate that this is not a new field that somebody has just suddenly discovered. That there is work going on. You said you have affected some 3,000 counties. I would think you would give us some information in that what States primarily are involved in that issue, et cetera, et cetera, et cetera.

It does not have to be lengthy, but pithy and to the point, as your statement was.

Mr. SIEGEL. Fine. We can do that.

Mr. ROE. That would be very helpful to us.

Does that also relate to the ACP on the incentive payments? Is that a separate item?

Mr. SIEGEL. Well, the ACP is, as I said, the basic program, and the ACP administers an additional fund called the rural clean water program.

Mr. ROE. OK. Is the rural clean water program by legislation or is it by executive pronouncement under Agriculture?

Mr. SIEGEL. It was, I believe——

Mr. ROE. You are talking about coming out of section 208?

Mr. SIEGEL. Well, section 208 was the legislative section that set up the planning process, the water quality nonpoint source planning process in the 50 States.

Mr. ROE. OK.

Mr. SIEGEL. The rural clean water program was an action taken by the appropriations committees——

Mr. ROE. OK.

Mr. SIEGEL [continuing]. After the need was noted for some special emphasis and some earmarked funds in the Department of Agriculture to focus on—and there are 21 sites in 22 States that have the experimental rural clean water program.

Mr. ROE. Can you give us a copy of that report?

Mr. SIEGEL. Certainly.

[The following was received from Mr. Siegel:]

Committee request. Provide a summary of nonpoint source pollution control under ACP and RCWP.

Response. The enclosed tables lists the USDA obligation for "special" projects and programs directed toward nonpoint source pollution control. These are over-and-about the water quality contribution of our ongoing efforts to protect the soil resource base for sustained agricultural productivity.

It is important to distinguish between those nonpoint source pollution control projects under the Agricultural Conservation Program (ACP) listed as the first table and the Rural Clean Water Program [RCWP] listed as the second table.

ACP is authorized by the provisions of Sections 7 to 16(a), inclusive, and Section 17 of the Soil Conservation and Domestic Allotment Act (Pub. L. 74-46). Funded through USDA, ACP involved cost-sharing with landowners who establish soil and water conservation practices and other environmental enhancements on their property.

The Rural Clean Water Program [RCWP] is authorized by the Clean Water Act (Pub. L. 95-217). RCWP authorizes the Secretary of Agriculture with the concurrence of the Environmental Protection Agency Administrator to establish a nonpoint source pollution control program.

TABLE 1.—WATER QUALITY PROJECTS

State	Funding	Project status
MIPS—1978-81:		
Indiana	$1,112,722	Completed.
Nebraska	758,104	
New York	915,000	
Oklahoma	507,580	
South Carolina	622,835	
South Dakota	148,000	
Washington	745,555	
Total	4,809,796	
WQ projects—1979-81:		
Alabama	870,000	Completed.
Arkansas	271,130	
Connecticut	54,495	
Delaware	70,000	
Illinois	285,945

South Carolina	650,000	
Tennessee	1,278,104	
Texas	85,615	
Total	9,957,163	

TABLE 2—RCWP PROGRESS REPORT SUMMARY BY STATE/PROJECT

State/project	Total project cost [1]	BMP funds approved for project	BMP funds under contract	Percent	Critical acres	Critical acres under contract	Percent
Alabama: Lake Tholocco	$1,841,048	$1,332,655	$1,114,059	84	9,270	7,061	76
Delaware: Appoquinimink	1,074,048	866,425	836,499	97	13,000	11,166	86
Florida: Taylor Creek-Nubbin Slough	1,911,048	1,104,250	373,713	34	93,500	26,629	28
Idaho: Rock Creek	5,676,048	1,954,591	1,174,699	60	34,800	12,375	36
Illinois: Highland Silver Lake	4,272,048	1,039,125	549,221	53	10,500	6,938	66
Iowa: Prairie Rose Lake	869,048	446,200	336,841	75	3,920	2,929	75
Kansas: Upper Wakarusa	3,921,048	2,231,560	1,373,095	62	43,252	18,620	43
Louisiana: Bayou Bonne Idee	6,880,048	3,930,000	2,823,696	72	117,000	41,075	35
Maryland: Double Pipe Creek	5,156,048	2,892,480	1,761,268	61	18,180	10,768	59
Massachusetts: Westport River	1,041,048	603,452	314,023	52	2,715	458	17
Michigan: Saline Valley	3,411,048	1,888,106	1,085,049	57	97,700	11,087	11
Minnesota: Garvin Brook	2,520,048	1,455,000	210,718	14	12,500	2,170	17
Nebraska: Long Pine	2,612,048	1,355,875	285,447	21	58,310	20,906	36
Oregon: Tillamook Bay	2,860,048	2,534,942	2,494,660	98	7,040	5,204	74
Pennsylvania: Conestoga	3,631,048	1,448,000	501,256	35	16,000	3,176	20
South Dakota: Oakwood Lakes-Lake Poinsett	2,512,048	742,387	582,065	78	83,371	32,182	39
Tennessee/Kentucky: Reelfoot Lake	6,431,048	3,527,784	1,323,889	38	78,406	22,548	29
Utah: Snake Creek	517,048	223,753	153,868	69	489	456	93
Vermont: St. Albans Bay	4,861,048	1,581,668	1,311,468	83	15,355	9,405	61
Virginia: Nansemond-Chuckatuck	2,689,040	1,476,000	644,207	44	18,749	7,392	39
Wisconsin: Lower Manitowoc	2,436,048	1,345,545	1,125,306	84	32,967	11,952	36
Total	67,122,000						
General reserve	2,878,000						
Grand total	70,000,000	33,979,798	20,375,047	60	767,024	264,497	34

[1] Includes OTS, OME and a modest contingency reserve.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. I would like to ask unanimous consent to address the committee for 1 minute on an unrelated subject.

Mr. ROE. No objection. So ordered.

Mr. EDGAR. Thank you, Mr. Chairman.

Mr. Chairman, I just stumbled onto the House floor a few moments ago to discover Jamie Whitten asking that the continuing resolution—excuse me—the supplemental appropriation be considered perhaps in an hour. He made note of where that was in the Congressional Record and I took a look at it and I find it very disturbing, and I checked with staff, that there are whole sections on water projects, many of which are probably very good, but which will be considered in an hour on the House floor.

And I think they take off the pressure from our committee's efforts to have an omnibus water bill. I would like staff to take a look at it. It is on page H-98-76 and 77 and 78 of the Congressional Record, that includes projects in Black Rock Canal, N.Y.; Aliceville Lake, Chesapeake Bay model, Md; Marine branch and Callaway branch, Hurst, Tex.; Hugo Lake, Okla.; Dredge Kennedy, Coles Point, Sardis Lake, Miss.; Yazoo Basin Reservoir. And it goes on and on for a whole shopping list.

There are some authorizations for the corps in this. It is not just a strict appropriation of existing projects. I ask the chairman whether or not there were any new projects in here or off the floor and he could not identify any new ones. But I know that some of

them appear in our omnibus bill. And as a Member who is trying to keep a very delicate coalition together, I would just like to voice my strong concern that the appropriations committee has not fully and adequately communicated with us on this measure, and I for one am a bit disturbed at finding so many of these projects in the supplemental appropriation with such short notice.

Mr. ROE. You have not had a chance to review these yet, Bob? Are they the same ones that were taken up before?

Mr. EDGAR. They are not the same ones.

Mr. ROE. These are additional ones?

Mr. EDGAR. These are different in scope and tenor, probably a little cheaper if I added up some of the numbers. A lot of them are studies of this, and that, and the other thing. But I think it really takes away from the jurisdiction of our committee.

And it, in my opinion, although I am just saying this with only 5 minutes of information, violates the commitment that we had, I think, with the appropriations committee, at least in terms of full communication.

I hope I am wrong, and I am going to spend the next 45 minutes at least looking at some of these issues, but I find it very disturbing that in every continuing resolution or supplemental appropriation, we nickel and dime four or five more projects in. It really takes away from our ability to set a national water policy based on the merit selection and the cost sharing and the other issues that we have determined.

And there is very little opportunity for us to know whether or not these projects fit within the cost sharing provisions of our bill.

Mr. ROE. Well, you are going to look into that now. When is that coming on the floor? In an hour?

Mr. EDGAR. Well, Jamie Whitten suggested that it would be within an hour. They have to wait 1 hour before it is brought up. About half of these projects are in our omnibus bill. And these are different projects than were——

Mr. ROE. Was it discussed the last time on the floor?

Mr. EDGAR. Discussed in terms of the appropriations committee. These have evidently been put in on the Senate side. I just find that, you know——

Mr. ROE. Are you going to review them?

Mr. EDGAR. We are going to review them.

Mr. ROE. OK. All right.

Mr. EDGAR. I apologize to the committee for the interruption.

Mr. ROE. No, no, that is all right. Review them and then we will get back together in about a half hour.

All right. You spoke in your testimony to the cumulative effect, which the committee understands. Has there been any work done in your 1977 report or the report you are doing now in reference to cumulative effect?

Have you anything ongoing that is actually getting into a review, or a study, or anything of that nature of cumulative effects?

Mr. SIEGEL. I am not aware that we have delineated this or quantified it. I think that everything that is generally known between our agency and EPA tells us that it is cumulative.

Mr. ROE. Well, all I am trying to get at here is I am wondering if we should be pursuing in our thought process what you speak to in

part of your testimony, which is on page 4 under general comments on nonpoint-source pollution. And I quote:

> It can be difficult if not impossible to determine the extent of an individual farmer's responsibility for a water quality problem, especially when the problem will be experienced downstream and offsite from where the pollution originates.

And then you go on to say:

> Therefore, it would be neither practicable nor equitable to force individual agriculture landowners to alter their land management practices under a regulatory program.

I think it is a very important statement. So we are coming back and saying, however, that if we get into a point of cumulative effects, we should not be setting up some regulatory function that would make the farmers, who were contiguous to where cumulative effects go into other special types of work if we are not going to make everybody do it.

Is that a fair commentary?

Mr. SIEGEL. That is right.

Mr. ROE. You see, that is very similar to the PCB problem we have in the Hudson River. That is the point I am trying to get in the record.

So you are saying that from your observations, studies, and the work you are doing and your management programs, it would be difficult to pinpoint any particular farm operation or agricultural operation to be the culprit. That is because you are dealing with cumulative effects. Any regulatory or any work that would go on ought to be evenhanded and uniform so that one person is not penalized because they are in a particular section of outfall from their properties into the rivers where you would have heavy accumulations of pesticides or whatever. Call them hotspots. It would be impossible to, would you say, to pinpoint that responsibility.

Mr. SIEGEL. That is right.

Mr. ROE. The nature of the beast, so as to speak. Is that a fair commentary?

Mr. SIEGEL. That is right. You do not find out about this water-quality problem until many, many years of sedimentation have occurred from many, many different sources.

So we get back to the approach of prevention by suitable management practices on the land, which happen to be good practices from other standpoints as well. They preserve topsoil and keep it from washing away.

Mr. ROE. You mentioned in your testimony on page 5 that some of the pollution occurs naturally. For the record, I am aware of some of that, but would you just want to get into the record what we would be talking about in that direction?

Mr. SIEGEL. Here are some examples: natural erosion of streambanks, which has nothing to do with the human activity along the stream; soil sedimentation of a natural level that will always go into the stream no matter what the human activity is; natural salts that dissolve the oxygen demand. These are things which occur naturally without any causes from human behavior.

Mr. ROE. Well, then, what I am trying to get at is our definition of pollution that man has made does not necessarily stand as something newly discovered. You have heavy sedimentation or a lot of

siltation and things of that nature, that has been going on since time began, so as to speak.

Mr. SIEGEL. Sure.

Mr. ROE. And, therefore, it is something that creates—that develops itself in the natural cycles.

Mr. SIEGEL. That is right.

Mr. ROE. So that has to be dealt with in the nonpoint source relationship, too.

Mr. SIEGEL. That has to be——

Mr. ROE. What I am getting to, we had testimony from San Antonio yesterday, which has experienced wide growth and the whole bit. They have their sewage-disposal system going and they have intermittent flow in streams there. And consequently they are the source of the major sustained flow—I have forgotten the name of the river, so as to speak, which would not have occurred naturally anyway.

So that there is an interrelationship of what happens in the natural cycles before man got on to the area and how that relates.

That is all part of the nonsource relationship.

Mr. SIEGEL. But when you are deciding who is going to pay for a particular condition——

Mr. ROE. You make a very important point there. And that was a very important point made yesterday, that the idea that we speak of people being charged a fee, in their home sewage treatment is only part of the story. Because if we are putting up 75-, or 65-, or 55-percent Federal matching funds that still is coming from the whole pot. So there is a relationship not only of the user of the facility needs a sewer plant as the relationship that both the benefits—it also applies back to the general public. Do you understand what I am trying to get at?

Mr. SIEGEL. Yes.

Mr. ROE. OK. We want to just make that point.

And I think you followed further again in your testimony on page 5, and I quote from that:

> Pollution resulting from human activity may be effectively controlled, while treatment of pollution from natural nonpoint sources may not be economically feasible or even desireable.

I think that was an important point. I have more questions, but let me defer to the gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

I, too, want to commend you, Mr. Siegel, and the Department on an excellent piece of testimony. I think you outline in just plain commonsense terms what many of us—and I happen to be a farmer—really know for a fact, but lots of people do not completely understand. And it has to be explained in these kinds of terms.

What year was the Soil Conservation Service first authorized by law?

Mr. SIEGEL. 1935.

Mr. STANGELAND. 1935. And how many millions or billions has SCS expended to attempt to get farmers to adopt good management practices? Do you have any idea? Submit it for the record.

What I am leading up to is that we have had SCS since 1935, and I believe it was in the "Futures of Agriculture," the booklet put out

by USDA about 3 years ago, after 2 years of study by then Secretary Bergland, that showed there was more water and wind erosion of soils today than there was in the Dust Bowl days of the thirties when soil conservation was first started.

And that is fairly obvious because farming practices have changed from everyone having some cattle, and grass, and a pasture, and hay land to current intensive farming practices involving a great increase in the use of fertilizers, herbicides, pesticides.

It seems like the faster we run the behinder we get in this problem of erosion and pollution of streams.

[The following was received from Mr. Siegel:]

Committee request. Provide information as to the total amount of technical assistance expenditures since 1935.

Response. See enclosed table.

Soil Conservation Service

[Conservation technical assistance obligations]

Fiscai Year:	
1936	$790,974
1937	2,628,424
1938	4,076,902
1939	7,377,783
1940	13,083,529
1941	14,648,148
1942	18,973,899
1943	21,394,311
1944	21,880,272
1945	27,913,546
1946	32,952,629
1947	43,070,274
1948	37,769,128
1949	46,584,787
1950	51,426,026
1951	51,556,288
1952	53,842,054
1953	57,504,630
1954	56,344,862
1955	58,204,132
1956	62,237,407
1957	66,247,877
1958	74,726,155
1959	79,980,282
1960	81,323,566
1961	88,013,104
1962	88,906,267
1963	93,396,849
1964	96,527,266
1965	103,164,725

1973	128,150,047
1974	137,570,525
1975	153,829,696
1976	158,585,983
Transition quarter	44,228,290
1977	167,850,027
1978	189,165,641
1979	194,006,462

1980	204,239,457
1981	232,720,435
1982	240,943,631
1983	251,183,427

Mr. STANGELAND. What strategies does SCS have for the future to encourage and induce farmers to adopt better practices to prevent this kind of erosion? If we cannot do it by regulation, we have got to do it by enticements. And what new--are there any new strategies being developed?

And along that line, the chairman asked for a description of the ACP program. I would like to have you include in that description what farming practices are eligible for ACP payments.

But did you have some new, innovative strategies that are going to encourage farmers to husband their soils more carefully and as a result help in the problem of nonpoint soil pollution?

Mr. SIEGEL. I will submit additional information on that matter.

[The following was received from Mr. Siegel:]

Committee request. Provide a listing of practices eligible for an cost sharing under ACP and RCWP.

Response: Enclosed is a listing and description of ACP conservation practices and RCWP best management practices (BMP's).

(U.S. Department of Agriculture, Agriculture Stabilization and Conservation Service: ASCS Handbook, "Agricultural Conservation Program Development and General Provisions", for State and County Offices, August 29, 1980. ASCS Handbook, "Rural Clean Water Program" for all Offices, March 19, 1980, retained in subcommittee files.

Mr. SIEGEL. Well, I can open the subject briefly and then turn to someone who is a real authority, a practicing farmer like you, Peter Myers, chief of the Soil Conservation Service who is sitting here at my right.

The figures on soil erosion, it is true, are quite serious, give us great concern. Intensive, year-in-and-year-out continuous cropping of row crops is giving us this problem. We are working our good land harder and we are working a lot of additional marginal lands that should not really be in crops. It should be used for pastureland.

The statistics are serious, but along with the statistics we have a tremendous awareness on the part of today's farmer that he is seeing his soil wash away, and blow away, and that this is a precious resource that he cannot permit to have dissipated.

Fortunately, just as there is a tremendous increase in the amount of erosion, there has been a tremendous increase in the awareness by farmers of a new technique called conservation tillage. At a minimum, conservation tillage involves the use of implements and plows that do not disturb the soil as much as the traditional moldboard plow. The most comprehensive type of conservation tillage is "no-till," which is a system of not plowing up the residue from a harvested crop, leaving the residue on the soil all winter, leaving it there through the spring, and then planting the new crop down through the residue.

The benefits are that the presence of the crop residue holds the soil, prevents the soil from washing or blowing away and preserves moisture in the soil. This was a great help to many farmers during this drought. And this also saves the labor and the energy needed

to fuel the tractors that would go over the field and make many trips just to plow up the residue in the past.

Now, whether it is conservation tillage or no till, the different forms of conservation tillage are now being used on about one quarter of America's crop land. And this has been a tremendous increase just in the last decade. And at this point I do not want to say any more, because I have a practitioner of no till sitting right beside me.

Mr. MYERS. He has given you all the answers, Mr. Stangeland, but I feel very strongly that the farmers themselves are going to innovate these changes. We are concentrating along with the Extension at State universities on showing the farmers the economic benefits of these tillage practices because we feel very strongly, and you being a farmer would know, that you—it is hard to get everyone to adopt something on an ethical basis.

So we are trying to show, in dollars and cents, the soil loss, how many dollars you are losing when you lose x amount of topsoil. And we are also educating and working with Extension to show the farmers what they can save when they use the different types of conservation tillage.

And you alluded earlier to, you know, what have we been doing in these years, why is the soil loss so great. The real problem that I see traveling the country is we are farming land probably since the middle seventies that we should not be farming. It should be in grass and trees, but this is a free country and we can do this. And we have put a lot of highly erodible land into production since the price of cattle went down and the price of beans and wheat went up in the middle seventies, which you well know.

But we are working very actively with the farmers, with the Extension to promote these tillage practices along with many other things.

There is cost sharing from ACP on some of these tillage practices to directly help a farmer buy, say, a no-till planter. So there is a real massive—I think there is a revolution going on in the farm country, and the farmers themselves are going to carry the brunt of it, I really feel. Secretary Block does, too.

Mr. STANGELAND. Well, I see the revolution myself as far as no till or minimum tillage. I think it is a phenomenon that has happened within the last 5 years. But no till and minimum tillage have been around for a long time, and it has taken a long time for farmers to accept it.

I guess what my question is is how do we stimulate things like this, not only minimum tillage but strip cropping, contour farming, and terracing in some areas that need it very badly?

I do not see that severe kind of erosion in my district because it is a reasonably flat land which does not erode from waters. There is some wind erosion.

But I know Ed Jones of Tennessee, the chairman of the Agriculture Committee's Subcommittee on Conservation, Credit, and Rural Development, is very concerned about erosion in Tennessee. And I have seen slides that he has compiled of the terrible gullies that are cut in, I think it is western Tennessee, an intensely farmed area there.

I think SCS has to make some recommendation to use methods of enticing and stimulating new and better practices. A lot of farmers just do not see those dollar-and-cents figures, do not relate to them. They have the old notion that you have to plow the stuff down in order to get a crop the next year.

And some land does have to be plowed. Some land is not conducive to minimum tillage, but most land is, and I just think SCS has to really scratch its head for some new ideas. And maybe there are some incentive payments that are needed to get the job done.

Mr. Siegel, yesterday Mr. Ruckelshaus indicated USDA and EPA have agreed that USDA will support EPA's efforts to address, on a priority basis, nonpoint-source controls in each State as a part of your ongoing national conservation program.

Would you describe to the committee how you intend to implement and carry out that agreement?

Mr. SIEGEL. In each conservation district, you have an office of the Soil Conservation Service, and our employees will be encouraged to take a new look at nonpoint-source pollution especially in those areas that have been designated by EPA for particular action. The nature of nonpoint-source pollution is that it is very site specific. In some areas you have a problem that needs to be addressed and should become a great concern, in other areas, not so much. We are waiting for EPA to get us the data to show us where we need to put our resources.

Mr. MYERS. Could I address that, too?

Mr. STANGELAND. Sure.

Mr. MYERS. Congressman, we are right now in the process and just about ready to go to the field with a new training program on water quality. We are going to train all of our technicians and DC's in the field on up-to-date methods of looking at problems and solutions for water quality to go along with their sediment work.

Mr. STANGELAND. Under section 208, the Department of Agriculture has significant responsibilities with respect to the rural clean water program.

Would you summarize for the committee the agency's experience with the RCWP and what recommendations do you have for improving the program?

Mr. SIEGEL. Why don't you go ahead.

Mr. MYERS. Well, in most cases in my experience with these projects, they have done excellent work as far as controlling water quality. We have closely monitored all of these, especially within the last 6 to 10 months, part of our staff, ASCS, has reviewed each one, made some recommendations for changes in some, recommended in a few cases that we drastically change some.

Most of these rural clean-water projects have been very effective in controlling water quality. They have all done a good job of sedimentation control.

Mr. STANGELAND. Do you have any recommendations for improving the program?

Mr. MYERS. I could submit them for the record. Offhand I do not.

Mr. STANGELAND. I would appreciate it if you could do that. I have no more questions.

[The following was received from Mr. Siegel:]

Committee request: Provide recommendation for improving the RCWP.

Response: It is important to distinguish between the Rural Clean Water Program (RCWP) authorized by Section 208(j) of the Clean Water Act and the experimental Rural Clean Water Program funded by the Agricultural Appropriation Acts of 1980 and 1981.

Section 208(j), Public Law 95-217 authorized the Secretary of Agriculture with the concurrence of the Administrator to EPA to establish and carry out a nonpoint source pollution control program. Regulations were promulgated under 7CFR635 and $75 million were requested in the President's 1980 budget.

The Congress appropriated $50 million in FY80 and $20 million in FY81 to carry out an "experimental" program as a part of the Agricultural Stabilization and Conservation Service (ASCS) budget. The experimental program is being carried out in 21 projects identified in response to the above Committee Request #4 under 7CFR700 regulations.

The following suggestions are offered in the event the Congress determines to enact a nonpoint source pollution control program. They do not imply that the Administration would favor such legislation.

A nonpoint source pollution control program should serve as the implementation vehicle for water quality management plans developed in the States i.e. the program should not redo what was done under Section 208 or other water quality planning efforts.

Implementation should include the development of project specific plans prior to initiation of work.

The program should be highly focused or targeted. It should not be spread unformly across the country.

The program should miximize the use of existing USDA program authorities and interagency arrangements.

Mr. ROE. Are there any further questions? The gentleman from Georgia.

Mr. ROWLAND. Thank you, Mr. Chairman. Many States I know of enacted soil erosion and sedimentation legislation. We have in my own State of Georgia. Could you give me some idea of about how effective this is nationwide in addressing the problem we are talking about?

Mr. SIEGEL. Congressman, are you referring to regulatory programs?

Mr. ROWLAND. Right. Enacted by State legislatures.

Mr. SIEGEL. I think they are going to have a much greater effect as time goes on. A lot of them have been newly enacted. The original form of many of these State laws was to regulate urban runoff but exclude agriculture. More and more of them have addressed agriculture runoff, and we have, perhaps, 15 States around the country that have begun to take the regulatory approach. But much of it begins at the local level with soil and water conservation districts, and these soil and water conservation districts are given the power to bring complaints against particular farmers who are causing a nuisance to their neighbors.

We believe such programs should be emphasized at the local level so that farmers are being addressed by their peers. I think there is a great amount of the iceberg that we do not see because a lot of these problems are cleared up by local conciliation with the threat of regulation being the effective thing that brings parties together.

We think in the Department of Agriculture that this is one of the State and local responsibilities that should come to the fore. The job of curing soil erosion is not exclusively a Federal function. The State and the local governments should not wait for Washington to come and take care of the entire problem.

We offer voluntary programs. We offer programs of voluntary technical assistance, voluntary financial assistance.

Our programs are admittedly not going to reach every single farmer. We offer incentives, but many farmers are not willing to take our incentives. If some of these farmers are creating a problem, a site-specific problem with their lack of good management of their land, then it is a local regulatory matter. We are glad to see States and localities coming forth.

As for an overall effect, I think it is too early to tell and I think some of the effect we will never see because the existence of the sanction at the local level or at the State level is frequently enough to bring along a farmer who has a land-use problem.

Mr. ROWLAND. In your experience, do you think farmers are less concerned now with soil erosion than they may have been at one time. I ask this question because I can recall in years gone by that I would see fields that had terraces on them and I hardly ever see a field now that has a terrace in it.

And could you shed any light on whether or not you think—maybe because farmers are having a lot of trouble now, they are more concerned with getting their crops in and harvesting and they are less concerned about what is taking place with their topsoil now.

Mr. SIEGEL. The farmer has been in a tremendous squeeze with his rising costs and his declining prices for his farm products. Also, with the advent of a lot of the new equipment; some of the old terraces are not wide enough. They were built for older equipment. The new, wider equipment cannot work on a terrace. So unfortunately we have seen terraces removed from fields so that the new equipment could be used.

We have seen windbreaks cut down because the trees were getting in the way of the big equipment. Terraces have become a very expensive soil conservation technique, more expensive than in the past because of the labor and energy required to finance a terrace.

So it is unfortunate that many of the older terraces have been taken out and have not yet been replaced by newer terraces that are more amenable to new equipment.

However, conservation tillage is a management practice that does not involve constructing a terrace. It involves some special farm equipment. It involves additional attention to spraying and careful management by the farmer, but it is less expensive in terms of an extra capital outlay.

In conservation tillage, there are expenditures for spray and expenditures for certain kinds of equipment which the farmer might be replacing anyway. But nothing needs to be done structurally to the land as with a terrace.

So I think that maybe you will see fewer terraces around, but there are more opportunities for farmers to manage and handle their cropping through conservation tillage than you had in the past.

The terrace used to be our prime tool for controlling soil erosion. Now we have conservation tillage as well.

Mr. ROWLAND. And that is just, as if not more, effective than the terracing system.

Mr. SIEGEL. Well, I do not want to make a general statement. There are some fields which have such a sharp slope that conservation tillage cannot provide the sole answer. There are some areas where you need a combination of terracing and conservation tillage, but there are many kinds of farm fields where conservation tillage can do today what a terrace did yesterday.

Mr. ROWLAND. One other question I wanted to ask and you may have already addressed this question. We have talked about nonpoint sources of pollution and agricultural versus others, nonagricultural, some things that are controllable and some things that are not controllable.

Those things that are controllable, could you give me some idea about what percentage in general that is from the standpoint of agriculture?

Mr. SIEGEL. We will have to supply that for the record, the breakout between the uncontrollable and the controllable sources of stream sedimentation.

Mr. ROWLAND. Thank you very much, Mr. Siegel. Thank you, Mr. Chairman.

[The following was received from Mr. Siegel:]

Committee request: Provide an estimate of the percentage of nonpoint source pollution that is controllable.

Response: We do not have definitive information on a National scale concerning the percentage of nonpoint source pollution that is controllable. The degree to which NPS pollution can be controlled is site specific and is a function of the type of pollutant (pesticide, sediment, salt, etc.) and watershed characteristics. It is for these reasons that USDA believes that careful planning is a prerequisite of BMP implementation.

Several research activities in EPA, USFS, ARS, and elsewhere are providing indicators of the degree of controllability. Projects being carried out under the experimental Rural Clean Water Program and other USDA program authorities are providing answers relative to both the technical and institutional controllability of NPS pollution.

Existing technology indicates that it is possible to control man induced nonpoint source pollutants. Careful planning prior to BMP implementation can determine the most cost-effective level of control relative to the specific water use impairment and the watershed characteristics.

Mr. ROE. The gentleman from Minnesota.

Mr. OBERSTAR. Thank you, Mr. Chairman.

Mr. Siegel, I am very much impressed with your statement. You provided us with a wealth of factual data and more importantly, a positive attitude on the control of nonpoint-source runoff. I think that is a very, very commendable approach to the issue.

I know that EPA has been having discussions with the Department on closer coordination of ASCS and the Forest Service. What is the status of those discussions?

Have you reached any agreements, tentative agreements?

Mr. SIEGEL. Chief Myers has been taking part in those discussions and will reply.

Mr. MYERS. We are at the stage where we are drafting a memorandum of understanding at this point between the agencies. But it is still in the draft stage. We have been working very intensely on this and we have been getting great cooperation from EPA, and I think we are well on the road.

Mr. OBERSTAR. Very good. Do you feel that you have the adequate financial and staff resources to include water quality as a high priority in land management against nonpoint-source runoff?

Mr. SIEGEL. We feel that we can satisfactorily address nonpoint-source pollution with our existing manpower by judicious use of our resources. Our national conservation program will be targeting 25 percent of our funds for financial and technical assistance to areas of certified as the highest resource need.

We are taking our program away from a first-come-first-served approach around the country and we are focusing and sharpening our priorities. Our big priority in the national conservation program is prevention of soil erosion. And that is going to get the lion's share of the targeted money that we are spending.

Mr. OBERSTAR. If you are targeting your financial and human resources, you will be able to do that?

Mr. SIEGEL. We are targeting to put our resources where the need is greatest. We are not seeking any great additional increase in funds for the soil conservation program because we are confident that what our program needs more than additional funds on the top is better management, targeting, and focusing of the funds we are spending presently.

Mr. OBERSTAR. If funds were available through EPA under the 304 program where EPA can enter into agreements with other departments and agencies—there is authority in the law. There is $100 million authority. It has not been appropriated, but if it were available, would that be helpful?

Mr. SIEGEL. If there were an additional source of funds that we could train on water-quality problems, I think we could use those funds effectively.

Mr. OBERSTAR. So long as you did not have to put it in your budget; is that right?

Mr. SIEGEL. This is not a budget hearing and I am not going to give you a budget answer at this time.

Mr. OBERSTAR. All right. Now, the Department has had long-term experience with cost sharing. You have had a history of very successful experience with it.

Has it led to lack of action where funds have not been available, where funds have been theoretically available but no appropriations or no grants provided?

Have you had experience with that kind of thing? Has it delayed action on the part of farmers in conservation practices?

Mr. SIEGEL. I do not think there is a general answer. For example, in Pennsylvania, I visited a rural clean-water project in Lancaster County, Pa., a very heavy dairy-producing area. A complete manure-storage system was installed on a dairy farm with the help of rural clean water programs cost-sharing funds.

I think there was a $45,000 payment made to this farmer to put in the last word in a complete, modern, dairy-storage system. It was a very impressive thing, a big, blue metal tank.

Now, this is very helpful to the farmer. It means he can store the manure. He does not have to cart it out every day. It is a benefit to his balance sheet and his cost of operation to have this.

However, he could not have installed such a fine system with his capital resources unless there were a Federal payment available.

Now, that is the type of situation where I think without a cost-sharing program we would not have gotten that farmer into the state-of-the-art practice which takes his farm off the list of farms that were feeding pollutants into that little stream flowing next to his cow pasture.

On the other hand, some of the nonpoint-source pollution problem is indistinguishable from the general problem of controlling soil erosion. And the most effective thing and the most promising way to combat soil erosion is to convince farmers that it is in their short term as well as their long term interest in dollars and cents to practice soil conservation by means of conservation tillage.

Mr. OBERSTAR. I think that is key. I think one of the most telling points of your testimony is your observation on which page I cannot recall, that you have to demonstrate to the farmers that there is a direct benefit to them because most of the benefits are to downstream occupants of the land or riparian downstream owners who see cleaner water. But you do not see that immediate benefit to the individual farmer.

Mr. SIEGEL. If a farmer is growing corn or soybeans, if he practices conservation tillage, this may not require any cost-sharing payment to him. There are cost-sharing payments available, but most farmers are doing this without a cost-sharing payment.

They are doing it with technical assistance from the Soil Conservation Service, or possibly the Extension Service in their county, or possibly by talking to their equipment dealers and their pesticide dealers. And this is happening because it is in the culture. This is very well ingrained in the farm culture today and we want to stimulate it.

Mr. OBERSTAR. I am quite aware of that. Do you have or could you provide for the committee a compilation of the success stories such as you described a moment ago about the appearance of the farmer who was able to keep his manure stored in a shed without having to haul it out. I mean, you must have a number of success experiences of that kind that would be helpful for the committee.

Mr. SIEGEL. That would be in our monitor in for the rural clean water program and we will include that information for you.

Mr. OBERSTAR. I think if we had a list of such success stories, it would be very helpful to us.

Thank you very much for splendid and candid testimony.

Mr. ROE. Are there any other questions from the members?

[No response.]

Mr. Siegel, Mr. Myers, and Mr. Harper, we want to thank you very much for your testimony. You have been extremely helpful in setting the foundation for our review of the nonpoint source issue. We appreciate looking for the other documentation as part of our record at your earliest convenience.

So, thank you very much for being with us this morning.

[The following were received from Mr. Siegel:]

Committee request. Provide examples of nonpoint source pollution control success stories.

Response. See enclosed reports and articles.

(Note.—Reports and articles referred to were retained in subcommittee files.)

Article from the Conservation Advisor, Maple Creek Model Implementation Project, Clarkson, Nebr., April 1981.

Progress and Status of the ACP Hall County Water Quality Special Project, prepared by the Conservation Section of the Nebraska State ASCS Office 1979 Fiscal Year.

Pamphlet on the Blue Creek Watershed Project, Ilinois EPA, Dec. 1981.

The Model Implementation Program—Leasons Learned from Agricultural Water Quality Projects, February 28, 1983.

Broadway Lake Watershed Model Implementation Project, Anderson County, South Carolina, 1982 Final Report.

Maple Creek Nebraska Model Implementation Project, Final Report, December 30, 1982.

Insights into Water Quality, Indiana Heartland Model Implementation Project—Status Report, March 1981.

Spring 1983 issue of Extension Review, U.S. Department of Agriculture.

Committee request. Identify innovative techniques being used to get conservation practices applied.

Response. USDA continues to stress the application of systems of conservation practices that solve soil and water resource problems in a cost effective manner. Additional emphasis has been provided by the completion and adoption of the National Conservation Program (NCP) described in the enclosed report. Examples of innovative techniques include:

Emphasis on the use of reduced tillage systems (conservation tillage, no till, etc.) to reduce erosion, sediment, and sediment borne pollutants while conserving energy, time, and labor associated with crop production. To date, almost ⅓ of the Nation's cropland is farmed under some form of reduced tillage system.

Emphasis on the use of modern conservation practices which are compatible with today's farm equipment and farming systems. These practices include the use of new terracing concepts (tile-outlet terraces, grassed back terraces) in place of more traditional designs to control erosion and the use of broadbase, flat channel terraces to conserve water in low rainfall areas.

Emphasis on drip, trickle, and sprinkler systems of irrigation to minimize the amount of water used in irrigation.

Increased use of computer and laser technology to increase the quantity and quality of technical services provided to farmers and ranchers. This includes the development of computer models that permit technicians and landowners to quickly evaluate conservation alternatives and their impact on resource conditions, production, and productivity.

Many conservation districts have purchased or leased conservation equipment, especially no-till planters and made them readily available to farmers who want to try this technique. This has greatly increased the rate of adoption of conservation tillage systems.

(Note.—The Report referred to U.S. Department of Agriculture, Soil and Water Resources Conservation Act, "A National Program for Soil and Water Conservation", 1982 Final Program Report and Environmental Impact Statement, Issued September 1982, was retained in subcommittee's files.)

Committee request. Provide information about the status of the agreement between USDA and EPA concerning nonpoint source pollution control and recommendations as to how it can be implemented.

Response. Negotiations between the agencies are progressing satisfactorily, but the agreement has not been executed as of this date.

The disussions to this point deal primarily with the means for effectively coordinating the USDA priorities contained in the National Conservation Program with the priorities of the EPA including the use of existing authorities to address nonpoint source pollution problems. Any change in existing authorities stemming from reauthorization of the Clean Water Act would necessitate reconsideration or modification of the agreement.

Our next witness is the Honorable James L. Oberstar, a very distinguished senior member of this committee, and one has been a great leader in this Nation on water resources development, water quality, and pollution control.

So, Jim, without further ado, if you would proceed with your testimony.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF HON. JAMES L. OBERSTAR

Mr. Chairman, and distinguished Members of this Subcommittee, I am pleased to appear before you today to speak on behalf of H.R. 4037, the Nonpoint Source Control Act of 1983.

Mr. Chairman, in establishing an implementation program to control nonpoint sources of water pollution, this Subcommittee will be closing the last major gap in the Clean Water Act. This Subcommittee has over the years established and refined the programs to control municipal and industrial point sources. Under Section 208 we laid the groundwork, accumulating the data base and identifying Best Management Practices (BMP's) for a nonpoint source implementation program. But such a program has never received the Federal leadership needed to truly bring nonpoint sources under control.

The Nation pays each year a heavy toll, in dollars and in lost resources, for this lack of leadership. In many States, nonpoint sources are now a major impediment to achieving water quality standards. Water quality in our rivers and streams—in moving water—is seriously degraded by various forms of run-off. Our still waters—our lakes and estuaries, the most biologically productive waters—are the final setting places for water-borne pollutants, including choking sediments, excessive nutrients, and toxics.

Preliminary information gathered by the Conservation Foundation indicates that the total economic costs of sediment and pollutants associated with erosion may amount to as much as $2.5 to $3 billion per year. Nonpoint sources carry not only sediments and nutrients but pesticides, heavy metals, and virtually all other toxic substances. It is a serious problem in urban and suburban areas as well as in rural areas.

Many States and substate organizations have gone ahead on their own, building on the experience gained through Section 208. The National Association of Conservation Districts conducted a survey which indicates that 44 States are taking some action to control agricultural nonpoint sources. A survey by the National Council of the Paper Industry for Air and Stream Improvement indicates that 40 States are moving to implement programs for silviculture nonpoint source controls. There is considerable interest in doing much more, if funds and other encouragement from the Federal Government are forthcoming.

My bill would provide the incentives needed for a full-scale implementation program.

The bill recognizes first that, unlike point sources of pollution, nonpoint sources do not lend themselves to a national control program with national regulations and standards. Rather, controls must be developed at the State and local levels, to address local conditions. The Federal role, therefore, is to provide encouragement and leadership, both financial and other, to elevate nonpoint sources to a national priority; to assure that the Federal investment is wisely spent, and that implementation is moving forward expeditiously.

The bill acknowledges that an implementation program must, at this point, rely on incentives from the Federal level. It does not preclude enforcement; but it recognizes that the decision to establish an enforceable program must be made at the local and State levels, not at the Federal level.

H.R. 4037 further recognizes that, while there is much still to be learned about nonpoint source controls, we know enough now to begin a serious implementation program. The bill thus does not establish a whole new planning process. Rather, it builds on the knowledge, the experience, the plans already established and Best Management Practices (BMP's) already developed under Section 208 and other sections of the Clean Water Act. It is an implementation program, not a planning program.

20-955 O—84——178

Finally, my bill recognizes that the nonpoint control process must begin at the local and State levels, by those who will be involved in implementing the plans. It requires the States, in developing their implementation plans, to work closely with local agencies, such as conservation districts, 208 agencies, watershed districts and others which have experience in controlling nonpoint sources.

Briefly, H.R. 4037 requires States, working with local agencies, to develop 4-year implementation plans, specifying problem stream segments to be addressed, categories and subcategories of sources to be controlled, BMP's and other measures to be used, and to propose expeditious timetables for achieving these controls.

The bill requires States, working with substate agencies, organizations and individuals, to propose their own timetables for expeditious achievement of their goals, and to report to the Environmental Protection Agency each year on their progress in meeting these self-selected timetables. I underline the word expeditious; States are to be bold as well as realistic in setting their goals, and EPA is to insist on ambitious plans, as long as there is a realistic chance of success.

Once the State submits its implementation plan to EPA, the agency has 6 months to review it. Unless the Administrator specifically disapproves all or parts of the plan, it is automatically approved. EPA may disapprove all or portions of a plan if the State does not have adequate authority to implement it, if it is not sufficiently expeditious, or if it is otherwise inadequate.

If a State fails to submit a plan, or if its plan is not approved, a local agency may, with the permission of the State, assume implementation for its area. Such an organization must have a history of experience in nonpoint source controls, and have authority to implement a control program.

Also, a State may request EPA to provide technical assistance in developing a portion of its overall plan. The State would have to implement that portion.

States are encouraged to use programs under other laws to complement this bill wherever possible.

There is some evidence that other Federal programs may work at odds with nonpoint source controls, placing farmers or others in Catch-22 positions, or encouraging practices which would counteract nonpoint source control measures. To better coordinate the nonpoint source control effort, the bill requires the States to identify Federal programs which run counter to their nonpoint source control plans, and to recommend changes in these programs. EPS would forward these recommendations to the appropriate Federal agencies, which would be required to consider the States' comments and, to the extent possible, administer their own programs in a way that helps States implement their plans.

I hope that the cumulative comments from the States, together with their recommendations for change, would be helpful to Federal agencies in solving a problem which reaches across agency mandates, and effects the wealth of this Nation: Our lands and our waters.

The bill also extends Section 304(k), which authorizes EPA to enter into agreements with other Federal agencies, and provides supplemental funds for programs under these agencies which could assist in controlling nonpoint sources of pollution.

The bill contains a provision whereby a downstream State with an approved implementation plan may, if its waters are being adversely affected by upstream pollution, request the Administrator to call a management conference of States along the water body, and to resolve the problem between the States. I believe such an approach is fair to those States willing to do a good job. We cannot ask a State to spend its financial resources for water cleanup if its own citizens cannot enjoy the benefits, or if they are in fact damaged by pollution from another State. The management conference concept goes back to the earliest days of water pollution control and the Federal Water Pollution Control Act of 1956. I believe the negotiated approach can prove a useful means to resolve nonpoint source issues among States, and assure that those States which are willing to control nonpoint sources will not suffer from another State's indifference.

In developing their implementation plans, and in collecting whatever additional data are necessary, States are encouraged to use funds under Section 106, 205(g) and 205(j) of the Clean Water Act.

For implementing the plan, the bill provides $150 million per year on a 50/50 matching basis. The tools available would include education, training, technical assistance, cost sharing and other services.

I know that the Administration has serious concerns about cost sharing, fearing that the promise of funds, however diminutive, will encourage people to wait for dollars to become available rather than begin implementation now. I share that concern, and hope to focus on this subject throughout today's hearing. On the one hand there is clearly not enough money available for a full cost sharing program. On the

other, cost sharing may serve a purpose where the job will not and cannot be done without it.

As a further incentive to States to do as much as their own resources permit, the bill contains no distribution formula. Rather, States are encouraged to come in for as much money as they can match, although there is a cap of 15 percent of the appropriation per State.

Congress will keep close watch over how implementation is progressing during this first four years of the program. EPA is required to report annually to Congress on how the program is working, and to report, by January 1, 1988, on whether this incentive program is working, or whether stronger measures are necessary.

While this bill establishes an implementation program, it is also a learning process. We will need, between now and further legislative action, to determine what information we still need, and to make sure this program will provide the answers we will need when we revisit the legislation in 1988.

I look forward to hearing the testimony of our other witnesses today, who are the real experts in nonpoint source controls.

Mr. ROE. Please proceed.

TESTIMONY OF HON. JAMES L. OBERSTAR, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF MINNESOTA

Mr. OBERSTAR. Thank you very much, Mr. Chairman, and my apologies to you and our colleagues on the committee for not being here at the outset of the hearing. I was delayed by a car accident that caused a terrible traffic jam.

Mr. Chairman and colleagues, since the 1972 Water Pollution Control Act, the Environmental Protection Agency, in cooperation with States and agencies throughout the United States, has worked very diligently on section 208. That legislation included section 208 as an areawide wastewater-planning program with the visionary sense that we needed to address the problem of pollution from nonpoint sources, but we didn't have the information with which to address the problem.

Therefore, section 208 was considered essential to the development of a data base, which we have, to delineating best management practices, which has been done, and at this point, 11 years later, with an investment of half a billion dollars, we do have data, best management practices, numerous plans at State and multicounty agencies, but few control programs actively in place.

At risk, as a result, are streams where sediment is flowing from runoff of land that is not properly managed. Estuaries and lakes which literally act as catch basins for sediments, nutrients, toxics, heavy metals, pesticides. Those areas, cannot cleanse themselves as readily as fast-running water in streams.

It has been estimated that the negative effect of this kind of nonpoint-source runoff, the failure to put in place management programs, is $2.5 to $3 billion annually in lost resources, in the land that is losing nutrients, and in areas that are losing valuable topsoil, about the equivalent of the State of Ohio each year.

Still, with the help of the National Association of Conservation Districts, 44 States have developed some form of an action program to control agricultural runoff. Some 40 States have developed action plans to deal with forest runoff, but these are inadequate, and what we really need now is to move from the planning stage to

the implementation stage, and that is what my bill, H.R. 4037, will do.

Nonpoint-source control does not lend itself readily to a national program with a single national standard. If there is any lesson that we have learned for the last decade, it is that States and localities must be involved, because problems vary from one area of the country to the other. The Federal role must be one of leadership, must be one of providing financial incentives, and establishing priorities and stimulating the States and localities to do something.

That is what I have developed in this legislation. It is an implementation, not a planning bill. It builds on the 208 experience, but passes beyond that stage. It envisions the development by States and localities of 4-year implementation plans.

First, to specify problem stream areas; second, identify the source categories, the various categories of sources of nonpoint runoff problems which must be controlled, and, third, to identify the best management practices that are most adaptable for each area that should be used in such programs, and, fourth, to establish timetables within which to meet these goals.

The plans are to be made by the States in cooperation with conservation districts, in cooperation with 208 agencies, individuals, and localities. The States are, then, to report annually to EPA on the progress that they are making with the nonpoint-source program.

I am hoping that States will be ambitious but realistic. I think it would be unwise to insert a number of deadlines restraining the action of States, or localities, or multicounty agencies. We had too much of unrealistic deadlines set in the 1972 act. There were 135 such deadlines in that act, and my recollection is that not a single one of them was met, but I do think we have to keep the heat on both EPA and the States to implement programs.

Therefore, I choose the partnership approach. You give EPA some 6 months to review the plans submitted by the States, but if EPA does not disapprove the plan, either all or in part, then it is automatically approved.

EPA would have authority to disapprove a State's plan if the State did not have adequate authority, if it has not set an expeditions timeframe, or if in some other fashion it is not adequate, and that some provision of the bill that I think we ought to tighten up or be a little more specific about.

If a State does not submit a plan, or if the plan is not appropriate or effective, a local agency can act and go to the State and say: "Look, you have been dragging your feet, you have been waiting around. We have something we would like to do. Give us the authority to go ahead." The State will do that. They can go directly ahead with their plan, as long as they have the experience and the necessary legal authority to do so, and they can proceed with their own nonpoint-source program.

I was interested in the testimony of the previous witness about cross-compliance or coordination of State plans with other Federal agencies. My bill provides that a State would have authority to identify Federal programs that have regulations whose fundamental law runs counter to their nonpoint-source program, and would

allow such States to recommend changes to EPA which then would forward those recommendations to the Federal agency.

The previous witness suggested that Executive Order 12372 could accomplish the same goal, and it might well indeed be able to do so, and I will review that matter further; 895 authority in the past has not been adequate. I did not think it would be sufficient in the future. We don't have much of a track record with this new Executive order, but it might well serve that purpose.

At any rate, the point of the legislation is to achieve consistency among Federal programs with State programs. We sure as the dickens don't want to have a State establishing a plan only to find that a Federal Government agency is doing something that undermines or runs directly contrary to that State's proposal.

The bill also provides that downstream States may ask EPA to convene a conference of all riparian States, or those that are around a lake, or those that border on an estuary. They may ask EPA to convene a conference of all riparian States to negotiate an overall nonpoint-source-control program.

I think this practice, which was part of the initial 1956 Federal Water Pollution Control Act, proved to be a very successful program. It allows downstream States or watersharing States to express their concern with lack of progress by other participants, and to force action, but in a way that is—one in the sense of a conference of negotiation—rather than a hitting on the head with a hammer with a Federal law that nails people to the wall.

The funding recognizes that there is not enough money in the Federal Treasury in these times of limited budgets to provide grants for every need, and this bill proceeds on a cost-sharing basis, a 50-50 matching program, $150 million a year for 5 years, or $750 million. It is an adequate amount. It is certainly not all that would be necessary for the program, but I think if we can but appropriate the full amount, we will find States cooperating, and I think together with adequate targeting of resources, the job can be accomplished.

Thank you very much, Mr. Chairman. That is a summary of the legislation.

Mr. ROE. Well, we want to thank our distinguished colleague for a very splendid presentation. I think basically what you are saying is that we have laid the groundwork, primarily under the 208 section, the regional planning aspect, particularly on nonpoint, and now it is time to say: "Well what do we do with that? How do we implement it?"

How does that relate to the testimony that we have been receiving that roughly 50 percent of our pollution factors are nonpoint source? I think it is a very critical issue that has to be dealt with, and people have been asking us to deal with that issue. So I think your contribution has been very, very effective, as far as the committee is concerned.

The gentleman from Minnesota.

Mr. STANGELAND. Well, I just wanted to commend my colleague from Minnesota on an excellent presentation, and an excellent proposal, and one that certainly deserves a lot of study, and merit, and one that I think takes a commonsense approach. We all recognize

the problem of incentives to get States to do something. They need some help.

I think you make the point that there is a danger if we provide incentives if the States wait until the incentives are there before they do something. But some States, like our own Minnesota, have moved ahead well on their own. I see we are having testimony from Wisconsin, and they also have a good program. I think we have a good program through the pollution control agency, but one that can certainly be expanded and enlarged and improved upon.

I think you have got a good outline here.

Mr. OBERSTAR. Thank you, gentleman. I appreciate this, from practical experience, as one who has been on the land and understands the problems of farmers.

Mr. ROE. Would you want us to vote right now, Jim? [Laughter.]

Mr. OBERSTAR. I think we could take the vote right now in this room. I do think we can take heart from the testimony of the preceding witness, who presented some very, very practical observations, and indicated that the Department is willing to cooperate and work, and has been working vigorously.

Mr. ROE. Are there any further questions or comments?

We want to thank you very much, Jim, for your presentation.

Mr. OBERSTAR. Thank you.

Mr. ROE. Our next witness is Dr. Billy Bond, manager of Natural Resources and Economic Development for the Tennessee Valley Authority.

Dr. Bond, we want to welcome you to our committee, and if you would be kind enough to identify for the record your colleague.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF DR. BILLY J. BOND, MANAGER, OFFICE OF NATURAL RESOURCES AND ECONOMIC DEVELOPMENT

Mr. Chairman, I am pleased to appear before you today in response to your request for information about nonpoint source water pollution from agricultural and other land use practices, and about possible methods of reducing such pollution. My testimony is based on TVA's experience with nonpoint pollution since the 1930s. As a Federal agency with a regional perspective on natural resource management, TVA is interested in protecting the Tennessee Valley's natural resources and the Nation's investment in the TVA reservoir system. In the legislation that created TVA 50 years ago, the agency was charged by Congress—among its other obligations—with promoting the conservation, unified development, and wise use of natural resources in the Tennessee Valley. Although TVA has limited regulatory authority, the agency is a major force in the region for environmental protection and restoration. Citizens of the Tennessee Valley expect TVA to develop and publicize information on environmental concerns, and we believe they have confidence in our data, objectivity, and technical judgment.

Beginning in 1936, long before the Federal Water Pollution Control Act, TVA undertook a basinwide survey of water quality in the Valley and found that the most pressing source of pollution was sedimentation in streams and rivers caused by unwise agricultural and forestry practices. Today, almost 50 years later, sedimentation remains the most serious problem in the Valley. In addition, there are concerns about nonpoint source pollution from urban runoff, active and abandoned surface mining operations, and hydrologic modifications.

In this testimony, I want to share with you (1) the knowledge TVA has developed about the significance of nonpoint sources of pollution in the seven State region, (2) some of the lessons learned in working with other organizations to correct nonpoint source problems, and (3) recommendations for elements of a program to address nonpoint source pollution in a cost-effective manner.

NONPOINT SOURCE POLLUTION

In the Tennessee Valley, the most widespread nonpoint source pollutant is sediment from soil erosion. Excessive amounts of soil erosion from cropland, averaging 40 tons per acre per year and ranging up to 200 tons per acre per year on some farms, are seriously affecting water quality and fisheries in western Kentucky, western Tennessee, northern Alabama, and northern Mississippi. As a result of this and other factors, many of the Nation's streams and rivers do not meet the interim 1983 goal of the Clean Water Act for protection and propagation of fisheries populations. In addition, deposition of eroded topsoil in rivers and streams has seriously reduced drainage capacity causing extensive flooding and swamping of formerly productive cropland and pasture, damage to bridges, and massive timber kills. In one 8-county area of the western part of the Tennessee Valley, more than $11 million of damage is estimated to occur each year to agricultural crops and timber resources. In another 14-county area of west Tennessee the damage is estimated at $75 million each year. In western North Carolina, sensitive trout populations have been eliminated from agricultural watersheds with accelerated cropland erosion. Runoff of pesticides, nutrients, and bacteria from agricultural activities have degraded fish populations, increased nutrient loadings to TVA reservoirs, and could affect public health.

Sediment losses and associated acid runoff from surface mining operations is the second most serious nonpoint source problem. Past unreclaimed strip mining for coal has severely affected aquatic life, and runoff from abandoned mine lands is causing nonpoint source pollution in some locations in north Alabama, east Tennessee, and southwest Virginia. One especially troublesome area is Upper Bear Creek Reservoir, a TVA impoundment in north Alabama. The Upper Bear Creek project was built to provide recreation and a quality regional water supply for future economic development. Today these uses are being threatened by sediment buildup and acid runoff from abandoned mine lands.

Other mining activities are also causing serious nonpoint source pollution. Sediment from mica and feldspar mining in western North Carolina has destroyed natural aquatic communities in over 100 miles of the Nolichucky River. In many places, silt has buried aquatic plants and animals, altered feeding and spawning habitat, and suffocated fish by coating their gills. The silt has also constricted the flood-channeling capacity of area streams and has eliminated all flood-storage capacity behind Nolichucky Dam (Davy Crockett Lake). The subsequent retirement of the power units at Nolichucky Dam has resulted in an average energy loss of 50,000 MWh worth $1.1 million per year at TVA's current rates.

In many waters, designated uses continue to be impaired by nonpoint sources despite expenditures for point source abatement. A good example is the Ocoee River Basin in southeast Tennessee. For decades, water quality conditions in a 30-mile stretch of the Ocoee River have been adversely impacted by point and nonpoint source pollution from the Copper Basin. Initially 30,000 acres were denuded as a result of clearcutting and sulfate emissions from copper smelters. Industry has spent approximately $10 million to control point source pollution and reclamation efforts have restored some vegetation on 22,000 acres. However, the failure to control nonpoint source pollution from the remaining unreclaimed land and toxic metals from the plant site continue to cause the river to be a biological desert. Other impacts also include the elimination of essentially all storage capacity at Ocoee Reservoir No. 3 and reductions in capacities at Parksville Lake (Ocoee Reservoir No. 1).

Urban nonpoint source pollution is more complex than agricultural and mining sources. Raw sewage diluted by runoff is being released to urban streams in the Bristol area of Virginia and Tennessee; Chattanooga and Knoxville, Tennessee; and Asheville, North Carolina. Erosion and sedimentation from construction activities are choking urban streams, causing flooding, and eliminating aquatic life. Pollutants washed off industrial land, leached from solid waste disposal sites, and discharged from frequent spills are also common contributors to poor water quality. One of the more critical water quality problems in the Valley involves urban runoff in Knoxville, Tennessee. Water quality studies conducted as part of the Section 208 planning program showed that fecal coliform bacteria, oxygen-demanding material, nutrients, and metals were the major pollutants in stormwater runoff to tributary streams and Fort Loudoun Reservoir.

NONPOINT SOURCE POLLUTION CONTROL ACTIVITIES

TVA has addressed poor water quality from nonpoint sources through its traditional role of research, demonstration, participation in cooperative water quality improvement projects with other agencies, and more recently as a leader and facilita-

tor in focusing the attention of regulatory agencies and the public on water pollution.

In the early days, TVA was instrumental in reforesting millions of acres of badly eroding land in the Valley. Some of the most highly eroded lands are now forests that look as if they had never been disturbed. In the 1960s TVA placed emphasis on comprehensive demonstrations of multiple soil conservation and land management practices in specific watersheds to help increase the economic base of agricultural communities while reducing erosion. For two of these demonstrations, Chestuee Creek watershed in Tennessee and Parker Branch watershed in North Carolina, the average net cash income per farm on test-demonstration farms increased three to fourfold over five years with the implementation of soil conservation practices and land management changes. With reduction in sediment transport by 45–70 percent, soil conservation practices were shown to be effective in improving water quality. The key to higher farm income and better water quality involved the combination of demonstrations, interagency cooperation, educational activities, and local involvement.

Unfortunately, when the decision to plant "fencerow to fencerow" was made in 1972, farmers in west Tennessee began planting soybeans on soils that are highly susceptible to erosion. Large equipment tore up the old terraces and serious erosion once again became evident. By the late 1970s cropland erosion averaged 40 tons per acre per year in 21 counties of west Tennessee.

In 1979 TVA, the U.S. Department of Agriculture, and land grant universities began a cooperative program known as Save Our Soil (SOS). The program emphasized the use of conservation tillage, water management practices, and winter cover crops in west Tennessee. This six-point multiagency program involving demonstrations, educational efforts, cost sharing incentives, and technical assistance was targeted at "hot spots" of agricultural erosion and degraded water quality. One portion of the program involves cooperative demonstration farms with The University of Tennessee. The key element involves preparation of a conservation plan containing best mangement (BMPs) for each farm and an agreement signed by the farmer to implement the recommended BMPs in this plan. This agreement is a prerequisite for receiving cost-sharing incentives provided by the program. Those not complying are dropped from eligibility.

On 144 of these demonstration farms, soil loss has been reduced 74 percent with implementation of BMPs in the plans, saving more than 300,000 tons of topsoil each year. In the first four years of this demonstration program in west Tennessee, the farmers implemented almost 100 miles of terraces, 65 acres of waterways, 350 sediment basins, 11,000 acres of drilled soybeans, and 7,000 acres of no-till. Crop yields have increased and production costs have gone down. Experience with these BMPs in west Tennessee have shown that labor costs are reduced about 50 percent, and about 350 gallons of diesel fuel are saved for each 100 acres cropped using conservation tillage.

Research projects have demonstrated that no-till reduces soil loss about 90 percent and drilling soybeans reduces soil loss about 65 percent over conventional tillage in the area. Long-term studies show soybean yields are increased 3–5 bushels per acre using drilling and corn yields are increased 10–12 bushels per acre using no-till compared to conventional tillage.

In west Tennessee and surrounding areas, these demonstrations are showing farmers that it pays to implement BMPs as part of conservation plans. In fact, since 1979 use of no-till has increased from 40,000 acres to 225,000 acres in the area. The entire six-point west Tennessee program has resulted in the implementation of BMPs on almost 600,000 acres of cropland—with an annual reduction in soil loss of over 4.5 million tons—over the last three years. This success story illustrates the importance of interagency cooperation, the utility of targeting incentives and technical assistance to "hot spots" of nonpoint source pollution and the significance of securing commitments to implement BMPs through long-term agreements and conservation plans. However, less than 25 percent of the program has been addressed in west Tennessee, and water quality may not improve sufficiently to restore designated uses until BMP implementation becomes more widespread.

TVA has been actively involved in seeking implementation of control measures for other than agricultural sources of nonpoint pollution. In the 1960s TVA pioneered many of the techniques for reclaiming strip mined lands and included reclamation provisions in its coal procurement contracts more than a decade before enactment of the 1977 Surface Mining Control and Reclamation Act. Recently, TVA has carried out successful reclamation demonstrations in the Upper Bear Creek and Nolichucky River watersheds. However, in undertaking these nonpoint source demonstrations TVA has noted that the voluntary followup measures needed to implement

the results of demonstrations have been less than satisfactory. We have also found interstate pollution problems to be particularly vexing. One such example is the Nolichucky River. In 1981 TVA, working with the State of North Carolina, Soil Conservation Service, the Region D Council of Governments, private landowners, and the mining industry was able to reclaim 41 acres of abandoned feldspar and mica mines. In 1982 and 1983 approximately 161 and 46 acres, respectively, were reclaimed primarily with TVA funds. Today, 357 acres remain unreclaimed and local cooperators are being forced to seek special State legislation to finish the project. At present the financial commitment by North Carolina to gain implementation of BMPs on the abandoned mine land, tailings piles, and active mined land remains uncertain. In the meantime downstream residents of Greenville and Jonesboro, Tennessee, have to contend with abrasive wear and clogged intakes at their public water supply systems.

In addition to serving as a facilitator, TVA has also sought and accepted responsibility from the Governor of Tennessee under Section 208 of the Clean Water Act as an area management agency for nonpoint sources of pollution originating from properties under TVA custody and control. We have developed best management practices (BMPs) in forest harvesting; we have provisions for using BMPs to control erosion and sedimentation from land disturbing activities as part of deeds, easements, leases, and permits issued by TVA; and we are developing requirements for BMPs in our agricultural license for crop production on TVA lands that are consistent with State nonpoint source programs. But this land under TVA control represents only a small portion of the land in the Valley, and the cumulative impact of nonpoint sources of pollution on the streams and reservoirs in our region needs to be addressed.

The other major nonpoint source issue being addressed by TVA involves the improvement of the quality of reservoir releases. In 1978, TVA completed a comprehensive assessment of the impact of its dam releases on downstream water quality and use. We are currently completing a 3-year exploratory program on improving dissolved oxygen in our reservoir releases. Improvements in aeration devices have enabled us to increase dissolved oxygen concentrations in water released through turbines by two to three mg/l at Norris Dam. We believe it would be useful for the Tennessee River Valley to be recognized as a national demonstration region for state-of-the-art water quality improvement technologies. Such a cooperative project, conducted to collaboration with the U.S. Environmental Protection Agency, would build on TVA's experience of the last three years to demonstrate technologies for improving water quality downstream of dams and to evaluate the benefits that accrue from water quality improvement. This demonstration would be useful to Congress in deciding how dam-related water quality impacts can be addressed nationally. For the Committee's use, we are attaching as an appendix to our testimony a proposal that describes such a demonstration in greater detail.

SUMMARY

The abuse of land resources and the failure to use wise land management practices stands out as one of the most serious and neglected of the major environmental issues facing this Nation. One major result of this abuse and mismanagement is nonpoint source pollution. It is TVA's experience that existing mechanisms for implementing nonpoint source measures generally are not working and that any benefits tend to be localized in nature.

An important first step in addressing nonpoint source pollution is the identification of watersheds where nonpoint sources are known or suspected to be major contributors to poor water quality and the development of priorities for resolving the impacts. In developing priorities, State water quality standards should not be the sole criterion because many States have not adopted standards applicable to pollution from sediment, eutrophication from excessive nutrient loadings and toxic materials that may have nonpoint source origins. Existing standards also fail to sufficiently recognize the inherent differences among streams, lakes, reservoirs, and estuarine waters. It is essential that the identification of priority nonpoint source problem areas are based on impacts to other potential uses as well as violations of existing standards.

A key element in TVA's approach in organizing interagency cooperative projects has been the Federal presence and TVA's willingness to serve as a facilitator to get others to cooperate on a regional, sometimes interstate basis. Many of the Nation's serious water quality problems are interstate in nature. EPA maintains it presently has sufficient authority and responsibility to oversee the preparation and implemen-

tation of measures to improve water quality. What is needed, then, are sufficient resources for EPA to exercise this authority.

For a nonpoint source management program to succeed, Federal, State, and local cooperation is essential to focus coordinated efforts on high priority watersheds. TVA has found that different Federal agencies have valuable capabilities and experience essential to finding solutions to nonpoint source pollution. In such cooperative efforts, educational activities are essential to keeping the land user informed about the environmental impacts of his land management practices as well as the benefits he would reap by implementing best management practices. In addition, State legislation or local ordinances may be needed to gain compliance. Good examples include Iowa's approach to soil erosion or North Carolina's approach to urban erosion control and stormwater management. It is also clear that such cooperative efforts should be targeted to watersheds with priority nonpoint loadings first and then being applied uniformly over entire States.

To sum up: It is TVA's experience that a system of incentives tied to a cooperative effort among key Federal, State, and local agencies is the most effective way to achieve sound land management practices for improvement and protection of water quality. TVA believes that the success achieved to date by the cooperative west Tennessee agricultural soil erosion control program is due in large part to agreements made with farmers for implementing recommended BMPs as part of their conservation plans. Eligibility for participation in the program with its cost sharing and fertilizer incentives, is contingent on this commitment to implement specific, recommended BMPs.

We are frank to say, however, that it is premature to reach any definitive conclusions regarding the ultimate success of TVA's approach on a national scale. However, Congress should give serious consideration to supporting selected demonstrations in other parts of the country that might include such incentives as cost sharing and increased technical assistance in implementing BMPs. Congress should also consider the utility of selected disincentives, such as possible loss of cost sharing or other Federal assistance, as a tool for securing BMP implementation. TVA will, of course, communicate to Congress further results of its demonstrations in Tennessee, Alabama, and Mississippi as they are available.

In addition, consistency among all Federal agencies to ensure that their programs do not contribute to adverse water quality impacts from nonpoint pollution will set the example for State and local efforts to restore water quality in areas with priority problems.

National Demonstration of Methods To Improve the Quality of Reservoir Releases

EXECUTIVE SUMMARY

Major water resource project development in the United States during the last half century has proceeded on a scale that is without precedent and that is nothing less than phenomenal. Existing projects will continue to generate major economic and social benefits for many years to come. Experience in the operation of water projects, however, reveals that environmental and social impacts can be incurred which, to varying degrees, reduce overall project benefits. Among the major adverse and costly effects is water quality deterioration downstream from dams, a problem that is typically most acute in controlled large river systems having multiple dams and reservoirs. Similar effects may also occur in single dam projects or on smaller controlled streams where high nutrient input from the watershed combines with project design features to induce stratification and related water quality deterioration in deeper parts of reservoirs. The principal downstream effects of water quality impairment are reduced sport and commercial fisheries, increased treatment costs for municipal and industrial water users, and reduction of the natural waste treatment capability of the stream.

The general public, industry, and government at all levels, have now begun to recognize these widespread problems. As a result, there should be an organized effort to define the extent of the problem and to devise and test means for mitigation. TVA has accumulated a wealth of background water quality information from operational water resource projects within the Tennessee River system and has begun to identify opportunities for water quality improvement through dissolved oxygen enhancement and streamflow reregulation. Lack of adequate funding, however, has precluded the protracted and systematic investigations needed to test and prove mitigation methods having promise of national applicability.

TVA is proposing a demonstration of national significance involving three major evaluations of the efficacy of water quality enhancement and streamflow regulation downstream of dams. The demonstration would be conducted under the auspices of the Environmental Protection Agency because of the agency's mandate ". . . to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." The demonstration will identify the benefits resulting from these measures and the social and monetary costs, including unavoidable increases in power costs. This work could begin in 1984 or 1985. The proposed evaluations would have an overall cost of approximately $21 million and would require from three to five years to complete.

TENNESSEE VALLEY AUTHORITY PROPOSAL FOR A NATIONAL DEMONSTRATION OF METHODS TO IMPROVE THE QUALITY OF RESERVOIR RELEASES

Introduction

Over the last 50 years most of the best sites for large-scale water resource projects have been developed in the contiguous United States. These projects, with their long service lives, have provided and are continuing to provide major economic and social benefits to the country. The majority of these projects were constructed for purposes such as flood control, navigation, hydroelectric power, and water supply. Little consideration was given to downstream water quality and uses, particularly in older projects. Stated another way, water quality impacts and effects on downstream uses were often either not fully anticipated or considered as acceptable trade-offs to achieving the "higher valued" primary purposes of the project.

In recent years scientific research has begun to assess what changes occur when a river is impounded. This has indicated that reservoir water quality improves and associated benefits increase initially with impoundment. However, as the impoundment ages or begins to change because of nutrient enrichment, water quality may deteriorate. One indication of this naturally occurring process is poor water quality in the releases from some reservoirs, particularly from lower levels in stratified reservoirs with long storage or retention times. Dissolved oxygen concentrations can approach zero (mg/1) and dissolved iron and manganese, hydrogen sulfide, ammonia, and turbidity often reach levels that are undesirable.

The operation of dams may also alter water temperatures which can have significant effects on downstream fisheries. These altered water quality conditions affect recreational fishing, municipal and industrial water supplies, and the ability of the river to assimilate treated waste waters.

In situations where there is only one dam, the downstream impacts may be localized; however, the cumulative impacts of multiple dams may extend for many miles and severely limit the capacity of downstream reaches to support present and future water uses. This is a major resource management problem, the solution of which may involve technological and operational modifications at the dams, more stringent point and nonpoint source pollution controls in the drainage basin, and/or the more controversial issue of possible project reevaluation and reallocation of project purposes. No comprehensive study has been undertaken at the national level to demonstrate and evaluate methods of improving reservoir releases in this context. Recent litigation, legislative proposals, and renewed public interest on improving water quality highlights the need for such an investigation.

PROPOSAL FOR A NATIONAL DEMONSTRATION

The Tennessee Valley Authority proposes a demonstration of national significance to identify, test, and evaluate measures that can mitigate the adverse impacts of reservoir releases. TVA, with its large integrated system of dams and a long history of carrying out a variety of national demonstrations under its statutory mandate, is an ideal choice for this purpose. With its diversified technical and operational expertise, TVA is also uniquely capable of identifying and evaluating the associated costs and constraints of any such demonstration.

The TVA reservoir system has the following characteristics essential to such a demonstration:

1. An integrated system of dams similar to those built in other regions of the country that currently exhibit the water quality conditions previously described.
2. A moderate range of climatic and hydrologic conditions that would allow any findings to be tranferable to other areas.
3. An organization capable of addressing technological, institutional, and operational considerations at the local as well as national level.

4. An existing body of knowledge about the chemical, biological, and physical conditions at most of the dams in the TVA integrated water control system.

As a water resource management agency, TVA is familiar with water quality issues at the national and regional level.[1 2] With respect to dams, TVA's 1978 report on reservoir releases is one of the most comprehensive documents ever assembled on dam-related water quality concerns.[3] The report not only identified where problems exist in the TVA system but suggested potential mitigative actions and recommendations for future work. Following this study, TVA began a 3-year experimental program on improving dissolved oxygen downstream of its dams. Results from the first two years include initial field testing of several alternatives for increasing dissolved oxygen and minimum streamflows.[4 5] This research has resulted in TVA becoming the national leader on this environmental issue.

The demonstration being proposed by TVA would be applicable to individual water resource projects and integrated basin-wide systems. It would also enhance the waste management flexibility of water users in the near term. With comprehensive national planning and implementation, the proposed water quality improvement methodologies could become the focus of a national effort to enhance and conserve water resources for the protection and propagation of fish and other aquatic life, wildlife, recreation, water supply, agriculture, industry, and other necessary and appropriate uses. It would also be a logical extension to the Environmental Protection Agency's [EPA] water quality efforts under the Clean Water Act. As a result, the demonstration should be carried out under the auspices and funding of EPA.

TVA and EPA presently maintain a cooperative agreement that could be utilized for this purpose. The demonstration and TVA's participation in the program would build on TVA's experience and would examine, in depth, the effects of and potential solutions to water quality problems such as low dissolved oxygen, temperature fluctuations, iron, manganese, hydrogen sulfide, and ammonia. The proposed activities outlined in the following workplans are within TVA's capability and are expected to take from three to five years to complete.

Under the TVA Act, dams and reservoirs are required to be operated primarily for navigation and flood control and, to the extent consistent with these purposes, for the generation of power. The proposed activities would not affect navigational and flood control purposes; however, revised operational schedules will result in shifting power releases to off-peak hours and possible increases in spilled water. When this adversely affects power system costs, reimbursement expenses are identified.

HOLSTON RIVER BASIN PROJECT

Objective

This project would demonstrate methods to alleviate low dissolved oxygen, intermittent streamflow, and incompatible water temperatures in a highly developed watershed (see diagram).

WATER CONTROL
SYSTEM

Test site

This project would be conducted in the Holston River basin, which is located in the northeastern part of the Tennessee Valley. The basin is heavily industrialized, especially in the Bristol-Kingsport-Johnson City area. The drainage area upstream of Cherokee Dam is 3,776 square miles. There are six TVA dams in this subbasin. These dams regulate most of the river basin, but long reaches of the river are still unimpounded.

Releases from these dams are generally low in dissolved oxygen during the summer and early fall. At times, dissolved oxygen levels in certain of the reservoir releases approach zero. Each of these dams provides peaking capacity hydropower to the TVA system. Consequently, flows are interrupted for extended periods. Also during certain times of the year, the temperature range of release water can have adverse effects on existing downstream fisheries.

Reservoir releases in the uppermost part of the basin have the potential to significantly enhance downstream trout fisheries. Releases from Cherokee, the large dam near the lower end of the river, have the potential to support a major warmwater fishery. The enhancement of a warmwater fishery during the test period would be a goal of this project.

Testing measures

During the testing period, the releases from the Cherokee, Fort Patrick Henry, Boone, South Holston, and Watauga/Wilbur Dams would be regulated to increase dissolved oxygen to various concentration levels up to State and Federal criteria levels. The oxygen levels would be increased by methods that can result in demonstrating the most promising techniques for national application. Various ranges of minimum flows will also be maintained for evaluation below South Holston, Watauga/Wilbur, and Cherokee Dams.

Releases from these dams would be scheduled during the course of the year to enhance the fishery downstream of the dams. Computer modeling would be used to identify the operational mode needed to achieve objectives. As part of this project, site-specific aquatic life criteria for selected fish species would be examined.

Timeframe

The tests to enhance dissolved oxygen and minimum flows would be conducted over a 5-year period, and the tests to enhance temperature conditions would be conducted over a 3-year period.

Resource requirements

The hydroelectric units at these dams are principally used for peaking purposes. Thus, the power generated by these dams is used in lieu of more costly sources of power and is therefore very valuable to the power system. The above tests would result in some loss of power production efficiency and releases during off-peak hours when the power is worth much less. This differential represents a direct economic loss. As a result, the power system must be reimbursed for any power losses. It is estimated that this cost is approximately 50 percent of the total project costs. The other major cost is the more extensive technological measures that would be required to increase dissolved oxygen to recommend State and Federal levels. The dissolved oxygen, minimum flows, and temperature-related tests would cost approximately $13 million. The design and evaluation costs are $4 million with a total estimated project cost of $17 million as indicated in the following table.

[In million of dollars]

UPPER BEAR CREEK PROJECT

Objective

This project would demonstrate methods to increase dissolved oxygen and reduce concentrations of iron, manganese, hydrogen sulfide, and ammonia in low-level reservoir releases from nonpower projects.

Test site

The project would be located in the Bear Creek basin, in the southestern part of the Tennessee Valley. The basin has a drainage area of 946 square miles. There are four relatively small TVA dams in the basin. One of the purposes of these dams is water supply. At times, releases from the Upper Bear Creek Project are high in iron, manganese, hydrogen sulfide, and other undesirable constituents. These constituents adversely affect the downstream fishery.

Demonstration measures

During the demonstration period, mixing oxygenation of the hypolimnetic waters with epilimnetic waters in the reservoir will be examined as a means of improving water quality without increasing dissolved nitrogen concentrations. This approach would allow precipitation and settling of the undesirable constituents in the reservoir instead of being released downstream. It would also avoid "gas bubble" disease in fish that could result from increased dissolved nitrogen levels from low-level reservoir releases.

Timeframe

The tests would be conducted over a 3-year period.

Resource requirements

Total cost including design and evaluation is estimated to be $2 million as indicated in the following table.

[In millions of dollars]

	Fiscal year—		
	1984	1985	1986
Upper bear creek project subtotals	0.8	0.6	0.6

VENTABLE TURBINE PROJECT

Objective

This project would involve the development and testing of a prototype "ventable turbine," i.e., a replacement turbine wheel that is designed to achieve maximum air aspiration at minimum power losses.

Test site

Tims Ford and Norris Dams are among the most likely candidate sites for the prototype turbine demonstration. Each project has the potential for significantly enhancing a year-round cold water fishery and they both experience seasonally low concentrations of dissolved oxygen and inadequate minimum flows. The Tims Ford is being investigated by TVA in 1983 for releases of dissolved iron and manganese.

The Tims Ford project is located in middle Tennessee on the Elk River. The basin upstream of the dam drains approximately 529 square miles in a predominantly rural area. Norris Dam is in east Tennessee on the Clinch River. The Basin upstream of Norris Dam drains approximately 2,912 square miles of rural Appalachia predominated by agriculture and coal mining.

Testing measures

The first phase of this activity would be conducted primarily at a manufacturer's hydraulic test facility. Specific design calculations will be made to create low pressure regions on the downstream side of a turbine to achieve maximum air aspiration and minimum power losses. Computer modeling will be used to develop the final design. Based on this design, a model turbine will be built and tested. If test

results are favorable, a prototype unit will be installed and field tested at an existing hydropower facility. The field testing will include index testing with and without aeration, measuring dissolved oxygen uptake and the concentration of total dissolved gases, water quality and fisheries studies, and monitoring turbine cavitation.

Timeframe

Developing and demonstrating an enhanced turbine runner design will require approximately 5 years. Two years are needed for designing and developing the runner at the manufacturer's test facilities. Fabrication and installation will require another year, and two years will be needed for field testing the prototype turbine wheel.

Resource requirements

Using Tims Ford as the potential test site, the cost for the design and model tests of a new turbine runner is estimated to be $550,000. Fabrication and field testing is approximately $940,000 with an installation cost of approximately $310,000. The outage cost while the unit is being installed could be as much as $600,000, depending on the time of year and hydrologic conditions. (Note.—If Tims Ford is selected as the test site, the installation and outage cost would be paid by TVA.)

The resource requirements for Norris Dam or any other project were not estimated, but they would likely be higher than Tims Ford.

[In millions of dollars]

	1984	1985	1986	1987	1988
Prototype turbine project, subtotals	0.5	0.9	0.8	0.1	0.1

ECONOMIC CONSIDERATIONS

Determining who will pay the costs and under what arrangements are important considerations in improving the quality of releases from existing dams.

As a result, the demonstration will include an evaluation of the financial aspects of the most promising water quality improvement methodologies in TVA's study as well as those demonstrated by other agencies. This would include an economic analysis, a cost allocation, and the exploration of potential cost-sharing arrangements. The economic analysis would be done in accordance with the criteria applicable to Federal water resource development agencies. Presently, these are the *"Principles and Guidelines for Planning Water Projects"* which were approved by the President on February 3, 1983. Allocation of costs would be undertaken in accordance with the separable Cost-Remaining Benefit Method, which is the procedure commonly used by the U.S. Army Corps of Engineers and other Federal water planning agencies, including TVA.

Cost-sharing policies and procedures for collecting user fees are not as well established. Thus, various alternatives would be identified and examined. This examination would extend to assessing the feasibility of the alternative schemes and their appropriateness. As part of this process, beneficiaries would be identified along with possible arrangements for their participation in a cost-sharing and reimbursement scheme.

Conclusion

It is recommended that Congress authorize and fund an EPA demonstration utilizing the Tennessee River system as a vehicle for testing and evaluating dam-related water quality improvement technologies under which TVA would conduct these demonstrations. EPA would oversee this program because of its mandated responsibilites for water quality conservation and the fundamental implications the demonstration would have for improving water quality nationally. The cost for the program is approximately $21 million. The tests will take 3 to 5 years to complete. During this period TVA will provide periodic reports to EPA and Congress on the effectiveness of the various water quality improvement methodologies. A final report will also be prepared summarizing the results of the program, their implica-

tions, and recommendations on how dam-related water quality impacts could be addressed nationally.

Mr. ROE. Please proceed.

TESTIMONY OF DR. BILLY BOND, MANAGER, NATURAL RESOURCES AND ECONOMIC DEVELOPMENT, TENNESSEE VALLEY AUTHORITY: ACCOMPANIED BY DR. ALFRED DUDA, MEMBER OF TVA'S ENVIRONMENT QUALITY STAFF

Dr. BOND. Thank you, Mr. Chairman.

My colleague is Dr. Alfred Duda, who is a member of TVA's Environmental Quality staff.

As mentioned, I am Bill Bond, manager of TVA's Office of Natural Resources and Economic Development. My presentation today is based on TVA's experience with nonpoint pollution since the 1930's.

As a Federal agency with a regional perspective on natural-resource management, TVA is interested in protecting the Tennessee Valley's natural resources, and the Nation's investment in the TVA reservoir system.

In our testimony, we want to briefly share with you, first, the knowledge TVA has developed about the significance of nonpoint sources of pollution in the seven-State region; some of the lessons learned in working with other organizations with direct nonpoint-source problems; and recommendations for elements of a program to address nonpoint source pollution in a cost-effective manner.

In the Tennessee Valley the most widespread nonpoint-source pollution is sediment and soil erosion. Excessive amounts of soil erosion from cropland averaging 40 tons per acre per year and ranging up to 200 tons per acre per year occur on many farms in the region, especially in western Tennessee.

In one 14-county area in western Tennessee, more than $86 million of damage is estimated to occur each year to agricultural crops and timber resources because of sediment and flooding caused by eroding soil.

Sediment losses from coal and other mining activities are also causing serious nonpoint source pollution. Sediment and acid mine drainage are threatening water quality in the Upper Bear Creek Reservoir in northwestern Alabama. Sediment from mica and feldspar mining in western North Carolina has destroyed natural aquatic communities in over 100 miles of the Nolichucky River. The silt has also constricted the flood-channel capacity of various streams, and has eliminated all flood-storage capacity behind the Nolichucky Dam. The subsequent retirement of the power units at this dam has resulted in an average energy loss of 50,000 megawatts hours worth $1.1 million per year at TVA's current rates.

The failure to control nonpoint-source pollution and toxic metals from the Copper Basin in southeast Tennessee is also adversely impacting a 30-mile stretch of the Ocoee River. This impact is expressed in terms of no biological life in the river, elimination of essentially all storage capacity at the Ocoee Reservoir No. 3, and reductions in capacities at Ocoee Reservoir No. 1.

20-955 O—84——179

If we summarize the water quality situation at Tennessee Valley, 7 of the 10 critical water problems have nonpoint-source origins. TVA has attempted to address poor water quality from nonpoint sources through the use of demonstrations, educational efforts, cost-sharing incentives, and technical assistance, and cooperation with public and regulatory agencies. Recently, TVA, the Department of Agriculture, and land-grant universities began a cooperative program known as Save our Soil in western Tennessee. This six-point, multiagency program is targeted at hotspots of agricultural erosion and degraded water quality.

One portion of the program involves demonstration farms conducted in cooperation with the University of Tennessee. A key element of the program involves the preparation of a conservation plan containing best management practices, BMP's, for each farm, and an agreement signed by the farmer to implement the recommended BMP's. This agreement is a prerequisite for receiving cost-sharing incentives provided by the program. Those not complying are dropped from eligibility.

On 144 of the demonstration farms, soil loss has been reduced 74 percent with implementation of BMP's and the plans, saving more than 300,000 tons of topsoil each year.

In the first 4 years of this demonstration program in west Tennessee, the farmers implemented almost 100 miles of terraces, 65 acres of waterways, 350 sediment basins, 11,000 acres of drilled soybeans, and 7,000 acres of no till. Crop yields have increased, and production costs have gone down. Experience with BMP's in west Tennessee has shown that labor costs are reduced about 50 percent, and about 350 gallons of diesel fuel are saved for about each 100 acres of crops using conservation tilling.

Research projects in the region have demonstrated that no till reduces soil loss about 90 percent, and drilling soybeans reduces soil loss about 65 percent over conventional tilling.

Long-term studies show soybean yields are increased 3 to 5 bushels per acre using drilling, and corn yields are increased 10 to 12 bushels per acres using no till compared to conventional tillage.

In west Tennessee and surrounding areas, these demonstrations are showing farmers that it pays to implement BMP's as part of their conservation plan. But in 4 years, less than 25 percent of the erosion problem has been treated, and water quality may not improve sufficiently to restore designated usage until BMP implementation becomes more widespread.

Other ongoing nonpoint-source pollution-control problems include land reclamation projects in the Upper Bear Creek and Nolichucky River watersheds. These projects are being undertaken not only to correct onsite environmental damages, but to protect against further water-quality degradation in TVA reservoirs.

In addition to these efforts, TVA is also addressing the issue of poor water quality in reservoir releases. Thusfar, we have been able to increase dissolved oxygen concentrations by 2 to 3 milligrams per liter by aerating turbine releases. Since this is a national as well as a regional concern, it seems appropriate for the Tennessee Valley to serve as a national demonstration region to identify how dam-related water quality impacts might be addressed. Ad-

ditional details on this issue are included in the comprehensive statement that I presented for the record.

Across the Nation, nonpoint sources of pollution not only prevent our attaining the goals of the Clean Water Act, but they threaten public investment in water-resource projects, and force the public to bear added costs of uncontrolled pollution.

Demonstrations and scientific studies have shown that best management practices do control nonpoint-source pollution from agriculture and urban runoff. Unfortunately, it has been TVA's experience that the present programs for nonpoint-source control do not work. Based on our work in the Tennessee Valley, a system of incentives tied to a cooperative effort among key Federal, State, and local agencies is an effective way to achieve sound land management practices for improvement and protection of water quality.

TVA believes that the success achieved to date by the cooperative West Tennessee agricultural soil erosion control program is due in large part to agreements made with farmers for implementing recommended BMP's as part of their conservation plan. Eligibility for participation in the program with its cost sharing and fertilizer incentives is contingent on this commitment to implement specific recommended BMP's. We are frank to say, however, this morning that it is premature to reach any definite conclusions regarding the ultimate success of TVA's approach if used on a national scale.

However, we think Congress should give serious consideraton to supporting selected demonstrations in other parts of the country that might include such incentives as cost sharing and increased technical assistance in implementing BMP's.

Congress should also consider the utility of selected disincentives, such as possible loss of cost sharing and other Federal assistance as a tool for securing BMP implementation.

TVA will, of course, communicate to Congress further results of this demonstration to attain water-quality improvement in the region as they are available.

In addition, consistency among all Federal agencies to insure that their programs do not contribute to adverse water-quality impacts from nonpoint pollution will help set the example for State and local efforts to restore water quality in areas with priority problems.

We appreciate this opportunity, Mr. Chairman, to testify before the subcommittee on what we think is a very important national issue, and we will be pleased to answer any questions if you have some.

Mr. ROE. Dr. Bond, I want to thank you for your testimony. I think some of the points in your full testimony have a material bearing on the committee's thought process, namely, the following:

In the testimony we have received so far from the administration, from Mr. Ruckelshaus and others, they have suggested to us that one of the things the committee has to be most careful of is not to infringe on States' rights vis-a-vis the point of land use. It reflects in my mind that some of the testimony we had about 1 year ago having to do with that acid-mine-drainage issue, and I don't know how we are going to deal with nonpoint source if in

some way we don't relate to the land-use issue, which is delicate, to say the least, as far as Congress is concerned.

Would you want to respond a little bit to that observation?

Dr. BOND. Yes; the Tennessee Valley still has abandoned mine areas, that are contributing significantly to the pollution problem in the TVA reservoir system as well as other streams, and much of the strip mining going on now also makes some contribution to that pollution.

There is legislation available at the present time that could be used in cleaning up those abandoned mines, but the funds have not been made available, and the problem is very extensive. We are not suggesting that this is not a State problem, that it is a Federal problem, but we think it is a cooperative problem that the States and the Federal Government have to work on together to be able to solve.

Mr. ROE. Well, let me pursue that further, because I think it has to be dealt with. When we heard testimony from Agriculture this morning, they spoke of the actions they had been taking. No. 1, and I think also the point that they are looking at the issue of preventative pollution, if you like, is proper management practices where agriculture is involved.

On the other hand, as you manifested in your testimony, or in your summary, you spoke to problems that emerged from mine tailings. For example, the acid-mine issue. You spoke to the point, or observation, of pollution, if we want to call it that, as it relates to erosion and sedimentation are the two largest areas of concern.

Having said all that—and then you also make another very important comment as I see it, and I quote on the bottom of your summary, page 10:

> Many of the Nation's serious water problems are interstate in nature, and that EPA maintains it presently has sufficient authority and responsibility to oversee the preparation and implementation of measures to improve water quality. What is needed, then, are sufficient resources for EPA to exercise this authority.

On the other hand, what we are coming back and saying is that is the problem we are faced with. The testimony we have been receiving in the last couple of months is based on the point of recognizing that nonpoint source is—again I am using the figure that has emerged—50 percent of the problems and issues we are faced with.

Now, with that little summary, one comes back and says that it almost seems to be impossible to deal with the nonpoint source unless we face up to the point of view that it is land use that relates to that.

Dr. BOND. Yes, sir, that is right.

Mr. ROE. Then, basically, that is what is creating the problem, other than the so-called natural pollution.

Dr. BOND. Yes, sir.

Mr. ROE. Then the question is how far does Congress choose or want to go, to create mechanisms or methodologies to begin to deal with that issue. For example, if we go ahead, and you made a good point, cleaning up strip mining areas and some of the acid-mine areas, do we provide the funds to that and leave an open end for people to go ahead if they discover another deposit of copper, or whatever, to mine without having any additional restrictions?

What is your observation? What should we be doing? You are running TVA. What should we be doing?

Dr. BOND. Well, it would be our position, sir, that the problem of what has been done in terms of poor mining practices and poor land-use practices—whether construction, farming, whatever, in the past that are still contributing to the pollution problem in the streams—is going to take a cooperative effort to clean up. However, we feel that in the future, those who create the pollution should also solve that problem.

We think, for example, that best management practices, if followed by farmers will basically solve nonpoint-pollution problems from agriculture. However, we are not sure that just making plans as we have participated in for the last several years in the Tennessee Valley region—there have been some excellent plans in the seven States—but we have many areas that have deteriorated rather than improved during the time that those plans have been completed.

So, therefore, we feel something must be done to bring about the implementation of such plans. That is what we are talking about in terms of incentives and disincentives, yes, sir.

Mr. ROE. Suppose we recess for 10 minutes while we go and vote and we will be right back.

[Brief recess.]

Mr. ROE. The committee will reconvene.

When we broke up for that vote, Dr. Bond, you were expressing some of your observations. Do you want to continue.

Dr. BOND. Yes; one of the concerns you expressed was the interstate division. In Tennessee, we have a lake, that drains Kentucky and Tennessee and while I do not have any fear as to the deterioration that has occurred there, the conditions in the lake have been going down. In the area we have been pushing farmers very hard to get them to use best management practices. As I indicated in my testimony, we are making some progress, but at the same time the conditions in the lake are deteriorating both from—well, we know that it is filling quickly with sediment. There have been fishkills from pesticides. Fish in the lake have high levels of pesticides, which are probably being fed from the agricultural areas in west Tennessee and western Kentucky. It has higher phosphorous levels than other Tennessee lakes and there is massive algae and weed growth.

It is this kind of thing that TVA is very concerned about.

Mr. ROE. I think that TVA—of course, we are knowledgeable on your operation—is a microcosm, really, of a regional relationship of all kinds of diversified uses and power generation, food production, and so forth.

And I think locking in the earlier testimony this morning from Mr. Oberstar where he reflected on the points of many of our lakes, and streams, and headwaters becoming now the focal point of a drainage basis where pollutants are being gathered, this has an extraordinarily important impact on the whole nonpoint-source issue.

What we are trying to get a handle on here, obviously, is to what degree and what direction does Congress follow on this.

Without belaboring the discussion now, we have had many witnesses, and others have pontificated on the problems of the elimination, for example, of the combined sewer runoff and what that means in urban settings, and so forth.

But by the same token, what you have brought into focus now is the relationship of the concentration of these pollutants and waste, the cumulative effect, and so forth, and it does directly relate to the land use.

Dr. BOND. Yes, sir, it does.

Mr. ROE. And whether or not best management practices is the—and I do not mean this unkindly—is the easy way to go. Or how one does or what Congress should be doing from a Federal point of view by incentives or disincentives, to force the issue. Because otherwise, to spend large sums of money on point-source control, emptying into multiple-use rivers, both for water supply and flood control, and so forth, could be counterproductive.

In other words, there is a limit that we can go because we are not going to be able to clean that all up unless we deal with the overall picture. Land use does have a bearing.

Dr. BOND. Yes, sir, it does. That is what we wanted to bring to the committee's attention.

Mr. ROE. And I think you have done a good job in doing that.

Mr. BOND. Thank you.

Mr. ROE. I have no further questions.

Mr. STANGELAND. I just, too, want to commend you, Dr. Bond, on an excellent piece of testimony, and also I think you have a great deal to offer, based on the experience that you had with your TVA projects, your demonstration projects.

On page 6 you describe your SOS program. You mention cost-sharing incentives provided by the program. Would you describe for us what some of these cost-sharing incentives are?

Dr. BOND. Yes, sir. Ever since 1934, when TVA began an agriculture program in the Tennessee Valley region, we have worked cooperatively with the Extension Service to introduce sound management practices and to improve organization and to increase farmers' income as part of our responsibilities to increase economic growth in the Tennessee Valley region.

In this particular program, with the cost that the Soil Conservation Service has estimated for investments that have to be made to solve these horrendous soil-erosion problems in western Tennessee, it was obvious that such investment could not be totally made from public funds, that the farmer was going to have to make a substantial amount of that investment.

We felt that we should combine the efforts of what the Soil Conservation Service was doing with the efforts that TVA was doing to demonstrate on a limited number of farms that a farmer could make, could maintain an income while he was making investments that would improve his land use to slow down erosion.

TVA has been putting a limited amount of experimental fertilizers that it produces at its Muscle Shoals fertilizer center on each of those demonstration farms. It is probably in the neighborhood of a $200 to $500 incentive. The Soil Conservation Service, of course, is making available to the farmers their regular cost sharing provisions of the ACP Act.

Now, the interesting thing is when a farmer participates, he agrees to follow a 5-year plan of best management practices that include capital investment. The ACP program, if you are dealing with crop land, only provides sufficient funds to apply those practices on a cost-sharing basis to a limited part of the farm.

The farmer agrees to go ahead and do that on his total farm. So I guess the amount of investment that TVA and the Soil Conservation Service is doing is substantial, but probably still much lower in investment than the farmer is making. And in total, including small watershed programs there's been about $27 million in Federal funds invested over the 4-year period in that 20-county area. Farmers have received a very high share of that investment.

Mr. STANGELAND. In your experience, can you cite for us any examples or instances where ACP programs have been counterproductive to clean water and solving the problem of nonpoint-source pollution?

Dr. BOND. No, sir. I am not knowledgeable of any. There may be some.

Al, are you?

Dr. DUDA. I do not think so.

Mr. STANGELAND. And then maybe for future reference, you might want to recommend to the committee how ACP could be used to better advantage. Are there practices presently not covered by ACP that should be and could be used to help solve the problem of nonpoint pollution? I think at times we use ACP to pay farmers to do things that are not very costly but should have been done just in good management practices for their own well-being.

And I would like to see that ACP money used perhaps to better advantage, and I would ask you to make some of those recommendations to us at a future time.

Dr. BOND. I would be glad to, sir. I know what you are talking about. Many times I think they were applied to production practices rather than conservation.

Mr. STANGELAND. Yes; on page 7 you cite some impressive results from your six-point west Tennessee demonstration program. At the same time you indicate that less than 25 percent of the problem is being addressed.

Why is that the case? Is it because there are not enough participants in your voluntary program, or is it because of the narrow scope of the demonstration project?

Dr. BOND. Well, at this point it is basically because we have within a 20-county area about 200 farms that are participating, and of course the educational process is slow. Those 200 demonstration farms are demonstrating to other farmers, but many of them have not adopted best management practices on their farms. On the 200 we have that. So, therefore, we still have a long ways to go.

Mr. STANGELAND. Your testimony makes the point that the first element in a successful nonpoint-source control program should be identification of high priority or hotspot watersheds. You also indicate that State water-quality standards should be only one of the criteria used in making this identification.

What other criteria does TVA use and what criteria should be used in fashioning a national program?

Dr. BOND. I would like for Dr. Duda to comment on that. He has worked both with the States and also with TVA and is very familiar with that.

Dr. DUDA. The States do not have appropriate water-quality standards for many nonpoint-source-related problems, such as sediment problems. There are not specific water-quality standards for sediment eutrophication problems, algae in our TVA reservoirs or in lakes in Massachusetts. There are not specific State water quality standards for dealing with that.

So in their absence, you need to look at whether or not the use of a stream is affected. And there are things like biological monitoring that are important. Has the sediment affected the fish populations? Are the algae, nuisance algae, such that the nutrients may be causing problems. You have to focus then on the uses of the stream as well as standards, not just the standards.

In addition, you need to focus on the watersheds upstream of the area with the problem and not deal uniformly across the State with nonpoint-source issues. Deal with those targeted watersheds that are really contributing—the hotspots—to those problems.

With those three criteria one could come up with the areas that would need to be addressed in such a program.

Mr. STANGELAND. Thank you.

Mr. Chairman, I have other questions, but in the essence of time, I would ask unanimous consent that I might submit them in writing.

Mr. ROE. No objection. So ordered.

[Questions submitted by Representative Stangeland and responses by Mr. Bond, TVA, follow:]

TENNESSEE VALLEY AUTHORITY
KNOXVILLE, TENNESSEE 37902

DEC 20 1983

The Honorable Arlan Stangeland
U.S. House of Representatives
Washington, D.C. 20515

Dear Mr. Stangeland:

Please find enclosed the Tennessee Valley Authority's response to the nonpoint source pollution questions raised in your November 29 letter. We respectfully request that these answers be included in the Water Resources Subcommittee's hearing record on the Federal Water Pollution Control Act.

If we can be of any further assistance to you or the subcommittee, please let me know.

Sincerely,

Billy J. Bond, Manager
Office of Natural Resources
and Economic Development

Washington, D.C. 20515

ANSWERS TO QUESTIONS POSED BY CONGRESSMAN STANGELAND AT THE NOVEMBER 16 HEARING BEFORE THE WATER RESOURCES SUBCOMMITTEE

Question 1: Dr. Bond, I am particularly interested in the demonstration efforts that TVA has been involved with since the 1960s. On page 5 of your testimony, you cite some rather remarkable results in the Chestuee Creek and Parker Branch demonstration projects. Were these two particularly successful or were they representative of your program results in the 1960s?

Answer: TVA began scientific investigations on small watersheds in 1934 to evaluate the effects of reforestation and improved conservation practices on reducing floods and sediment loading. The Parker Branch and Chestuee Creek watershed demonstration projects of the 1950s and 1960s were the first projects to focus on the interrelationship between economic development and watershed hydrology.

The objective in the Parker Branch project was to determine the extent to which farm income could be raised in a typical low income rural area with subsistence farming (e.g., low productivity, abused land); and to evaluate the resulting effects upon the hydrologic characteristics of the watershed. The project successfully demonstrated that net real-farm income could be raised fourfold, and organizational change could greatly increase productivity (1/6 the effort required to produce $100). At the same time, the hydrology of the watershed

improved markedly with reduced flooding and a 70 percent reduction in sediment loading because of greatly reduced soil erosion.

Similarly at Chestuee Creek watershed, the demonstration was to develop the agricultural resources of the region, and to measure the effects of these adjustments on the water resource. Raising the income of the area would improve education, health, and government services. The Chestuee Creek watershed was much larger than that at Parker Branch and included several small cities and towns. The demonstration in the Chestuee Creek watershed resulted in a 3-1/2 fold increase in net farm income; a shift from cropland to pasture and forest; and a modest reduction in storm runoff and flooding along with a 45 to 70 percent reduction in sediment loads.

TVA designed these demonstrations to collect hydrologic data and to determine whether rural economic development was consistent with flood control and reductions in sediment loading with commonsense land management. These practices were the forerunners of what are today known as best management practices (BMPs). These were the only two investigations undertaken to collect these data, but the lessons learned were implemented in subsequent TVA programs in tributary development. TVA learned two important lessons about source areas of runoff and sediment from agricultural lands. The first is the need to

take a watershed-wide approach to water pollution, and the second is that development of an area must account for both manufacturing and agriculture (a rural-urban blend).

These lessons are as valid today as 15 years ago. On our west Tennessee demonstration farms (see answer to question 4), we still find that implementation of recommended BMPs decrease operating cost of farmers and increase crop yields.

Question 2: On pages 8 and 9 of your testimony, you mention that TVA has been the designated 208 management agency, at least in Tennessee. What are your views of the 208 process and the extent that it should be continued?

Answer: TVA assisted in area-wide and State-wide 208 planning efforts in the TVA region in the 1970s. We served on technical advisory groups and provided water quality information to the State and local agencies. Section 208 planning was an important first step in addressing nonpoint source pollutants particularly because it was a vehicle for many different groups to begin talking to each other. Unfortunately, the lack of adoption of effective plans and the lack of implementation have blocked effective 208 management.

The lesson of the 208 process is that the voluntary plans that have been adopted are generally insufficient to achieve all nonpoint source abatement, and implementation is in most instances nonexistent. In fact, legislation has been passed in some

Valley States to exempt nonpoint sources such as agriculture and silviculture from full compliance with the State's Water Quality Act. It is TVA's experience that existing programs developed under Section 208 are not working to achieve needed water quality improvement.

As a management agency under Section 208 for properties under its custody and control, TVA is able to side-step implementation constraints and has incorporated the use of BMPs in its activities. In summary, planning and management implementation must go hand in hand. Section 208 could have worked, but in many States it was not fully carried out.

Question 3: On page 9 of your testimony, you state that "In 1978, TVA completed a comprehensive assessment of the impact of its dam releases on downstream water quality and use." Could you please provide a copy of this study for our committee record?

Answer: We are attaching a copy of TVA's 1978 report entitled "Impact of Reservoir Releases on Downstream Water Quality and Uses."

Question 4: On page 11, you sum up your testimony supporting a system of incentives tied to cooperative interagency efforts as being the best way to approach the nonpoint source control

problem. What types of incentives, particularly cost-sharing incentives, does TVA employ? What incentives should be built into a national program?

Answer: In our testimony, we indicated that a system of incentives was being used on The University of Tennessee - TVA Resource Management Conservation (RMC) farms in west Tennessee. The only agency providing cost-share funds for implementation of soil erosion/water quality measures on RMC farms is the Agricultural Stablization and Conservation Service (ASCS), United States Department of Agriculture (USDA). A sister agency, the Soil Conservation Service, USDA, determines a farmer's eligibility for cost-share funds, designs the protective measures, and supervises the installation. Because the west Tennessee soil erosion project is considered a targeted area by USDA, each participating RMC farm is eligible to receive a maximum of $3,500 in cost-share funds in the first year of program participation for the installation of various BMPs (e.g. terraces, debris basins, no-till cropping). Each farmer must sign a long term agreement in order to receive these cost-share funds. This is a commitment for applying these measures to the farm for a minimum of 3 years, and up to 10 years depending on the nature of the practice or measure employed.

After the first year, RMC farms are eligible for additional cost-share funds for the application of conservation measures.

However, at this point, the farm is treated as any other in the county; in other words, it is not given any special funding as in the first year of program participation.

TVA provides RMC farms a direct program incentive in the form of a fertilizer discount on locally purchased fertilizers. This incentive averages $250 to $300 per year for a six-year period. TVA also shares in the cost of conducting the program by reimbursing The University of Tennessee for specialist time.

In regard to incentives for a national program, the use of incentives for soil conservation has a long precedent through ASCS. The TVA experience would indicate that lasting benefits from incentives need to be accompanied by educational programs with the individual farmers involved and by long-term written agreements to utilize BMPs. As we indicated on page 11 of our testimony, TVA believes that the success achieved on RMC farms in west Tennessee is due in large part to these written agreements made with farmers for implementing recommended BMPs as part of their conservation plans. Eligibility for incentives is contingent on a local commitment to implement specific practices as part of conservation plans on entire farms.

Question 5: How does TVA determine the effectiveness of its water quality improvement efforts? Would you describe for the committee what kind of water quality monitoring program TVA currently employs?

Answer: Where feasible, TVA conducts follow-up water quality surveys after completion of major water quality improvement efforts, such as cleanup of toxic contaminants or upgrading of municipal wastewater treatment facilities. Recent examples include fish sampling in the North Fork Holston River after cleanup of mercury at Saltville, Virginia, and investigation of water quality in Fort Loudoun Reservoir following expansion of the Knoxville Third Creek wastewater treatment plant. Intensive water quality surveys such as these are quite costly; therefore, in many cases evaluations of improvements must be based, for example, on analyses of water quality modeling results for different water resources management options, or on theoretical calculations of reductions in erosion rates achieved with different land uses and land management techniques.

TVA currently has no comprehensive ambient water quality monitoring program. From 1973 to 1980, TVA operated a network of as many as 180 ambient monitoring stations strategically located throughout the Valley. The cost of these monitoring stations became prohibitive, and in 1980 TVA decided to focus its efforts on short-term, intensive surveys of specific streams and reservoirs. In 1981-83 TVA conducted surveys of this nature on three mainstream Tennessee River reservoirs, one tributary reservoir, and three tributary streams. Targeted monitoring can be very useful in evaluating the effectiveness of water quality improvement efforts on a watershed scale. This fiscal year TVA is

developing plans for implementation of more cost-effective targeted monitoring in FY 1985 to supplement the intensive surveys and to provide information on water quality trends.

Question 6: Yesterday we heard from Administrator Ruckelshaus that he fears a new nonpoint source grant assistance program could lead to less, rather than more, water quality protection because it might tend to inhibit voluntary nonpoint source control efforts. Based on your experience in TVA, would you comment on this potential problem?

Answer: Based on having participated with farmers in educational and incentive programs dealing with soil conservation, we believe that such measures can work if properly structured. We have not found that incentives made available to farmers in a demonstration program kept them from making the investments and carrying out the needed BMPs where it was demonstrated that those investments had increased incomes. They could see the results! The incentives lead to more, not less water quality protection.

To a degree we agree with EPA; poorly structured Federal programs may provide incentives to cause nonpoint pollution problems. Such programs in a sense encourage the farmer to make various kinds of economic decisions that in turn are contrary to the long-term goals of the Clean Water Act. For example, programs that encourage cultivation of marginal, steeply sloping land result in increased soil erosion and add pollutants to waters. On page 12 of our testimony, we suggested that Federal agencies should provide leadership to State and local groups by ensuring that their programs do not contribute to adverse water quality impacts from nonpoint pollution.

TENNESSEE VALLEY AUTHORITY

IMPACT OF RESERVOIR RELEASES ON DOWNSTREAM WATER QUALITY AND USES

Special Executive Report in Response to a Request from the Acting General Manager

Prepared by:
Division of Environmental Planning - Task Force Coordinator
Division of Forestry, Fisheries, and Wildlife Development
Division of Law
Division of Water Management
Office of Power

Division of Environmental Planning
Chattanooga, Tennessee
August 1978

EXECUTIVE SUMMARY

As a part of its regional resource development program, the Tennessee Valley Authority (TVA) operates a system of dams and reservoirs on the Tennessee River and tributary streams. Benefits to the region and the Nation in terms of flood control, navigation, electric power generation, and recreation are counted in billions of dollars. The reservoirs improve water quality conditions in many ways. However, the management and operation of this integrated system also has adverse impacts on water quality and water uses in the reaches below certain dams.

Releases from Tennessee Valley reservoirs were evaluated with respect to their adverse impacts on water quality and related characteristics and on various uses of the water downstream. The water quality characteristics examined were temperature, dissolved oxygen, resolubilization of metals, streamflow, turbidity and suspended solids, and gaseous supersaturation. The downstream water uses examined were recreation, fisheries and other aquatic life, water supply, and assimilative capacity. Evaluations wer. based on available data on water quality and reservoir operations from 1970 through 1977 in conjunction with biological and engineering judgments of the significance of the impacts.

The most significant impacts of reservoir releases are associated with low concentrations of dissolved oxygen, short-term variations in temperature, and inadequate streamflows in the reaches below the dams. The adverse impacts of releases from individual reservoirs were categorized as having no impacts, potential impacts, or existing impacts. These categories were used to identify priorities for additional detailed studies to evaluate possible mitigative actions.

In general, releases from main stream reservoirs have very few adverse impacts on water quality or water uses. However, releases from many tributary storage reservoirs do significantly impact dissolved oxygen concentrations, temperatures, and streamflows and, therefore, downstream water quality and uses.

Water Quality Impacts

Temperature

Releases from eight tributary dams have existing long-term impacts on temperature. The temperatures of these releases during the summer and early fall are marginal for the development of either cold water or warm water fisheries (too warm for cold water species and too cold for warm water species). The only option for improving long-term temperature conditions to favor viable fishery resources downstream from these dams would be to seek methods for increasing temperatures in spring, summer, and early fall to provide conditions more favorable for warm water species.

Short-term (daily) temperature impacts are associated with the releases from 15 of the tributary projects as a result of intermittent operation of the hydro units for peaking purposes. Establishment of an instantaneous minimum release from each of these projects is the principle option for reducing these adverse temperature impacts.

Dissolved Oxygen

Releases from 18 reservoirs result in concentrations of dissolved oxygen that significantly deviate from numerical criteria. Releases from eight of these storage reservoirs cause severe problems (concentrations of less than 1 mg/l), and should be classified in the "priority" category for any future studies for mitigating dissolved oxygen problems. The specific option that might be best for any specific project would vary depending upon the other water quality characteristics and water uses to be protected.

Streamflow

Because streamflow needs depend directly upon both the water quality and water uses to be achieved or protected, no existing problems were identified separately for this water quality related characteristic. Any problems related to streamflow were identified with the specific water quality characteristic (short-term temperature, dissolved oxygen, iron, manganese, turbidity and suspended solids, and gaseous supersaturation) or water use.

Resolubilization of Metals

High concentrations of iron, manganese, or both in the releases from two dams cause problems. Mitigative measures have been taken to reduce the adverse impact from these projects.

Turbidity and Suspended Solids

Releases from three dams cause problems with respect to turbidity and suspended solids. Hydraulic drag during peak generation at Fort Patrick Henry uproots aquatic plants from the Holston River bottom. The disturbance of sediments and the subsequent washing of materials from the plant roots increases turbidity and suspended solids. Options for correcting this problem have adverse impacts and are beyond the scope of this study. Water sluiced from the bottom of Ocoee No. 3 to prevent accumulations of silt causes a problem, but there is presently no readily available alternative if power generation is to be continued. High rates of turbine releases at Tims Ford previously caused high water levels downstream and erosion of river banks, but restrictions on releases are mitigating this problem.

Gaseous Supersaturation

No significant problems of gaseous supersaturation are known to be associated with the releases from the reservoirs evaluated in this study. However, there is the potential for elevated concentrations of total dissolved gases in the spillway releases from the mainstream reservoirs.

Water Use Impacts

The adverse impacts of releases from individual projects were evaluated and categorized for each of the downstream uses. The specific water quality related characteristics of the release that contribute to the impact were also identified. When more than one contributing water quality characteristic was identified, correction would be required for each characteristic for successful mitigation of conditions for the specific use.

Recreation

Releases from 18 reservoirs do not provide dependable streamflow high enough for recreational floating during the most desirable hours of the recreation season. Although reservoir releases are now scheduled at five dams to increase floating opportunities, such flows are not reliable enough to allow full development of commercial and public recreation.

Nantahala, Apalachia, and Ocoee No. 2 tailwaters are now receiving national interest as white water streams and should be given priority for future studies in relation to improving recreational opportunities.

Releases from 12 reservoirs adversely impact recreational fishing, primarily because streamflow is either above or below optimum during the early morning and late evening. Some fishery resources are also adversely affected by water quality characteristics other than streamflow; these characteristics would need to be improved before recreational fishing could be enhanced.

Fish and Other Aquatic Life

Releases from 14 reservoirs impact fisheries and aquatic life resources. In each case, the problem is caused by intermittent releases associated with peaking operations and by resulting short-term changes in temperature. Minimum instantaneous releases would solve the problem of cyclic wetting and drying of the streambed, eliminate the short-term cyclic temperature variations, and provide flows suitable for recreational fishing. Streamflow modifications alone would enhance the fisheries resource downstream from two of these projects.

In addition to streamflow, low concentrations of dissolved oxygen in the releases from nine reservoirs adversely impact tailwater fishery resources.

In addition to streamflow and dissolved oxygen, seasonal temperature impacts associated with the releases from six reservoirs create marginal conditions that are not favorable for either cold or warm water species. Any future studies of possible improvements for these tailwater reaches should consider providing warmer releases during the spring, summer, and fall to enhance the development of viable warm water fisheries.

The tailwater reaches downstream from South Holston, Fort Patrick Henry, Cherokee, Douglas, Norris, Chatuge, Apalachia, Blue Ridge, and Tims Ford should be considered as "priority" reaches for any future studies directed toward improving fishery resources.

Water Supply

Water supply is impacted by releases from two dams. For one of these projects the impact is related to both streamflow and resolubilized iron and manganese. Mitigative measures have successfully reduced these impacts in the past and are expected to be effective as long as they are continued. At the other dam, minimum mean daily releases are insufficient to meet water supply requirements downstream. Adjustments to increase releases have been made, but these are still insufficient to meet the request of the downstream user.

High concentrations of soluble manganese in the releases from one dam have created problems for downstream users, which have already been partially mitigated, and releases from another dam are a potential problem. Both are relatively new projects that cannot be fully assessed until the process of initial lake aging is completed.

Assimilative Capacity

Low concentrations of dissolved oxygen and low streamflows cause assimilative capacity problems downstream from two dams. Although no existing problems of assimilative capacity are associated with the releases from eleven dams, deviation from the minimum streamflows now provided would result in problems. Assimilative capacity is marginal downstream from six of these dams. Unless streamflows, concentrations of dissolved oxygen, or both are improved in the tailwaters below these projects, assimilative capacity will become one of the factors that will restrict development in areas along the reaches downstream.

The releases from Fort Patrick Henry - Boone, Cherokee, Douglas, and Norris should be given priority for any future studies in relation to improving assimilative capacity.

Generic Options for Reducing Impacts

Possible improvements at a specific project could involve both physical and operational changes. Specific changes must be evaluated and tailored directly to individual projects on a case-by-case basis, considering the impact to be corrected, the cost of implementing corrective actions, the present purposes of the project, present water uses both upstream and downstream, and the impact of any corrective action taken at projects located farther upstream. No single technology can be applied under all situations. The application of one technology at a specific project may reduce or correct one adverse impact but compound another adverse impact. This report does not evaluate or propose specific actions for individual projects.

Physical Changes

Physical changes include installing processes or equipment or structurally modifying projects. Physical changes are generally required or most useful for improving dissolved oxygen and, to a lesser extent, temperature and streamflow. Physical changes may be broadly classified as (1) control of water quality within the reservoir, (2) selective withdrawal of reservoir water with acceptable quality, (3) aeration of reservoir releases, or (4) habitat modification. For essentially all the methods investigated, more study is needed to develop adequate, detailed design criteria. To date, there have been no successfully demonstrated full-scale systems that have achieved consistently a dissolved oxygen concentration of 5 or 6 mg/l. In addition, the various methods need to be demonstrated to determine operational problems that inevitably arise in the process of developing new technologies.

Operational Changes

Some water quality and water use impacts associated with reservoir releases can be partially solved by changing present operating procedures. Operational changes are generally required or most useful for improving streamflow for downstream uses and for correcting problems of short-term temperature variations, concentrations of soluble iron and manganese, turbidity and suspended solids, and to a lesser extent, dissolved oxygen. It is doubtful that operational changes alone can mitigate water quality and water use impacts at all projects, especially those that involve severe dissolved oxygen problems or marginal long-term temperature problems. A combination of both physical and operational changes may be necessary to improve releases from some reservoirs.

Possible operational changes include (1) maintaining a constant, minimum discharge, (2) limiting maximum flow, and (3) altering rule curves for reservoir operations to prevent water quality problems. Such operational changes would severely affect and limit the flexibility of the reservoir system as it is now used for its primary statutory purposes of flood control, navigation, and power generation.

Recommendations for Further Studies

Overall, the greatest need is to investigate ways to solve the compound problems that occur at projects where multiple water quality characteristics and water uses are impaired. Both water quality and downstream water uses are now or potentially could be affected by the releases from 14 reservoirs. Each of these could be classified overall as a "priority" reservoir, but for various reasons, further studies should not be initiated now at five of them.

The overall ranking for initiation of additional studies for the remaining nine priority reservoirs is as follows:

1. Cherokee
2. Douglas
3. Norris
4. Fort Patrick Henry - Boone
5. Apalachia
6. Tims Ford
7. Chatuge
8. South Holston
9. Blue Ridge

The additional studies recommended for these nine projects cannot be limited to methods for improving the quality of the releases or enhancing downstream uses, because the achievement of these objectives directly conflicts with present uses of the tailwaters and upstream reservoirs. The studies must consider both present and possible future uses. Any action recommended on the basis of these studies should reflect the best balance of all of the competitive uses for a given body of water.

Legislative action would be required to authorize any changes that would conflict with present statutory purposes. An environmental impact statement would be required for any basic alterations in major projects or programs that could cause significant environmental impacts.

CHAPTER I

INTRODUCTION

This report identifies adverse impacts on water quality and stream uses that are associated with water releases from dams operated as part of the Tennessee Valley Authority water management system. It also includes a generic assessment of available technologies for reducing these impacts and identifies some of the options for mitigating actions that TVA might consider. No attempt was made to identify mitigative actions for specific projects or to propose institutional methods for implementing such actions.

There are two possible methods for identifying and determining the extent of impacts from reservoir releases. The first method compares the releases from all structures to specific numerical criteria. This method simplifies problem identification and monitoring. However, the application of rigid, uniform numerical criteria may overlook the actual or highest value uses and needs upstream and downstream from a specific project. The second method determines the need for improvements on a case-by-case basis and emphasizes providing balanced protection of the water uses associated with each specific project without unduly penalizing any given project by the application of rigid numerical criteria. Although this method makes problem identification and subsequent monitoring efforts much more difficult, it provides the flexibility needed to optimize resource management. In this report, an attempt has been made to describe the problems and impacts with respect to both specific numerical criteria and water uses.

Some reservoirs in the Tennessee Valley were excluded from this study because of their limited size or the lack of basic data: the Beech River projects, the Bristol projects, the minor Alcoa projects, Watersville Reservoir, and Woods Reservoir. Those projects under construction but not yet completed were also excluded: Tellico, Columbia, Upper Bear Creek, and Cedar Creek projects. Great Falls Reservoir, although located in the Cumberland River Basin, was included because it is owned and operated by TVA.

In accordance with the TVA Act, the reservoir system has been operated as an integrated reservoir system for the primary purposes of flood control, navigation, and generation of power. Recreation and wildlife management programs are carried out as consistent with these primary purposes. Initially, they were generally operated to provide base load to the power system. As system load increased and as fossil and nuclear plants were added, however, their role shifted to one of providing a flexible reserve for responding to peak power demands. Any proposed modification of the present structures or operating schemes to mitigate adverse impacts of reservoir releases on water quality and stream uses must be closely evaluated both with respect to costs and expected benefits and with respect to impacts on present uses of the reservoir system.

CHAPTER II

GENERIC DEFINITION OF ADVERSE IMPACTS

Introduction

The releases from impoundments have both beneficial and adverse effects on the physical, chemical, and biological quality of stream reaches downstream from the regulating structure. These effects in turn impact the uses of the stream reach. Because the purpose of this report is to identify the adverse impact of reservoir releases on water quality and stream uses under present operating conditions, no attempt has been made to evaluate the beneficial aspects. The objective of this chapter is to provide a brief description of the more significant adverse water quality and stream use problems commonly associated with releases from reservoirs. The severity and scope of the impacts identified vary among the projects. It should be recognized that these descriptions do not identify all of the adverse impacts associated with reservoir releases; other water quality characteristics or water uses may be impacted significantly but only at one or two specific projects.

Water Quality Related Impacts

The principal water quality characteristics affected by reservoir releases are temperature, dissolved oxygen, resolubilization of metals (primarily iron and manganese), streamflow, turbidity and suspended solids, and gaseous supersaturation (primarily nitrogen). Adverse impacts can be associated with other factors such as odor, ammonia, hydrogen sulfide, other resolubilized metals, and algae; however, these impacts are significant only at isolated projects and would have to be considered on a case-by-case basis. Because most adverse water quality impacts are the result of natural phenomena directly related to the thermal conditions within the impoundment, the description of thermal impacts includes an explanation of typical thermal conditions that occur in an impoundment.

Temperature

An understanding of thermal stratification in reservoirs and of the influence it exerts on the way water flows through reservoirs is essential to an understanding of the effects a reservoir may have on the temperature and also on many other water quality characteristics of released water.

At the latitude of the Tennessee Valley, the reservoir phenomenon commonly termed "fall turnover" continues throughout winter and into early spring. The climate is such that the surface stratum of a reservoir is not cooled below the temperature corresponding to maximum water density (4°C).

Consequently, no period of density stratification develops in the colder months of the year. Instead, the water is essentially of uniform density and quite thoroughly mixed from top to bottom. Water released through the power intakes during such isothermal periods comes from the entire vertical section of the pool at the dam. As spring advances, warmer inflows from tributaries and direct heating of surface waters by the sun produce thermal stratification in the pool. By mid-May or early June during most years, the warm upper stratum (the epilimnion) is separated by the thermocline (the stratum in which temperature changes rapidly with depth) from the colder waters of the deep hypolimnion below. After the thermocline becomes established in the spring, mixing effects of wind and diurnal changes in atmospheric temperature are limited to the warm epilimnion. The thermocline fixes the lower limit of the mixing effect. After the thermocline becomes established, inflow from the headwaters usually flows directly into the epilimnion, where it may be held for months.

During thermal stratification, water released through low-level power intakes is drawn exclusively from the hypolimnion, because the warmer waters of the epilimnion float on the cooler, more dense waters below. The coldest (most dense) water at or above the intake level is discharged first. Thus, cold water deep in the pool and perhaps many miles upstream from the dam may be discharged before water that is at the dam and only 50 feet or so above the power intake but that is several degrees warmer. As the colder waters are discharged, warmer waters settle slowly downward. Velocities in the hypolimnion, induced by the draft, are very low except close to the intake.

As atmospheric temperatures continue to drop in the fall months, water in the surface stratum of a reservoir is eventually cooled below the temperature of the underlying water and, being heavier, sinks beneath it. This forces the warmer water to the surface, where in turn it is cooled. This process sets up a vertical circulation that, aided by winds, continues until the entire mass of water in the reservoir is essentially uniform in temperature and density. When water in a reservoir is mixing in this manner, the pool is said to be "turning over." This mixing process continues all winter and results in water that is essentially of uniform quality, in all respects, from the surface to the bottom.

During periods of thermal stratification, water released from the cold hypolimnion of a reservoir is much colder than the local inflow to the stream reach immediately downstream. Consequently, releases from a thermally stratified reservoir can have both a long-term impact (seasonal) and a short-term (daily) impact on the thermal regime of the downstream reach. The extent of these impacts depends upon the reservoir characteristics and daily operating discharge schedule.

The long-term impact of releases from the hypolimnion of a thermally stratified reservoir is primarily an overall lowering of the water temperature from early spring through early fall in the downstream reach. Average and maximum temperatures in the tailwater reaches during this period will be much lower than the corresponding temperatures that

occurred in the stream before construction of the reservoir. This overall reduction in stream temperatures changes the basic character of the tailwater reach from a warm water stream to a cold water stream and results in ecological conditions more favorable for cold water aquatic life than for warm water aquatic life.

This change has been recognized by the states and has been reflected in their use classification for streams. Some tailwater reaches, although they were warm water fisheries before the construction of a reservoir, have now been classified as cold water (trout) fisheries. Tennessee Valley tailwater reaches classified for cold water fisheries include those below South Holston, Wilbur, Fort Patrick Henry, Fontana, Norris, Chatuge, Nottely, Cheoah, Calderwood, Thorpe, Nantahala, and Santeetlah Dams (the last five are Alcoa projects). Tailwater reaches below Blue Ridge and Tims Ford are being managed as cold water fisheries even though they have not officially been classified for this use. Although the tailwater below Normandy is not classified as a cold water fishery, it is expected that it will be reclassified as such in the future, because development of a downstream cold water fishery was one of the purposes of the project.

The extent to which these tailwater reaches have thermal regimes suitable for the cold water classification depends on the relationship between the volume of the reservoir hypolimnion above the dam intakes (including cold water inflows from upstream) and the volume of reservoir releases during periods of thermal stratification. If the volume of cold hypolimnetic water is larger than the volume of the reservoir releases, the cooler water temperatures conducive to cold water aquatic life can be maintained in the tailwater throughout the spring, summer, and early fall. However, if the volume of the releases is greater than the volume of cold water available in the reservoir, warmer releases would occur during the latter portion of the period of thermal stratification. Temperatures during the spring and earlier portions of the summer would be favorable for cold water aquatic life but too cold for warm water aquatic life. During the late summer and early fall, temperatures would begin to approach those favorable for warm water aquatic life but would be too warm for cold water aquatic life.

The short-term impact of releases from the hypolimnion of a thermally stratified reservoir is the result of intermittent releases of cold water associated with the daily operation of the reservoir primarily to provide power during peak demands. During periods when water is not being released to generate power, the tailwater reaches may be warmed by solar heating and by warmer inflows from local tributary streams below the dam during daylight hours in the summer or cooled during winter or nighttime hours. When power generation begins at the dam, the sudden release of a large volume or "slug" of much colder water rapidly reduces the water temperature of the tailwater reach. When power generation stops, the water again gradually warms until generation is resumed and the next slug of cold water is released. Such cyclic changes in water temperature can adversely impact aquatic life if the overall change or the rate of change is too great.

It is readily recognized that changes in water temperature may adversely affect aquatic life or may create conditions more favorable for some species but less favorable for others. Although there is still technical uncertainty concerning the temperature rise that can be tolerated before adverse impacts will occur, state water quality standards generally limit not only the maximum stream temperature but also the allowable rise in overall temperature. Because the principal concern regarding temperature has historically been associated with discharges of heated water, the water quality standards for most states limit only the incremental rise in temperature. However, the temperature standard for Tennessee specifies an allowable incremental "change" that applies to either an increase or a decrease in water temperature. The Tennessee standards also limit rate of change.

Dissolved Oxygen

The mechanisms contributing to the depletion of oxygen in the bottom portion (hypolimnion) of a reservoir are closely related to the occurrence of thermal stratification. Natural processes such as the respiration of living organisms, the decomposition of organic materials, and the biochemical reaction of materials in the water and sediments continuously remove dissolved oxygen from reservoir waters. The exposure of surface water to the air, aided by wind and wave action; and the addition of oxygen-rich inflows from tributary streams replenish this supply of dissolved oxygen, and in a well mixed reservoir, it is distributed from top to bottom. When thermal stratification begins, however, vertical circulation and mixing are limited to localized effects within the epilimnion and hypolimnion, and little or no interchange takes place between the two strata. Although the surface waters continue to be reaerated, the hypolimnion becomes isolated. As the processes that demand oxygen continue there, they deplete the available supply. Therefore, during the long period of thermal stratification, dissolved oxygen concentration often becomes very low in the hypolimnion.

Water drawn from stratified impoundments through low-level intakes generally has low concentrations of dissolved oxygen during the summer and fall months. When this water is released, it may reduce the dissolved oxygen concentrations in the stream reaches below these dams to the extent that it is no longer sufficient to support fish and other desirable aquatic life or to allow the satisfactory assimilation of discharges from waste treatment facilities. These releases are reaerated by natural processes as the water flows downstream, but the length of the stream reach affected by low concentrations of dissolved oxygen depends upon the initial concentration of dissolved oxygen, streamflow, and channel characteristics of the stream reach.

Resolubilization of Metals

Water quality downstream from impoundments may, in some cases, be adversely affected by discharges with high concentrations of soluble metals. These conditions are usually related to periods of thermal stratification and oxygen depletion in the upstream reservoir. Iron and manganese are

20-955 O—84——181

the metals of greatest concern. Oxidized forms of iron and manganese suspended in the water and deposited in bottom sediments are subjected to reducing conditions when the dissolved oxygen becomes depleted as a result of stratification.

Furthermore, oxidized forms of iron and manganese brought into the epilimnion during thermal stratification may settle into the hypolimnion and also become subject to reducing conditions. Under these conditions, they are subject to resolubilization and subsequent discharge to the downstream reach. As the releases flow downstream and become reaerated, the soluble manganese and iron are oxidized and again converted to insoluble forms that precipitate on the stream bottom. Because soluble iron oxidizes rather rapidly, the length of stream reach subject to high concentrations of soluble iron would be rather short. Soluble manganese oxidizes much more slowly, however, and a much longer stream reach would be subject to high concentrations of soluble manganese. High concentrations of either soluble iron or manganese would adversely impact downstream water supplies, because they can stain plumbing fixtures and laundry, affect the taste and aesthetic quality of the water, and interfere with manufacturing processes.

Streamflow

Many hydroelectric reservoirs are operated for flexible response to peak power demands. As a result, streamflow in the downstream reach often fluctuates widely, cyclically raising and lowering water depths downstream and cyclically wetting and drying shoreline environments or even the entire streambed immediately downstream from the project. This variation in streamflow may adversely affect use of the stream for recreation, aquatic life, water supply, and assimilative capacity.

Turbidity and Suspended Solids

Normally, reservoirs reduce turbidity and the concentration of suspended solids in releases by serving as tremendous settling basins. However, operating a reservoir in response to peak power demands produces scouring effects in the downstream reaches that may result in the resuspension of deposited bottom sediments and, in some cases, erosion of streambanks. Aquatic life farther downstream is subjected to a smothering effect when these bottom sediments resettle. Also, the lowering of reservoir levels for winter flood storage or for maintenance may result in significant movements and subsequent discharges of silt that had been deposited in the reservoir.

Gaseous Supersaturation

Gaseous supersaturation in water can occur as a result of rapid temperature increases, rapid pressure decreases, and turbulent mixing of air with water under hydrostatic pressures. The primary concern about excessive dissolved gases relates to the exposure of fish to waters containing excessive dissolved gas pressure or tension. Fish may be

stressed or killed when dissolved gases in the circulatory system come out of solution to form bubbles that block the flow of blood in capillary vessels. In aquatic organisms, this is referred to as gas bubble disease, which is analogous to the "bends" experienced by divers. External bubbles also appear on the fins, eyes, skin, and other body tissues. Because dissolved oxygen is extremely bioactive, it causes no problem. However, dissolved nitrogen is biologically inert in invertebrates and therefore the most significant cause of gas bubble disease.

Supersaturation of gases in releases from reservoirs is primarily related to spillway discharges. Air, which is 79 percent nitrogen, is entrained in the discharge as it passes over the spillway and plunges into the stilling basin below the dam. Increased pressure at the lower depths of the stilling basin forces the oxygen and nitrogen in the air bubbles to diffuse into the water. The extent of gas transfer to the water depends on how long the bubbles are detained in the tailwater (which, in turn, depends on bubble size and the vertical velocities in the tailwater), the depth to which the bubbles are carried, tubulence, initial concentrations of dissolved gases, and water temperature. As the water flows downstream from the dam, the concentrations of gases in the water tend to equilibrate with those in the atmosphere. The number of miles required for this to occur varies with each stream reach, depending upon the rate of flow and the physical characteristics of the stream channel.

Stream Use Related Impacts

The primary stream uses adversely impacted by reservoir releases include recreation, fisheries and other aquatic life, water supply (primarily potable and industrial water supply), and stream assimilative capacity. Adverse impacts are also associated with other stream uses such as agricultural water supply (irrigation and livestock watering) and aesthetics; however, these are significant only in isolated cases.

Recreation

Reservoir operating regimes can significantly impact or even preclude recreational uses of tailwaters. The rate and scheduling of reservoir releases mainly impact (1) recreational fishing use and (2) recreational floating use.

Recreational Fishing Use--The rates and schedules of reservoir releases can affect the use of tailwaters for fishing:

1. High discharge rates produce swift currents that preclude wade fishing, make bank fishing extremely difficult, and may impair fishing success.

2. Zero discharges in many cases decrease the extent of fishable water available.

3. Releases that are acceptable for bank and wade fishing often occur at times that are not prime for fishing (such as midday or night).

4. Seasonal temperature patterns of some tailwaters are not suitable for the development of either a good warm water or cold water fishery. In many cases, the lower water temperatures of releases have converted a previous warm water fishery to a put-grow-and-take cold water fishery. In some cases, a self-sustaining warm water fishery could provide more fishing use, particularly where tailwater conditions are marginal for cold water species.

Recreational Floating Use--The rate and schedules of reservoir releases can affect potential use of tailwaters for boating:

1. Zero flows eliminate floating opportunities and impair tailwater aesthetics.

2. Discharges that are adequate for floating use often occur at times that are not prime for floating.

3. The uncertainty of adequate releases during the prime periods for floating restricts individual and commercial floating use of many reservoir tailwaters.

4. The extremely low water temperatures of releases from some reservoirs discourage use for water-contact recreation such as tube rafting.

Fish and Other Aquatic Life

Tailwaters are defined as the portion of a stream from a dam to the headwaters of a downstream impoundment or to its confluence with a larger stream. There are more than 300 miles of tributary reservoir tailwaters in the Tennessee Valley. As discussed earlier, many physical and chemical characteristics of an unregulated stream are changed to some degree by impoundment and operation of the resultant reservoir:

1. Streamflow is much more variable on a daily basis, often increasing one hundred fold in a matter of minutes one or more times a day. These intermittent flows can result in drying the streambed and loss of fish habitat at low flows and in substrate scouring at high flows.

2. Thermal regimes are altered, typically causing tailwaters to be warmer in the winter and cooler in the summer than unregulated streams. In addition, extended low flows followed by high discharges can result in warming and rapid cooling of the tailwater.

3. Altered thermal regimes have created opportunities for the establishment of cold water fisheries at the expense of maintaining fisheries for endemic warm water species. In some cases, the resulting thermal regime favors neither warm nor cold water species.

4. The tailwaters of most of the stratified tributary reservoirs have seasonal deficits of dissolved oxygen.

5. Turbidity is generally lower than in unregulated streams.

6. Concentrations of certain trace metals may be greatly increased.

7. There is less movement of substrate than in unregulated streams; this sometimes results in compaction of the substrate.

8. Because upstream reservoirs tend to "sieve" or trap incoming organic debris, the productivity of tailwater systems depends upon fine particulate organics and plankton from the reservoirs and production of periphyton in the tailwater.

Although any one of these circumstances can influence the type of biological community that develops in a tailwater, the principal limiting factors are temperature, flow, dissolved oxygen, and toxic substances. Other factors are interactive components of the tailwater environment that more subtly influence the structure and productivity of fish and other biological communities. Concentrations of heavy metals and other toxic substances are seldom high enough to cause biological damage in Valley tailwaters. From a fisheries standpoint, temperature, flow regimes, and dissolved oxygen levels are the main factors of concern in the Tennessee Valley.

The nonfisheries biological communities are important parts of the food web and are necessary to the preservation or development of a viable biological system. In stream reaches immediately below impoundments (particularly those with low-level intakes), the nonfishery community is dominated principally by aquatic insect larvae, snails, and clams. The main source of food for this community is the organic material in reservoir releases.

Because benthic organisms are relatively nonmobile, their survival depends upon the streamflow and water quality conditions of their habitat. The releases from reservoirs can adversely impact the benthic community:

1. Intermittent releases can cyclically wet and dry large portions of the stream habitat.

2. High-volume intermittent releases may erode streambanks or scour the streambed and subsequently smother organisms farther downstream when the resuspended sediments again settle.

3. Dissolved oxygen concentrations may be lower than those that organisms can tolerate.

4. Rapid cyclic changes in water temperature associated with intermittent releases may be outside the range that the organisms can tolerate.

Under these conditions, overall biological productivity, species distribution, reproduction, and species diversity may be impaired to the point that no viable resources can be maintained.

Water Supply

One of the principal uses of surface water is for municipal and industrial water supply. Waters released from reservoirs are in most cases desirable as a source of water supply because of the cooler temperatures, low turbidity, low bacteria content, and relatively consistent mineral quality. Under certain circumstances, however, releases from storage reservoirs can have quality characteristics undesirable for water supply purposes.

Iron and manganese compounds abound through the Tennessee Valley and occur in the water and in the bottom sediments of reservoirs. When anaerobic conditions occur in a reservoir during periods of thermal stratification, reducing conditions in the hypolimnion can result in the resolubilization of iron and manganese from the water and the bottom sediments. Subsequent releases from the hypolimnion through low-level power intakes can contain concentrations of soluble forms of iron and manganese that are troublesome to downstream water supplies.

When iron and manganese concentrations in the supply are less than 300 and 50 μg/l, respectively, water of sufficient quality for potable municipal water can in most cases be produced by providing conventional treatment (coagulation, sedimentation, filtration, and disinfection). Quality requirements for industrial process water vary considerably from one type of industry to another; however, in general, industrial water users can operate successfully when process water is comparable in quality to conventionally treated municipal water supplies. These normal treatment processes are not effective in removing high concentrations of soluble iron or manganese. Excessive concentrations of iron or manganese in finished water do not constitute a health hazard, but they can stain plumbing fixtures and clothing, affect the taste and aesthetic quality of water, and interfere with manufacturing processes.

When high concentrations occur, additional treatment such as aeration and chemical additions are required to produce acceptable finished water. Beyond the additional treatment requirements, there are also problems associated with the operation of the additional treatment facilities when intermittent reservoir releases result in temporary flows of water high in soluble iron and manganese. Under these conditions, significant quantities of iron and manganese could enter treatment systems before they were detected.

Water supply intakes located below impoundments can obviously be affected when reservoir releases fail to provide sufficient quantities of water to meet use demands. The water supplies most often experiencing difficulties with insufficient quantity are located immediately below tributary dams or on stream reaches where tributary inflow between the water supply intake and the dam is insufficient to meet water supply requirements.

Assimilative Capacity

Use of streams for the assimilation of treated wastewaters is often omitted from the list of beneficial uses of water resources, yet the use of a stream's natural assimilative capability is a necessity and must be considered in an evaluation of the effects of reservoir releases on stream uses. Impoundments can adversely affect the assimilative capacity of the downstream reach by altering streamflows and lowering dissolved oxygen concentrations.

Water quality standards consist of stream use classifications and water quality criteria that define the stream conditions necessary to maintain the designated use classifications. In all cases, the water quality standards recognize that it is not practical or cost-effective to require meeting the numerical criteria under all streamflow conditions. Thus, all water quality standards identify a base minimum streamflow; if streamflow falls below that level, the water quality criteria are not applicable. Maintenance of water quality criteria at these designated minimum levels of streamflow results in these streamflows becoming the design basis streamflow for waste treatment facilities and discharge permit requirements. If streamflow falls below these identified critical flows, waste treatment by individual dischargers may not be sufficient to achieve the water quality criteria. The 7-day, 10-year recurrence interval minimum flow is normally the designated critical flow used on free-flowing unregulated streams. For regulated streams, the minimum base flow is the instantaneous minimum flow (or in some cases, the minimum average daily flow) resulting from the reservoir operation.

Normally, the design basis streamflows on regulated streams are less than the natural 7-day, 10-year minimum flows that occurred before impoundment. This is especially true of stream reaches below reservoirs used in response to peak generation demands, where releases may routinely be zero for several hours of the day and for several days of the year. In this situation, the individual dischargers must install additional waste treatment to protect water quality standards during periods of zero streamflow or provide holding ponds for storing wastewater following normal treatment until it can be discharged from these ponds in proportion to streamflow during the generating cycle.

Reservoir releases that are low in dissolved oxygen concentrations also significantly affect the levels of waste treatment that a downstream discharger must provide to meet water quality standards. Releases low in dissolved oxygen are reaerated to acceptable levels as the water flows downstream. However, the level of reaeration that occurs before the water reaches a downstream discharge depends upon the initial dissolved oxygen level in the release, the streamflow, the physical characteristics of the stream reach, and the distance between the dam and the outfall.

The level of waste treatment that a downstream discharger must provide depends upon the margin of the available oxygen resource at the outfall in comparison to the dissolved oxygen stream standard for the protection of fish and aquatic life. If the dissolved oxygen margin is not sufficient to assimilate the normally treated effluent and still provide adequate levels of dissolved oxygen to meet the fish and aquatic life criterion, the discharger must provide additional treatment. If reaeration has not been sufficient to bring the dissolved oxygen concentrations up to the stream standard, the discharger must provide sufficient additional waste treatment beyond the normal treatment requirements to ensure that the treated effluent does not further depress the dissolved oxygen concentration.

CHAPTER III

IMPACTS OF INDIVIDUAL PROJECTS ON WATER QUALITY

This chapter describes impacts of releases from individual projects in the Tennessee Valley on temperature, dissolved oxygen, resolubilization of metals (primarily iron and manganese), streamflow, turbidity and suspended solids, and gaseous supersaturation (primarily nitrogen). Where data were readily available, these impacts were evaluated on the basis of the operation of the projects from 1970 through 1977. To the extent practical, the severity of the impact at each project is identified.

Impacts on water quality are summarized in table 1. The impacts of releases from individual reservoirs were categorized for each water quality characteristic considered. These individual impacts were categorized as no impact (N), potential impact (P), and existing impact (E).

Table 1 makes it readily evident that the most critical impacts are associated with the releases from the tributary impoundments. Correction of the more severe tributary problems would probably result in improvement sufficient to satisfy the lesser water quality problems associated with releases from the main stream reservoirs. The most critical individual reservoir releases with respect to water quality considerations are those from Cherokee, Douglas, Tims Ford, Norris, South Holston, Blue Ridge, Fort Patrick Henry, Fontana, Chatuge, Nottely, and Great Falls.

Temperature

The temperature of reservoir releases can be considerably different from the surface temperature of the reservoir as well as from the temperature of the original river before impoundment. This effect is strongly related to water movement into, within, and out of the reservoir in the presence of density stratification, which is primarily caused by thermal stratification. The degree of thermal stratification in each of the reservoirs is classified in table 2. This classification is based on temperature observations, special studies, and the judgment of the TVA technical staff. Those reservoirs classified as unstratified do show diurnal temperature variations near the surface, but they are considered unstratified on a seasonal basis because they lack a defined, reoccurring surface layer of warm water.

Releases from reservoirs classified as unstratified would not result in a significant alteration of the downstream thermal regime and would be considered as having no long-term impact on the temperature of the downstream reaches. Reservoirs in this category include Nickajack, Wheeler, Wilbur, Ocoee No. 2, and Nolichucky.

Releases from reservoirs classified as weakly stratified could result in some alteration of the thermal regime downstream, but in most cases, the alteration would not be considered significant. Tributary reservoirs in this category include Fort Patrick Henry, Melton Hill, Apalachia, Ocoee

No. 1, Bear Creek, Cheoah and Calderwood, which are the smaller tributary reservoirs primarily operated as run-of-the-river reservoirs. The main stream reservoirs included in this category are Fort Loudoun, Watts Bar, Chickamauga, Guntersville, Wilson, Pickwick Landing, and Kentucky.

Releases from the 20 reservoirs that are strongly stratified produce significant long-term alterations in the thermal regime of the tailwater reaches. The extent to which these alterations have changed the long-term temperature regime depends upon the volume of cold water in the hypolimnion (including cold water inflows) and the volume of releases from the reservoir during periods of thermal stratification. In many cases, this alteration in the thermal regime of the tailwater reaches has already been recognized by the states by their classification of these reaches as cold water (trout) fisheries.

In assessing the applicability of this use classification, the average numbers of days in which the temperature of the releases exceeded 68, 74, and 80°F were used as guides. Most state water quality standards recognize 68°F as the maximum temperature for the cold water (trout) fishery use classification. The temperatures of 74 and 80°F were included in the assessment to determine the extent of deviations from the temperature of 68°F. The average numbers of days on which each of these temperatures was exceeded from 1970 to 1977 are summarized in table 3.

These data show that the releases from Cherokee, Douglas, Ocoee No. 3, Ocoee No. 1, and Great Falls are too warm to meet the 68°F maximum temperature criterion for a cold water fishery. Although temperature data are not available for Ocoee No. 2, because of the temperature of the releases from Ocoee No. 3 located upstream and Ocoee No. 1 located downstream, the releases from Ocoee No. 2 should also be considered as too warm for a cold water fishery. The thermal conditions of the releases from Melton Hill and Blue Ridge should be considered marginal for a cold water fishery. A cold water (trout) fishery classification would be inappropriate for the tailwater reaches from these 8 reservoirs.

With respect to the short-term (daily) impacts associated with reservoir releases, intermittent releases associated with peaking operations could result in significant changes in the tailwater temperatures. During periods of zero releases, tailwater temperatures may increase significantly if the equilibrium temperature is much higher than the temperature of the releases. The resumption of reservoir releases could significantly decrease the temperature in the tailwater.

The extent to which excessive daily changes in the temperature of tailrace water would occur depends upon the frequency and duration of the period of zero release and the degree of thermal stratification in the reservoirs. A period of zero release for about a day would allow the tailwater temperature to approach equilibrium temperature so that a large decrease in the temperature of tailwaters would occur when releases were resumed. A secondary factor that influences the temperature change that would occur in the reach below a dam is whether that reach is a free-flowing open river reach or an impounded reach.

A qualitative summary of the likelihood of large temperature changes or rates of change resulting from intermittent releases from individual reservoirs is shown in table 4. This summary is based on a comparison of the information in table 2, showing the extent of thermal stratification in each reservoir, and the information in table 5, which shows the numbers of days of zero release. The Tennessee water quality criteria of 5.4°F change and 3.6°F per hour rate of change have been used as guides to categorize the temperature change problem. It should be emphasized that this categorization is a qualitative categorization based on the experience and judgment of the TVA technical staff. Insufficient data are available for a quantitative categorization for all reservoirs.

Twenty-three reservoirs fall within the categories of very unlikely or unlikely to produce problems of temperature change. These groups include the 9 main stream Tennessee River reservoirs, 10 run-of-the-river tributary reservoirs, 3 new tributary reservoirs, and 1 storage reservoir (Boone). Boone Reservoir falls within this category because of its close operating relationship with Fort Patrick Henry Dam immediately downstream. Large fluctuations in water temperature would be very likely downstream from the tributary storage reservoirs with the exception of Boone. A large temperature change downstream from Melton Hill would be likely because of its operating relationship with respect to Norris upstream and Watts Bar downstream.

Dissolved Oxygen

The minimum dissolved oxygen water quality criterion applicable to the streams of most of the Valley states is 5.0 mg/l. Although this criterion was adopted primarily for the fish and other aquatic life stream use classifications, it is also, in most cases, applicable to all other stream use classifications. The basis for this criterion is that 5 mg/l of dissolved oxygen is the minimum concentration required for the propogation of warm water fish. However, this level of dissolved oxygen is not necessarily the minimum concentration required for fish survival.

The average numbers of days per year from 1970 to 1977 during which the dissolved oxygen concentrations of the individual project releases were less than 5, 3, and 1 mg/l are summarized in table 6. Also shown are estimates of the numbers of miles of stream reaches below each project in which concentrations of dissolved oxygen could be less than 5 mg/l under worst conditions, which occur during maximum generation when the dissolved oxygen content of the release is at a minimum. Under these conditions, the increased depth of water reduces the reaeration rate, and higher velocities decrease the time of passage in the reach, which in turn extends the length of the downstream reach affected. The data relating to concentrations of 3 and 1 mg/l of dissolved oxygen were included to allow an assessment of the severity of the problem at each project.

With respect to a strict numerical criterion of 5 mg/l of dissolved oxygen, releases from seven reservoirs (including an Alcoa reservoir) have no problem of dissolved oxygen levels. There are an additional 11

reservoirs (including an Alcoa reservoir) that have dissolved oxygen concentrations in the releases below 5 mg/l for less than 15 days, but no concentrations below 3 mg/l. Data on dissolved oxygen concentrations are not available for three reservoirs (Nolichucky, Thorpe, and Nantahala); however, it was judged from a knowledge of the tailwater reaches that releases from these projects cause no significant problems. These data indicate that there are 21 reservoirs (including two Alcoa reservoirs) with no substantial problems of low dissolved oxygen levels in their releases.

As evident from table 6, there are severe dissolved oxygen problems associated with the releases from eight reservoirs, in that concentrations less than 1 mg/l occur. These reservoirs are South Holston, Cherokee, Douglas, Fontana, Norris, Chatuge, Nottely, and Tims Ford, all of which fall into the category of storage reservoirs. The releases from Cherokee, Douglas, and Tims Ford cause the worst problems. This group of eight reservoirs should be considered as the "priority reservoirs" for any recommended subsequent studies of the dissolved oxygen problem.

A total of 10 reservoirs have dissolved oxygen problems associated with releases that would be classified in an "intermediate" category. This category includes those reservoirs that experience either periods of dissolved oxygen concentration below 5 mg/l (exceeding 15 days) or infrequent occurrences of concentrations less than 3 mg/l but no occurrences of concentrations less than 1 mg/l. The dissolved oxygen problems associated with several of these reservoirs should be considered as "secondary" because to a great extent they may be the result of inflows from other upstream reservoir releases that are low in dissolved oxygen. Specific reservoirs in this category include Fort Loudoun, Watts Bar, Fort Patrick Henry, and Cheoah (Alcoa project). Improvements in the levels of dissolved oxygen in the inflows to these reservoirs would contribute to improved quality of the releases, and in some cases, could completely eliminate the problem. Completion of the Tellico project would significantly improve the dissolved oxygen content of releases from Fort Loudoun.

In addition, the tailwaters below several projects have been classified by the states as "trout waters" because of the suitable temperature of reservoir releases. These include South Holston, Wilbur, Fort Patrick Henry, Fontana, Chatuge, Norris, Nottely, Hiwassee, Apalachia, Normandy (expected in the future), Santeetlah, Thorpe, Nantahala, Cheoah, and Calderwood (the last five are Alcoa projects). The tailwater reaches below Tims Ford and Blue Ridge are being managed as trout fisheries although they have not officially been classified for this use. Because trout require higher levels of dissolved oxygen than other species, the criterion applicable to the trout water classification is 6 mg/l. Although a separate assessment has not been made with respect to the 6 mg/l criterion, some insight into the extent of problems with this criterion can be obtained by reviewing the reservoir releases with respect to the three dissolved oxygen criteria that were assessed. Six of these reservoirs (South Holston, Fontana, Norris, Chatuge, Nottely, and Tims Ford) have already been identified within the group of projects having severe dissolved oxygen problems. Blue Ridge is in the "intermediate" category with regard to concentrations of dissolved

oxygen in the releases. Although only limited data are available for Thorpe and Nantahala, based on knowledge of these projects and their tailwater reach, it is judged that there are no significant dissolved oxygen problems related to these projects. There is no dissolved oxygen problem with releases from Normandy because the development of the tailwater cold water fishery was one of the purposes of the project and provisions were incorporated into the project to ensure the achievement of adequate dissolved oxygen. Concentrations of dissolved oxygen in releases from Wilbur, Fort Patrick Henry, Apalachia, Cheoah, and Calderwood cause greater problems for the present cold water classification than they would for a warm water classification.

Resolubilization of Metals

Resolubilization of metals in reservoir releases is primarily related to the temperature, dissolved oxygen, and pH conditions in the reservoir. Within the Tennessee Valley, the main factors impacting resolubilization of metals are temperature and dissolved oxygen. Except at the Ocoee projects, there are no unusual pH problems in the reservoirs. The specific metals most subject to resolubilization are iron and manganese, and these metals were used in this assessment as indicators of resolubilization problems assoicated with releases. Solubilized iron and manganese are also the metals that would most often impact downstream uses for potable and industrial water supplies.

As a basis for reference, the present Environmental Protection Agency (EPA) guidelines for public water supply for iron and manganese are 300 and 50 μg/l, respectively. These guidelines apply to the total form of the metal and not the soluble form. The more critical form is the soluble form, because the insoluble portion is usually associated with the particulate matter suspended in the water, which is readily removed by conventional water treatment processes. For purposes of this assessment, the EPA guidelines were used as the numerical criteria for determining impacts of reservoir releases, although the TVA staff believes these criteria are somewhat conservative.

The total iron and manganese concentrations observed in the releases from individual reservoir projects from 1974 through 1976 are summarized in table 7. Also included in the table is a summary of the dissolved iron and manganese concentrations for those projects for which data were available. From a comparison of the total form and the dissolved form, it is evident that, in most cases, most of the iron and manganese occurs in the suspended or particulate form. The data also show that the mean concentrations were much closer to the minimum than to maximum concentrations. This indicates that the data distribution is skewed and that most of the data are less than the mean values. This also indicates that the mean values are strongly influenced by the occurrence of a few high observations and, as a result, tend to overstate the normal concentration in the releases. High concentrations in releases would normally be expected to coincide with periods of high turbidity and suspended solids associated with periods of heavy rainfall and surface water runoff. Therefore, the mean concentration of the total form of each

metal was used in this assessment for comparison with the suggested EPA guidelines. This comparison, however, may tend to overstate the extent of the problem.

No recent data on iron and manganese are available for three reservoirs (Nolichucky, Thorpe, and Nantahala); however, there are no known problems associated with releases from these projects.

Releases from 12 reservoirs had mean concentrations less than 300 μg/l total iron. In addition, in releases from 15 reservoirs the mean total iron concentration was within the range of 300 to 500 μg/l. Based on the conservative method by which this assessment was made and an engineering knowledge of the reservoirs, it was concluded that there are no significant iron problems associated with the releases from these 30 reservoirs as they are now operated.

The mean total iron concentration exceeded 500 μg/l in nine reservoirs (Kentucky, Douglas, Chatuge, Nottely, Ocoee No. 3, Ocoee No. 2, Normandy, Bear Creek, and Santeetlah). The mean concentration of 606 μg/l in the releases from Kentucky Reservoir was the lowest mean concentration for releases from these nine reservoirs. Because Kentucky is a main stream reservoir in which strong thermal stratification does not occur and because it is subject to frequent flood control operations associated with localized surface water runoff, most of this iron concentration would be expected to occur in the particulate or suspended form. Therefore, it is judged that there would be no significant impacts on downstream water uses resulting from the Kentucky releases.

The high concentrations of iron in releases from the Ocoee No. 3 and Ocoee No. 2 projects are primarily associated with industrial waste discharges (impacting pH) and extensive surface water runoff from the Copper Basin area. Consequently, the occurrence of high concentrations of iron at these projects should be judged potential problems associated with normal reservoir releases or operations if water quality is improved in the future.

Releases from the Normandy project have high concentrations of both total and soluble iron. These concentrations are judged to be associated with extensive dissolved oxygen depletion during the first few years of lake aging. Within the next few years, it is expected that this phenomenon will be completed and that the iron concentration will decrease. In addition, provisions were incorporated in the project design and operation to ensure that all releases from this project would be well aerated, which would result in the ready oxidation of the soluble iron. The iron problems associated with the releases from Normandy are judged to be only temporary in nature; consequently, no long-term iron problems are expected to be associated with Normandy releases.

Releases from the Bear Creek project are subject to the same problems of lake aging identified for Normandy. In addition, the Bear Creek project receives larger amounts of surface water runoff from an area that has high concentrations of iron in the geologic formations of the basin. A comparison of data for total and soluble iron shows that most of this iron occurs in the insoluble form. As initial lake aging is completed,

iron concentrations are expected to be reduced. There is now no reason to believe that long-term iron problems will occur in the releases from Bear Creek.

Potentially significant problems are associated with the total iron concentrations in the releases from four reservoirs (Douglas, Chatuge, Nottely, and Santeetlah). Three of these reservoirs (Douglas, Chatuge, and Nottely) have already been identified as priority reservoirs with respect to the problems of low levels of dissolved oxygen associated with their releases. Improvement of the dissolved oxygen concentration of the releases from these three projects would in all probability resolve the iron problems. No separate assessment has been made for Santeetlah because it is an Alcoa project and because its releases are not impacted by or do not impact a TVA reservoir.

The mean concentration of manganese in the releases from 10 reservoirs was 50 μg/l, or less. In addition, concentrations in releases from six reservoirs ranged from 51 to 60 μg/l, and those in releases from five reservoirs ranged from 61 to 70 μg/l. The conservative nature of this assessment method indicated no significant problems associated with the total manganese concentrations in the releases from these 21 reservoirs.

Mean total manganese concentrations in releases from 15 reservoirs were greater than 70 μg/l. Included in this group are three main stream reservoirs (Watts Bar, Chickamauga, and Guntersville). Because these reservoirs do not undergo strong thermal stratification, and because significant dissolved oxygen depletion does not occur in these reservoirs, these high concentrations of total manganese in the releases are not judged to be the result of extensive resolubilization within the reservoirs. The principal source of these high mean concentrations of total manganese is surface water runoff associated with frequent periods of heavy local rainfall. This is substantiated by the high maximum concentrations in the Chickamauga and Guntersville releases, which have greatly impacted the mean concentration. In addition, the dissolved manganese data for the Watts Bar, Chickamauga, Nickajack, and Wheeler releases confirm that much of the total manganese concentration in the releases is in particulate or suspended form. These data indicate that no significant manganese problems are associated with the releases from these three main stream reservoirs.

The high manganese concentrations in the releases from the Ocoee No. 1, No. 2, and No. 3 projects are primarily attributed to the impacts of industrial waste discharges and surface water runoff from the Copper Basin area. Although there is a public water supply intake downstream from Ocoee No. 1, the high manganese concentrations in releases from these projects are not attributable to extensive resolubilization within the reservoirs. Therefore, although a potential manganese problem exists at this downstream water supply, this impact is not judged attributable to the reservoir releases as such.

The high manganese concentrations in releases from Normandy are primarily attributed to the impacts associated with initial lake aging. Within the next few years, these levels are expected to decline. The provisions incorporated into the project design and operation to provide aeration

of the releases should mitigate, in part, any future downstream manganese problems. Because the oxidation rate for manganese is much lower than that for iron, however, there is a potential for future downstream manganese problems associated with the releases from Normandy.

Manganese concentrations in excess of 70 μg/l occur in the releases from Cherokee, Douglas, Chatuge, Nottely, Tims Ford, Great Falls, Bear Creek, and Little Bear Creek. Six of these reservoirs (Cherokee, Douglas, Chatuge, Nottely, Tims Ford, and Great Falls) were identified as becoming strongly stratified and (with the exception of Great Falls) are considered as being "priority reservoirs" with respect to problems of low concentrations of dissolved oxygen in the releases. These low concentrations of dissolved oxygen are conducive to the occurrence of reducing conditions in the reservoir hypolimnion that could result in high concentrations of resolubilized manganese in the releases. However, there are no known problems associated with the high concentrations of manganese in the releases from Cherokee, Douglas, Chatuge, Nottely, and Great Falls. Therefore, releases from these projects should be considered as only potential problems. Critical manganese problems have occurred at a water supply downstream from Tims Ford. The implementation of mitigative action to reduce the adverse impacts associated with the low dissolved oxygen releases from this project should contribute to alleviating the problems associated with high manganese concentrations. However, because the oxidation rate for soluble manganese is much lower than that for iron, it is uncertain if mitigative action to reduce the dissolved oxygen problem would be sufficient to eliminate the manganese problem.

High concentrations of total and soluble manganese do occur in the releases from the Bear Creek and Little Bear Creek projects. Although a portion of these elevated concentrations may be attributable to initial lake aging, there is a potential for continued high concentrations in the future. Because there is a potential long-term problem with these releases, they should be periodically assessed to determine the extent of any continuing long-term problem.

Although there are no significant iron or manganese problems associated with the normal releases from South Holston Reservoir, there has been and continues to be a significant problem associated with maintenance operations at this project. This problem is the result of the buildup of a "pocket" of water containing high concentrations of iron or manganese (primarily manganese) in the original river channel within the reservoir, which is at the same elevation as the reservoir bypass sluice. During periods of hydro unit maintenance, releases must be maintained for downstream water supply. These releases can only be made through the sluice, which withdraws water from the pocket of water with high iron and manganese concentrations at the bottom of the reservoir. These releases have, in the past, had a significant adverse impact on the downstream water supply. Although there is no simple method for correcting this problem permanently, mitigative measures have been taken on a case-by-case basis to reduce the magnitude of the problem. These actions include, (1) scheduling maintenance outage to coincide with the period when the manganese concentrations in the vicinity of the sluice are at their lowest, (2) bleeding the high manganese water from the bottom during the period before the maintenance outage, (3) providing notification

and technical assistance to the water plant operators before and during sluicing operations, and (4) monitoring iron and manganese concentrations in the releases and in the reservoir during the sluicing operations to provide early warning to the water system if unusual conditions are encountered. These actions have been effective in reducing the impact of the problems, and it is expected that they will continue to be used for future maintenance outages.

Streamflow

The construction and operation of reservoirs can significantly affect the flow in the stream reach below a dam. Under natural conditions, streamflow may on occasion recede to low levels; however, this is a gradual recession and usually results in some base minimal flow still occurring in the streambed during critical seasons. However, a regulated stream is subject to complete termination of flow at any time depending upon the schedule of reservoir operations. During periods of zero release, the downstream tailwater reach is subject to reduced water depths and drying of the streambed if the reach below the dam is not impounded by another downstream reservoir or if it does not receive a significant inflow from tributaries below the dam. Table 5 indicates the extent of this problem. It shows the average numbers of days per year on which, for a defined 24-hour period, the releases from the individual projects are zero.

Of equal importance is the fact that the table does not include an identification of the number of hours each day of zero discharge, because periods of zero releases occur almost daily at most reservoirs. The exception to this generalization is that minimum instantaneous flows are maintained at Kentucky, Chilhowee, Normandy, Nolichucky, Bear Creek, and Little Bear Creek. The information to quantify the frequency and duration of periods of zero releases, for periods other than a day, were not readily available in a form that could be included in the table. Further studies would be necessary to evaluate these data to determine the frequency and durations of these periods of zero releases and to quantify their impact on the tailwater streamflow regime.

Also included in the table for purposes of comparison is an estimate of the natural 7-day, 10-year minimum streamflow that would have occurred at each reservoir site without regulation and an identification of the condition of the tailwater reach with respect to downstream impoundment or open river stream conditions. For the nonpower projects, table 5 also summarizes minimum regulated streamflow and the natural 7-day, 10-year streamflow.

Based on a review of the information in the tables, it is concluded that there are basically no streamflow problems resulting from intermittment reservoir releases from the main stream reservoirs, from the tributary reservoirs where the tailwater reach is impounded, or from the nonpower projects that have provisions for maintaining minimum instantaneous streamflows incorporated into their design and operation. Possible exceptions to this would be the releases from Chickamauga and Guntersville, which could potentially impact downstream waste discharges.

Turbidity and Suspended Solids

No applicab.e water quality criteria have been established for turbidity and suspended solids. In the stream, wide variations occur naturally because turbidity and suspended solids are normally the result of soil erosion associated with surface water runoff following rainfall. In most cases, these characteristics are indicators of the physical suspension of inert soil and sediment particles in the water column under turbulent flow conditions. Under quiescent flow conditions, these particules readily settle by gravity.

Observed turbidity and concentrations of suspended solids in the releases from individual reservoirs from 1974 through 1976 are summarized in table 8. These data typically reflect the characteristics expected for normal reservoir releases. However, after heavy rainfall, turbidity and concentrations of solids much higher than those reflected in the table may occur in turbine or spillway releases from several projects for short periods. There are no significant water quality problems associated with the turbidity or concentrations of suspended solids of the normal releases (turbine or spillway) from any of the reservoirs.

No significant adverse effects from turbidity and suspended solids are known to result from the scouring of downstream reaches by releases from any of the reservoirs except Fort Patrick Henry and Tims Ford. The releases from Fort Patrick Henry have an indirect scouring effect in the reach of the Holston River upstream from the John Sevier Steam Plant retention dam. The streambed of this reach of the river is extensively colonized by prolific growths of aquatic macrophytes. As these plants grow, their "hydraulic drag" increases to the point that the root system is not capable of holding the plants. The streamflow pulls the plants up by the roots and carries them downstream. When this occurs, increased turbidity and concentrations of suspended solids result from the disturbance of the bottom substrate in the vicinity of the plant root system and from the washing of sediment lodged in the root system of the floating plants. The critical hydraulic conditions associated with this phenomenon are rapidly increasing stream velocities associated with the downstream movement of the power wave from the peaking operations at Fort Patrick Henry Dam. Although this condition results in increased turbidity and suspended solids concentrations and also creates unpleasant aesthetic conditions in this reach of the Holston River, it may also have a beneficial effect of limiting the growth of aquatic macrophytes.

At Tims Ford, extensive scouring and overbank streamflows occurred during the initial periods of operation. This condition resulted from high capacity operation of the hydro unit for this project. Although no specific water quality data are available, these operations created conditions of increased turbidity and concentrations of suspended solids similar to those expected under natural flooding conditions. To mitigate this situation, operating restrictions have been placed on the Tims Ford unit to limit release rates to those that the downstream stream reach is hydraulically capable of accommodating.

The Ocoee No. 3 project is unique with respect to turbidity and suspended solids. The reservoir has become extensively silted by runoff of storm

20-955 O—84——182

water from the Copper Basin area. Within a few hundred feet of the dam, extensive silt deposits are higher than the spillway crest. Consequently, during flood control operations, extensive quantities of silt are discharged through the spillway gates and result in high turbidity and concentrations of suspended solids in the spillway releases. Most of this silt is carried downstream with the flood waters and has no significant impact on the water quality of the reach immediately downstream.

However, the critical situation associated with this reservoir is the extensive silt deposits that accumulate near the hydro unit intake. To prevent sediment from accumulating to the level that entrainment into the intake would damage the generating unit, periodic bottom sluicing is required. The sluiced water is in essence mud that coats the downstream channel and adversely impacts the quality of the residual pools in the stream channel. There does not now appear to be any feasible alternative to the sluicing operations if the Ocoee No. 3 project is to continue to be used for hydro generation.

The Nolichucky Project is also a unique situation with respect to turbidity and suspended solids. This reservoir, like Ocoee No. 3, has become extensively silted as a result of both point and nonpoint source discharges originating upstream. During the late 1960s, when the reservoir was drained for maintenance purposes, massive silt movements occurred within the reservoir and covered the intakes of three of the four hydro units. With increased maintenance and structural problems associated with the dam, a decision was made in the early 1970s to retire the project.

The disposition of silt in the reservoir was the greatest problem associated with the alternatives available for the retirement of the project. Consequently, the alternative adopted was to strengthen the structure so as to retain the silt in the reservoir and to develop the remaining surface portion of the reservoir into a wildfowl resting area. In conjunction with this, the powerhouse was renovated and converted to a museum, and the adjacent shoreline areas were converted to an environmental education area.

The project is now operated as a run-of-the-river detention dam, although reservoir elevation is periodically fluctuated somewhat to improve the browse conditions for wildlife. Consequently, the turbidity and concentrations of suspended solids in the overflow releases from Nolichucky reflect the conditions in the inflow to the reservoir as they may be altered by deposition or resuspension as the water passes through the reservoir. The extent to which these releases adversely impact downstream water quality or stream uses in the Nolichucky River is unknown.

Gaseous Supersaturation

The main environmental concern about supersaturation of dissolved gases is the potential for the occurrence of gas bubble disease in fish. Gaseous supersaturation downstream from reservoirs is normally associated with spillway releases to deep stilling basins. The suggested EPA

guideline for total dissolved gases is that the concentration should not exceed 110 percent of the saturation value for the existing atmospheric and hydrostatic pressures.

Generally, the occurrence of supersaturated concentrations of total dissolved gases that could adversely impact aquatic life is not considered a significant problem associated with the releases from projects in the Tennessee Valley. This conclusion is substantiated by the results of investigations of fish kills and other fisheries studies during which no evidence of gas bubble disease in fish has ever been encountered.

Because very few data are available on total dissolved gas conditions downstream from reservoirs in the Tennessee Valley, the potential for the occurrence of adverse concentrations was assessed indirectly by reviewing the frequency of spillway operations (including sluicing). The average numbers of days per year of spilling or sluicing releases at each project from 1972 through 1977 are summarized in table 9. The numbers of days indicated in the table are the days on which spilling or sluicing occurred for some period, no matter how brief, and should not be misinterpreted that spilling necessarily occurred for the entire 24-hour period.

Table 9 shows that the frequency of spilling at the tributary reservoirs is generally very low except at Norris, Apalachia, Ocoee No. 3, Ocoee No. 1, Tims Ford, Great Falls, Normandy, and Nolichucky. All spillway releases or other discharges from these latter reservoirs are to shallow stilling basins from which the water then flows into relatively shallow stream reaches. These two factors would help minimize the occurrence of supersaturation. In addition, spillway operations at projects with hydro generating capabilities are normally conducted concurrently with turbine releases. The turbine releases provide additional compensation with respect to dissolved gas saturation in that they are often much colder (therefore raising the saturation concentration) and usually have dissolved gas concentrations much lower than those of the spillway releases.

Main stream reservoirs spill water relatively frequently each year, sometimes for extended periods. During flood control operation, tailwaters may be 30 feet deep (about one atmosphere of pressure) or more, and the potential exists for elevated concentrations of dissolved gases. Because of the high stream velocities and turbulence associated with these flood control operations, long stream reaches could be impacted by elevated concentrations of dissolved gases.

Thus, it is concluded that, for tributary reservoirs, there is little potential for frequent and prolonged elevated concentrations of dissolved gases. However, spillway operations associated with the main stream reservoirs could result in concentrations of total dissolved gases remaining elevated for extended periods in relatively long stream reaches.

CHAPTER IV

IMPACTS OF INDIVIDUAL PROJECTS ON STREAM USES

On the basis of the water quality impacts identified in chapter III and the operation of the projects from 1970 through 1977, this chapter describes the impacts of the releases from the individual projects in the Tennessee Valley on downstream uses of water for recreation, fisheries and other aquatic life, water supply, and assimilative capacity. The assessments are also based on knowledge of specific problems that downstream users have experienced. In some instances, particularly in the case of recreation and fisheries resources, an attempt was made to assess the opportunties for resource utilization that have been precluded in past years as a result of adverse water quality conditions and discharge regimes.

Impacts on stream uses are summarized in table 10. In all cases, an attempt was made to assess the severity of the impact and to suggest improvements in water quality needed to enhance the use. Improvements have been identified as far as practical to protect uses on a case-by-case basis rather than to meet specific numerical criteria. These assessments relate to downstream uses but do not consider potential impact of the possible improvements on present uses or upstream uses. Additional studies would be required to address the balance between present upstream and downstream uses and potential future uses.

The summary table shows that the most critical stream use impacts under present operating conditions are associated with the releases from the tributary impoundments. There are no significant existing impacts on water use associated with releases from the main stream reservoirs. However, there is the potential for future impacts from the releases from Chickamauga and Guntersville on assimilative capacity.

Extreme fluctuations in release rates and seasonally low concentrations of dissolved oxygen cause most of the use problems associated with the tributary reservoirs. For instance, inadequate minimum flows reduce available habitat for fish and fish food organisms, impair stream aesthetics, limit recreational floating, allow excessive temperature fluctuations, and limit available water supplies and stream assimilative capacities. Maximum or peak discharges limit fishing use and reaeration of oxygen-deficient water. Low concentrations of dissolved oxygen limit the diversity and abundance of fish and fish food organisms. Although little can be done to correct oxygen deficits by modifying flow, the establishment of an adequate minimum or base flow could significantly increase opportunities for recreational use and enhance uses for fisheries resource, water supply, and assimilative capacity. Recreational floating could be enhanced through selective scheduling of peak discharges.

The most critical individual reservoirs with respect to the overall adverse impacts of present releases on downstream water uses are South Holston, Fort Patrick Henry, Cherokee, Douglas, Norris, Chatuge, Nottely, Apalachia, Blue Ridge, Tims Ford, and Nantahala. With regard to water use downstream, these 11 projects should be considered as the "priority reservoirs."

Consequently, any additional studies to develop mitigative measures to reduce adverse impacts on water uses should be directed toward these reservoirs first. Except for Fort Patrick Henry, Apalachia, Blue Ridge, and Nantahala each of these projects has been identified as a priority reservoir with respect to any future studies for improving low concentrations of dissolved oxygen.

The other tributary reservoirs would be classified in an "intermediate" category regarding adverse impacts on water uses. This does not imply that the impact on a specific use is not as severe at these projects, but rather implies that the overall impact on all uses is not as severe.

Recreation

The principal adverse impacts of reservoir releases on existing or potential recreational uses are directly associated with the water quality factors affected by streamflow. Other water quality characteristics that can directly impact recreational uses are turbidity and suspended solids, odor, and color. There are, in general, no significant problems associated with the occurrence of these secondary factors in the releases from reservoirs in the Tennessee Valley addressed in this report, although significant problems may be encountered on a case-by-case basis.

The two most important recreational uses associated with the tailwater reaches below reservoirs are fishing and floating. Recreational uses are also indirectly affected by temperature and dissolved oxygen, which are primary considerations for fisheries resources. No significant adverse impacts on any recreational use are associated with releases from mainstream reservoirs. Some significant adverse impacts on floating and fishing recreational uses are associated with releases from most of the tributary impoundments, however.

Tailwater Floating Use--The general effects of reservoir releases from tributary reservoirs on downstream recreational uses are restricted for quality commercial development and boating use. For various reasons, there is often a lack of adequate, reliably regular flow during the daylight hours most desirable for floating (10 a.m. to 6 p.m.) during peak recreation season. Additionally, the bypassing of water around the natural streambed (as occurs below Ocoee No. 2 dam) precludes boating use.

Releases from the following reservoirs adversely affect potential recreational development for floating:

Ocoee No. 1, 2, 3	Fort Patrick Henry
Nantahala	Tims Ford
Apalachia	Chilhowee
Thorpe	Chatuge
South Holston	Nottely
Norris	Blue Ridge
Cherokee	Bear Creek Reservoir
Douglas	Wilbur

Weekend operations at Nantahala and Apalachia have resulted in extensive interest in floating these tailwaters. However, significant conflicts have developed with public use and commercial recreational development because adequate flows could not consistently be provided during desired periods. Releases for recreational purposes at Ocoee No. 2 are evaluated in the environmental impact statement concerning rehabilitation of this project. These three reaches are now receiving considerable national interest as white water streams and should be given priority for any future studies for recreational enhancement.

Some releases are scheduled for recreational purposes downstream from Tims Ford, but the inconsistency of these releases results in conflicts among river uses. Chilhowee Reservoir is operated to maintain a minimum flow for other purposes that also provides some recreational opportunity, but it is not adequate for optimal floating use.

Preliminary plans for recreational releases from Bear Creek are being evaluated, but there is yet no definite commitment to provide such releases.

Special releases for specific boating events have been provided upon request from organized boating groups at Nantahala, Apalachia, Ocoee No. 2, and Norris.

Tailwater Fishing Use--The nine main stream reservoirs (Fort Loudoun, Watts Bar, Chickamauga, Nickajack, Guntersville, Wheeler, Wilson, Pickwick, and Kentucky) and Melton Hill Reservoir receive extensive use ranging from an estimated 79,000 trips per year (1977) at Kentucky to 20,000 trips at Melton Hill. It is possible that selected combinations of turbine discharges during operation of these reservoirs could significantly affect fish distribution in the tailwaters and, therefore, their use for fishing.

Impacts on fishing use of TVA tailwater areas are mainly related to scheduling and rates of discharges. Tailwaters that now receive extensive fishing interest [Norris, Chilhowee, South Holston, Douglas, Apalachia, Tims Ford, Wilbur (Watauga), Nantahala, Thorpe, Chatuge, Fort Patrick Henry, and Cherokee] have limited fishing access because of present reservoir operating regimes (i.e., fishing is possible only when discharge rates and time of discharge permit). High discharge rates during prime times for fishing use (early morning and late evening), particularly during weekends and holidays, result in high velocities and increased depths that preclude wade fishing and significantly hinder bank fishing.

Nottely, Blue Ridge, and Ocoee No. 1, 2, and 3 provide limited fishing opportunities because of factors that adversely impact fisheries resources. If the fisheries resources of these tailwaters are improved, reservoir releases could still hinder fishing. All other tailwaters provide recreational fishing but experience release rates that limit fishing use; however, they are of less immediate importance.

The low temperatures of many storage impoundments have converted a previous warm water fishery to a cold water (trout) fishery. Some tailwaters provide established put-grow-and-take trout fisheries, but others with marginal temperatures not adequate for cold water species could provide more use for fishing if a warm water fishery were developed. These tailwaters are affected by cool or cold discharges for only part of the summer; therefore, both cold and warm water fishery uses are limited. These reservoirs include Cherokee, Douglas, Melton Hill, Blue Ridge, Ocoee No. 1, Ocoee No. 2, Ocoee No. 3, and Great Falls.

Potential Actions for Improving Recreation--A rescheduling of releases could potentially reduce the impacts on recreational uses of tailwaters that result from present operating regimes. However, any change in existing operations will affect power generation and possibly flood control, navigation, and recreational use on the upstream reservoir. Evaluations of existing reservoir operations, with specific consideration of potential recreational opportunities, may identify methods for providing additional downstream uses without adversely affecting other programs:

1. Establish instantaneous minimum streamflows to enhance fisheries resources.

2. Schedule most discharges for recreation on weekends (including Fridays) and holidays from May through September to increase opportunities for recreational use during peak recreational demand. Consider the desirability of some scheduled releases during early spring to provide more fishing opportunities for migratory fish species.

3. Schedule minimum releases (item 1 above) at appropriate high-use sites during early morning and late evening to provide discharge levels suitable for wading and bank fishing and, in many cases, to provide opportunities for low-flow floating use.

4. Schedule higher-rate releases during midday (about 10 a.m. to 6 p.m.) to provide opportunities for optimum floating use.

5. Guarantee flows for recreational use and to provide incentive for development of commercial recreation.

6. Minimize nighttime discharges to reserve more water (generating capacity) for daytime releases when recreational opportunities can be realized.

Fish and Other Aquatic Life

The main adverse impacts of reservoir releases on existing or potential fisheries resources of stream reaches below impoundments are directly related to the water quality and the quantity of the releases--temperature, dissolved oxygen, and streamflow. Other water quality factors affected by reservoir releases, such as solubilized metals, turbidity and suspended

solids, and total gas supersaturation, are also capable of adversely impacting fishery resources, but in general, these water quality characteristics do not cause problems for fisheries in the releases from reservoirs in the Tennessee Valley.

Two main components of a fishery resource must be assessed: the fish and the other aquatic biota that comprise the food chain. In this assessment, an attempt has been made to consider both components within the scope of readily available data.

No significant adverse impacts on either fish or the aquatic food chain are associated with releases from the main stream reservoirs. Although historically (1960s) there has been low dissolved oxygen in the releases from Fort Loudoun and Watts Bar that have limited conditions for food chain organisms, recent improvements have resulted in a significant recovery of the food chain organisms. Even though the dissolved oxygen levels in these releases are still (1970s) below the numerical stream standards, there are no significant adverse biological impacts associated with these releases.

The water quality characteristics of releases from most tributary impoundments in the Valley cause significant adverse impacts on fishery resources. However, there are no fishery resource data readily available for a direct assessment of the effect of the releases from Watauga, Hiwassee, Great Falls, Bear Creek, Little Bear Creek, Boone, Fontana, Nolichucky, Thorpe, Santeetlah, Cheoah, and Calderwood. The impacts associated with each project for which tailwater fisheries resource information was available are summarized in the following paragraphs.

South Holston--The South Holston tailwater is now managed as a trout fishery by the Tennessee Wildlife Resources Agency (TWRA). Its potential is limited by intermittent releases with low concentrations of dissolved oxygen. There is a low diversity of both fish and macroinvertebrates, but standing stocks are now high. Increased concentrations of dissolved oxygen in the releases would increase the potential for diversity of species. The establishment and maintenance of an adequate instantaneous minimum base flow would significantly increase biological production (fish and fish food organisms) and opportunity for use of the resource for recreational fishing. Although this tailwater fishery is now adversely affected by intermittent streamflows and low concentrations of dissolved oxygen, it does successfully sustain moderate fishing pressure and has a high potential for improvement.

Wilbur--The combination of relatively low discharge rates, absence of extreme oxygen deficits, and significant inflow from tributary streams causes the fauna of Wilbur tailwater to be similar to that of an unregulated stream. There is great diversity of fish and bottom fauna (especially in the lower reaches), and standing crops are fair. Establishment of an adequate instantaneous minimum base flow would significantly improve this fishery resource. The tailwater is now managed as a trout fishery by TWRA and sustains moderate levels of use for fishing.

Fort Patrick Henry--Although the diversity of fish and bottom fauna is low, the tailwater below Fort Patrick Henry Dam supports relatively high standing crops of fish and fish food organisms and is being managed as a trout fishery by TWRA. Minimum instantaneous flows and dissolved oxygen concentrations are not adequate for maximum biological production or fishing use. The low faunal diversity is probably related to the seasonal oxygen deficits and inadequate minimum instantaneous flows. Although the tailwater is only about three miles long, it has a high potential for improvement and increased levels of fishing use.

Cherokee--The fisheries resource of the upper 20 miles of the 50-mile-long Cherokee tailwater is very poor, primarily because of the adverse impact the Cherokee releases have on dissolved oxygen, temperature, and streamflow. The temperature regime resulting from Cherokee releases is unsatisfactory for either warm or cold water species of fish.

The lower half of the tailwater supports a good localized fishery for smallmouth bass and other warm water species. The diverse fish and bottom fauna communities in the lower portion of the tailwater, where some reaeration has occurred, where flows have been supplemented, and where temperatures have moderated, indicate the potential for improvement of this fishery resource. Because of its size and potential as an exceptional warm water stream, this tailwater should be given a high priority for further study.

Douglas--Like Cherokee, the Douglas tailwater is too warm for part of the year to support trout and too cold to favor the establishment of most warm water species. Because of the temperature regime, both fish and bottom fauna communities are of very limited diversity. Sport fishing is largely confined to late winter and early spring when sauger and crappie migrate from downstream areas. About 30 miles long, this tailwater has the potential to become a significant warm water stream fishery if the adverse impacts associated with seasonally low dissolved oxygen, unfavorable thermal regime, and inadequate minimum flows can be corrected. Because of the potential for improvement, this tailwater should be given a high priority for further study.

Norris--Although the 13-mile-long Norris tailwater is intensively managed as a high quality trout fishery by TWRA, the diversity and productivity of fish and bottom fauna communities and use for fishing could be greatly enhanced by correcting problems associated with seasonally low concentrations of dissolved oxygen and inadequate minimum flows. The existing thermal regime, except for warming during extended periods of low flow, is ideal for a trout fishery. Because of the potential of this tailwater to accommodate sustained, high quality, and heavy trout fishing pressure, it should be given a high priority for future studies.

Melton Hill--As below most main stream dams, there is a very limited reach of actual tailwater below Melton Hill Dam before it becomes the headwaters of Watts Bar Reservoir. Consequently, this fishery resource has limited significance except as a collection point for migrating species.

Chatuge--Although Chatuge is managed as a trout fishery by the State of North Carolina, the diversity of fish and bottom fauna communities is seriously limited in a 4-mile reach below the dam by seasonally low concentrations of dissolved oxygen. Inadequate minimum flows associated with intermittent reservoir releases limit productivity and fishing use, especially in the upper reaches of the tailwater. Improvement of these two limiting factors would allow this fishery to sustain significantly higher levels of use.

Nottely--Although the fish population of the Nottely tailwater has not been inventoried, the bottom fauna community is very limited both in terms of diversity and standing stock. Georgia Game and Fish personnel report very little fishing in this tailwater. In addition to having seasonally low concentrations of dissolved oxygen and inadequate flows, Nottely is chronically more turbid than other tailwaters. High turbidity probably accounts, at least in part, for the low standing stocks of bottom fauna. In its present condition, the fishery resource in this tailwater is of little value. The potential for the development of a significant fisheries resource in this tailwater reach is also limited by the occurrence of unfavorable habitat and substrates.

Apalachia--There are essentially two components of Apalachia tailwater: the "bypass" section from Apalachia Dam to Apalachia powerhouse and the Hiwassee River from Apalachia powerhouse to the confluence with the Ocoee River. The bypass section of the Hiwassee usually receives flow only from local tributary streams; consequently, its faunal communities are very similar to those of comparable unregulated streams. Flow is the principal limiting factor for the fishery resource in this approximately 8-mile reach of stream.

The Hiwassee River below the powerhouse supports diverse communities of fish and bottom fauna but has relatively low faunal standing crops. Although it is managed by the TWRA as a trout fishery, inadequate minimum flows limit the biological productivity of this stream reach and allow summer water temperatures in the stream to rise above levels required for a high value trout fishery. Because of the potential for this tailwater to sustain significantly higher fishing use, it should be given a high priority for further study.

The snail darter was transplanted from the Little Tennessee River to the section of the Hiwassee River below the Apalachia powerhouse, and reproducing population of snail darters is now supported in the lower portion of this reach. Power generation is presently scheduled to provide at least 2,400 ft^3/s for three hours each day or, alternatively, 1,400 ft^3/s for five hours each day to provide more suitable water levels in the lower portion of the tailwater, where most of the snail darters have become established.

Blue Ridge--Although the diversity of fish and bottom fauna is low in the upper tailwater section below Blue Ridge Reservoir, diversity is high in the section starting seven miles below the dam, suggesting a limited area of adverse impact attributable to discharges. Because of the relatively high ratio of tributary inflow to reservoir discharge volumes, fish and bottom fauna communities in all but the upper reaches of the tailwater

are very similar to those in the river above Blue Ridge Reservoir. The presence of some warm water fish species in the tailwater, coupled with apparently low returns from recent trout stocking, suggests that the temperature regime is unsatisfactory for either warm or cold water species.

Ocoee No. 3--Because all of the flow from Ocoee No. 3 Reservoir bypasses the stream channel and is routed to a downstream powerhouse, about seven miles of streambed from Ocoee No. 3 to the powerhouse is usually dry or at best contains scattered pools of water. These circumstances predictably preclude the presence of a fishery resource. Present water quality conditions in the Ocoee River further complicate this situation. In the past, point and nonpoint source discharges originating in the Copper Basin area have resulted in adverse water quality conditions that have precluded virtually all biological productivity in Ocoee No. 3 Reservoir, as well as in Ocoee No. 2 and Ocoee No. 1 Reservoirs. Although progress has recently been made to correct the point source discharges, there has been little progress in correcting the impacts of nonpoint source discharge. Thus, it will be some time in the future until water quality conditions improve sufficiently to allow the development of viable biological communities in these reservoirs. If these conditions were to improve, it is reasonable to assume that a significant fishery resource could be developed below Ocoee No. 3, if releases could be provided to maintain an adequate minimum base streamflow with appropriate temperature regimes in the presently dry stream channel.

Ocoee No. 2--As in the case of Ocoee No. 3, water from Ocoee No. 2 Reservoir is routed past about four miles of stream channel. There is inadequate flow in this section to allow the development of a fishery resource. The future status of a fishery resource in this reach is also subject to the same requirement for upstream improvements in water quality conditions as for Ocoee No. 3 Reservoir.

Ocoee No. 1--Historically, there has been very little fishing in Ocoee No. 1 tailwater because of poor water quality in the Ocoee River below Copperhill, Tennessee. Development of a fishery resource in Ocoee No. 1 tailwater will be predicated upon improvements in water quality similar to those required for Ocoee No. 3 Reservoir and upon reservoir operations at Ocoee No. 1 to provide adequate minimum flows and appropriate temperature regimes.

Normandy--The development of a cold water fishery in the tailwater reach of Normandy Reservoir was one of the planned purposes for this project. Consequently, provisions were incorporated in the design and operation schedule for the project to ensure that releases provide minimum instantaneous streamflows, an appropriate temperature regime, and high concentrations of dissolved oxygen. A viable cold water fishery is expected after initial lake aging is completed.

Nantahala--Because the natural stream channel is bypassed for 9.2 miles from Nantahala Dam to the powerhouse, the fishery resource of this section is restricted. Communities of fish and bottom fauna in the section below the powerhouse are very diverse and closely resemble those of similar unregulated streams. It is now managed as a trout fishery by

the State of North Carolina. The only significant improvement needed for the fishery resource is the establishment of an adequate minimum flow.

Chilhowee--Chilhowee tailwater supports relatively diverse, abundant communities of fish and fish food organisms similar to those found in the Hiwassee River below Apalachia powerhouse. The chief difference is that Chilhowee tailwater has higher faunal standing crops, presumably because of its established minimum flow of about 1,400 ft^3/s. Although fishing use could be increased considerably by scheduling periods of minimum flow during daylight hours and on weekends, conditions appear near optimal for a tailwater trout fishery.

Tims Ford--Standing stocks and diversity of fish and bottom fauna are low in the upper reaches of the Tims Ford tailwater, but they recover significantly about 20 miles below the dam. Limiting factors in the upper 20 miles of the tailwater include seasonally low concentrations of dissolved oxygen and inadequate minimum flows. The TWRA is successfully managing the tailwater as a trout fishery. Alleviation of low dissolved oxygen conditions and inadequate minimum flows would improve the diversity of fish and bottom fauna and also to increase standing stocks and fishery resource.

Water Supply

The principal adverse impacts on existing or future water supplies that are associated with reservoir releases are directly associated with water quality characteristics, streamflow, and resolubilized metals (iron and manganese). Other water quality factors, such as taste, odor, temperature, and turbidity and suspended solids, can also significantly impact water supplies, but in the Tennessee Valley, these are of secondary importance with respect to the quality of the reservoir releases and are usually of significance only on a case-by-case basis. Within the Valley, there are now no continuous, unresolved, adverse problems of water supply associated with reservoir releases. When adverse impacts have been identified, appropriate studies and mitigative actions have been undertaken to reduce these impacts. As new or expanded water supplies are developed, however, there is the potential for additional problems to arise. These conditions will have to be evaluated, and appropriate mitigative action will have to be implemented as the situations are identified.

Three TVA impoundments have, in the past, adversely impacted downstream water supplies. Releases from South Holston Reservoir have affected downstream water supplies with respect to both water quality and water quantity. The releases from Tims Ford have adversely impacted the quality of Fayetteville's water supply. In the past, normal releases from Fort Patrick Henry Dam were insufficient to meet requirements for industrial uses.

The mean concentrations of iron and manganese in releases from 24 impoundments exceed guideline criteria for a source of water supply; however, problems have been experienced in only two cases. In the other 22 cases,

the water supplies are either far enough downstream for the iron and manganese to be oxidized to an insoluble form, thus eliminating the problem, or any operational difficulties that may have been encountered have not been publicized. Only three dams (Fort Patrick Henry, South Holston, and Normandy) are now operated to provide special releases to meet downstream demands for water supply.

Iron and manganese in the releases from South Holston Dam could potentially affect the water supply for both Bristol, Tennessee, and the Bristol Bluff City Utility District. These systems have water intakes located about 1.5 miles and 14 miles, respectively, below the dam. Under normal operating conditions, iron and manganese concentrations in the releases from South Holston Dam do not interfere with water treatment at these plants; however, when circumstances such as emergency flood control or maintenance work require the use of the low-level sluice, high concentrations of iron and manganese from the lower depths of the reservoir could be a problem. Experience has shown that concentrations of iron and manganese in sluice releases decline rapidly after the sluice is opened, and in the past, severe problems have been avoided by discontinuing operation of water treatment plants until iron and manganese concentrations in the releases subside to an acceptable level (see the discussion of manganese in chapter III for more details of the mitigative actions that have been implemented).

Periodically, high water usage at Bristol necessitates the off-peak operation of South Holston Dam to provide water to meet the demand. When these situations occur, the Bristol water plant personnel notify TVA and request the release of additional water from South Holston Dam.

During the fall of 1972, the city of Fayetteville, Tennessee, experienced difficulties with manganese in the raw water supply taken from the Elk River at mile 93.9. The problem resulted from high rates of release from Tims Ford Dam of water containing manganese. Under normal conditions, the manganese would be expected to be oxidized in the 40-mile reach between the water intake and the dam; however, the unusually high rates of release from the dam decreased reaeration and decreased time of passage. The manganese failed to become oxidized and required additional treatment at the city of Fayetteville water treatment plant. The city is not now experiencing problems from iron and manganese in releases from Tims Ford Dam. Although the projected water demand at Fayetteville is only 11 ft^3/s, Tims Ford Dam is operated to provide the historic minimum average daily flow of 106 ft^3/s at Fayetteville.

Under normal operating conditions, mean daily releases of 400 ft^3/s from Fort Patrick Henry Dam would not be sufficient to meet water supply needs in the Kingsport area. The Tennessee Eastman Company has a contractual agreement with TVA to maintain a mean daily flow of 750 ft^3/s to meet present water supply requirements. The company requested additional releases, but TVA determined that additional water was unavailable within the operating constraints of the upstream reservoirs.

Algae released from the upper level of Normandy Reservoir have caused taste and odor problems and difficulties in operations at the treatment plants, respectively, at Shelbyville, Lewisburg, and Columbia during the

spring of 1977 and 1978. Special studies are in progress to develop reservoir operating criteria to reduce and, if possible, to prevent future problems related to algae.

Assimilative Capacity

Any impoundment located above a waste discharge could, because of its ability to restrict the quantity of flow available, reduce the capacity of the downstream reach to assimilate organic wastes. Thirteen TVA dams (Chickamauga, Guntersville, Kentucky, Watauga, Wilbur, Fort Patrick Henry, Cherokee, Douglas, Norris, Apalachia, Ocoee No. 1, Normandy, and Bear Creek) have been identified as having potential adverse impacts on assimilative capacity if adequate flows are not maintained. Two of these impoundments (Normandy and Bear Creek) now provide guaranteed instantaneous minimum flows to increase stream assimilative capacity.

Eighteen dams release waters with dissolved oxygen concentrations significantly below the established water quality criteria. These low concentrations in turn reduce the available assimilative capacity of the reaches downstream. Treated wastewater discharges below five dams (Chickamauga, Fort Patrick Henry, Cherokee, Douglas, and Norris) are adversely affected.

The concentrations of dissolved oxygen in releases from Chickamauga Dam affect the assimilative capacity of Nickajack Reservoir at Chattanooga. Releases from Chickamauga Dam do not have a severe problem with low dissolved oxygen, but during the summer months the dissolved oxygen concentration barely meets the 5.0 mg/l minimum requirement. Because little reaeration occurs between the dam and the principal discharge to Nickajack Reservoir (the Chattanooga Moccasin Bend sewage plant), the amount of oxygen-demanding material that can be discharged by the sewage plant is impacted. TVA provides a minimum average daily flow of 6,000 ft^3/s from Chickamauga Dam to minimize the impact of discharges of treated waste on water quality in Nickajack Reservoir. With this flow, Chattanooga is not required to provide treatment beyond best practicable technology to protect stream uses.

Several large discharges of treated waste are made to Wheeler Reservoir at Decatur and Huntsville, Alabama. When releases from Guntersville Dam are low, the assimilative capacity of the river is reduced in the vicinity of these discharges. This reduction in assimilative capacity could potentially result in low concentrations of dissolved oxygen in the lower reach of Wheeler Reservoir or in the requirement that individual discharges provide additional treatment beyond best practicable.

Seven large industries discharge treated waste to a 3-mile reach immediately below Kentucky Dam. If releases from Kentucky Dam were discontinued for an extended period, discharges from the industrial waste sources could accumulate and create a water quality problem.

A large industrial plant and the city of Elizabethton discharge treated waste to the Watauga River below Wilbur Dam. Watauga and Wilbur Dams are operated to maintain the historical minimum flow of 112 ft^3/s at

Elizabethton. Studies in 1977 showed that the present flow is sufficient for assimilation of present wasteloads but that any reduction in flow would result in additional treatment costs.

The reach of South Fork Holston River below Fort Patrick Henry Dam and the upper reach of the Holston River (miles 141 to 125) receive waste from 13 industries and the city of Kingsport. The quantity of waste discharged to these reaches exceeds the natural assimilative capacity of the stream, and several dischargers must provide treatment beyond best practicable. The reduced concentrations of dissolved oxygen in releases from Fort Patrick Henry Dam contribute to the problems of low assimilative capacity in these reaches. The principal discharger, Tennessee Eastman Company, contracts with TVA to provide a minimum daily release of 750 ft^3/s for water supply purposes; this flow is ultimately available in the stream for assimilative capacity. Any reduction in this flow would lower stream assimilative capacity, and dischargers would be required to provide additional waste treatment. Lack of sufficient streamflow is one limiting factor for future growth and development in the Kingsport area.

Low concentrations of dissolved oxygen in the releases from Cherokee and Douglas Dams persist all the way through Fort Loudoun Reservoir. These low levels of dissolved oxygen reduce the amount of oxygen-demanding waste that can be discharged in the Knoxville area. Cherokee and Douglas Dams are operated to provide a minimum daily average flow of 2,000 ft^3/s to improve water quality at Knoxville. With this available flow, the city of Knoxville, the principal discharger to Fort Loudoun Reservoir, is not now required to provide treatment beyond that considered best practicable (secondary treatment). However, existing conditions of low dissolved oxygen could be a factor in limiting future growth and development at Knoxville and in the area around Fort Loudoun Reservoir, because additional dischargers would have to provide treatment beyond that normally required. To preclude possible restrictions of future development in this area, studies should be directed toward possibilities for improving the concentrations of dissolved oxygen in releases from both Cherokee and Douglas Reservoirs.

Low dissolved oxygen and low quantity releases from Norris Dam both affect the assimilative capacity of the Clinch River in the reach between the dam and Oak Ridge. Oak Ridge considered relocating its sewage discharge from a small stream (East Fork Poplar Creek) to Melton Hill Reservoir; however, because of the stringent treatment requirements resulting from the low dissolved oxygen levels and streamflow releases at Norris Dam, the discharge to Melton Hill Lake was not economical. Treatment beyond best practicable may be required of one or more existing dischargers near Clinton because of the low assimilative capacity of the reach below Norris Dam. Future development along the reach that would require additional assimilative capacity may also be hampered because treatment requirements will probably be stringent. Future studies should evaluate increasing minimum flows and improving dissolved oxygen levels in releases from Norris Dam.

A potential water quality problem exists in the Hiwassee River near Calhoun, Tennessee. If TVA were not operating Apalachia and Ocoee No. 1 Dams to provide a mean combined release of 600 ft^3/s, Bowaters Southern Paper Company and the city of Cleveland would be required to provide additional treatment beyond best practicable.

Normandy Dam is operated to provide a minimum instantaneous flow of 155 ft^3/s at Shelbyville, Tennessee. This flow is triple the normal minimum flow and increases the assimilative capacity of the Duck River sufficiently that the city can achieve good water quality below its sewage discharge by providing only secondary (best practicable) treatment. Additionally, increased streamflow for both water supply and assimilative capacity occur at Columbia, Tennessee, where the minimum flow provided by releases from Normandy Dam is about five times greater than the natural minimum flow.

Bear Creek Dam is operated to provide a minimum instantaneous release of 11 ft^3/s. Without this flow, Red Bay, located about 19 miles below the dam, would be required to provide treatment beyond best practicable technology.

Because of both the existing problems and the potential problem of restricting future development, the releases from Fort Patrick Henry, Cherokee, Douglas, and Norris should be given priority for future studies on improvement of assimilative capacity.

CHAPTER V

GENERIC OPTIONS FOR REDUCING IMPACTS

This section identifies generic methods for reducing or eliminating adverse impacts associated with releases from impoundments. This discussion reflects the state of the art of the available technologies. Further development work may be required before some of these methods can actually be implemented. The descriptions of the technologies are divided into two broad categories, physical changes and operational changes. Physical changes include technologies that require specific processes or equipment to be installed to correct a problem and also any structural modifications to existing projects. Operational changes include modifications of the present operational regimes of individual projects. Possible improvements at a specific project could involve both physical and operational changes. Because of the interrelationship between the available technologies and the present purposes of the projects, the specific technologies must be evaluated and tailored directly to individual projects on a case-by-case basis. This evaluation must consider, among other things, the impact that needs to be corrected, the cost of implementing corrective actions, the present purposes of the project and uses both upstream and downstream, as well as the impact of any corrective action taken at projects located farther upstream.

Any technology being considered for implementation must be tailored to the specific projects, because there is no single technology that can be applied under all situations. Furthermore, the application of one technology at a specific project may reduce or correct one aspect of the adverse impact but compound another adverse impact. For example, reaeration of releases with atmospheric air to increase dissolved oxygen may reduce the problem of low concentrations of dissolved oxygen at the expense of potentially creating a problem with nitrogen supersaturation. Because of the time-consuming and complex studies that would be required, no attempt has been made in this report to evaluate or propose specific actions at individual projects.

Physical Changes

Physical changes may be broadly classified as (1) control of water quality within the reservoir, (2) selective withdrawal of reservoir water with acceptable quality, (3) aeration of reservoir releases, or (4) habitat modification.

Control of Water Quality Within the Reservoir

Methods for controlling dissolved oxygen and other water quality characteristics within a reservoir include destratification of the reservoir and aeration or oxygenation of the hypolimnion. A reservoir can be destratified by pumping the cold, dense water from the bottom of the

20-955 O—84——183

reservoir to the surface to expose it to the atmosphere. This exposure raises the concentration of dissolved oxygen and decreases concentrations of iron, manganese, and other undesirable constituents that may have dissolved in the hypolimnion; however, pumping water to the surface also raises its temperature and usually results in thermal destratification of the reservoir. Pumping may be accomplished by low-head, high-volume mechanical pumps or diffused air pumping. On reservoirs large enough to support hydropower production, destratification has been used only in a zone immediately upstream from the dam, not in the entire reservoir.

Destratification is less expensive than other methods of improving concentrations of dissolved oxygen and it also improves other water quality characteristics by reducing levels of taste, odor, color, corrosion, phosphates, dissolved iron, and possibly dissolved manganese. Because destratification also increases the temperature of the water released through turbines, it may be the best method for use at projects where, in addition to increasing levels of dissolved oxygen, there is also a need to increase the temperature of releases to improve conditions for the management of a warm water fishery in the tailwater reach.

On the other hand, because destratification does increase the temperature of turbine releases, its main disadvantage is that it adversely affects downstream water uses for management of a cold water fishery and water supply. Full-scale projects by the Corps of Engineers and EPA have shown that another disadvantage of this method is that levels of dissolved oxygen in the releases cannot be regulated very readily and that a supplemental method may be required to ensure that adequate levels are maintained.

To preserve the cold water releases and yet improve water quality conditions in the reservoir, aeration of the hypolimnion may be applicable. Europeans have demonstrated hypolimnion aeration with air in a small water supply reservoir. This system employed diffused air at the bottom of a long tube that extended from about 10 feet above the bottom of the reservoir to the surface. Multiple outlets from the tube immediately below the thermocline allowed the water that was aerated and lifted by the air bubbles to be discharged back into the hypolimnion. Several American investigators have demonstrated or conceptually designed other techniques for aerating the hypolimnion with air. These methods do not now appear economical for a large reservoir used for power production because the hypolimnion usually contains such a large volume of water that is continually released through the turbines. Another possible problem with the device developed by the Europeans is that no provision is made for large variations in the reservoir pool level or for variations in the depth of the thermocline. Of even greater importance for reservoirs used for power generation is the probability of causing dissolved nitrogen supersaturation conditions downstream from the turbine discharge. However, the substitution of pure oxygen gas for air would solve this problem. Researchers at Rutgers University investigated a hypolimnion oxygenation system during the summer of 1973, but they achieved such low oxygen absorption efficiencies that they considered the system uneconomical.

The Corps of Engineers is investigating oxygenating the hypolimnion by diffusing oxygen gas through fine-pore diffusers, placed about one-mile upstream from the dam. (This system is a modification of the method developed by TVA, which will be discussed later.) Because essentially all of the oxygen is absorbed by the surrounding water before the bubble reaches the thermocline, the reservoir is not thermally destratified by this process.

In general, methods that control dissolved oxygen within the reservoir result in better overall water quality than those that increase levels in the releases only. However, methods of control within the reservoir may not ensure a fixed concentration of dissolved oxygen downstream from the dam and may, therefore, require supplemental aeration of the reservoir releases.

Selective Withdrawal of Reservoir Water With Acceptable Quality

Water that contains acceptable levels of dissolved oxygen can be selectively withdrawn from the reservoir by the use of submerged weirs upstream from the power intakes or by the use of an intake that can withdraw water from several different levels.

Submerged weirs or "dams" have been used at a number of installations to allow only the well-oxygenated surface water to pass through power units. All submerged weirs now in use are permanent structures located upstream from the base of a dam. These structures are not well suited for most multipurpose reservoirs because their pool levels fluctuate considerably. Because the crest of the weir must be relatively low to allow water to pass over it during all times of the year, water from the lower protion of the reservoir, which is deficient in dissolved oxygen, can pass over the weir when the pool is at normal operating levels during the summer. A possible solution to this problem might be a flexible curtain barrier, the crest of which would fluctuate with pool levels.

Construction of new multilevel intake structures for existing dams may be too expensive in comparison to the improvements that might be achieved. Consideration of multilevel outlets for new dams requires the determination of (1) whether a water quality problem would develop, (2) how reservoir water quality would be affected by use of such outlets, and (3) whether possible hydraulic problems would result around the outlet structure.

All schemes of selective withdrawal preclude taking advantage of the benefits that can be provided by use of the colder water from the hypolimnion. Moreover, if the volume of the epilimnion is relatively small in relation to the discharge through the turbines, selective withdrawal may not even be practical.

Aeration of Reservoir Releases

The only water quality characteristic immediately downstream from the dam that can be affected by the various methods for directly improving water quality in reservoir releases is the concentration of dissolved oxygen. These methods include turbine venting, U-tube aeration, weir aeration, mechanical surface aeration, diffused air aeration in the tailrace, and oxygen injection upstream or downstream from the dam.

Turbine venting is perhaps initially the most inexpensive method. Many hydro plants have built-in air vents to reduce vibration and cavitation. Additional vents can usually be added at an initial cost lower than the costs for other methods of aeration. Turbine venting has been used at a number of dams to increase concentrations of dissolved oxygen, but the aeration efficiencies reported are extremely variable. Alabama Power Company is investigating a modified turbine venting technique that is achieving significant aeration with minimal loss of power production efficiency. At present, design criteria are not available for determining the number and size of vents required to aerate turbine releases to a specified concentration of dissolved oxygen, and power losses caused by turbine venting cannot be predicted but must be determined after the vents have been installed. A potential disadvantage of turbine venting is that extensive use could appreciably reduce the capacity of a power generating system for meeting peak demands. Other disadvantages are that turbine venting usually is not practical for large increases (more than 1 to 2 mg/l), and could result in excessive nitrogen supersaturation downstream from the dam. TVA has requested funds through the Regional Water Quality Management Program to determine the engineering feasibility and biological effects of turbine venting at Norris Dam from 1980 to 1981.

The U-tube aeration system involves the diffusion of compressed air into the water just beneath the surface and just ahead of a baffle that traverses an excavated section of the stream. The mixture of air and water flows under the baffle, up the excavated section, and then downstream. This introduction of air at low pressures just below the surface of the water and the increased time that the air and water are in contact as a result of the "U-tube" pattern that develops significantly increases oxygen transfer. Unfortunately, the conditions that permit efficient oxygen transfer also cause nitrogen supersaturation, which may be an adverse condition for fish for saturation levels greater than 110 to 115 percent. Although studies have shown that the maximum nitrogen supersaturation that can result from a U-tube aerator with a 10-foot depth is 106 percent, it is not feasible to use less than about a 15-foot depth U-tube aerator below most hydro power plants. U-tube aeration with oxygen substituted for air probably would not be economical because of the combined high capital and operating costs.

An overflow weir, used downstream from a dam, aerates water by entraining air through the surface of the free-falling nappe and at the point where the nappe splashes into the downstream pool. The height of fall, the depth of the receiving pool, the water quality, the degree of atmospheric nappe venting, and the configuration of the splash area all affect the efficiency of weir aeration.

Although various investigators have conducted a considerable amount of research, their results vary significantly. Additional research is needed before a full-scale weir system can be designed for turbine discharges. One factor that deserves particular attention is the effect of streamflow per unit length of weir.

The main disadvantages of weir aeration are high capital cost and reduced efficiency of power production. An important consideration in designing a weir for aerating turbine discharges is providing some means of adjusting the crest of the weir to (1) produce various increases in concentration for various levels of initial dissolved oxygen, turbine discharge, and water temperature and (2) eliminate the effect of the weir on power production (i.e., increased tailwater elevation when an increase in dissolved oxygen is not required). The flapgate weirs used on the Mississippi River could be used in such a manner.

One advantage of a weir is that it can serve as a reregulating dam and provide a continuous minimum level of streamflow downstream--perhaps as much as 50 to 200 ft^3/sec for a 24-hour period depending on the size of the pool between the weir and the upstream dam. Higher reregulated streamflows are possible for shorter periods of time if the pool behind the weir can be replenished more frequently.

Mechanical surface aerators have been used for aerating polluted streams that have a residual biochemical oxygen demand; however, this method is not expected to be as economical as other methods for aerating reservoir releases because extremely large amounts of oxygen must be added to the stream within a short distance. Because mechanical surface aerators are limited to about 75 to 100 horsepower, an extremely large number of aerators is required. For example, in the case of Fort Patrick Henry Dam, a total of 6700 horsepower, or about 90 aerators, would be necessary to increase the dissolved oxygen level from 0.5 to 5 mg/l at a streamflow of 8800 ft^3/sec.

Diffused air aeration was demonstrated in tailwaters but was found to be uneconomical for a submergence depth of 10 feet. However, this method may be economical for greater submergence depths (perhaps 15 feet or more).

The main disadvantages of diffused air aeration as compared to oxygen injection are (1) a high power requirement for air compressors (about 5 percent of the power generating capacity of the plant), (2) a lower capability for adding dissolved oxygen at concentrations greater than about 5 mg/l, and (3) a higher initial investment cost. Estimates from data on diffused air aeration for sewage treatment plants indicate that an installation at Fort Patrick Henry Dam for aeration to 5 mg/l would require at least 3000 horsepower to drive the needed air compressors and 15,000 fine-pore diffusers such as those used in sewage treatment plants. The diffusers in the tailrace would cover an area about 100 feet wide and over 250 feet long. Nitrogen supersaturation may also occur.

Oxygen can be injected into turbine releases by penstock injection, diffuser injection immediately upstream from the turbine intakes, tailwater diffusion, the side stream supersaturation system, or the downflow bubble contact system.

Penstock injection involves injecting oxygen gas through small orifices in tubing attached to the trash racks. The main advantage of this method is the simplicity of installation. The main disadvantages are possible corrosion of the turbine system, a possible decrease in the efficiency of power production because of interference by gas bubbles, the possibility that all the oxygen would not be absorbed, and in longer penstocks, the possibility of gas accumulating at the top of the penstocks.

Injecting oxygen through small-pore diffusers upstream from the turbine intakes should eliminate the main disadvantages of penstock injection. However, the small pores necessary to produce bubbles small enough for high absorption efficiency creates a problem of plugging or clogging of the diffusers. Such diffusers are usually made of ceramic material with pore sizes of less than 20 μm. Corrosion still may occur in the turbine discharge system. Diffuser injection downstream from the dam would not cause corrosion problems, but would require a considerably larger diffuser system to inject the same amount of gas because of the reduced depth for absorption in the shallower water.

In the side stream supersaturation system, a small portion of the turbine discharges is withdrawn and subjected to a high pressure. Pure oxygen is injected into the high-pressure line, and then this oxygen-rich side stream is mixed into the flow of the main stream. Adequately high pressures are sometimes available from the reservoir without additional pumping. Because the water in the side stream must bypass the turbines, however, it is not available for power production. The bypass flow can amount to about 1 to 5 percent of the total streamflow. The main advantages of this system over oxygenation schemes discussed previously are that it cannot cause corrosion of the turbines and that there is no problem of diffusers becoming plugged.

The downflow bubble contact system that has been proposed for injecting oxygen upstream from the turbine intakes is similar to the side stream supersaturation system in that a small portion of the total flow is highly oxygenated and then mixed with the remaining turbine discharge. A part of the water is pumped downward through a conical or pyramidal device into which oxygen gas is injected. The velocity of the downflowing water is great enough to prevent bubbles of oxygen gas from rising through the top of the device; they are maintained in suspension until they dissolve. There are no diffusers to become clogged, and the low-head, high-volume pump requires relatively little power. Because oxygenated water passes through the turbines, power production capacity is not reduced, but corrosion of the turbine system could be increased. This technique probably will be feasible only in deep reservoirs where a relatively small portion of the turbine releases must be passed through the bubble contact chamber.

A possible problem with all methods that involve oxygenating turbine releases is that oxygen suppliers may not be able to provide the necessary amounts of liquid oxygen required during long periods (several days) of peak power operations. A possible solution to this problem may be to use onsite oxygen generation to oxygenate continuously a large volume of the hypolimnion upstream from the dam to reduce (or possibly eliminate) the peak demands for liquid oxygen during turbine discharge oxygenation.

Development of the Oxygen Diffuser Method

In 1972, the Division of Environmental Planning began developing the method of oxygen injection using small-pore diffusers upstream from Fort Patrick Henry Dam, working in conjunction with the Divison of Water Management. In the course of the project, numerous commercially available diffuser materials were evaluated for clogging, oxygen transfer efficiency, and potential miscellaneous operational problems. These evaluations were carried out through a combination of laboratory studies at Norris and field studies at Fort Patrick Henry. Clogging was found to occur in most diffusers in a period equivalent to about three years operating time. However, it is anticipated this problem can be minimized by periodic cleaning, either in place in the reservoir or by removing the diffusers about once each year. Laboratory studies showed high transfer efficiencies for several diffusers, and pilot-scale studies of two of these diffusers verified that high efficiencies could be achieved. The project was concluded in 1976 with the completion of a preliminary design and cost determination for a full-scale system. Depending on various considerations for dissolved oxygen objectives and design configurations, the system was estimated (in 1972) to have an annual cost of about $350,000, including capital amortization and operating costs, to maintain a dissolved oxygen concentration of 6 mg/l for 99.8 percent of the time. This cost would be reduced to $200,000 if a concentration of 5 mg/l were maintained only 99 percent of the time.

Habitat Modification

A tailwater reach otherwise suitable for a fishery but limited by inadequate minimum flow and low concentrations of dissolved oxygen might be improved by physical changes to the environment. Multiple rock structures, small dams, and wing walls could be constructed along the reach to form a series of small pools separated by reaches of fast, turbulent water. Providing such pools are small enough to be flushed entirely with fresh water during periods of full turbine discharge, these kinds of habitat modification could possibly solve part of the problem of minimum flow by increasing the extent of continuously wet substrate and the extent of reaches with deeper water. Such modifications might also solve part of the problem of low concentrations of dissolved oxygen by increasing the amount of turbulence and, therefore, aeration in the tailwater reach. These kinds of structures would not, however, solve the problem of low concentrations of dissolved oxygen during periods of maximum discharge through the turbine. The stability of such structures during floods might also be a problem. Among the possible adverse effects of these habitat modifications might be increased water temperatures in the still pools as a result of solar heating, a reduction in the extent of river habitat, and conflicts with development of recreational floating.

The Division of Forestry, Fisheries, and Wildlife Development has requested funding during fiscal year 1980 for a series of tests of structures to modify the habitat in the Clinch River below Norris Dam and to evaluate their effectiveness under different turbine discharge conditions. These studies would be carried out concurrently with studies evaluating turbine venting at Norris under the Regional Water Quality Management Program.

Summary

The main conclusions are that most of the various aeration methods have some merit and that no one method would be best for all dams. Among the important factors to be considered in each case are the desired level of dissolved oxygen, other water quality requirements, physical characteristics of the dam and turbine system, the required increase in dissolved oxygen, costs, and other stream uses to be protected or enhanced. Table 11 summarizes the applicability of the methods discussed above under various design considerations. The average annual oxygen requirement is also important for costs analyses of various methods for a particular dam. This factor is used to determine the feasibility of a system with a high initial and low operational cost versus a system with a low initial and high operational cost. For essentially all the methods investigated, more research is needed to develop adequate, detailed design criteria. To date, there have been no successfully demonstrated full-scale systems that have achieved consistently a dissolved oxygen concentration of 5 or 6 mg/l. In addition, the various methods need to be demonstrated to determine operational problems that inevitably arise in the process of developing new technologies.

Operational Changes

Some of the water quality impacts associated with reservoir releases can be partially solved by changes in the present operational procedures. It is very doubtful, however, that changes in the present operational procedures alone can eliminate the water quality impacts at all projects. A combination of both physical and operational changes may be necessary to improve the releases from some reservoirs.

Except for a few isolated cases, the reservoir system of multipurpose dams is not now operated for the specific purpose of achieving water quality objectives for the development and protection of downstream water uses. It should be noted that if the achievement of certain water quality and water use objectives through operational procedures is adopted as an additional purpose for the system, conflicts of interest will occur and compromises will be required. In other words, the primary operational purposes of flood control, power generation, and navigation would suffer. These losses can be estimated for each project and should be weighed against the benefits of protecting or enhancing stream uses.

The following operational schemes are discussed relative to their effectiveness in solving water quality problems with respect to the practicability, difficulties, drawbacks, and costs of each scheme.

Maintaining a Small, Constant, Minimum Discharge--Requirements for maintaining a small, constant, minimum flow will vary from project to project depending on downstream uses to be protected or enhanced. This type of operational change is generally applicable to dams from which zero discharge occurs periodically under the present mode of operation.

Among the advantages of this operational change are that it helps avoid some of the more rapid temperature fluctuations, while reducing the impact on dissolved oxygen concentration through natural reaeration in the tailrace, and that it provides a continuously wet substrate that provides a better fishery habitat and increases opportunities for river recreation.

This method does, however, involve a loss of flexibility in peak-power operation and a decrease in turbine efficiency. Discharges too small to allow operation of the existing turbines may have to be sluiced, leading to a complete loss of the energy potential of this water. In such cases, installation of a smaller turbine is an option that should be evaluated. In addition, reservoir levels may be affected, adding to the complexity of river management and flood control.

Limiting Discharge to a Certain Maximum Flow--Limiting discharge to a certain maximum flow reduces impacts on dissolved oxygen during the period of low concentrations in the discharges through natural reaeration in the tailrace. This method involves a loss of flexibility in peak-power generation and may place unacceptable constraints on flood control operations.

Altering the Rule Curves for Reservoir Operations--It would perhaps be possible after careful research to develop new "rule curves" for reservoir operations that would, to some extent, prevent a water quality problem before it develops. No detailed advantages or disadvantages of this method are yet well known. It can be expected that such major operating changes to enhance water quality would severely affect and limit the flexibility of the reservoir system regarding power and flood control as used today.

CHAPTER VI

SUMMARY AND RECOMMENDATIONS

Releases from Tennessee Valley reservoirs were evaluated with respect to their adverse impacts on water quality and related characteristics and on various uses of the water downstream. The water quality characteristics examined were temperature, dissolved oxygen, resolubilization of metals, streamflow, turbidity and suspended solids, and gaseous supersaturation. The downstream water uses examined were recreation, fisheries and other aquatic life, water supply, and assimilative capacity. Evaluations were based on available data on water quality and reservoir operations from 1970 through 1977 in conjunction with biological and engineering judgements of the significance of the impacts.

The most significant impacts of reservoir releases are associated with low concentrations of dissolved oxygen, short-term variations in temperature, and inadequate streamflows in the reaches below the dams. The adverse impacts of releases from individual reservoirs were categorized as having no impacts, potential impacts, or existing impacts. These categories were used to identify priorities for additional studies to evaluate possible mitigative actions.

In general, releases from main stream reservoirs have few adverse impacts on water quality or water uses. However, releases from many tributary storage reservoirs do significantly impact dissolved oxygen concentrations, temperatures, and streamflows and therefore, downstream water quality and uses.

Water Quality Impacts

Temperature

Releases from Cherokee, Douglas, Melton Hill, Blue Ridge, Ocoee No. 3, Ocoee No. 2, Ocoee No. 1, and Great Falls Dams have existing long-term impacts on temperature. The temperatures of these releases during the spring, summer, and early fall are marginal for the development of either a cold water or warm water fishery (too warm for cold water species and too cold for warm water species). The only option for improving long-term temperature conditions to favor viable fishery resources downstream from these dams would be to seek methods for increasing temperatures in summer and early fall to provide conditions more favorable for warm water species. For the Ocoee projects, however, there are overriding water quality conditions associated with upstream point and nonpoint source discharges from the Copper Basin area that now preclude the development of any viable fishery, regardless of long-term water temperatures.

Short-term (daily) temperature impacts are associated with the releases from 15 of the tributary projects (including three Alcoa projects) as a result of intermittent operation of the hydro units for peaking purposes, which causes a cyclic gradual warming and sudden cooling of the water in the tailwater reach during the summer and early fall. Establishment of an instantaneous minimum release from each of these projects is the principle option for reducing this adverse temperature impact. In some specific reaches, however, the use of habitat modification is another available option.

Dissolved Oxygen

Releases from 18 reservoirs (including two Alcoa projects) result in concentrations of dissolved oxygen that significantly deviate from numerical criteria. Releases from eight of these storage reservoirs (South Holston, Cherokee, Douglas, Fontana, Norris, Chatuge, Nottely, and Tims Ford) cause severe problems (concentrations of less than 1 mg/l). These eight reservoirs should be classified in the "priority" category for any future studies of options for mitigating dissolved oxygen problems. The specific option that might be best for any specific project would vary depending upon the other water quality characteristics and water uses to be protected. Releases from six reservoirs (Fort Loudoun, Watts Bar, Wilbur, Fort Patrick Henry, Apalachia, and Cheoah) are considered to be secondary problems, because low concentrations of dissolved oxygen in the inflows to these reservoirs contribute extensively to the low concentrations in their releases. Lesser dissolved oxygen problems are associated with the releases from Watauga, Boone, Blue Ridge, and Santeetlah.

Streamflow

Because streamflow needs depend directly upon both the water quality and water uses to be achieved or protected, no existing problems were identified separately for this water quality related characteristic. Any problems related to streamflow were identified with the specific water quality characteristic (short-term temperature, dissolved oxygen, iron, manganese, turbidity and suspended solids, and gaseous supersaturation) or water use.

Resolubilization of Metals

Mean concentrations of total iron in the releases from 26 reservoirs exceed the EPA guidelines. Although there are no known long-term problems associated with the releases from these reservoirs, the releases from eight of these reservoirs (Douglas, Chatuge, Nottely, Ocoee No. 3, Ocoee No. 2, Bear Creek, Normandy, and Santeetlah) should be considered as potential problems.

Mean concentrations of total manganese in the releases from 27 reservoirs exceed the EPA guidelines. Although there are no known long-term problems associated with the releases from these reservoirs, the releases

from 11 of these reservoirs (Cherokee, Douglas, Chatuge, Nottely, Ocoee No. 3, Ocoee No. 2, Ocoee No. 1, Great Falls, Bear Creek, Little Bear Creek, and Normandy) should be considered as potential problems.

High concentrations of iron in the releases from South Holston and high concentrations of manganese in the releases from South Holston and Tims Ford do cause existing problems. The problem at South Holston is associated only with flood control or maintenance operations that require sluicing water from the bottom of the reservoir. Mitigative measures have been taken to reduce this adverse impact; these measures can continue to be used and should prevent any significant adverse impact from future operations. The problem at Tims Ford is associated with both initial lake aging and reservoir operations. The present limitation on reservoir operations in conjunction with completion of initial lake aging should mitigate this problem.

Turbidity and Suspended Solids

Releases from Fort Patrick Henry, Ocoee No. 3, and Tims Ford cause problems with respect to turbidity and suspended solids. The problem at Fort Patrick Henry is unique. Hydraulic drag during peak generation in the summer and early fall uproots aquatic plants from the Holston River bottom. The disturbance of sediments and the subsequent washing of materials from the plant roots increases turbidity and suspended solids. This problem might be corrected either by limiting generation or by physically controlling the weed growths. Both options have significant adverse impacts, the evaluation of which is beyond the scope of this study. The problem at Ocoee No. 3 occurs when water is sluiced from the bottom of the reservoir to prevent accumulations of silt from damaging the hydro structure or closing the intake. There is now no alternative to this sluicing if operation of Ocoee No. 3 for power generation is to be continued. High rates of turbine releases at Tims Ford previously caused downstream flooding and erosion of river banks. Restrictions on releases from Tims Ford have mitigated this problem.

Gaseous Supersaturation

No significant problems of gaseous supersaturation are known to be associated with the releases from the reservoirs evaluated in this study. (This conclusion is substantiated by the results of investigations of fish kills and other fishery studies. No evidence has ever been encountered of gas bubble disease, which is caused by prolonged exposure of aquatic organisms, primarily fish, to supersaturated concentrations of total dissolved gases.) However, there is the potential for elevated concentrations of total dissolved gases in the spillway releases from the mainstream reservoirs.

Water Use Impacts

The adverse impacts of releases from individual projects were also evaluated and categorized for each of the downstream uses. In addition to the potential or existing impacts for each use, the specific water quality related characteristics of the release that contribute to the impact were also identified. When more than one contributing water quality characteristic was identified, correction would be required for each characteristic for successful mitigation of conditions for the specific use.

Recreation

Releases from 18 reservoirs cause problems with respect to recreational floating. The principal cause of these problems is lack of dependable streamflow high enough for recreational floating during the most desirable hours (10 a.m. to 6 p.m.) of the prime recreation season (May through September). Lack of such flows limits both use by individuals and development of commercial floating recreation. Although reservoir releases have been provided at Apalachia, Ocoee No. 2, Nantahala, Tims Ford, and Chilhowee to increase floating opportunities, such flows are not reliable enough to allow full development of commercial and public recreation. The only option for enhancing floating recreation is to adjust reservoir operations to provide the levels and scheduled dependability of streamflow needed.

Nantahala, Apalachia, and Ocoee No. 2 tailwaters are now receiving national interest as white water streams and should be given priority for future studies in relation to improving recreational opportunities.

Releases from 12 reservoirs adversely impact recreational fishing, primarily because streamflow is either above or below optimum during the prime fishing hours of the day (early morning and late evening). Conditions could be improved by establishing an adequate instantaneous minimum flow (to enhance production of fish and fish food) and scheduling releases to allow adequate periods for wading, bank, and float fishing.

Fish and Other Aquatic Life

Releases from 14 reservoirs impact the fisheries and aquatic life resources of tailwater reaches. In each case, the problem is caused by intermittent releases associated with peaking operations and by short-term changes in temperature. Establishing and maintaining minimum instantaneous releases from the individual projects would solve the problem of cyclic wetting and drying of the streambed, eliminate the cyclic daily temperature variations, and provide flows suitable for recreational fishing. Streamflow modifications alone would enhance the fisheries resource of the bypassed sections of the Nantahala River and of the Hiwassee River downstream from Apalachia Dam. The lower reach of the Apalachia tailwater is also critical, because it is the reach in which the snail darter has become established.

In addition to streamflow, existing low concentrations of dissolved oxygen in the releases from nine reservoirs (South Holston, Fort Patrick Henry, Cherokee, Douglas, Norris, Chatuge, Nottely, Apalachia, and Tims Ford) adversely impact tailwater fisheries resources. If these fisheries resources are to be protected or enhanced, the concentrations of dissolved oxygen in these releases must be improved. Further study would be needed to determine the specific technology that would be best for each project, which would depend, among other things, upon the characteristics of the projects and upon the other water quality characteristics and downstream water uses to be enhanced and protected.

In addition to streamflow and dissolved oxygen, seasonal temperature changes in the releases from six reservoirs (Cherokee, Douglas, Blue Ridge, Ocoee No. 3, Ocoee No. 2, Ocoee No. 1, and Great Falls) create marginal conditions in tailwaters that are not favorable for either cold or warm water species, especially during the spring, summer, and early fall. Any future studies of improvements for these tailwater reaches should evaluate providing warmer releases during the summer and fall to enhance the development of viable warm water fisheries. No studies of the Ocoee projects should be undertaken until other water quality characteristics have been improved and conditions for support of a viable fishery have been demonstrated.

The tailwater reaches downstream from South Holston, Fort Patrick Henry, Cherokee, Douglas, Norris, Chatuge, Apalachia, Blue Ridge, and Tims Ford should be considered as "priority" reaches for any future studies directed toward improving fishery resources.

Water Supply

Water supply is impacted by releases from South Holston, Fort Patrick Henry, and Tims Ford and could potentially be impacted by releases from Normandy. At South Holston, the adverse impact is related to both streamflow and to release of resolubilized iron and manganese during flood control and maintenance operations that require sluicing water from the bottom of the reservoir. Mitigative measures have successfully reduced the impacts of iron and manganese in the past and are expected to be effective as long as they are continued. At Fort Patrick Henry, initial releases of 400 ft^3/s minimum mean daily streamflow were insufficient to meet water supply requirements downstream. Consequently, Tennessee Eastman in the late 1960s contracted with TVA to raise the minimum mean daily flow to 750 ft^3/s. Subsequently, Eastman requested additional releases to provide flows of up to 1000 ft^3/s, but TVA denied this request because not enough water was available on a dependable basis consistent with the present operations of the upstream reservoirs. High concentrations of soluble manganese in the releases from Tims Ford have impacted downstream users, and those from Normandy could potentially impact downstream users. Improvements are expected in both cases when the process of initial lake aging is completed. The problem at Tims Ford had been compounded by high release rates that have not allowed sufficient reaeration and time for reoxidation of the soluble manganese before it reached a water intake downstream. Operating limits on the hydro unit at Tims Ford have reduced the potential for the reoccurrence of this problem.

Assimilative Capacity

Assimilative capacity problems are created by low streamflows and low concentrations of dissolved oxygen in releases from Fort Patrick Henry and Norris Reservoirs. In both of these tailwater reaches, dischargers either have been required or are expected to be required to provide levels of waste treatment beyond best practicable to protect water quality downstream. Establishment of instantaneous minimum streamflows and improvement in concentrations of dissolved oxygen would alleviate these problems.

Although no existing problems are associated with the releases from Chickamauga, Guntersville, Kentucky, Watauga, Wilbur, Cherokee, Douglas, Apalachia, Ocoee No. 1, Bear Creek, and Normandy, deviation from the minimum streamflows provided by present operations would result in existing problems. Therefore, they are categorized as potential problems.

Assimilative capacity is marginal downstream from Fort Patrick Henry, Norris (Melton Hill Reservoir), Cherokee and Douglas (Fort Loudoun Reservoir), Chickamauga, and Guntersville Dams. Unless streamflows and concentrations of dissolved oxygen are improved in the tailwaters below these projects, assimilative capacity will become one of the factors that will restrict development in areas along the reaches downstream.

The releases from Fort Patrick Henry, Cherokee, Douglas, and Norris should be given priority for any future studies in relation to improving assimilative capacity.

Generic Options for Reducing Impacts

Possible improvements at a specific project could involve both physical and operational changes. Specific changes must be evaluated and tailored directly to individual projects on a case-by-case basis, considering the impact to be corrected, the cost of implementing corrective actions, the present purposes of the project, present water uses both upstream and downstream, and the impact of any corrective action taken at projects located farther upstream. No single technology can be applied under all situations The application of one technology at a specific project may reduce or correct one adverse impact but compound another adverse impact. This report does not evaluate or propose specific actions for individual projects.

Physical Changes

Physical changes include installing processes or equipment or structurally modifying projects. Physical changes are generally required or most useful for improving dissolved oxygen and, to a lesser extent, temperature and streamflow. Physical changes may be broadly classified as (1) control of water quality within the reservoir, (2) selective withdrawal of reservoir water with acceptable quality, (3) aeration of reservoir

releases, or (4) habitat modification. For essentially all the methods investigated, more study is needed to develop adequate, detailed design criteria. To date, there have been no successfully demonstrated full-scale systems that have achieved consistently a dissolved oxygen concentration of 5 or 6 mg/l. In addition, the various methods need to be demonstrated to determine operational problems that inevitably arise in the process of developing new technologies.

Operational Changes

Some water quality and water use impacts associated with reservoir releases can be partially solved by changing present operating procedures. Operational changes are generally required or most useful for improving streamflow for downstream uses and for correcting problems of short-term temperature variations, concentrations of soluble iron and manganese, turbidity and suspended solids, and to a lesser extent, dissolved oxygen. It is doubtful that operational changes alone can mitigate water quality and water use impacts at all projects, especially those that involve severe dissolved oxygen problems or marginal long-term temperature problems. A combination of both physical and operational changes may be necessary to improve releases from some reservoirs.

Possible operational changes include (1) maintaining a constant, minimum discharge, (2) limiting maximum flow, and (3) altering rule curves for reservoir operations to prevent water quality problems. Such operational changes would severely affect and limit the flexibility of the reservoir system as it is now used for its primary statutory purposes of flood control, navigation, and power generation.

Recommendations for Further Studies

When a single water quality characteristic or water use is severely affected by releases from a specific project, it has generally been categorized as deserving top priority for any future studies that may be undertaken to seek solutions to that generic problem. Overall, however, there is a greater need to seek solutions to the compound problems that occur at projects where multiple water quality and stream uses are impaired.

Both water quality and downstream water uses are now or potentially could be affected by the releases from 14 reservoirs (South Holston, Fort Patrick Henry including Boone, Cherokee, Douglas, Norris, Chatuge, Nottely, Apalachia, Blue Ridge, Ocoee No. 3, Ocoee No. 2, Ocoee No. 1, Tims Ford, and Nantahala). Each of these could be classified overall as a "priority" reservoir, but for various reasons, further studies should not be initiated now at Nottely, Ocoee No. 3, Ocoee No. 2, Ocoee No. 1, or Nantahala. Although Boone is not a priority reservoir, because of its close operating tie with Fort Patrick Henry and its secondary impacts on Fort Patrick Henry releases, these two projects must be considered as a unit for any further studies relating to the releases from Fort Patrick Henry Dam.

Although water quality and streamflow limit use of the Nottely tailwater for a fishery resource and for recreation, other factors such as high turbidity, unfavorable substrate, and poor access also limit these uses. Studies to determine possible improvements would provide only limited returns for this reach in comparison to other reaches. Existing water quality problems resulting from point and nonpoint source discharges in the Copper Basin area limit biological productivity in the Ocoee River. Therefore, further studies to evaluate the releases from the three Ocoee projects should be deferred until improvements in overall water quality have occurred and it has been demonstrated that a viable fishery resource can be established. Although TVA schedules the operation of Nantahala Dam, it is owned and operated by Alcoa. Any studies relating to this project should be conducted jointly by Alcoa and TVA.

The following studies are recommended to investigate specific mitigative actions for the remaining nine priority reservoirs.

South Holston

Studies should explore methods for improving concentrations of dissolved oxygen and the streamflow regime of releases from South Holston Dam to solve the problem of short-term temperature changes, enhance uses of the stream for recreation and a fishery resource, and possibly eliminate any future problems for water supply.

Fort Patrick Henry - Boone

Studies should explore methods for improving concentrations of dissolved oxygen and the streamflow regime of releases from Fort Patrick Henry Dam to improve uses of the South Fork Holston River and the Holston River for recreation, fishery resources, water supply, and assimilative capacity.

Cherokee and Douglas

Studies should explore methods for improving concentrations of dissolved oxygen, seasonal temperature changes, and the streamflow regimes associated with the releases from Cherokee and Douglas Dams to improve recreational opportunities and the fishery resources in these tailwater reaches and increase assimilative capacity in Fort Loudoun Reservoir. With respect to long-term temperature changes, the possibility of providing warmer releases more favorable to warm water species should be investigated.

Norris

Studies should explore methods for improving concentrations of dissolved oxygen and the streamflow regimes of the releases from Norris Dam to improve uses for recreation and a fishery resource and to resolve the problem associated with use for assimilative capacity.

20-955 O—84——184

Chatuge

Studies should explore methods for improving the concentrations of dissolved oxygen and the streamflow regime of the releases from Chatuge Dam to improve uses for recreation and a fishery resource.

Apalachia

Studies should explore methods for improving the streamflow regime of the releases from Apalachia Dam to improve uses for recreation and a fishery resource. Improved streamflow would also provide enhanced conditions for the snail darter population that has become established in the lower portion of this tailwater reach.

Blue Ridge

Studies should explore methods for improving the long-term (seasonal) temperature changes and the streamflow regime of releases from Blue Ridge Dam to improve uses for recreation and a fishery resource. With respect to temperature considerations, the possibility of providing warmer releases more favorable to warm water species should be investigated.

Tims Ford

Studies should explore methods for improving concentrations of dissolved oxygen and the streamflow regimes of releases from Tims Ford Dam to improve uses for recreation and a fishery resource and to reduce the potential for impacts on water supply.

Ranking of Overall Priority Reservoirs

The ranking for initiation of additional studies for these nine overall priority reservoirs is as follows:

1. Cherokee
2. Douglas
3. Norris
4. Fort Patrick Henry - Boone
5. Apalachia
6. Tims Ford
7. Chatuge
8. South Holston
9. Blue Ridge

Scope of Recommended Studies

The additional studies recommended for these nine projects cannot be limited to methods for improving the quality of the releases or enhancing downstream uses. The achievement of these objectives directly conflicts

with present uses of the tailwaters and upstream reservoirs. These important considerations must be included in the study. Thus, the studies must include engineering, biological, and economic considerations of present uses (upstream and downstream) and considerations of possible future uses (upstream and downstream). Any action recommended on the basis of these studies should reflect the best balance of all of the competitive uses for a given body of water.

Any modifications recommended for improving the quality of the releases to enhance downstream uses must be accompanied by an identification and recommendation of sources of funds for implementing the modifications.

Some improvements may be possible within the constraints of present project operations. Other improvements, which would require changes in project operations that would not be consistent with their primary statutory purposes, would require reevaluation of the project purposes and legislative action to authorize project reallocation. In addition, an environmental impact statement would be required if actions proposed for mitigating adverse impacts on water quality or water uses would result in basic alterations of major projects or programs that could cause significant environmental impacts.

lderwood	0.5	0	860	Impounded
ilhowee[m]	0	1360	895	Open

Number of days of zero discharge means those days during which there was no discharge during the entire calendar day and does not reflect those days during which there was no discharge for only portions of the day.

Natural 7-day, 10-years minimum streamflow is the estimated streamflow at the dam site for seven consecutive days with a recurrence interval of one year in 10 years in the absence of any regulation.

Tailwater reach condition designations: open, means the release is to a free flowing stream reach; impounded means the release is to the headwater of a downstream impoundment.

TVA attempts to provide a minimum daily average flow of 6,000 ft3/s.

Maintain a minimum tailwater of elevation 355 for navigation. Requires some release when Kentucky headwater level at winter level, elevation 354.

Minimum daily average of 25,000 ft3/s, minimum hourly flow of 20,000 ft3/s for navigation

Watauga and Wilbur operated, when necessary, to supply minimum flow at Elizabethton of 112 ft3/s.

f. Ft. Patrick Henry operated to supply a minimum daily average of 750 ft^3/s by contractu agreement with Tennessee Eastman Company. This is accomplished by running one unit at approximately 3,100 ft^3/s every fourth hour with zero on remaining three hours when no operating at higher rates.

g. Cherokee and Douglas releases correlated to provide a minimum daily flow past Knoxvill of 2,000 ft^3/s.

h. Spill occurs whenever spill occurs at Ocoee No. 3 or when discharge from Ocoee No. 3 exceeds approximately 1,000 ft^3/s. All discharge spilled since use of turbine discontinued on September 1, 1976.

i. Apalachia and Ocoee No. 1 operated so that the sum of the two releases on a daily average is not less than 600 ft^3/s. (For water quality at Charleston).

j. Tims Ford operated when necessary to maintain a minimum flow of 106 ft^3/s at Fayettevi Special arranged schedule on weekends from Memorial Day through September for fishing, aquatic life, and canoeing.

k. Normally, the minimum flow actually released during normal operations of Bear Creek Dam is about 30 ft^3/s, which is obtained from the minimum standard opening (1.0 foot) of the water quality gate.

l. Normandy Dam is operated to regulate streamflow for water quality control at Shelbyville to ensure a minimum instantaneous flow of 155 ft^3/s across the spillway of the Shelbyville Dam, (river mile 221.4) plus releases for water supply, now averaging about 3 ft^3/s, but projected to increase to about 10 ft^3/s by the year 2000, thus increasing the total requirement to about 165 ft^3/s.

m. Chilhowee operated to supply minimum instantaneous flow of about 1,360 ft^3/s.

Table 6

AVERAGE NUMBER OF DAYS PER YEAR DISSOLVED OXYGEN CONCENTRATION IN THE RELEASES FROM INDIVIDUAL PROJECTS WERE LESS THAN SPECIFIED CONCENTRATIONS (1970 to 1977)[a]

Projects	Average number of days per year concentration was less than specified concentration			Distance below project required to reaerate to 5 mg/l under worst-case conditions[b] (miles)

a NA = not available or not applicable
N = no impact
P = potential impact
E = existing impact
M = mitigative measures already implemented to offset all or part of impact
* = priority impact
S = potential or existing impact of a secondary nature
( ) = water quality characteristic impacting use (dissolved oxygen, temperature, metals, or flow)
Poor water quality conditions resulting from point and nonpoint source discharges in the Copper Basin area now preclude most stream uses.

Table 11

APPLICABILITY OF VARIOUS AERATION METHODS UNDER VARIOUS DESIGN CONSTRAINTS[a]

	Group I Reservoir Aeration					Group II Selective Withdrawal			Group III Aeration of Reservoir Releases												
Possible Optional Constraints	Destratification	1. Mechanical pumping	2. Diffused air	Hypolimnion aeration	1. Diffused air	2. Diffused oxygen	Submerged weir	1. Inflexible	2. Flexible	Multi-level intakes	Turbine venting	U-Tube aeration	1. Compressed air	2. Oxygen gas	Mechanical aerators	Weir aeration	Side-stream supersaturation	Oxygen injection upstream	1. Penstock	2. Diffuser	3. Downflow bubble contact	Tailwater diffusers	1. Oxygen	2. Compressed air	Habitat modification
Warmwater tailwater	+	+		-	-		+	+		+	-		+	+	+	-	-		-	-	-		-	-	+
Coldwater tailwater	-	-		+	+		-	-		-	?		+	+	+	+	+		+	+	+		+	?	+
Tailrace deeper than 10 ft.											+						+						+	+	-
High DO increase	-	-		?	?		+	+		+	-		+	+	?	+	+		+	+	+		+	?	-
Fluctuating reservoir pool							-	+																	
No effect on power production	+	+		+	+		+	+		+			-	-	-	-	-		?	+	+		+	-	-
No increase in dissolved nitrogen	?	?		-	+		+	+		+	?		-	+	+	?	+		+	+	+		+	?	?

Need improved reservoir water quality	+	+		+	+		+	+		-	-		-	-	-	-	-		-	-	-		-	-	-

a. + = relatively positive effect of the particular aeration method.
- = relatively adverse effect of the particular aeration method
? = unknown effect on the condition indicated.

Mr. ROE. Are there other questions?

The gentleman from Minnesota.

Mr OBERSTAR. Thank you very much, Mr. Chairman. And I would like to thank our TVA witnesses for the splendid presentation and thorough discussion of your experience. I think your summary, that a system of incentives, as you put it, tied to a cooperative effort is the most effective way to achieve sound land management practices. That is the thrust of the legislation I have introduced. I think it is the collective wisdom of the past decade in dealing with nonpoint-source problems.

And you then cite cost sharing and fertilizer incentives as essential to the commitment to implement best management practices. Have you had experience with a totally voluntary program, and what has that experience been?

Dr. BOND. Yes, sir; all of our agriculture program activities that we are involved in in the Tennessee Valley regional are voluntary. However, we have limited resources to conduct agricultural programs, and after the planning process is completed, if the farmer is not willing or does not feel that he would like to make the kind of investments that the plan calls for, we suggest that he not participate with us. We want to be sure we have a demonstration that other farmers can observe.

We do not have enough funds to just put out a program and say anyone that wants to participate can. Our resources are quite limited. So what I would have to comment on then involves the Soil Conservation Service and the ACP program, which is on a much broader basis and which is voluntary, and the comment I would make is that I think that is the way to go, but we have found that many farmers in the area do not avail themselves of the program.

So there has to be some other encouragement as well as just the fact that it is available.

Mr. OBERSTAR. When farmers have refused to participate, what has generally been the basis for that refusal?

Dr. BOND. In our region many of the farmers are fairly elderly and have reached the age where substantial borrowing of capital and large investments to do the kind of—to make the kind of changes in their land-use practices that would be necessary to increase their income flow—just does not seem as desirable as it does to a younger farmer. And basically that is usually the reason.

Mr. OBERSTAR. Where you have an older farmer who is planning retirement and does not have the financial resources; a younger farmer who can see a future return on his investment and perhaps with some financial incentive——

Dr. BOND. Will do that.

Mr. OBERSTAR [continuing]. Might be able to do that.

Dr. BOND. Yes, sir.

Mr. OBERSTAR. What experience, if any, have you had with the Executive order that replaced A-95, which was referred to by a previous witness, Executive Order 12372? Is TVA subject to that?

Dr. BOND. I do not think—I just was making sure, but I do not think we deal with that, sir, in the work we do.

Mr. OBERSTAR. Thank you very much.

Mr. ROE. I want to thank the gentleman from Minnesota. We want to thank you very much for your testimony. It has been very

helpful. I think the one point that we want to develop further, one of many, is the fact that if we are going to pursue the nonpoint source issue, then we have to look to the issues of water—the relationship of water quality thereto. That is not called for at the moment, is the point you made. That is a very important point.

Now, we want to thank you for being with us, and we appreciate your testimony.

Dr. BOND. Thank you.

Mr. OBERSTAR. I would ask one more question.

Mr. ROE. The gentleman from Minnesota.

Mr. OBERSTAR. I have one more question that I would like to ask for the record here. We heard from Mr. Ruckelshaus that he fears a new nonpoint-source-grant-assistance program could lead to less rather than more water quality protection. It might tend to inhibit voluntary nonpoint-source-control efforts. Based on your experience in TVA, will you comment on this potential problem?

Dr. BOND. I guess our position would be somewhat different, having been involved with conducting educational program activities where farmers have participated and where there have been incentives. When I was talking about disincentives, I was—I am concerned with the fact that we may have two or three Federal programs where one will be in a sense encouraging the farmer to make various kinds of economic decisions that in turn might be contrary to the long term goals of the Clean Water Act.

I think that sometimes that happens, and I think the Government should be sure that it is consistent in what it lays out. And if a farmer does not want to meet the best management practices, he should not be able to avail himself of other incentives that would be contributing to degradation.

We have not found that incentives made available to farmers in a demonstration program kept them from going ahead and other farmers from making the same kind of investments and carrying out the same kind of management practices as long as it was demonstrated that those investments were increasing incomes and they could see that.

Mr. ROE. I want to thank you very much for your testimony.

Now, the committee has decided that we are going to break until 1 o'clock and then the first witness up will be the Wisconsin Department of Natural Resources, Ms. Linda Bochert and Mr. John Konrad.

Now, may I suggest to the witnesses, we have a very fine day in the sense that we love you dearly, but be that as it may, we are going to be running back to that floor on a number of occasions because there are that many bills up. So it looks to me like our schedule this afternoon will be longer than we had originally anticipated. Many of you have come a long distance to participate. There is no intent of the committee in hurrying anybody along because we happen to believe that the testimony involved today is extremely important to the overall implementation of the Water Quality Act.

So if you have early plans to make or whatever, I suggest you take another look at your schedule if you are going to be testifying today because there is nothing we can do about it. We will just labor through our efforts.

So thanks so much, and we will see you back at 1 o'clock. The subcommittee stands recessed until 1.

[Whereupon, at 12:17 p.m., the committee recessed to reconvene at 1 p.m. that same day.]

AFTERNOON SESSION

Mr. ROE. The subcommittee will reconvene.

Our first witness of the afternoon is Ms. Linda Bochert, from the Wisconsin Department of Natural Resources, accompanied by Mr. John Konrad, chief, Nonpoint Source Section, Bureau of Water Resources Management. And we also have our distinguished member from Wisconsin, Mr. Moody.

Mr. MOODY. The Department of Natural Resources in my State is very good, and I am sure the testimony will be clearly valuable for our committee records.

Mr. ROE. Splendid.

Ms Bochert, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF LINDA BOCHERT, EXECUTIVE ASSISTANT, WISCONSIN DEPARTMENT OF NATURAL RESOURCES MADISON, WIS.

Ladies and gentlemen, members of the Committee, thank you for the opportunity to appear before you today on a matter of considerable significance to the long-term health of our nation's lakes and streams.

My name is Linda Bochert. I appear on behalf of the Wisconsin Department of Natural Resources and its director, Secretary C. D. Besadny. I am the Executive Assistant to the Secretary of the Wisconsin DNR. The Wisconsin Department of Natural Resources has broad environmental protection and resource management responsibilities ranging from managing parks, forests, fish and game, to administering air pollution management, solid waste management, water quality management, and municipal treatment plant construction grants programs. Among our water quality responsibilities is the administration of the Wisconsin Nonpoint Source Water Pollution Abatement Program.

First, I would like to share with you some of our expertise gained from Wisconsin's nonpoint source control program. In 1978, Wisconsin became the first state to enact a state-funded nonpoint source water pollution abatement program. Today it is still the nation's most progressive and comprehensive nonpoint source control program. Wisconsin has gone beyond the stage of talking and conceptualizing into actual implementation of the program.

Second, I would like to comment on both the proposed House bill sponsored by Representative Oberster and the Senate bill which I testified on last July 19th.

In addition to my comments, I am submitting written testimony which decribes Wisconsin's program in greater detail and further discusses our concerns with the proposed bills.

BEGINNINGS OF WISCONSIN'S NONPOINT SOURCE PROGRAM

As mentioned earlier, in 1978 Wisconsin became the first state to enact a statewide nonpoint source water pollution abatement program. Although initial efforts in Wisconsin's water pollution abatement program were directed at the control of point source pollution, it soon became apparent that there was a need for a parallel nonpoint source control program. The Legislature and Governor recognized this need for a comprehensive point source/nonpoint source water pollution abatement approach and enacted the Wisconsin Fund grant program which provided state funds to cost share both point and nonpoint source control projects. Since 1978, Wisconsin has appropriated over 21 million dollars for the nonpoint source control program. The program is administered by the state's water quality agency—the Department of Natural Resources.

NATURE OF WISCONSIN'S NONPOINT SOURCE WATER QUALITY PROBLEMS

Wisconsin is internationally known for its numerous high quality recreational lakes and streams. This is due, in part, to the aggressive and long standing point source control efforts. As a state we take great pride in the water pollution abatement progress we have made through the control of point source discharges.

Wisconsin is also internationally known for its high quality agricultural products. You may be surprised to learn that Wisconsin's 44,000 dairy operations have more dairy cows than any other state. We are located in the northern corn belt, and also have several sizable urban areas. As a result of these factors, we estimate that about 40 percent, or 130 out of 330 delineated waterheads in Wisconsin, are in need of nonpoint source control projects.

These 130 watersheds shown on the shaded area of the attached map include many of Wisconsin's trout and smallmouth bass streams; over 60 large, deep inland lakes located in the heavily populated southeastern part of the state; and the majority of the drainage area to Lake Michigan. Most of these lakes and streams are not degraded by point sources while some are degraded by both point sources and nonpoint sources. In these cases, despite our achievements with point source controls, the water pollution clean up will not be complete until the nonpoint sources are controlled as well. The types of nonpoint sources we are dealing with include eroding construction sites in urbanizing areas; polluted stormwater runoff from existing urban areas; eroding stream banks; eroding croplands; and manure from barnyards and farm fields.

The following examples are cited to illustrate Wisconsin's nonpoint source water quality problems, particularly effects on fisheries. In the last 15 years, the fishery in some of Wisconsin's (and the Midwest's) best smallmouth bass streams has degraded to a point where the streams are no longer viable. In the steeply sloped agricultural section of southwest Wisconsin, stream monitoring on Pat's Creek found dissolved oxygen levels and ammonia levels considered unsafe for fish during and after some rainfall runoff events. In Livingston Branch, another bass stream, where 1,000 bass per stream mile were found in a 1964 survey, a 1980 survey found no bass at all.

Nor are the problems restricted to small streams. In 1980 and 1981, the dissolved oxygen in 65 miles of the Wisconsin River was nearly depleted during spring runoff. Although there are a number of municipal and industrial point source discharges to the river, wasteload modeling specialists estimated that manure runoff from farm yards and fields was the major cause of the problem.

Problems are not restricted to agricultural areas. In Milwaukee, monitoring of urban streams has found high levels of lead and other heavy metals from runoff from city streets.

In the last few years, we have only begun to understand the nature and severity of groundwater problems caused by nonpoint sources. In scattered areas of Wisconsin, manure entering creviced bedrock has resulted in high nitrate levels in private wells rendering them unhealthful for some human consumption.

Locations of current nonpoint source abatement projects and the critical nonpoint source areas.

DESCRIPTION OF WISCONSIN'S STATE FUNDED NONPOINT SOURCE PROGRAM

The Wisconsin Nonpoint Source Water Pollution Abatement Program is comprehensive in nature, in that it addresses both urban and rural nonpoint sources and provides state funds for financial, technical, and educational assistance. Landowners, land users, and municipalities are all eligible recipients of cost share funds.

The program uses a priority watershed project approach. The priority watersheds average about 100,000 acres in size. Grants are made for the implementation of Best Management Practices in watershed projects with critical water quality problems caused by nonpoint sources. Financial assistance is limited to those identified priority management areas which are contributing most significantly to the water quality problems.

The Wisconsin Department of Natural Resources, a state agency, is responsible for administration of the program. The implementation of projects, however, is carried out by county level agencies including county boards and the county land conservation committees.

This approach combines the water quality and fishery expertise of the state agency with the land management expertise of the county level agencies. A detailed plan for each watershed is prepared jointly by the Department and the county. Preparation of this plan requires a comprehensive assessment using computerized models. This assessment identifies pollutant loadings, critical sources, the quantities and types of nonpoint source control practices needed, and the costs of the practices. Along with this land management assessment, data on water quality, fish populations, fish habitat and potential for improved recreational uses are analyzed. The plan also identifies who will be responsible for the various implementation tasks, and lays out a schedule for the installation of practices. The plan guides the 6 to 8 year implementation phase of the particular project.

The priority watershed projects are selected by the Department of Natural Resources. The selection process involves recommendations from the general public, county elected officials, and representatives of federal, state, and local agencies and interest groups.

PROGRESS AND PROJECTED NEEDS

To date, eleven priority watershed projects are being implemented, two more will start shortly, and recently, an additional four were selected and watershed assessments have begun, for a total of 17 watershed projects. One of the projects is being funded jointly with the Experimental Rural Clean Water Program. Another is jointly funded with the Soil Conservation Service's Public Law 566 program.

A total of $21 million in state funds has been committed to these 17 watershed projects and 27 smaller-scale projects through fiscal year 1984–85. About $19 million is being used to cost share the installation of nonpoint source control practices and about $2 million to support county-level technical assistance and educational activities. The state's program funding has grown from $1.3 million in 1978–79 to over $5.5 million in 1984–85. The total projected need for nonpoint source projects in Wisconsin is about $250 million (1981 dollars). About $200 million of this projected need is for financial assistance and about $50 million is for technical assistance, education assistance and local administration activities.

COMMENTS ON PROPOSED FEDERAL LEGISLATION

Based on Wisconsin's 5 years of experience in developing and implemenmting a comprehensive nonpoint source water pollution abatement program, I would like to comment on major aspects of a nonpoint source program and the proposed House bill.

1. Wisconsin strongly supports the creation of a federal, comprehensive, urban and rural nonpoint source abatement program aimed at aggressively dealing with the water quality problems. It is our belief that a program is necessary since for many streams, point source control efforts will not be successful until nonpoint source controls are also in place. In most of our lakes and the rest of our streams, water quality problems do not involve point sources at all.

We encourage the House to pass a bill that specifically includes the control of all major urban and all major rural nonpoint sources. Although eroding cropland and rangeland are significant nonpoint sources, manure from dairy farms, eroding streambanks, and the variety of pollutants from urban areas have an equal or greater impact on the fisheries and recreational use of our lakes and streams. Ignoring those nonpoint sources other than cropland and rangeland will severely limit the accomplishments of a nonpoint source abatement program.

2. We believe funding available through a federal program should be sufficiently flexible to meet the state's needs. In Wisconsin's nonpoint source control program, implementation plan development, cost sharing, technical assistance, educational activities, and local administration are all important components.

The proposed House bill provides the flexibility to potentially fund all of these components. The Senate version, covering only technical assistance and demonstration projects, does not. Technical assistance and demonstration projects alone may work in some states. However, in dairy-based agricultural, Wisconsin and states such as New York, Pennsylvania, and Minnesota technical assistance and demonstration projects alone are not enough.

Wisconsin has already spent 12 million dollars just to cost share the installation of urban and rural nonpoint source controls. Of this amount, 42 percent has gone for manure management, primarily for barnyard runoff control. Cropland practices—primarily grassed waterways—have received 27 percent. Urban areas and urban and rural streambank erosion controls have received 20 percent. The remaining 11 percent has been spent for rural practices other than those for croplands.

WISCONSIN NONPOINT SOURCE WATER POLLUTION ABATEMENT PROGRAM DISTRIBUTION OF EXPENDITURES

The proposed House Bill is comparable to the Wisconsin program in that it would provide funds to states for technical, educational, and administrative assistance. We are concerned about the Senate version which would limit federal funds to technical assistance and demonstration plots. Based on the actual cost figures from the Wisconsin program, we project only a portion of our cropland practices needs would be met. The structural manure management, streambank, and urban practices which comprise 80 percent of our costs would not be installed.

3. The U.S. Environmental Protection Agency (EPA) should be the lead federal agency in this program. As the agency responsible for national water quality programs, EPA has the technical expertise for the establishment of water quality standards which are the foundation of the program. EPA can best provide the necessary integration with point source control, toxics management, groundwater, and clean lakes programs. It is the agency which has played a lead role in the pollution abatement for the Great Lakes. It is the only agency which can meet comprehensive program needs.

Recently, we have heard proposals where EPA would pass responsibilities to the U.S. Department of Agriculture (USDA) through a memorandum of agreement. We disagree with this proposal's shifting of responsibilities. In our experience with the Rural Clean Water Program, we found the state's role to be hindered by federal program policies. For a program to be effective, it needs the expertise of the state's water quality agency so that it truly reflects water quality objectives. USDA has not built strong ties with states. This shift would decrease the potential for coordination with ongoing water quality programs as well as with new programs for groundwater and toxics. Also it could cause urban nonpoint sources to be overlooked since they lie outside of USDA's areas of emphasis and expertise. In essence, this proposal would result in a federal program parallel rather than supplemental to state water quality programs.

This is not to say that USDA agencies should not be involved. In Wisconsin, the Soil Conservation Service plays a major role in assisting counties. Involvement of the Soil Conservation Service and other U.S. Department of Agriculture agencies is an aspect which can be negotiated by the state or designated management agencies. It should not be an involvement which is structured or mandated at the national level.

4. Based on our experience with Wisconsin's priority watershed project approach, we are convinced that concentrating watershed assessments, education activities, and implementation dollars into specific projects is successful and cost effective. This approach allows management of all aspects of the program, including selection of project areas, identification of critical sites, and identification of design standards for nonpoint source controls, to be based on water quality objectives. Also, it provides for integration with federal and state water resources programs such as inland lake rehabilitation, point source permit and grant programs, and fish management.

Neither the proposed House or Senate bills requires a watershed approach to be used. While work to be conducted under the House version would be based on water quality parameters to be identified in state plans, a concept we support, the bill does not identify any specific implementation approach in controlling nonpoint sources. We are concerned that the omission of a specific watershed approach in the bill could allow limited funds to be used in an inefficient, haphazard and scattered manner.

5. We believe funding levels and allocations should be based on need. From our perspective, the Senate version's funding level and allocation formula are inadequate and not based on actual needs. The $887,000 that would be allocated to Wisconsin for 1985 would be far short of the two million dollars needed to fund one of our priority watershed projects. The projected 1985 need in Wisconsin, based on a 25 year strategy is $8.8 million. State funds can only meet part of the need.

The formula based on cropland, rangeland, and forestland ignores important aspects such as the types of receiving water and significant sources such as animal waste. For example, additional emphasis should be given to the Great Lakes. They are of particular importance for two reasons. First, approximately one-third of the nation's fresh water resource is located in these lakes. Second, extensive documentation exists on the nonpoint source contributions to these lakes. In Wisconsin, and very likely in New York, Pennsylvania, and Minnesota, animal wastes particularly from dairy operations are of equal or greater importance than cropland erosion. There are 44,000 dairy operations in Wisconsin alone. We believe if any formula is used, it should incorporate livestock operations which do not come under the National Pollutant Discharge Elimination System. We believe data is available to include this factor in an allocation formula.

The proposed House bill, on the other hand, has the potential to allocate funding based on actual need and at the same time allow each state's program to be tailored to its particular situation. We believe that a formula, if included, should be based on actual water use impairments and realistic costs.

6. All states should be required to develop and implement a nonpoint source control program. Unless states are required to participate, there is no assurance that interstate or downstream waters will be cleaned up. Thus, the efforts of one state may not achieve their objectives due to a lack of effort by another state. Additionally, in some situations, point source control efforts may not achieve their objectives without nonpoint source control efforts.

The equity issue should also be considered. If we are asking a farmer or municipality to bear a portion of the costs to control their nonpoint sources, we should expect others in identical situations, but in other states, to do their share as well. For example, without equal responsibility throughout the entire dairy industry, it is likely Wisconsin's dairy farmers will bear an unfair burden.

In summary, I strongly suggest that a federal nonpoint source abatement program be developed with the following features:

(a) It deals with both urban and rural sources.

(b) It provides funds for cost sharing, technical assistance, education, and administration.

(c) It assists and supplements state programs.

(d) It is flexible enough to meet the needs in the different parts of the country.

(e) It allocates funds based on actual water use impairments and actual costs.

(f) It has adequate funding.

(g) It involves all states.

Of the two versions, the House version most closely fulfills the needs of Wisconsin and probably states such as New York, Pennsylvania, and Minnesota.

20-955 O—84——186

We support these efforts to establish a federal nonpoint source control program. It is an effort that is long overdue. While Wisconsin is certainly no stranger to the role of leader in environmental programs, we believe we have stood alone in this particular field long enough. We invite the rest of the nation to join us in controlling the nonpoint sources of pollution to our nation's waterways. Thank you very much.

Mr. ROE. Please proceed.

TESTIMONY OF LINDA BOCHERT, EXECUTIVE ASSISTANT TO THE SECRETARY, WISCONSIN DEPARTMENT OF NATURAL RESOURCES; ACCOMPANIED BY JOHN KONRAD, CHIEF, NONPOINT SOURCE SECTION, BUREAU OF WATER RESOURCES MANAGEMENT

Ms. BOCHERT. Thank you for the opportunity to appear before your subcommittee this afternoon on a matter of considerable significance to the long-term health of our Nation's lakes and streams.

As you know, my name is Linda Bochert. I appear on behalf of the Wisconsin Department of Natural Resources and its director, Secretary C. D. Besadny. I am the executive secretary to the secretary of the Wisconsin DNR. The Wisconsin Department of Natural Resources has broad environmental protection and resource management responsibilities ranging from managing parks, forests, fish, and game, to administering air pollution management, solid waste management, water quality management, and municipal treatment plant construction grants programs. Among our water quality responsibilities is the administration of the Wisconsin nonpoint source water pollution abatement program.

First, I would like to share with you some of the expertise gained from administering Wisconsin's nonpoint source control program for the last 5 years. Second, to comment on the proposed House bill sponsored by Mr. Oberstar, and the current version of the Senate bill, on which we had the opportunity to testify in July.

In 1978, Wisconsin became the first State to enact a Statewide nonpoint source water pollution abatement program.

Although initial efforts in Wisconsin's water pollution abatement program were directed at the control of point source pollution, it soon became apparent that there was a need for a parallel nonpoint source control program. The legislature and the Governor recognized this need for a comprehensive point-nonpoint source water pollution abatement approach, and enacted the Wisconsin fund grant program, which was established to provide State funds to cost-share both point and nonpoint source control projects.

Since 1978, Wisconsin has appropriated over $21 million for the nonpoint source control program. The program is administered by the State's water quality agency, the Department of Natural Resources, and it is implemented by county-level agencies, including county boards and country land conseration committees.

Wisconsin is internationally known for its numerous high-quality recreational lakes and streams. This is due in part, we believe, to our aggressive and longstanding point source control efforts. Wisconsin is also internationally known for its high-quality agricultural products. Wisconsin's 44,000 dairy operations have more dairy

cows than any other State. We are located in the northern Corn Belt, and we also have several sizable urban areas.

As a result of these factors, we estimate that approximately 40 percent, or 130 out of 330 delineated watersheds in the State of Wisconsin are in need of nonpoint source control projects. These 130 watersheds include many of Wisconsin's valuable trout and smallmouth bass streams. They include over 60 large, deep inland lakes located in our heaviest populated area, the southeastern part of the State, and the majority area to Lake Michigan.

Most of these lakes and streams are degraded, not by point sources, but only by nonpoint sources. We also have areas where there is degredation suffered by the water body caused by both point and nonpoint sources. In all of these instances, as a consequence, despite our best achievements with point source control, the water pollution cleanup will simply not be completed until the nonpoint sources are controlled as well.

The types of nonpoint sources we are dealing with, and I believe that this will be important in later parts of the testimony, include not only rural concerns. They include eroding construction sites in urbanizing areas. They include polluted storm water runoff from existing urban areas. They include eroding stream banks, they include eroding croplands, and manure from barnyards and farm fields.

The problems are not restricted to small streams. In 1980 and 1981, the dissolved oxygen in 65 miles of the Wisconsin River was nearly depleted during the spring runoff. Although there are certainly a number of municipal and industrial point source discharges to that river, those point source discharges are controlled. Our wasteload modeling specialists estimated that the manure runoff from farmyards and fields, that is, the uncontrolled nonpoint sources, were the major sources of this dissolved oxygen depletion problem.

Nor are the problems restricted to agricultural areas. In Milwaukee, the largest urban area in Wisconsin, monitoring of urban streams has found high levels of lead and other heavy metals from runoff from city streets.

The Wisconsin Nonpoint Source Water Pollution Abatement Program is comprehensive in nature. It addresses both urban and rural nonpoint sources, and provides State funds for financial, technical and educational assistance. Landowners, land users, and municipalities are all eligible recipients of cost-sharing funds.

The program uses a priority watershed approach. To date, 11 priority watershed projects are being implemented, 2 more will start shortly, and recently an additional 4 were selected and watershed assessments have begun, for a total of 17 watershed projects. In all $21 million in State funds have been committed to these 17 projects, and 27 smaller-scale projects through fiscal years 1984-85.

A part of that $21 million, $19 million, is being used to cost share the installation of practices and $2 million is going to support county-level technical and educational assistance activities. The State's program funding has grown from $1.3 in 1978-79 to over $5.5 million in 1984-85. The total projected needs for nonpoint source projects in Wisconsin is almost $250 million. Of that amount, we estimate that $200 million of this projected need is nec-

essary for financial assistance, and that $50 million is necessary for the technical, educational, and local administration activities.

Based upon our 5 years of experience in developing and implementing a comprehensive nonpoint source water pollution abatement program, and our review of the proposed bills, we offer six points for your consideration in regard to this legislation.

First, Wisconsin strongly supports the creation of a Federal comprehensive urban and rural nonpoint source pollution abatement program aimed at aggressively dealing with water quality problems. A program is necessary because for many of our streams and lakes point source control will not be succesful until nonpoint source controls are also in place. We encourage passage of a bill that specifically includes the control of all major urban and all major rural nonpoint sources. Although eroding cropland and rangeland are certainly significant nonpoint sources, manure from dairy farms, eroding stream banks and the variety of pollutants from urban areas have an equal or greater impact on the fisheries and recreational use of our lakes and streams. To ignore these other nonpoint sources will severely limit the accomplishments of a nonpoint source abatement program.

Second, funding available through a Federal program must be sufficiently flexible to meet the State's needs. In our program, implementation plan development, cost sharing, technical assistance, educational activities, and local administration are all-important components. The proposed House bill provides the flexibility to potentially fund all of these components. The current Senate version, which covers only technical assistance and demonstration projects does not.

Technical assistance and demonstration projects alone may be sufficient in some States. However, in dairy-based agricultural Wisconsin, technical assistance and demonstration projects alone are simply not enough.

Third, the U.S. Environmental Protection Agency must be the lead Federal agency in this program. EPA is responsible for national water quality programs. It has the technical expertise to establish water quality standards, which are the foundation of these programs. Only EPA can provide the essential integration with point source controls, toxics management, ground water, and clean lakes programs. It is the agency which has played a lead role in the pollution abatement for the Great Lakes. It is the only agency which can meet comprehensive program needs.

We understand that there is a proposal that EPA would pass responsibility for this program on to the U.S. Department of Agriculture through a memorandum of agreement. We disagree with this approach. Nonpoint source water pollution control is only a piece of the overall puzzle of water polution control. For a nonpoint source program to be effective, it needs the expertise of the Federal and State water quality agencies, so that it truly reflects water quality objectives. To shift responsibility to USDA would decrease the potential for coordination with ongoing water quality programs, as well as with new programs for ground water and toxic management. It could also, we fear, cause urban nonpoint sources to be overlooked, since we understand that they lie outside the area of USDA's emphasis and expertise.

Fourth, based upon our experience with Wisconsin's priority watershed approach, we are convinced that concentrating watershed assessments, education activities and implementation dollars into specific projects is both successful and cost effective. This approach allows management of all aspects of the program, including selection of project areas, identification of critical sites, and identification of design standards for nonpoint source controls to be based on water quality objectives.

It also provides for integration with Federal and State water resource programs such as inland lake rehabilitation, point source permit and grant programs and fisheries management. Neither the proposed House nor Senate bills requires a watershed approach to be used. While work to be conducted under the House version would be based on water quality parameters to be identified in State plans, which is a concept we support, the bill does not identify a specific implementation approach in controlling nonpoint sources.

We are concerned that the omission of a specific watershed approach in the bill could allow limited funds to be used in an inefficient, haphazard and scattered manner.

Fifth we believe funding levels and allocations should be based on need. From our perspective, the Senate version funding level and allocation formula are inadequate and not based on actual need. The $887,000 that would be allocated to Wisconsin for 1985 would fall far short of the $2 million needed to fund one of our priority watershed projects.

The projected need in Wisconsin for 1985 alone is $8.8 million. The total projected need is $250 million. State funds can only meet a part of that need.

The Senate bill formula based on cropland, rangeland, and forestland ignores important aspects of the nonpoint source problems, such as the types of receiving water and significant sources like animal waste. In Wisconsin, animal waste, particularly from dairy operations, are of equal or greater importance than cropland erosion.

The proposed House bill, on the other hand, does have the potential to allocate funding based on the actual need and, at the same time, allow each State's program to be tailored to its specific situation.

Sixth, all States should be required to develop and implement a nonpoint source control program. Unless States are required to participate, there is no assurance that interstate or downstream waters will be cleaned up. Thus the efforts of one State can fail to achieve its objectives due to a lack of effort by another and, as I stated earlier, point source controls will not achieve their objectives without nonpoint source control.

We believe it is a question of equity. If we ask a farmer or municipality in Wisconsin to bear a portion of the cost to control their nonpoint sources, we expect others in like situations but in other States to do their share as well. Without equal responsibility throughout the entire dairy industry, for example, Wisconsin dairy farmers will bear an unfair burden.

In summary, we urge that a Federal nonpoint source water pollution abatement program be developed with the following fea-

tures: (1) Deal with both urban and rural sources; (2) provide funds for cost sharing, technical assistance, education, and administration; (3) assist and supplement States programs; (4) be flexible enough to meet the needs in the different parts of the country; (5) allocates funds based on actual water use impairments and actual costs; (6) have adequate funding; and (7) involve all of the Statess.

Of the two versions, the House version most closely fulfills the needs that we view in the State of Wisconsin.

We commend and support these efforts to establish a Federal nonpoint source control program. It is an effort that is long overdue. While Wisconsin is certainly no stranger to the role of leader in environmental programs, we believe we have stood alone in this particular field long enough. We invite the rest of the Nation to join us in controlling the nonpoint sources of pollution to our Nation's waterways.

Thank you very much.

Mr. ROE. Thank you for your comprehensive testimony.

The Chair recognizes the gentleman from Wisconsin.

Mr. MOODY. Thank you, Mr. Chairman.

It is very good testimony, and it certainly is music to the ears of us who have been, along with the Chairman, have been raising questions of most of the witnesses about nonpoint, and it is excellent to have a State that has shown some leadership come before us and explain what their points of view are.

When Mr. Ruckelshaus was here yesterday, he singled out Wisconsin for special praise on nonpoint source pollution, and I think deservedly so.

I have several questions, Ms. Bochert. When you get right down to it, what is the justification for Federal funding? Mr. Ruckelshaus and others pointed out that if the Federal funding commitment was extensive, we would just about break the bank on this program alone, because it could be potentially so vast and so expensive. What is the conceptual justification for Federal funding as opposed to State funding on these programs?

Ms. BOCHERT. I think there are really two questions there, if I might. One is why need there be a Federal role at all and, second, why should there be money attached to that.

Mr. MOODY. Right.

Ms. BOCHERT. I think we need a Federal role for several reasons. First of all, as we have indicated, we consider it a question of equity among the States. The State of Wisconsin has aggressively pursued its own nonpoint source program, but we have many interstate bodies of water. We also have industries, municipalities, and agricultural operations in Wisconsin which compete with like operations of like kind in other States. If we are to ask of our people to pursue this and attack nonpoint source pollution as a problem, we believe it is appropriate that other States ask the same.

In order to do that, we believe that it is necessary to have a Federal presence and a Federal role in the program to insure that there is a similar request being made of all of the States. We think the role that EPA can provide is one of assistance, one of encouragement. We think that they can be a clearinghouse function for technical information in terms of best management practices that are successful in one States or another in terms of dealing with

nonpoint source pollution, and we believe that their presence enables the Congress to articulate a national goal, so that the problems that are indeed interstate in nature can be addressed.

We also think that financial assistance is appropriate, and I know that it is difficult in these budget times, and the State of Wisconsin has certainly been through difficult budget times as well, to look anyone straight in the eye and say: "That's a great idea, but we need more money in order to do it." Nonetheless, we think that that is the case.

Our experience has been that contrary to the belief I think some may have that dealing with nonpoint source pollution is basically a problem of going to the farmer and convincing him to adjust some technique that he is using, which is a relatively low-cost, inexpensive thing for him to do. Our experience has been that the practices that are required to actually effectuate some water quality improvement are largely structural, and consequently are largely costly.

And in addition, because basically these practices are directed to controlling a water pollution circumstance, to improving water quality, unlike some of the soil erosion programs where the benefit of the program inures to the individual farmer, or the individual landowner and is in fact a site-specific benefit, to a great extent nonpoint source controls inure to the benefit of the public, because you are improving water quality, and it is a problem of asking someone to improve water quality for his neighbor downstream.

We think that those arguments are sufficient to justify what the State of Wisconsin has done in terms of providing cost sharing to our nonpoint source program, and because we believe that it is appropriate for there to be a Federal role, we similarly think that those arguments are sufficient to justify Federal funding.

Mr. MOODY. Thank you. Did you hear the Department of Agriculture's testimony earlier today?

Ms. BOCHERT. I heard part of it.

Mr. MOODY. They would seem to argue an opposite approach regarding your watershed, your selecting a priority watershed approach. The assumption under your—or our, I should say since I am from Wisconsin—the program is that you can identify the source of pollution within a watershed and go after them and do something about it.

Their testimony is to the effect that it is so vague, it is so diffuse, it is so hard to trace, that they really don't think that is the way to go. Can you comment on that?

Ms. BOCHERT. I would be happy to. Our experience in the 5 years that we have been administering this program is that indeed we can identify the sources of the nonpoint source pollution, that we have been able to identify them and to develop management practices to deal with them, and we have not found it problematic in terms of administering the program.

What we have found is that the watershed approach, which basically identifies a priority watershed for cleanup, and then within that watershed all nonpoint source contributors are a part of the solution, only than selecting certain practices to be a part of the solution. That has been the only effective way to actually get water quality improvement.

So I could only say, based on our experience, we do not share the judgment of the USDA in that regard.

Mr. MOODY. How do you handle the problem of a very high polluter in a nonpriority area? If it is not a priority watershed, and yet you have some real bad actor, you don't go after him?

Ms. BOCHERT. We have other tools available to us, although to the extent that this is a voluntary program, which means that it is not regulated within the State, people can participate on a volunteer basis, that is to an extent a problem with the approach that we have right now. We do have other authority in our State statute, if a case can be built to show pollution in those circumstances which will enable us to address that.

Mr. MOODY. Finally, back for a second to the funding question and the Federal role question: Could you imagine applying a priority watershed approach nationwide and, if so—it is implicit in your testimony—the funding, as you say, would have to follow need, and not formula by State or population, for example. Would there be some way to arrange the watersheds into some kinds of priorities nationwide and then work down from the top so that you could cut it off when the funds ran out, even though they might be very strongly distributed in some areas? Can you envision a way of doing that?

Ms. BOCHERT. I am sure you could do that. I think what we would recommend instead is that to the extent that the priorities are developed, they be developed against national criteria, but that actually they are prioritized within the State, so that you would start out with some rough formula that gave each State an opportunity for a fund, and then against a set of national criteria they would prioritize the watersheds within their own States. I think that way you maximize the advantage of participation by each State rather than, for example, pitting California's No. 1 watershed against Wisconsin's No. 1 watershed on a national scale.

I use a formula similar to what has been used for the construction grant program, for example, on an approach of that kind.

Mr. MOODY. Thank you, Mr. Chairman.

Mr. ROE. I have some additional questions I want to ask, but we will have to recess for 10 minutes to go vote, and then come back and resume.

Ms. BOCHERT. Fine.

[Recess.]

Mr. ROE. We're waiting for another member to come back, but I think we can go ahead and finish up the questioning that I had in mind.

First of all, I think your testimony was excellent because you've given us an insight from a State's point of view and you're not just theorizing. You're doing it. So that you are to be complemented on.

The thought occurred to me as we were going through the dialog with many of our witnesses in testimony that we speak of, other than municipal sewer plants or industrial plants, as being point source. But I'm not so sure that when we start to unfold your observations in the area in which you've already worked that we have, for example, a feed lot or something. That really isn't a nonpoint source, in a manner of speaking.

I think the Agriculture Department testified this morning to the point of view where they had invested some incentive money with one of the farmers to build a manure containing unit so to speak that was advanced technology which also created a point source.

Ms. BOCHERT. Right.

Mr. ROE. So I'm just wondering if there should be some relationship to, when we put together and bulk everything together in the nonpoint source area and we identify within the nonpoint source area point source discharges. If they shouldn't be classified, if they can be identified having originally fallen into this broad category, and if they couldn't be identified as point source discharges.

Ms. BOCHERT. To the extent that the solution to a nonpoint source problem is to create a controlled point source, which I think is what you're saying.

Mr. ROE. I'm thinking hot-spot type of thing.

Ms. BOCHERT. Right. It seems to me that what you have is sort of in the lawyer's world something changing form because it's been manipulated.

In other words, it started out life as a nonpoint source problem, but when you brought a solution on it, you brought it under control as a point source. And we have some of that experience.

Mr. ROE. Well, let me deal with that a minute. I don't think this is so far afield. The thought occurs to me, you made a very solid point, and you had your charts included, where you spoke to the issue that you've broken your State down over a 5-year period, and you're dealing in watersheds.

Ms. BOCHERT. Right.

Mr. ROE. In a State such as mine, which is the most urban in the Nation, that's difficult to do unless we're dealing in a river basin approach. And I think you might find that to be so in most of the urban States, northeastern, and some of the midwestern States.

But in effect we have bulked everything that wasn't considered to be a municipal or regional sewage plant disposal as point source, and industry per se as point source. Everything else has been maybe directly or indirectly bulked in as nonpoint source.

Ms. BOCHERT. Sort of by exclusion.

Mr. ROE. By exclusion. So in effect if a State such as yours through the 208 program, and together with your own efforts that you have promulgated in your own State, you have been able to now start to break down and to not necessarily prioritize but categorize within the broad blanket, the recepticle, if you like, of a nonpoint source. You've now been able to identify which was one of the points that the people that testified from Agriculture. They said we thought it would be too difficult to identify. You took umbrage with that, or you disagreed with him because you've been able to do it.

Ms. BOCHERT. Yes.

Mr. ROE. Simply because you intensify in your head.

So I'm just wondering if we should not give some consideration while we're trying to unfold the nonpoint source issue. We could say well yes, if States have identified through 208 their farm or—I'm thinking for example of tailings in the mining industry, acid mines that are identifiable within a watershed or river basin, and really, truly are point source. And therefore, when the State has

identified a list of point sources in the nonpoint source category grouping, should that then not be classified into the point source area.

Ms. BOCHERT. And consequently treated under the national pollution discharge elimination system permit program.

Mr. ROE. Precisely. See the wisdom I'm trying to express here?

Ms. BOCHERT. I do.

Mr. ROE. Let me digress, if I could interrupt you.

Ms. BOCHERT. Certainly.

Mr. ROE. The pressure not to provide any funding is enormous. I happen to agree that if we're going to be honest with the American people we've got to tell them where the pollution is coming from, and if they want to invest in it, fine. If they don't, that's up to them or to Congress to decide.

But to take a blanket approach that nonpoint source is not going to be eligible for any funding which everybody has testified, from the administration on down, we could be flapping our wings again.

But if we can say that we've identified some of the point source issues that fell in the broad-based category of nonpoint source and therefore should be classified as eligible under the grant program, is that not something we should look to?

Half a loaf is better than none.

Mr. KONRAD. Maybe I could try to respond.

Mr. ROE. Go ahead.

Mr. KONRAD. I think I agree with you and agree with your logic. I think something that is an assumption that is falsely made and a statement which you hear very often made is that nonpoint sources are diffuse sources and therefore you can't identify the source.

I think that is an incorrect statement; technically it is incorrect. Nonpoint sources have definable sources as much as point sources do.

What makes them a nonpoint source is the effect that they have on the receiving body of water where you cannot make the nice cause and effect type of relationship you can with a pipe.

But I think that you're right in that many of these things that we call nonpoint sources when we start to separate them out, they in fact become point sources.

Mr. ROE. You're identifying them.

Mr. KONRAD. Right. A barnyard, for example, can be either a point source or a nonpoint source depending on the type of water quality problem that it creates. And what we're really looking at is the most effective means to try to control that particular problem no matter where the technical funding comes from.

Mr. ROE. Well, what I'm trying to get at is look at this in a broader sense. The Agriculture Department testified this morning that they were observant of the point of view that the acceptable, the newly redefined water quality standards by EPA which was a fierce battle fought last year, as you know, has now been redefined. And therefore, everybody smiles and says, well, chalk up one for our side. Now we really shouldn't put that into the law. It's been done by administration. That's another flap that we've got to deal with.

Many members want to write that into the law. The Agriculture Department comes back this morning and says well that's fine

without their saying it in those words, but really the water quality standards that we've promulgated for point source discharge do not speak to the issue of nonpoint source. And then they elucidated and they said, well we have involved a nonpoint source. We have an accumulation of nutrients; we have acid runoff. We have soil erosion; we have sedimentation and so forth.

I made some notes to myself. If we're going to set up a broad-based standard to start to attack the nonpoint source and those issues have to be dealt with. And I think that's a fair commentary.

Then they spoke to the issue of cumulative effect, which again is not new to this committee, because we've talked about that for years. We are saying that the upper reaches of a stream versus the middle reaches and the lower reaches, if you accumulate it who's responsible, a broad-based interest, and so forth and so on.

Some people are taking an easy way out and they're throwing their hands up in dispair and saying that for us to deal with a nonpoint source situation is of such extraordinary cost that we can't possibly deal with it or it would be 100 years before we would be able to achieve it.

Therefore, we're saying that unless we deal with a nonpoint source that we're fooling the American people. No matter how much money we spend on the Chesapeake Bay, unless we deal with the nonpoint source going into the Chesapeake Bay, we are not going to solve the problem.

So it seems to me that if we have—you're making a number of succinct points, because of your experience over 5 years. You've been able to take the geographic area of your State and break it down into watersheds. That happens to be indigenous in part to the terrain of your State. That's not true in other States.

Therefore, river basins, nee watersheds, could be a measure that we could deal in so that you're dealing in a systems approach to the nonpoint source as we're trying to deal with in the point source.

Is that a reasonable statement of fact so far?

Ms. BOCHERT. Yes.

Mr. ROE. Now we go back and we had testimony from TVA and from Agriculture, saying that as you got into the nonpoint source issue, and you started in the case of TVA to talk about mine waters and so forth, you've got back into the land use issue, that is, the following.

We go back to yesterday's testimony, everybody fell off the chair, my gosh and we are going to have Big Brother now telling people what they should do with their land, States rights, home rule, the whole bag.

But nevertheless, if the States don't control their political subdivisions, their zoning and planning, then they are allowing these issues to occur, such as strip mining.

Should a permit be issued for strip mining for energy needs and so forth if in turn it's going to have an effect upon receiving water someplace?

Or should the whole country now be responsible through the Water Resources Development Bank go back and spend half a billion dollars to clean up the situation in West Virginia vis-a-vis the point of the acid mine waters is what we're trying to get at.

Therefore, what has been your experience in the attitude of the people coming back in Wisconsin when you set up your regional and watershed areas in reference to, or has there been any relationship to land use involved?

Have you run into that issue?

Mr. KONRAD. We ran into that issue very early in the development of the program, mainly in negative concern over how much of a land use program this was going to be.

I think we have effectively defused that concern with the experience that we have in the watershed projects.

Mr. ROE. How did you defuse it?

Mr. KONRAD. I think that by experience and by education; I think that the landowners and land users have realized what we're really talking about is land management, not land use.

There is a subtle difference.

Mr. ROE. It's more than a subtle difference.

Mr. KONRAD. And what we're looking at are effective ways to manage a land within a particular land use. And we're not looking at changing that land use.

Mr. ROE. Well, you may not be in Wisconsin, and I don't mean this critically, but that's not the experience we're getting in other States.

In other words, part of the testimony had to do with, on the 404 permit section. If you're familiar with that we're controlling filling primarily, dredging and filling. But when it came to draining the swamps or people excavating humus and so forth from the swamps, that was not covered by a 404 permit. And there was a little criticism that came up yesterday vis-a-vis the point of the confrontation between the Corps and EPA who effect. They do have joint jurisdiction.

So what I'm simply trying to get at is maybe we have to take an interim step. If we strengthened the law and began to mandate that States, above and beyond what they're doing in their point source treatment, had to now start to implement their 208 program as it related to nonpoint source. And if they had to get incentives going, et cetera, perhaps with the first point to identify within the nonpoint source, without rehashing that, the points, the areas that could then be determined to be, other than sewer plants, point source. Thus creating a point source issue as an interim step, making them eligible for grant and aid funds under the ongoing grant program, and then mandating over a 2-year period that they implement on a stronger basis the 208 program.

And then come back with some incentives, like you were speaking to the point that in implementing your plan for one of your identifiable issues, one watershed, that would run about $2 million as I recall the figure.

Ms. BOCHERT. Right.

Mr. ROE. So that some funding may be able to be made available without going overboard. Because we won't be able to sell it; we'll never be able to raise the money—in such a way that the States that are more advanced, such as yourselves, could start to implement as demonstration programs.

Does that make some kind of sense?

Ms. BOCHERT. I think it does. I think the experience we've had in Wisconsin is pertinent on several points.

First of all, in the early part of my testimony I make the statement that the Wisconsin legislature created a single Wisconsin fund grant program and divided it into point source and nonpoint source grant moneys.

So essentially what we've done is look at it as the universe of water quality insults, if you will. What is it on the land surface and what are the human activities which go on, which can impact on surface water.

And we've treated them as a unit. I think one of the reasons we've been successful in overcoming the "this is nothing but a land use program in disguise" concern—which was a very real concern at the outset of our program, and is a longstanding issue in Wisconsin, particularly in relationship to my agency—one of the reasons we've been successful in overcoming that is because our entire orientation is that this is a water quality improvement program.

And to the extent that achieving water quality improvement means that you affect the way that the land adjacent to that water body is used, it is the same thing as to say that by improving water quality you are doing nothing inappropriate because you are telling a paper mill how it must arrange its budget for the next several years in order to construct a sewage treatment facility.

Or you are inappropriately imposing your wishes on municipal government by telling them that they must treat as a high priority the construction of a sewage treatment plant, which may not be what they want to do with their local budget.

It seems to me that that is as appropriate or as inappropriate, depending on your perspective, as saying to a property owner, you must arrange your land use techniques in such a way as to improve this water quality.

So we've always begun from the issue of water quality and focused our efforts there—the watershed approach is a technique for doing that—to the extent that that ripples back into affecting the way people carry out their activities, it does have land use concerns. It has budgeting concerns. It has corporate decision making concerns, but they are anchored in that initial premise that it is a water quality program. It's not just Government coming out and saying we don't like the way you're running your farming operations you have to change it.

I think that orientation has been very helpful to use in Wisconsin in order to sell this program.

Mr. ROE. Because in the point source area many States have invoked no build restrictions unless they met their particular needs, and therefore that did control and does control the land use of the area.

Ms. BOCHERT. Precisely, we have a similar relationship in Wisconsin between municipal compliance with the point source requirements and the addition of sewer extensions to the treatment plant.

And we have prohibited construction in many communities until such time as they were in compliance which is effectively managing their growth for a water quality objective.

So we've basically just taken the position that our objective is water quality improvement and that whatever needs to be done to do that is an appropriate thing to affect.

Mr. ROE. And it took you time to educate the State.

Ms. BOCHERT. And there has been a tremendous emphasis on education. I can't emphasize how important that is.

Mr. ROE. I think it's critical.

I have no further questions. I think your testimony and your response have been excellent. I really do.

Ms. BOCHERT. Thank you very much.

Mr. CLINGER. Thank you very much for your testimony.

Mr. ROE. Thank you very much for being with us.

Ms. BOCHERT. Thank you.

Mr. ROE. Now let me tell the folks what we're doing. There is an hour of some ceremonial presentations taking place on the floor in respect to the anniversary of President Kennedy's death. And then we're going to go into some more legislation; 17 or 18 suspensions which will be voted on. A good portion of them will.

We have with us now, for example, the National Association of Counties who have been waiting since yesterday, and the National League of Cities who are kindred soles, I would think in part there. Would you have any objection—we're prepared to sit here all night. Would you have any objection if we were to merge a couple of these groups together.

There are some that lean toward the conservation, natural resource area. Some lean towards governmental responsibility in the field. If we would merge you together and took you as groupings would that be satisfactory? Because many of the questions would be related.

Is there anyone who would object to that?

[No response.]

Mr. ROE [continuing.] All right. Suppose we now take as our next witnesses the National Association of Counties and the League of Cities and the National Association of Conservation Districts together.

If that's so, then we have Hon. Neal Potter, council member from Montgomery County, Md., representing the National Association of Counties; we have Hon. Walter Rockenstein, city council member from Minneapolis, Minn.; and we have Mr. Neil Sampson, executive vice president, National Association of Conservation Districts.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT BY HON. NEAL POTTER, COUNCIL MEMBER, MONTGOMERY COUNTY, MD., ON BEHALF OF THE NATIONAL ASSOCIATION OF COUNTIES

Mr. Chairman and members of the committee: I am Neal Potter a member of the county council of Montgomery County, Md., appearing today on behalf of the National Association of Counties[1] to present our recommendations for amending the Clean Water Act.

---

[1] NACo is the only national organization representing county government in America. Its membership includes urban, suburban and rural counties joined together for the common pur-

Continued

America's counties have strongly supported Federal water pollution control legislation since its enactment in 1972. Since 1980, however, we have witnessed a trend towards reducing the Federal commitment to counties and cities responsible for complying with Federal treatment requirements and State water quality standards. This has markedly shifted the cost and compliance burden to the local level and we are concerned that it will make us unable to meet national public health and environmental goals.

To regain the momentum toward achieving national water quality objectives, NACo recommends:

First, a major increase in the authorization for the wastewater construction grants program; and

Second, directing that increase toward assisting those local governments having critical water quality problems or facing immediate enforcement action by the Federal Environmental Protection Agency or their respective states.

THE NATIONAL WATER QUALITY COVENANT

In 1972, the Congress broke with longstanding tradition and established national goals and a detailed system for achieving those goals under the Federal Water Pollution Control Act. That system included a covenant establishing shared responsibilities among Federal, State, and local governments. The purpose of that covenant was to clean up this Nation's rivers in order to achieve basic public health needs, provide for recreational use, protection of fish and wildlife, and enhancement of environmental quality.

The covenant among Federal, State, and local governments contained two essential elements:

First, the Federal Government mandated that as a matter of national priority publicly owned treatment works must provide secondary treatment and comply with state water quality standards, the current deadline for which is 1988. These requirements have and will continue to impose major costs on county governments, cities and other local agencies owning and operating treatment works.

Second, in return, for compliance with Federal treatment requirements, the Congress pledged to assist local governments by establishing the Federal wastewater construction grants program providing up to 75 percent of the cost of building publicly owned treatment facilities. In 1981, the Congress reduced the Federal share to 55 percent and eliminated some of the construction costs eligible for Federal assistance.

Federal treatment requirements and the mandate to comply with State water quality standards imposed new and major costs on sewer customers. These costs would be met entirely by sewer rate payers but for the existence of the Federal wastewater construction grants program and a few states which have agreed to pay part of the local share of that program. Many persons, businesses, recreational areas, farmers, and other interests receive the benefit of wastewater cleanup but would never pay for those benefits but the existence of the wastewater construction grants program supported by Federal revenues.

The wastewater construction grants program enjoyed a consistent level of support through fiscal year 1979. Beginning with fiscal year 1980, however, it has suffered major reductions. The chart which is attached to our statement graphically demonstrates the sharp reduction in the Federal commitment in the 10 year history of the program.

Unless the Congress commencing with the current fiscal year strengthens its commitment for assisting local governments to comply with Federal treatment requirements, the demand for weakening or eliminating the Federal mandate to achieve water quality and public health goals will increase as the deadline now scheduled for 1988 approaches.

The National Association of Counties strongly supports a revitalization of the covenant first established in 1972 by returning the annual authorizatotion to not less than $5 billion. In our judgment this step should be taken during fiscal year 1984 for one very important reason: Wastewater treatment plants are very sophisticated and complicated facilities. Their construction must follow detailed specifications. If

---

pose of strengthening county government to meet the needs of all Americans. By virtue of a county's membership, all its elected and appointed officials become participants in an organization dedicated to the following goals: improving county government; serving as the national voice for county government; acting as a liaison between the nation's counties and other levels of government; and achieving public understanding of the role of counties in the federal system.

localities are to comply with the 1988 deadline, construction of these facilities must begin during the next 3 years.

The number of facilities and financial support needed for compliance with Federal treatment requirements and State water quality standards have been well documented. The Environmental Protection Agency's 1982 national needs survey reported a total Federal exposure under the 1981 amendments of $37.5 billion in grant eligible costs. Of that amount, $30.2 billion has been reported by EPA as backlog needs for compliance with Federal requirements and abatement of existing water pollution.

Counties and other local agencies are less able to meet that financial burden imposed by Federal law than they were in 1972. Even with the 1981 amendments, the Federal exposure is far greater than the annual appropriation of $2.4 billion for the next five fiscal years would provide to meet the Federal deadline. Renewing the Federal commitment is the single most important step toward preserving local government support for national water quality goals. It is certainly necessary if the Congress intends to enact so called antiback-sliding provisions contained in H.R. 3282 which would freeze stream use designations to those now in existence.

To meet the Federal exposure reported by the Federal Governments own needs survey, the National Association of Counties recommends that the construction grants program authorization be returned to its historic level of no less than $5 billion per year for the next 5 fiscal years, coincident with the period in which local governments must initiate construction to meet the 1988 deadline.

Our recommendation is consistent with amendments to the Clean Water Act proposed by Chairman Howard as H.R. 3282. That proposal would authorize $4 billion for fiscal year 1984; $4.5 billion for fiscal year 1985; and $5 billion annually for fiscal year's 1986 through 1988.

Counties are aware that the 1988 deadline is drawing near and in view of the fact that fiscal year 1984 is the last year in which the Federal Government will provide up to 75 percent of the cost of constuction, there is as strong likelihood that the full $2.4 billion appropriated this summer will be obligated before the end of fiscal year 1984. With careful planning by EPA, the States and local governments, an additional $1.6 billion could be committed in the next 12 months.

In addition, to further encourage the States to obligate funds appropriated in the out years, we recommend that the Congress shorten the obligation period from 24 to 18 months and add an additional 5 percent to the Federal matching share for those States which are able to obligate their annual allocation within a 12-month period.

PRIORITY WATER POLLUTION PROBLEM AREAS

In 1981, Congress declared in section 216 of the act that projects funded by the wastewater construction grants program "shall be projects which in the estimation of the State, are designed to achieve optimum water quality management, consistent with the public health and water quality goals and requirements of the act". Implementation of this policy has been left to the States. Since that time there has been growing interest in directing Federal assistance to the most critical water pollution problem areas. In addition, many counties and other communities are now facing enforcement action and EPA's draft municipal policy would focus enforcement action on those areas with the worst pollution problems.

States have had essentially 2 fiscal years in which to devise their approach to implementing section 216 to achieve optimum water quality management with Federal assistance. The Environmental Protection Agency has reviewed and approved State project priority systems which should implement that policy. Tempering the policy outlined in section 216, however, was the establishment of the State discretionary fund for major sewer system rehabilitation, new collector sewers, new interceptors, and correction of combined sewer overflows.

The net result of 216 in achieving optimum water quality management is not clear and should be carefully reviewed by this subcommittee. To what extent have the States focused Federal assistance on water pollution problem areas? To what extent has the use of the State discretionary fund hampered cleanup of the most polluted water bodies? What further direction should be given to EPA and the States to direct scarce Federal resources to the most significant water pollution problem areas?

These issues should be carefully studied as part of the current review of Clean Water Act amendments. We also recommend that consideration of approaches for further directing waste water construction grants to those areas with the greatest pollution problems or those local governments facing Federal and State enforcement action be an integral part of this evaluation.

There are essentially two approaches which have been identified to give priority to assistance under the Wastewater Construction Grants Program:

First, a separate track of grants to local governments discharging to the most polluted water bodies or requiring the greatest degree of abatement. Grants would be made based on prior approved implementation plans for certified projects. This separate track would be supported by a separate authorization and appropriation to meet construction schedules for each fiscal year.

The separate track would: result in faster obligation of Federal funds; establish a schedule for obligating those funds and complying with treatment requirements; and direct Federal resources to those areas with the greatest pollution problems.

A second approach to achieving optimum water quality management would require the States to allocate the major portion of their federal funds, perhaps as much as 75 percent to those areas and local governments where the greatest amount of cleanup can be achieved. This approach would retain the current formula for alloting funds to the States and the State grant process while requiring States to focus primarily on major pollution sources.

The National Association of Counties supports consideration of these and other approaches and pledges to work closely with the subcommittee to develop a solution for concentrating assistance to achieve the greatest cleanup possible for the resources invested.

CONCLUSION

The National program for achieving improved water quality is at a distinct crossroads. If Federal support for construction of wastewater treatment facilities is maintained at current or lower levels, local government compliance with the 1988 deadline and achievement of national water quality objectives in the near future will not be realized. The impact of this loss of momentum on industrial compliance with the Clean Water Act should be of major concern to the Congress.

We cannot lose sight of the fact that water pollution abatement is a matter of public health with major benefits for environmental quality, recreation, wildlife protection and those economic uses which depend on clean water. A major increase in the wastewater construction grants program along the lines we have recommended must be among the highest priorities.

Thank you very much for the opportunity to present our views and recommendations

---

STATEMENT OF WALTER ROCKENSTEIN, CITY COUNCIL MEMBER, MINNEAPOLIS, MINN., FOR THE NATIONAL LEAGUE OF CITIES

Mr. Chairman, members of the subcommittee; I am Walter Rockenstein, City Council Member from Minneapolis, Minnesota. I am testifying today on behalf of the National League of Cities and the 15,000 cities of all sizes it represents.

It is an honor to be here this morning to support reauthorization of the Clean Water Act and suggest positive changes in this legislation. I would first like to summarize NLC's general position on the Act and then comment on specific provisions of existing law that we think should be revised.

PUBLIC HEALTH AND LOCAL ECONOMIC GROWTH

Protection of public health and encouragement of urban economic development are two of the highest priorities of the National League of Cities. The need to balance these two priorities and our concern that the protection of one not diminish the other guide our position on reauthorization of the Clean Water Act.

First, there can be no question that the Clean Water Act has resulted in significant improvements in water quality and public health. Passage of the Act has also contributed to the economic vitality of cities. The improvement in water quality in our major urban areas has made these cities more attractive places to live and work. And the growth of the water pollution control industry has added jobs in many cities.

Second, NLC underscores the importance of uniform and enforceable national clean water standards. Although states and local governments have the primary responsibility for protecting public health and safety, the federal government plays an essential role in assuring clean water. Without uniform and enforceable national clean water standards, states and local governments would be tempted or forced to reduce local water pollution standards to attract new industrial development. Without such standards, distressed areas would have little alternative but to seek the

short-term promise of economic development by compromising the long-term public health of the community. Only national standards can ensure that long-term national health interests will not be traded away in the day-to-day competition for community economic development.

Third, NLC believes that the cost of compliance with the Clean Water Act, while large, represents a cost-effective investment in the Nation's future. We acknowledge that some of the legislative provisions and regulations are overly complicated. Cities know that firsthand, and we will suggest specific improvements here today.

Despite this, the League knows that this cost cannot be avoided: either today to protect the health of our constituents and the vitality of our communities, or in the future, as dirty water causes burgeoning health costs and forces rescue missions to revitalize distressed cities.

Let me now turn to the League's position on specific provisions of the act which we believe should be considered for revision.

FUNDING FOR THE CONSTRUCTION GRANTS PROGRAM

As you are well aware, funding for this program has been reduced by 50 percent since 1978. Further and more damaging, the federal share of construction costs for publicly owned treatment works [POTW's] will drop from 75 percent to 55 percent beginning in fiscal year 1985. We continue to oppose this change.

The ability of municipalities to comply with any clean water program is contingent upon adequate funds for building treatment facilities. We support Mr. Howard's proposal which recognizes this relationship by providing for increased funding for this vital program.

We recognize the budget constraints facing the federal government, but those same constraints exist at the state and local level as well. If federal funds are not available to support the requirements and objectives of the act, timetables for meeting these requirements should be extended substantially.

We also believe that cities must be encouraged to proceed toward water quality objectives regardless of the current status of federal funding. Therefore, to encourage municipal self-help, cities that pre-finance water pollution control programs must be assured priority for reimbursement of local funds advanced.

PRETREATMENT

The National League of Cities believes that Congress should authorize EPA to establish pre-treatment standards only for those industries EPA has classified as major polluters and only for those classes of toxic pollutants which are known to be widespread and which may be causing human health and aquatic life problems.

Concurrently, EPA should have authority to exempt from the pre-treatment program those POTW's which can demonstrate that they are not interfering with the designated use of the receiving water.

The Administration proposed such a pre-treatment provision in its clean water bill. It has since reversed its position, claiming there are inadequate resources for effective implementation. Since States already have the option to enforce the National Pollutant Discharge Elimination System (NPDES)—in effect, accepting responsibility for end of the pipe discharges—our membership is considering support for granting the States a beginning of the pipe enforcement responsibility as well. This, it seems to us, would obviate EPA's concern about inadequate enforcement capability.

Allowing owners/operators of POTWs to substitute local standards for categorical standards to meet specific environmental circumstances and assure protection of water would be cost-effective and not resource-intensive. However, such local standards should not become a loophole for avoiding national requirements. Therefore, any such amendment should require: (1) compliance with National Pollutant Discharge Elimination System (NPDES) conditions; (2) development and implementation of local standards that are in the aggregate equivalent to national standards; and (3) maintenance of an adequate local monitoring and reporting program to protect the receiving waters.

LEVELS OF TREATMENT

NLC recommends that the statutory requirement of "secondary treatment" should be defined as a desired level of water quality and not restricted to any one particular process. The desired treatment level required of municipalities should be defined to prevent expenditures for unnecessary and expensive facilities. Moreover,

the least expensive solution should be favored, such as low flow augmentation when such a solution is the most economically efficient solution.

NONPOINT SOURCE POLLUTION

Over $30 billion in Federal grants has been invested in POTWs. Industry and State and local governments have contributed an equivalent sum for controlling point sources of water pollution. To date, there is no effective program for the control of non-point sources of water pollution under the Clean Water Act. Yet, we know that urban stormwater drainage, construction, agriculture and mining activities, and seepage from individual wastewater disposal systems are major contributors to water quality problems.

NLC believes Congress and the administration should proceed expeditiously—through expanded research and development, technical and managerial assistance, and funding—to aid the efforts of local and state governments in the control of nonpoint sources of water pollution.

In addition, Section 201 of the Act should provide for the funding of localized nonpoint source-abatement measure identified as priorities in approved and certified Section 208 plans.

FEDERAL COMMON LAW AND THE ACT

The interaction of federal common law and the Clean Water Act remains a confusing legal tangle for most municipal officials. Last year, we reviewed the issue from the perspective of the injured party and the injuring party. We believe no municipality injured by a willful or negligent violation of federal or State law should be deprived of a remedy if one exists under the Federal Water Pollution Control Act or other appropriate laws.

Further, where the violator presents as a defense, acting "in good faith" or in compliance with EPA and state permits, the injured municipality should be able to make EPA a party in the lawsuit.

WATER QUALITY STANDARDS

When our Steering Committee met last April, the outcome on the controversy over the proposed changes in Water Quality Standards was very unclear. While it appears thats the Senate and EPA have reached agreement on this issue, we are still uncertain about the final resolution of this matter. Accordingly, NLC's Steering Committee recommended that we adopt a policy prohibiting states from downgrading or revising standards where designated uses have been attained; permitting a revision of the standards if a state can demonstrate that the existing designation is unattainable because of (1) natural background, (2) irretrievable man-induced conditions or (3) because attainment of the designated use would result in substantial and widespread adverse economic and social impact.

Further, we believe that where water quality exceeds the level necessary to maintain a designated use, a state should have the option to allow lower water quality for that stream because of necessary and justifiable economic or social development for which there is no feasible alternative. In no case should the degradation of water quality interfere with or become injurious to existing instream use. Before a state exercises such an option, it should be required to hold public hearings and coordinate with all affected governmental agencies.

TOXIC SLUDGE

Ironically, the statutory requirements designed to alleviate water pollution are so successful that they are now producing second generation problems. New treatment plants are generating mountains of sludge to be disposed of, some of which is highly toxic.

While the League of Cities is only now in the process of developing a detailed policy on the use and disposal of toxic sludge, our current policy calls for EPA to support research of the problems arising from the management of wastewater treatment facilities.

We also believe innovative and alternative treatment technologies have not been used to their fullest potential, and that federal research, development and public education concerning these technologies should be expanded.

CONCLUSION

We believe these suggestions will speed attainment of the Clean Water Act's important goals. I appreciate the opportunity to present NLC's views before the committee and would be happy to answer any questions you have.

TESTIMONY OF NEIL SAMPSON, EXECUTIVE VICE PRESIDENT, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS

Mr. Chairman, members of the subcommittee: I am Neil Sampson, Executive Vice President of the National Association of Conservation Districts, a private nonprofit organization representing the nearly 3,000 soil and water conservation districts of America. It is a privilege to come before you today to represent the views of those districts and the 17,000 men and women who guide their daily work.

We believe that the farmers and ranchers of America, if given the proper incentives, are fully ready to take major steps to reduce the nonpoint source pollution that can occur from agricultural and forest production.

Ten years ago, the major problem facing conservation districts and local governments was that they simply did not know how much of a problem nonpoint sources of pollution really were, and had little notion of how to address them after they were identified. Today, the problem is the apparent apathy on the part of the Federal Government as to whether those problems are important or not.

In the past few years, the 208 program in the Environmental Protection Agency has virtually dried up. Over at USDA, where clean water programs proliferated in the late 1970's, a new set of priorities for the conservation programs completely ignores water quality, focusing instead on soil erosion on cropland, water supply, and flood control. Programs directed at water quality are continuing in 44 States, as Appendix I illustrates, but that seems to be the result of local people who recognize that clean water is no less important today than it was a few years back. It certainly cannot be attributed to any significant encouragement from the Federal Government.

This is why NACD strongly supports H.R. 4037 and urges the subcommittee to include it in the Clean Water Act Amendments.

We feel H.R. 4037 addresses an important issue at a critical time. The ongoing implementation efforts that have emerged from a decade of 208 planning activity needs aid and encouragement right now. If the Clean Water Act were to be amended today without mention of nonpoint Source implementation programs, we would find ourselves 5 years from now with even more serious water pollution problems, but little if anything in the way of institutional capability to deal with them. That capability exists today, in state and local governments, conservation districts, and agricultural organizations. It will wither and die, however, unless we continue to give those people the signal that the problems they are addressing are of enough importance to the Nation to merit continued effort.

It is important that we address agricultural nonpoint source pollution in the correct fashion. Other forms of water pollution have been addressed by regulatory programs, but agricultural nonpoint source pollution can not be handled in this fashion. It is simply impossible to regulate the wind, the rain, and the daily activities of millions of people who work the agricultural lands of America. In addition, political realities dictate that the imposition of a regulatory program—or even the threat of one—engenders violent opposition from the very people upon whom we must depend for cooperation—the well-meaning farmers and ranchers of America. It is, therefore, vital that Congress design a program that encourages the voluntary coopertion of these land users. Without that cooperation, we simply will not get the pollution reduction that is needed.

In our opinion, the type of program outlined in H.R. 4037 meets that criteria, and its passage would result in a significant reduction in water pollution stemming from nonpoint sources. Our assessment of the situation in rural America is that there are many potential water quality programs eagerly awaiting the funds that will give them the chance to operate.

Those funds that are needed, while they are vital, are not overwhelming in amount. Conservation districts in many localities are operating water quality demonstration projects that are greatly reducing the amount of soil erosion, water runoff, and pollution from agricultural activities.

Conservation districts have used local funds, state water quality agency funds, [illegible] programs, and EPA demonstration grants over the past decade, and the variety of approaches that have been tested are numerous. One thing stands out, however. In all these programs, success has been proportional to the amount of local in-

volvement, initiative and commitment that was incorporated in the program design. That can be recreated if the federal program that emerges is one of education, incentives and assistance.

We are aware that others feel strongly that more direct and drastic measures are needed. A program that is largely voluntary, they argue, will not reach those people who willfully destroy the land and pollute the water for their personal profit.

Sadly, that assessment is too often true. Today's economic climate has encouraged land speculation and abuse that attracts the kind of pepole to whom the future means little, and conservation means nothing. So we are baraged by examples of land abuse, and conservation districts find some of these abusers almost impossible to reach.

But we must not let the "headline" stories of soil abuse and erosion lead us to be lieve that this type of behaviour is common in rural America. It is not. Most farmers and ranchers are simply looking for ways to survive in business, during some terribly difficult economic times, and build or maintain the quality of their land in the process. It is to this vast majority that we must appeal in any nonpoint source pollution control program. By winning their cooperation, we have much to gain, both in terms of public understanding and support for improving water quality, and in the quality of the water itself.

Conservation districts have demonstrated that locally-directed programs, with only modest funding, can accomplish this goal. It is to this end that the Nation must address its nonpoint source control efforts, and H.R. 4037 represents the right way to begin the process.

We have compared H.R. 4037 with S. 431, the proposal that has emerged from the Senate Committee on Environment and Public Works, and would like to offer some observations about specific issues that will need to be addressed.

Section 319. (a)(1) of H.R. 4037 gives the state only 9 months to produce a report on nonpoint sources of pollution and (b)(1) gives the same amount of time to submit a plan which the State can implement over the next 4 years. Such a schedule seems difficult, if not impossible, for most states to meet. It seems unlikely that EPA could even have regulations guiding the submissions in less than 6 months, which would leave the states to develop their programs largely in the dark.

We have no inclination to promote another long, expensive round of planning, but would suggest that a more reasonable time frame might be a year to 18 months. We think it is possible that the longer time frames could result in more effective programs that would accomplish more and cost less than if they were the result of a hasty job done to meet an impractical deadline.

We support the requirement in (b)(1)(A) that requires the state to develop its plan in cooperation with local agencies and organizations who have expertise in nonpoint source control. Again, this will mean consulting with many organizations, representing a wide range of interests and geography, and makes the 9-month time limit seem even more difficul

Section (b)(1)(B) addresses the federal consistency issue by suggesting that somehow, within 9 months, a State can indentify all the federal activities that might impact on their water quality program over the next 4 years. That seems impractical. This is not an easy issue to address, but the Senate approach that encourages States to identify specific programs and projects as part of the ongoing implementtion of Executive Order 12372 seems a more workable approach which we would encourage the Subcommittee to consider.

We support the requirement in section (b)(1)(C) for a State-established schedule of implementation. There have been proposals for a federally-mandated time limit, but the wide variety of situations encountered around the country makes such a deadline impractical.

There are differences between H.R. 4037 and S. 431 in several areas having to do with funding the proposed nonpoint implementation programs. H.R. 4037 would authorize up to $150 million a year to be appropriated for the program. We support that level of funding.

S. 431 allows federal cost-sharing to the extent of 75 percent of the cost; H.R. 4037 is limited to 50 percent. S. 431 would distribute two-thirds of the funds on a formula basis and one-third on the basis of merit for those States willing to address difficult or serious problems, test innovative methods, or tackle interstate problems. H.R. 4037 allows for special grants to States willing to address interstate problems, but limits grants to any one State to a maximum of 15 percent of the amount of the appropriation. Neither way is either clearly superior, in our view.

One area that we find particularly well-conceived in H.R. 4037 is the ability of the Administrator to fund local projects in those States where the State has not been willing or able to undertake a statewide program. (Subsection f)

Mr. Chairman, we commend the Subcommittee on this legislation, and urge its passage. We have attached a statement of general principles to this testimony as Appendix 2. These principles were the outcome of a great deal of cooperative work on the part of many organizations this summer. We are in full support of them, and feel that H.R. 4037 does an adequate job of adhering to them.

We appreciate this chance to bring our views on this important legislation to the Subcommittee, and will be pleased to answer any questions you might have.

APPENDIX

A telephone survey was conducted by NACD the week of July 4, 1983 to gather information on 208 activities. Responses to questions and a brief summary of the activities currently in progress are highlighted in the succeeding pages.

These are examples of various projects being undertaken in the States, but may not be all inclusive.

208 SURVEY

The following questions were asked:

(1) Did the State ever get a 208 statewide plan that includes an agricultural element approved by EPA?

(2) Is the State soil conservation agency and/or districts designated as the implementing agency for the agricultural nonpoint phase?

(3) Are you doing anything right now?

Summary

Question No. 1.—44 States responded in the affirmative; 6 States responded in the negative—California, Colorado, Delaware, Indiana, Massachusetts, New York.

Question No. 2.—47 States indicated that the State soil conservation agency and/or districts is the designated implementing agency; 3 States indicated that other agencies are the designated agency—Maine, New Hampshire, Pennsylvania.

Question No. 3.—44 States responded in the affirmative; 6 States responded in the negative—North Carolina, Texas, Iowa, Nebraska, Maine, Massachusetts.

State	Question No. 1	Question No. 2
Alabama	Yes	S&W Conservation Committee.
Alaska	Yes	Soil Conservation Subdistricts.
Arizona	Yes	State Land Department, Division of Natural Resources Conservation
Arkansas	Yes	S&W Conservation Commission.
California	No	Some RCD's designated.
Colorado	No	Soil Conservation Board.
Connecticut	Yes	Council on S&W Conservation.
Delaware	No	Conservation Districts.
Florida	Yes	Bureau of S&W Conservation.
Georgia	Yes	S&W Conservation Committee.
Hawaii	Yes	Conservation Districts.
Idaho	Yes	Soil Conservation Commission and Districts.
Illinois	Yes	Division of Natural Resources and Districts.
Indiana	No	S&W Conservation Committee and Districts.
Iowa	Yes	Soil Conservation Committee and Districts.
Kansas	Yes	Conservation Commission and Districts.
Kentucky	Yes	S&W Conservation Commission.
Louisiana	Yes	S&W Conservation Committee.
Maine	Yes	State Planning Agency.
Maryland	Yes	Soil Conservation Committee.
Massachusetts	No.	None.
Michigan	Yes	Soil Conservation Committee and Districts.
Minnesota	Yes	S&W Conservation Board and Districts.
Mississippi	Yes	S&W Conservation Commission.
Missouri	Yes	S&W Districts Commission and Districts.
Montana	Yes	Department of Natural Resource and Conservation and Districts.
Nebraska	Yes	Conservation Districts.
Nevada	Yes	State Conservation Commission and Districts.
New Hampshire	Yes	Water Supply and Pollution Control Commission.
New Jersey	Yes	Soil Conservation Committee.
New Mexico	Yes	S&W Conservation Commission and Districts.

State	Question No. 1	Question No. 2
New York	No	S&W Conservation Committee and Districts.
North Carolina	Yes	S&W Conservation Commission.
North Dakota	Yes	Soil Conservation Committee and Districts.
Ohio	Yes	S&W Conservation Commission and Districts.
Oklahoma	Yes	State Conservation Commission.
Oregon	Yes	Department of Agriculture through Division of Conservation and Conservation Districts.
Pennsylvania	Yes	Water Quality Commission.
Rhode Island	Yes	Conservation Committee.
South Carolina	Yes	Land Resources Conservation Commission.
South Dakota	Yes	Conservation Districts.
Tennessee	Yes	Conservation Committee.
Texas	Yes	S&W Conservation Board.
Utah	Yes	Conservation Districts.
Vermont	Yes	Natural Resources Conservation Council with provision to farm out work to other agencies.
Virginia	Yes	S&W Conservation Commission.
Washington	Yes	Conservation Commission and Districts.
West Virginia	Yes	Soil Conservation Committee.
Wisconsin	Yes	Land Conservation Board and Districts.
Wyoming	Yes	Conservation Commission.

SUMMARY OF 208 ACTIVITIES

SOUTHERN R[illegible]

Note: In some cases the plan states that the Dept. of Agric. is lead agency but have contracted with state committee to be lead agency.

Alabama.—Preparation of an '83 supplement to their statewide plan (agricultural portion) which will bring them up to date.

Arkansas.—Training program for district directors, employees and working with cooperators.

Florida.—Have had a $60,000 grant which they have been using and working out Memorandum of Understanding between Bureau, Dept. of Envt. Regulations, SCS and districts—all but 1 district has executed M of U.

Georgia.—Have a full time 208 man. Had some money that came through DNR and in '82 and '83 put on 25 demonstrations of BMPs which have been seen by 20,000 people. Also, water quality displays that ½ million people have seen.

Kentucky.—S&W Cons. Comm. lead agency, not only for agricultural but also for construction. Have prepared and distributed a BMP manual for construction and are currently preparing a BMP manual for agriculture. Documents that there is a noticeable increase in BMP particularly in construction.

Louisiana.—Have a couple of projects on lakes—trying to pin down what is polluting the lakes. Not much else.

Mississippi.—Are carrying out an extensive educational program which includes such things as distributing water quality brochures and showing slide shows.

North Carolina.—Not much going on.

Oklahoma.—Have identified 10 watersheds with nonpoint problems which are being surveyed to pin down exactly what problems exist. Will then develop management plans to solve problem and look for someone to help them out financially. Sediment has been the only thing identified as polluting—not herbicides or insecticides.

South Carolina.—Not much going on other than conservation tillage as a BMP.

Tennessee.—Have been diligently updating their agricultural portion of statewide plan. Conducting no till clinics and have been talking BMPs at district meetings—slide shows.

Texas.—Not much going on.

Virginia.—Have documented that there are 750,000 acres increase in cropland that is being adequately tried to cut down on sediment. Istigated a filter strip program. Districts in Piedmont are increasingly active in water quality. Districts have purchased and made available 25 no till seeders as BMP.

PACIFIC REGION

Alaska.—State Dept. of Envt. Conservation has allocated funds to soil conservation subdistricts for their review of conservation plans developed in the districts—checking to see whether BMPs are included. They pay the district $40 for each plan they review.

California.—Some RCDs were designated but basically develop theirs on selected basis. Work being done in selected areas through specifically identified RCDs.

Hawaii.—Plan is being implemented and Hawaii Assn. chairs a nonpoint committee monitoring 208 type programs. Hawaii Assn. president serves as chairman with various representatives from state agencies.

Idaho.—Commission is completing their planning phase. Eight projects identified and each has an implementation project underway. One being funded under RCWP and 7 under the state water quality cost share program. Need planning funds to proceed further.

Nevada.—Have salinity nonpoint program down by Las Vegas.

Oregon.—Have an RC&D project on dairy waste. Certain areas have irrigation water quality program and 7 state grants to districts for projects relating to water quality.

Washington.—Three projects—irrigated, dryland and dairy waste. Reporting all activities regarding water quality. Four projects underway being financed with public bonds—2 dairy waste, 1 dryland, 1 irrigated.

NORTH CENTRAL REGION

Indiana.—Note: Nothing but using section 108 money for demonstration projects.

Illinois.—Have a state soil erosion and nonpoint committee that is developing a long range plan, priority watershed committee, have a state cost share program but no money—using whatever federal funds they have.

Ohio.—Has similar program to Illinois. Note: Using Section 108 money for demonstration projects—44-48 counties involved.

Minnesota.—Good state plan—problem is that it is in their state water quality agency. No funds but good plan.

Michigan.—Nothing. Note: Using Section 108 money for demonstration projects.

Wisconsin.—Gary Williams, EPA, says Wisconsin has best program. Has $1 million plus in nonpoint program. Also have priority watershed program which involves land conservation committees. Going strong!

Missouri.—Instructed by water quality agency to secure funding for erosion control.

Iowa.—Do not have any particular program set up for nonpoint.

WESTERN REGION

Arizona.—Working on groundwater quality. It was ignored in other plans. Anticipated permit program relative to groundwater pollution. Surface water is not serious problem—reuse their water.

Colorado.—As direct result of 208 program, had planning regions approved by EPA—had a watershed project, project on irrigated land to cut water loss and stop salinity. Basically a concrete ditch lining project.

Kansas.—In process of reviewing the agriculture runoff portion of the 208 plan after five years of operation. Being assisted by EPA employee on loan for 90 days. Will report where they are in their plan: accomplishments, where they need to go and what needs to be done. This report will be given to the legislature in 1984.

Montana.—Funds are limited now. Have several streambank stabilization projects in operation. Crop production involving 15 districts, water quality and sediment control involving 2 districts. Every district has signed an agreement with water quality department, EPA and DNR.

Nebraska.—Nothing doing.

New Mexico.—Most contracts have been completed. One contract is still in effect involving toxic waste studies. Have booklet on sedimentation and erosion on forest land. Univ. of New Mexico was involved in element on BMPs on rangeland. Tracking system for implementation of conservation practices.

North Dakota.—Have 3 targeted watershed areas. State Health Dept. has an agreement with CDs to help finance ¾ of the cost of manpower to supply information of the BMPs to the area (involves 4 districts). State Health Dept. is designated water quality agency.

South Dakota.—Have 208 money available. Have 7 CDs involved. Money is used to hire a coordinator who contacts people and number 1 priority is lake restoration

techniques; also contact people about selling story of soil conservation, conservation tillage, any other information about conservation programs. ASCS also gives support. Are going to give statements and issue letters for July 19 hearings. Have learned that ASWIPCA leaning heavily towards issue. NALMS will also give testimony.

Utah.—208 plan is now called 205(j). Money has been distributed in grants to 6 agencies including Dept. of Agric. to implement and carry out their plan. All area of plans are the nonpoint implementation and all plans are oriented towards agriculture. Dept. of Agric. is very involved in nonpoint issue.

Wyoming.—Priority is stream water quality assessment with CDs. Not called 208—water quality management. Work on a 15 mile creek which is a tributory to Big Horn River. Another project—Final Water Quality Assessment on Salt River—involves Star Valley CD, SCS, Wyoming Fish and Game Dept. and ASCS. Another one—Bitter Creek water quality assessment involving 2 counties—and another at Big Sandy River.

NORTHEAST REGION

Connecticut.—Agric. enforcement activities. Requirement for permits. Groundwater management program. Erosion and sediment control program.

Delaware.—No, but working on it. New Castle Dist. has an approved plan but not a statewide plan. Have hired a specialist under 208 who works with DNR and Extension Service.

Maine.—Nothing going on.

Maryland.—Agric. plan has critical areas designated: RCWP project, clean lakes program. Each county has their own critical area where they target their emphasis. ACP special project and reactivating 208 technical team to tackle Chesapeake Bay.

Massachusetts.—Nothing going on.

New Hampshire.—Voluntary compliance with BMPs for normal agric. activities. Education and conservation advice to farmers. Maintain water pollution control.

New Jersey.—Ongoing ACP program, 2 PL 566 land treatment projects, increased emphasis on large soil loss areas.

New York.—Whole thing was not approved but agric. portions were approved. Looking to find out reason for non-approval and get it going.

Pennsylvania.—As of September 1979. Assessment of nonpoint agric. pollution involved with erosion and sediment control evaluation program. Develop plans to carry out first agric. assessment on nonpoint.

Rhode Island.—No new projects other than the existing programs—watersheds and CO-1.

Vermont.—P.L. 566 project underway, RCWP and RC&D.

West Virginia.—Not one big statewide project. Broken down into 4 areas: agric., forestry, conservation and mining. State committee in charge of agric. portion. Emphansis by CDs has been to increase the BMPs by 10 percent each year for the last 3-4 years and are still working on this. Also have watershed projects.

PRINCIPLES ON THE CONTROL OF NONPOINT SOURCE POLLUTION

1. While Encouraging Progress Has Been Made to Date in Controlling Nonpoint Source Pollution, Additional Effort Is Needed to Work Toward Achieving the Goals of the Act

The Clean Water Act's Section 208 planning process was instrumental in fostering the development of state programs to address nonpoint source pollution. As a result of this effort, much attention has been focused, since passage of the Act in 1972, on devising programs and practices to control nonpoint sources. Nevertheless, on many water bodies nonpoint source pollution remains a significant problem. Consequently, additional federal and state emphasis should be placed on the control of nonpoint source pollution.

2. Completed and Approved Section 208 Plans Should Serve as the Springboard for Additional Efforts to Control Nonpoint Source Pollution

State plans developed through the Section 208 process in most cases represent the most comprehensive available assessment of: (1) nonpoint source problems; (2) needed controls; and (3) viable institutional arrangements for implementing these controls. While the Section 208 data base will need to be updated, augmented and, in certain areas, modified, any new initiatives designed to address nonpoint sources should build upon what we have already learned through the Section 208 planning process.

3. Primary Responsibility for Developing and Implementing Nonpoint Source Controls Should Continue to Reside at the State and Local Levels

One important finding of the Section 208 effort is that the nature and variability of nonpoint source problems and needed control measures, dictate that control programs must be developed and implemented at the state and local level. Resource, personnel, and technical limitations make direct federal implementation of nonpoint source control programs infeasible. Consequently, even in cases where states are, for some reason, unwilling or unable to act, direct federal imposition of specific controls is not viable.

4. States Should Be Afforded Broad Flexibility in Developing the Types of Nonpoint Source Control Programs that Address the Particular Problems in Each State

Because of the variability of nonpoint source problems from state to state (and within states), EPA has adopted a policy of providing the states with considerable flexibility in controlling nonpoint source pollution. Important components of this policy include the flexibility to develop: (1) different types of control programs, both regulatory and nonregulatory; (2) schedules for achieving implementation milestones that reflect the necessary differences in control programs; and (3) economically and technically feasible best management practices that will be applied in a site-specific fashion. This policy is an essential element of any new initiatives to address nonpoint sources. States should not be bound to: (1) a particular type of program; (2) a uniform, national compliance schedule that is not keyed to the state program; or (3) a specific set of practices that are not site-specific in application.

5. The Federal Government Does Have an Appropriate Role in Fostering the Development of Nonpoint Source Control Programs

While the implementation of nonpoint source control programs should remain a state and local responsibility, there is an appropriate role for the federal government in this process. EPA should: (1) continue to review and approve state nonpoint source control programs; (2) provide financial support to states to assist in the implementation of nonpoint source controls on those water bodies where nonpoint source pollution is causing water quality problems; (3) serve as a "clearing house" for the transfer of information on successful implementation programs at the state level; and (4) assess the progress being made and keep Congress abreast of needed changes to the federal strategy for dealing with nonpoint sources, including recommendation of appropriate sanctions or remedies where nonpoint source controls are not being implemented. The U.S. Department of Agriculture should also provide technical assistance, where appropriate, to assist state implementation of nonpoint source control programs. All federal agencies should work with states to make their programs consistent with state nonpoint source control efforts.

6. Federal Financial Support Is Necessary To Encourage the Implementation of Nonpoint Source Controls

Given the current limitations on resources at the state and local levels, federal financial assistance will be essential to: (1) help states refine implementation plans, where necessary; (2) implement education, training, technology-transfer, and other programs designed to get best management practices implemented on the ground; and (3) in some cases, cost-share the implementation of best management practices.

7. Positive Initiatives, Rather Than Financial Sanctions Against Nonpoint Sources, Will Have the Greatest Impact on Improving Water Quality

The element of compulsion injected by proposals for financial sanctions conflicts with current EPA policy under Section 208 to foster cooperative programs to implement nonpoint source controls. Experience with the Section 208 program suggest that an approach which emphasizes education, training, and incentives—both financial and institutional—offers the best chance of success, especially in dealing with rural nonpoint source problems. A controversial sanctions program may make states reluctant to honestly identify problems and develop control programs. Any additional initiatives should thus, emphasize incentives rather than sanctions.

8. New Efforts to Deal With Nonpoint Soruce Polution Should Concentrate First on Implementation to Address Known Problems

There is still much to learn about the relationship between the implementation of best management practices and improvements in measures of ambient water quality. Data gaps also exist in determining natural background levels of some nonpoint source pollutants, and quantifying the impact of long-range transport of pollutants as part of the bedload that already exists in most stream systems. New nonpoint source initiatives should be designed to assist states in implementing best manage-

ment practices to deal with known nonpoint problems on priority water bodies. The positive thrust of initial implementation efforts should not be confounded by attempting to address issues where insufficient decision-making data exist, such as: (1) nonpoint source compliance with water quality standards; and (2) resolving interstate conflicts over long-range transport of nonpoint source pollutants.

Mr. ROE. We'll hear first from Mr. Potter who has waited for 2 days to testify. I think you've earned that right.

TESTIMONY OF HON. NEAL POTTER, COUNCIL MEMBER, MONTGOMERY COUNTY, MD., ON BEHALF OF THE NATIONAL ASSOCIATION OF COUNTIES; HON. WALTER ROCKENSTEIN, CITY COUNCIL MEMBER, MINNEAPOLIS, MINN., ON BEHALF OF THE NATIONAL LEAGUE OF CITIES; AND NEIL SAMPSON, EXECUTIVE VICE PRESIDENT, NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS

Mr. POTTER. Thank you very much, Mr. Chairman. We've been very patient because it's very important to us, and I have observed at length your patience, diligence, and knowledge of the subject, and I appreciate it deeply.

Mr. ROE. Thank you. May I make this statement: All of your statements will appear in full in the record; if you choose to summarize them, that will be fine.

Mr. POTTER. I had assumed that, and we will submit our statement for the record, and therefore I will try to summarize the main points that have concerned us so much.

Basically we've been strongly in support of the clean water legislation since 1972. We've been very active and have tried to supply every support we could in Congress and in working with the EPA.

Since 1980, however, we have been discouraged by a trend toward diminished support for the construction grants program in the face of inflation; the appropriations have gone way down throwing a heavy burden on our taxpayers and ratepayers.

We feel that the national commitment can be maintained only through a major increase in the authorization above present levels, and second, in order to economize in a tight period in financing, to focus the effort on the critical problems where there are immediate enforcement actions threatened by EPA or where other monitoring has indicated a severe problem.

That focus could save a lot of money and do a lot for the water quality problems about which we are all worrying.

We feel that in 1972 there was basically a covenant, a declaration of national purpose in which Federal enforcement was accepted but that a shared responsibility was recognized as part of living up to that national commitment. That recognition of a problem that had existed and gotten more severe through the decades.

And we feel now that the Federal Government is withdrawing from that covenant, and unless the enforcement process and the deadlines are to be waived, as they may be if we go on at present levels of support, we're into deep trouble.

We feel that it cannot all be put on the ratepayers. Water and sewer rates can triple; in fact in some cases I think they have increased tenfold to the point where people were failing to pay their bills, were simply disconnecting. They would rather bring in the

water in buckets than try to pay for the cleanup which is imposed by Federal standards at this late date in the growth of our areas.

We also feel that it is fair to have a national tax support, financial support for the improvement. I think the lady from Wisconsin indicated some of the reasons very well. There are downstream people. It's community wide benefit, and a communitywide neglect that has led us to the present situation.

But we also want to emphasize the deadlines that are now in the law. The 1988 deadline for meeting water quality standards is virtually upon us, and unless we can increase the annual Federal commitment to the $5 billion level, then EPA's own inventory of EPA responsibilities, which come to about $30 billion in recognized problems, $5 billion a year would be a minimum to get close to it in 1988.

We don't feel it can start in 1985 because these are large, slow moving public works projects in many cases, and if you start in 1985 and 1986 there is no way you're going to make it by 1988.

Five billion dollars a year starting as quickly as possible is a minimum commitment to achieve accepted obligations.

Our recommendation, we feel, is consistent with the amendments to the Clean Water Act proposed by Chairman Howard in H.R. 3282. That would authorize $4 billion for 1984 which we feel is barely enough; $4.5 billion for fiscal year 1985; and $5 billion for fiscal year 1986 through 1988.

And we hope it can at least do that.

We are also saying that you might look at the degree to which the States have been focusing their efforts in commiting the funds allocated to them in an expeditious manner to meet these deadlines.

We feel that section 216 responsibilities may not have provided enough focus; you may want to examine that.

We also feel that you may want to look at the problem of directly providing Federal funds to some local problems. I think this could supplement the State efforts, provide a better focus in some cases than the States may provide, because these are often interstate waters, or the State may not have enough to devote to the problems that are most critical on a national basis.

Finally, I would like to say that we're very worried about the enforcement actions as well as the quality of the water. And we feel that therefore, the Congress should recognize that unless the funding is greatly increased, EPA is going to move into some enforcement actions, or Congress is going to have to withdraw EPA's powers and commitments to the improvements that we have all accepted.

We don't want to get into a position of having to urge postponement of those deadlines or removing of those commitments, and yet in terms of our financial capacity and the increased burdens that are involved in trying to come anywhere near these deadlines, we feel that would inevitably grow out of a failure to commit more funds this year to the needs that we all have.

Let me say also that postponement means dying rivers, lakes and of special concern to us in this area, a dying bay. You must have seen some of the articles I've heard mention today concerning the situation in Chesapeake Bay.

If we simply postpone these things, the bay is going to die. It's in critical condition in many areas already as you have no doubt read, where the fish habitat is getting lost, the fish population is getting lost, and a very important national natural resource is in deep trouble. And postponement can only bring it past the point of no return for a long, hard restoration process.

Now, I've emphasized very much the sewage treatment plant grant program. I don't want to imply in that that they are the only source of the problem. In Chesapeake Bay it is by no means the only problem.

But I have emphasized this because it is an ongoing program, a commitment, and we're faced with enforcement actions if we don't enlarge that program, that whole business of the commitments and the construction schedules are going to be hopelessly lost.

But we certainly do support greater effort on the nonpoint source program.

The immense studies which EPA and others have gone into on Chesapeake Bay in the past half dozen years have indicated that nonpoint sources are probably a majority of the problem. They're by no means all, but we have certainly got to work on both areas of the problem if we are to achieve water quality goals and, indeed, save the bay from a sad state of decay.

I guess that's enough summary. Thank you very much for all you're doing on these problems.

Mr: ROE. Mr. Rockenstein?

Mr. ROCKENSTEIN. Thank you, Mr. Chairman. I am Walter Rockenstein, a council member from Minneapolis, Minn., testifying on behalf of the National League and the 15,000 cities it represents.

I, too, am going to summarize my written statement, and thank you for the opportunity to have that in the record in its entirety.

I would like to first summarize the league's general position on the act and then comment on specific provisions.

First: We don't think that there can be any question that the Clean Water Act has resulted in significant improvements in water quality and public health.

Second: We want to underscore the importance of uniform and enforceable national clean water standards.

Third: We believe that the cost of compliance with the act, while large, represents a very cost effective investment in the Nation's future.

I will now turn to the specific provisions of the act which we believe should be considered for provision.

First: Funding for the construction grants program. As you are well aware, and in fact as the previous witness has pointed out, the funding for this program has been reduced by some 50 percent since 1978. Further and more damaging, the Federal share of construction costs for publicly owned treatment works will drop from 75 percent to 55 percent beginning in fiscal year 1985.

We continue to oppose these changes. The ability of municipalities to comply with any clean water program is contingent upon adequate funds for building treatment facilities. We support Mr. Howard's proposal which recognizes this relationship by providing for increased funding for this vital program.

We recognize the budget constraints facing the Federal Government. Those same constraints exist at the State and local level as well. If Federal funds are not available to support the requirements and objectives of the act, then timetables for meeting these requirements should be extended substantially.

We also believe that cities must be encouraged to proceed toward water quality objectives regardless of the current status of Federal funding. Therefore, to encourage municipal self-help, cities that prefinance water pollution control programs must be assured priority for reimbursement of the local funds advanced.

Turning to our second specific position, the National League of Cities believes that Congress should authorize EPA to establish pretreatment standards only for those industries EPA has classified as major polluters and only for those classes of toxic pollutants which are known to be widespread which may be causing human health and aquatic life problems.

Concurrently, EPA should have the authority to exempt from the pretreatment program those POTW's that can demonstrate that they are not interfering with the designated use of the receiving water.

However, such local standards should not become a loophole for avoiding national requirements. Therefore, any such amendments should require, 1, compliance with the national pollutant discharge elimination system conditions; 2, development and implementation of local standards that are, in the aggregate, equivalent to national standards; and 3, the maintenance of an adequate local monitoring and reporting program to protect the receiving waters.

On the specific issue of nonpoint source pollution, the National League believes Congress and the administration should proceed expeditiously through expanded research and development, technical and managerial assistance and funding, to aid the efforts of local and State governments in the control of nonpoint sources of water pollution.

In addition, section 201 of the act should provide for the funding of localized nonpoint source abatement measures identified as priorities, in approved and certified 208 plans.

Turning to the Federal common law in the act, frankly, the interaction of Federal common law and the Clean Water Act remains a confusing legal tangle for most municipal officials.

Last year, we tried to step away from this and review the issue from the perspective of the injured party and the injuring party. We ended concluding that no municipality injured by a willfull or negligent violation of Federal or State law should be deprived of a remedy if one exists under the Federal Water Pollution Control Act or other appropriate laws, and that further, where the violator presents as a defense acting "in good faith" or in compliance with EPA or State permits, that the injured municipality should be able to make the EPA a party in any lawsuit it should choose to bring under the act or under Federal common law.

On the issue of toxic sludge, the League of Cities is only now in the process of developing a detailed policy on the use and disposal of toxic sludge. Our current policy calls for EPA to support research on the problems arising from the management of waste water treatment facilities in general.

We also believe innovative and alternative treatment technologies have not been used to their fullest potential, and that Federal research, development and public education concerning these technologies should be expanded.

On the water quality standards issue, the NLC Energy Environment and Natural Resources Steering Committee is recommending to the National League a policy that parallels the provisions of H.R. 3282; namely, the steering committee is recommending that we prohibit States from downgrading or revising standards where designated uses have been attained, permitting a revision of the standards of the State can demonstrate that the existing designation is unattainable because of natural background, irretrievable man-induced conditions, or third, because attainment of the designated use would result in substantial and widespread adverse economic and social impact.

We hope these suggestions would speed attainment of the Clean Water Act's important goals. Again, I appreciate the opportunity to present the National League's views before the committee.

Mr. ROE. Mr. Sampson.

Mr. SAMPSON. Thank you, Mr. Chairman.

My testimony will be around agriculture nonpoint sources, H.R. 4037.

Rather than read my statement or summarize it, I would like to digress from the written statement and talk about some issues that have come up in front of the committee today.

It seems to me that in the agricultural nonpoint area, how one perceives the problem will dictate how one perceives the approach to solution.

If, as we've done under other aspects of this law in the past, we perceive the problem as one of being a clientele in the States, local agencies, and the agriculture community that is reluctant to move ahead, then you move one way. If, on the other hand, you perceive that there is a tremendous desire built up out in the countryside to get at the implementation of some of the clean water practices that have been identified over 10 years, then obviously you can use another tool.

I'm here today to tell you that we perceive the issue in the latter fashion. We find a great deal of desire in rural American to get on with the water quality projects that have been identified in 10 years of looking at this issue.

In 44 States, as the appendix to our testimony shows, there is some activity going on. It's funded from a variety of sources. It exists in a variety of forms.

But this is a tremendous amount of activity, it seems to me, in the face of a lackadaisical, almost nonexistent push from the Federal Government in the last 3 to 4 years on this issue.

I think that speaks to another question. It's my understanding that Mr. Ruckelshaus has exhibited some reluctance about including cost-share as a part of this program on the basis that anticipation of some cost-share would essentially cause people to stop and wait until the funds became available.

A look at the record argues against that. In 1977 this committee put section 208(j) in the Clean Water Act, which promised cost-sharing for the installation of agricultural nonpoint source control

practices across this country. The appropriations process did not agree, and to this point we've had no funds for this program.

But tremendous activity is under way in conservation districts, local municipalities, counties, agricultural organizations, and other organizations to address nonpoint source implementation in the last few years, and this has happened in spite of the fact that that anticipation for cost-sharing was there, and was never met.

So the existence of cost-share promises, and the fact that there's never enough money to go around, and that somebody's always waiting, has not, slowed this up.

As to whether or not there needs to be cost-sharing, I think the record is fairly clear. The localities and the States that have been moving ahead have almost universally seen the need for some cost-sharing as a part of this.

But, we don't have to buy rural America. The amounts of money are not staggering. It is unfortunate that we have people saying that if we were to start from zero and put everything on the land that was needed that we would need multibillion-dollar commitments. That may be true if you decide to operate that way, but you don't have to operate that way.

Right now, we have demonstration projects funded in the range of $50,000 for an entire county that are making significant impacts on water quality. These projects are encouraging such things as conservation tillage, better management practices on the part of agricultural producers, and some specific water cleanup efforts that need to be made after other good management has been applied.

There's a very important point to be made here. If there were not an active soil conservation program in this country you couldn't afford nonpoint source pollution control no matter how you went about it.

Nonpoint source pollution control has to piggyback onto a good active soil conservation program. By the same token, let's be very honest about something. A good soil conservation program that deals with agricultural productivity and soil erosion may not do enough for water quality. It may not do the right things for water quality and it may not do enough.

So it takes both. It takes a good active soil conservation program, but it also takes an emphasis on water quality. So it seems appropriate for the Clean Water Act, through EPA, and through State water quality agencies, to give that last impetus to communities, conservation districts, and counties, to tack water quality practices on the top of their other good management programs.

Mr. Chairman, there was one other issue that came up and this was the nonpoint source versus point source debate.

In my personal judgment, that issue cannot be decided on the basis of whether or not you can find the source of pollution. Clearly we can locate nonpoint sources, and we can both measure their degree of contribution to water problems and identify what needs to be done to alleviate or prevent them.

The difference is whether that is a pollution source that is in its essence most likely to be best handled by treatment or most likely to be best handled by prevention.

Nonpoint sources, as we find them, are almost always best handled by preventive methods. We simply can't regulate the wind and the rain and the activities of all those people out there.

We have to educate and provide the incentives so those people will apply the kind of preventive conservation management that gives us the best chance to keep high quality water as one of the parameters in the rural environment.

We appreciate the chance to come here. We appreciate all the work that you've done, and we strongly support H.R. 4037. We've listed two or three specific points for possible charges that we would bring to your attention. We thank you for that opportunity.

Mr. ROE. I want to thank you all for your testimony and again I regret that we didn't have enough time to go into more depth.

It's ironic in a way, because Mr. Sampson, when you speak of the soil conservation, that has a connotation of rural. Mr. Potter and Mr. Rockenstein are speaking to the issues of the urban. So the urban runoff has specific relationships that we've discussed with other witnesses.

What do you think about the idea where States have been making advances under the 208 work and were able to break down in what was previously considered to be nonpoint sources. They have been able to identify where they in effect had a conversion into a point source. What do you think about the idea of making them eligible under the basic program? Giving the States more latitude in that direction?

I would consider those primarily to be hot spots that could be cleaned up.

Mr. SAMPSON. That's been a pretty difficult issue. You may recall some of the earlier problems we had over irrigation waters, whether they were a point or a nonpoint source.

The problem arises because of the preventive versus the treatable thing.

Mr. ROE. But we have both to deal with.

Mr. SAMPSON. Absolutely. I have a feeling, though, that given the 10 year or more history on those issues with the agricultural and forestry communities, there would be a great deal of uneasiness about the ability for a State to sort of arbitrarily start grouping what were formerly nonpoint source pollution sources. If they could find enough of them in one place or group them in some way, and then say, they're a point source that come under the permit system or another regulatory program, our people would object.

Mr. ROE. No, we're trying to break new grounds. There are one or two directions to take on this bill. We can either fool the American people and make the extension for 2 years and add a lot of other jibberish and so forth and so on. Money is the issue that Mr. Potter spoke to. If we get enough money in there we'll be able to get the job done. That's one approach.

But we know from a factual point of view that unless we make some substantive readjustments along the line, we're not going to clear up the pollution. We know that's so.

When we talked about the Chesapeake Bay issue earlier and went through that, we know that unless you deal with that nonpoint source issue, it's not going to clear up the Chesapeake Bay. It's that simple.

20-955 O—84——188

So therefore, we can isolate, we can come and say let's do more research and study. We spend $35 million on that bay and now we've got a special tack-on to the legislation for Naragansett Bay because Senators are powerful in those areas, and whatever. That is not going to solve the problem.

What I'm trying to come back and do, for example, and I don't want to take all of your time, but we know that in the city of Patterson which is in my district—I know it like the back of my hand and every alley and bypass that exists in that city, and 99 percent of the people—that unless you eliminate the combined sewers we are wasting our money.

Now, for some reason that's a hangup to people in the Senate. And for that matter, some people in our own area, in the House.

But we know that that's a thing that ought to be decided by that city and ought to be decided by that county and ought to be decided by that State. Because that is not an indigenous thing throughout the Nation; it is peculiar to older cities. They were built that way.

So I fight vehemently and vigorously and intend to do all I can to see that Washington gets out of the way of that issue and says to New Jersey and the cities, Boston, and Massachusetts, and so forth, if that is part of your nonsource problem, then you have the right to deal with that and correct it as part of a system. Because that's what it is.

But if we say the same thing, now, when we developed to the water resources development bill, some members from West Virginia came in and said well we ought to be considering cleaning up of the acid mine sites as part of a public water resources project.

They're not all wrong, just as much as somebody comes in from California or Florida, and says, we have a flood control program. We built on the flood plain, the whole bit. This litany goes on and on and on.

And then we try to discern and some of the members here, including myself, got a little bit annoyed with that issue. We said well why should, after a private enterprise has come in and has exploited the country, exploited the lands. They're strip mined or they went into their—you know, took out all their coal and so forth, then left the scarred Earth for the rest of the population to clean up. They took the profits out of it.

But when we're done with all that emotion, that doesn't solve the problem. So therefore I have to admit to you that I have tempered my emotion on that issue. I'm trying to get at a point that if we can identify in the rural relationship of mine tailings and if we can identify that within an agricultural area there's been some mining that's gone on and there are some point source. If we know that its point source, and we know that we've got a problem emanating from that area, would it be so wrong for us to have States under the 208 program identify those particular items as hot spots, and contributing more than 1,000 acres of farmland? And could we not treat them under the grant program?

If we go back—and then we're treating both urban and rural issues, getting some kind of a balance.

Mr. SAMPSON. If I could, I think what you have done is define the question in a way that I can't argue with. My home State of Idaho, for instance, passed legislation to allow rural nonpoint projects to

compete against urban point source projects for the State construction grants program, and they've now put $7 million into rural nonpoint source projects by simply making them eligible to compete.

Mr. ROE. Has EPA approved that?

Mr. SAMPSON. That's State raised money.

Mr. ROE. Not Federal money?

Mr. SAMPSON. It's State money. It's the way they've treated their State money.

Mr. ROE. If the gentleman would yield. Are you saying that that is the grant money going into Idaho?

Mr. SAMPSON. It's the State's portion.

Mr. ROE. The Federal portion of the State's grant money?

Mr. SAMPSON. It's the State's portion.

Mr. ROE. But it's Federal money?

Mr. SAMPSON. It's State match money. It's the State appropriated money that matches the Federal grant.

Mr ROE. That came out of the State money.

Mr. SAMPSON. Yes.

Mr. ROE. So it's not Federal money yet.

Mr. SAMPSON. Not yet, but there's no reason why it couldn't be. What you said is that you've given them the latitude to treat it under a different portion of the program; not that you've redefined a certain pollution area from nonpoint to point, which is what I thought you said to start with.

Mr. ROE. No, no, no. I'm saying by having followed what they have been talking about in Wisconsin and other witnesses, they have advanced their work in the 208 area. They have determined now that yes, we can identify 3 or 4 or half a dozen or 10 items within that nonpoint source universe, that yes, are point sources. Why should they not be eligible?

And you're coming back and saying the State of Idaho has recognized that and has used some of their State money in turn.

Let me ask another question. Anybody who wants to answer may. We're talking about what happens, and a lot of the testimony has come through from Mr. Ruckelshaus and citizens and groupings, when the Federal Government gets into the act, vis a vis the financing aspect of it. That is a deterrent to the program, in their observation, because people then wait and say well, we're waiting for ourselves to come up on the priority list. We're waiting for the Federal money before we move ahead.

There is nothing in the law—albeit the point of view that the 75 percent grant, the 60, and then the governors can establish a uniform 55 percent—that mandates that the States have to put up a representative share of the money.

That could all come from local. Some States don't have, as I understand it, any State program. Should we be coming back and either providing a bonus or something of that nature for States that implement and provide State money for matching money back to their counties and their cities?

Mr. POTTER. I think that could be helpful. I think that the States have generally opted out of this, although my own State of Maryland has provided good matching funds.

Mr. ROE. My State, too.

Mr. POTTER. I think when the percentages are as low as in the case of the Federal Government, 55 percent next year, that the incentive for waiting, particularly when we're faced with these near deadlines of compliance, is not very great.

I think that there are two responses that the legislation might make to deal with the problem of waiting. One is to require that funds be committed quickly and the other is cut the eligibility list but provide for repayment where advance commitments are made. I think one of the previous witnesses has mentioned that that could only be fair, and it would diminish the incentive to wait.

Mr. ROE. I didn't miss that point in your testimony. You see, there's a section in the law that provides for that now, but regrettably the Appropriations Committee would never allow it to be implemented.

In other words, we recognize that. We said, well why deter the States or cities from moving ahead? If they want to put up advance money on a commitment, covenant, somebody used the word, and advance some money and then pay them back over a period of time.

Well, the Appropriations Committee has never funded that, which is regrettable.

Mr. POTTER. It's most unfortunate, and that does encourage waiting for the Federal funds.

Mr. ROE. And you made a very telling point in the point of how much can the average citizen bear as far as sewer charges are concerned.

For some of our senior citizens' developments and so forth, the charges have gone to seven and eight hundred dollars a year. There's no way on social security they can pay that.

Mr. POTTER. And where you go to tertiary treatment standards in a small plant, as I said, it can increase the rates about ten fold, and very few people can afford it.

Mr. ROE. The gentleman from Minnesota.

Mr. ROCKENSTEIN. Mr. Chairman, I was going to say since we had already mentioned it in our testimony that the guarantee of repayment would be, I think, of considerable importance. And it is unfortunate that has never been funded.

The other problem that I think is affecting many of the cities, is whether those that had covenanted and gone ahead would be protected from the reduction of 75 to 55 percent?

If in the future that might go to 45 percent, why would you covenant and set up your bond schedules and all of that, and then have that percentage adjusted on you.

Mr. ROE. I don't fault you at all, sir. Having been a mayor of a community and headed up a county government, I know precisely what you speak to.

Regrettably, the attitude around here is, and this is no effrontery to our members, that quote unquote, no legislature can commit itself beyond its life. That's the general attitude.

Now, I don't know how anyone can make a covenant, looking down the future, and have we broken faith with the American people? Here was a dream to get to the Moon, but we put up the money to get there. But here is a dream to clean up our water

supply so it's safe for the people of the Nation—literally 90 percent of our bodies of water.

If I were king, I would ordain this tomorrow morning, and it would be done as the top priority of the Nation. But somehow we have to use all of the best brains we've got in this country, including yours, and say how do we build up that understanding in the Congress.

Let me say this, and pardon my emotion involved here. Every Member of this House is up for election next year and a third of the Senate. And one ought to come back and say to one's Representative, well, where do our priorities truly lie?

You understand what I'm trying to get at? That's something you can carry back home to your folks and say to your representatives, hey, look, we think—Mr. Sampson made that point in part, obliquely in a different way. You said that from your experience out in the field, you've been finding that the American people are saying to you what can we do? Let's get on with it. We want to do something about that.

The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman. I have a question for all of the members of the panel to respond to. The Administrator of EPA expressed concern that an incentive program of grants or other funding for nonpoint control might act as a disincentive to voluntary action. Folks would be more prone to get in line for the dollars and not act unless they got their share.

Would you please give us your perception of that problem and how it could best be dealt with? Or do you see it as a problem?

Mr. ROCKENSTEIN. Mr. Stangeland, I think that will very much depend, frankly, on the circumstances of a given city, because cities do have nonpoint source pollution problems.

I can think of Minneapolis where we have several of our lakes wholly within the city which are subject to nonpoint source pollution problems: the stormwater, drain runoff from our streets.

While we would dearly like to have Federal dollars to help us with that, they have not been available and we have proceeded.

We have programs underway. I don't think we are at this point simply going to cut those programs off if you provide some Federal incentive money.

We may at the time that it's appropriate take an additional step that we wouldn't otherwise have been able to fund, but we're certainly not going to step back from the steps that we've taken so far.

Those lakes in our city are too important to us. Over the last 20 years in our city, we've going so far as to separate our entire sewer system. We're 85 percent separated, in order to get at the problem of combined sewer outflow. Now, that's partly smart for us because then we don't have to treat all that water at the treatment plant. But it's creating a nonpoint source of pollution for the river, for the Mississippi River, which we will eventually have to deal with.

We are now looking at how do we deal with that nonpoint source of pollution. We are not going to stop because the Federal Government puts incentives out.

I guess I concur with the other witness. People want clean water. They are driving their representatives at the local level to clean

water. Simply because you offer a Federal incentive, I don't believe, we'll stop that drive for clean water. It may cause us to do different or better things because there are more funds, but it's not going to stop the drive for clean water, at least not in Minnesota. I think you would be very well aware of that.

Mr. POTTER. Let me add that. I agree with that, but I think it depends on the situation. In the case of the Chesapeake Bay, I think there's no question that Maryland feels the situation is so acute it must proceed. You perhaps have seen some of the Governor's statements. We'll have to have an increase in income tax to deal wtih this, among other problems.

But we're not as sure that Pennsylvania, for example, that doesn't have the problem internally, but is contributing to the problem enormously, would necessarily move ahead on that problem, and I think it probably has to be combined, not only the Federal commitment to some funding, but to some standards, that there has to be a program, as there is on the treatment plants to get on with the job for those who don't have the incentive on their doorstep.

Mr. SAMPSON. I testified earlier that you did in fact pass section 208(j) of this act in 1977 which did promise funding. That funding never materialized, and yet the tremendous activity we see around rural American today in terms of agricultural nonpoint sources has developed in the face of unmet anticipations.

So it seems to me that that record indicates that there is a desire and a commitment to move ahead.

From an agricultural nonpoint source point of view, I worry about people who think we're going to have to spend tremendous amounts of money in rural America. I think some money is absolutely necessary, and certainly some Federal incentive and policy priority is necessary.

We've got conservation districts running conservation tillage demonstration programs in your State and others today that are finding that farmers are perfectly willing to go ahead if they're given a chance to cut the risk of conversion by having some of the specialized machinery to rent, by having some of the real technical questions answered and available, and by having the encouragement that it takes to get into a new technology.

And we're finding runoff rates on those fields dropping 90 to 95 percent with commensurate drops in soil erosion and therefore the pollution that's associated with that soil movement. That's happening, not because we have all that much money to spend, but because it is good business. It's good business on the farm; it's good business in the community, and the fact that we're showing people that it's good business is having a salutory effect.

I don't want to pretend we can clean up every problem with demonstration projects. We truely can't. But we can make tremendous amounts of gains. Some cost sharing will be positive help. We'll never have enough money to do everything, no matter how big the appropriation. And I don't think that fact is going to be any deterrent to progress.

I think Mr. Ruckelshaus is wrong, in other words, on that assessment.

Mr. STANGELAND. Mr. Sampson, I would ask the same of you that I asked of the head of the Soil Conservation Service. Would you analyze the ACP programs, to determine how they could be better used towards conservation as opposed to production. A lot of ACP programs have been geared to production rather than conservation.

And perhaps you could give us your analysis in writing at a later time of some programs we might think about that could better utilize ACP moneys to be a more effective incentive to encourage farmers to participate in a program that will reduce nonpoint source pollution.

Mr. SAMPSON. I would be happy to provide that.

[Subsequently, the following was received from Mr. Sampson:]

NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS,
Washington, D.C. November 18, 1983.

Hon. ROBERT A. ROE,
Chairman, Water Resources Subcommittee, House Committee on Public Works and Transportation, Rayburn House Office Building, Washington, D.C.

DEAR CHAIRMAN ROE: At the hearing on November 16 relative to the Clean Water Act Amendments, we were asked to respond in writing to two questions.

First, we were asked for our ideas on how the regulation preparation process at EPA could be accelerated. This is a difficult question. One process which we have found to be helpful with other agencies is to hold open meetings with interested parties early in the preparation process way ahead of the publication for public comment. This gets outside input into the process early and allows an opportunity to resolve controversial issues ahead of time on a cooperative basis rather than on an adversarial basis. The process helps to preclude the possibility of the regulation writers working in a vacuum.

An important part of the regulatory process is the public comment period. We find that this period should be at least two months in length.

The second question posed to us was our thoughts of how the Agricultural Conservation Program (ACP) could be changed so that it would be more helpful in addressing agricultural nonpoint source problems.

As background, we would remind you that the ACP has already been significantly changed over the last decade to address nonpoint source problems. Five of the 26 practices in the national handbook are now designed for specific water quality benefits. These are either entirely new practices or re-designed conventional practices.

Additionally, it is estimated for fiscal year 1981 that 37 percent of ACP funds went into these five water quality practices. Many of the conventional ACP practices have water quality practices. Many of the conventional ACP practices have water quality benefits. For a program originally designed as an erosion control cost-sharing program, it appears that the shift to water quality purpose has already been significant.

Many of the ACP practices have been primarily improved management practices which are cost-shared at a very low rate as an encouragment to adoption for a few years. Once these management practices are fairly well accepted by farmers, the practice is dropped from the cost-share program and other priorities are addressed. This approach has been very successful with practices such as conservation tillage.

The real problem with ACP has been the funding. The appropriation has remained at $190 million for more than a decade. Therefore, the buying power of the program, and thus effectiveness, has suffered.

We hope this letter is responsive to the questions presented at the hearing.

Sincerely,

NEIL SAMPSON, *Executive Vice President.*

Mr. STANGELAND. Mr. Rockenstein, to what extent is nonpoint source pollution a problem in the cities, compared to point source pollution, in your estimation or in your experience in the Twin Cities?

Mr. ROCKENSTEIN. Representative Stangeland, I think it is the experience of our committee and members of our committee that the more pressing problem for most of us is the point source and that's because of the necessity to build the publicly owned treat-

ment works to separate sewers where they are combined. Those are clearly more expensive and more of a drain on our budget even with the 25 percent match than would be attacking the nonpoint source pollution problem.

But as we get better at that we're going to leave behind the nonpoint source pollution problem which cities will have to address. In Minneapolis-St. Paul we've got a good treatment works. We are—at least in our city—we're 85 percent separated, and as we finish our repaving projects, we'll complete that separation, and then we will be faced with the nonpoint source problem.

But in terms of immediacy and cost, it is point sources that are the most concern to cities.

Mr. STANGELAND. Minneapolis and St. Paul is a joint metropolitan sewer district?

Mr. ROCKENSTEIN. It's a seven county metropolitan sewer district with headquarters in St. Paul.

Mr. STANGELAND. We were questioning that yesterday when AMSA was testifying because we saw St. Paul listed but not Minneapolis, and I said I sure that was a combined situation.

Mr. ROCKENSTEIN. Yes, it's the Metropolitan Waste Control Commission, which is headquartered in St. Paul.

Mr. STANGELAND. I have no other questions for this panel. I just want to say that I'm sorry that I couldn't be here. I had to testify before another committee on Indian land claim matters, Mr. Rockenstein.

I just want to say that Mr. Rockenstein has been an extremely highly respected member of the Minneapolis City Council, recently retired.

Mr. ROCKENSTEIN. In December.

Mr. STANGELAND. Not retired; he will retire. And let me say that the Minneapolis Tribune is not disposed to speak highly of too many Republicans. But they did very much express concern at the loss of Mr. Rockenstein's expertise on that city council and his willingness to work with the majority in forming coalitions for the betterment of Minneapolis.

Mr. ROE. Are you becoming a Democrat now? [Laughter.]

Mr. ROCKENSTEIN. Mr. Chairman, no. I am returning to a more private approach to life.

Mr. STANGELAND. I thank the panel, and thank you, Mr. Chairman.

Mr. ROE. The gentleman from Minnesota.

Mr. OBERSTAR. Thank you, Mr. Chairman

I don't know whether Mr. Rockenstein is going to switch his party, but we do want to have people of his caliber on the other side. He's been a very well respected member of the Minneapolis City Council and has made a splendid contribution. He has great respect in the community and his testimony today is ample evidence of why he has had and enjoys such respect.

Congressman Martin Sabo asked to be remembered to you this afternoon. He is committed in the work of the Appropriations Committee this afternoon. He would have been here himself to welcome you.

Indeed, all of the testimony of all members of the panel is splendid, and I do want to thank you all for the very considerable effort that went into the preparation of your presentations.

In particular, the statement of Mr. Sampson dealing with the nonpoint source legislation, I found very enlightening. I think you made some good contributions and suggestions about particularly the timeframe for submission of the State plan.

You suggest on page 3 that EPA might not be able to have regulations prepared in 6 months or less. That's true, if they build a mountain out of a molehill. What we ideally would like to see is a streamlined body of regulations that wouldn't take very long to publish. I mean, it just seems to me that EPA ought not to be there and massage the paper over 6 months. I mean, they can shuffle it a little bit, but they needn't massage it.

Do you have some suggestions on how we might lighten the burden for the agency and make sure that they don't take an eternity to produce something that is workable? They ought to be able to write a simple declarative English sentence in less than 6 months.

Mr. SAMPSON. I'm afraid that therein lines the difference between hope and expectations on that matter. I'm mindful of the story that was told in the Safe Water Drinking Act, which, if memory serves me right, was something between one and two pages long. The first draft of regulations that hit Russ Train's desk was said to be 13 inches thick.

I certainly hope we don't have to go through that again. We certainly pledge our effort as a private organization to push for simple, straightforward, and very quick regulations.

But unfortunately, the wheels grind slowly, and 9 months from the date of passage of an act seems to slip away from us very quickly. That was the point I was making.

Mr. OBERSTAR. I have made a point in my opening statement, and throughout the development of the legislation to be mindful of the numerous deadlines set in the 1972 act, none of which were met, and not to be unrealistic about deadlines with respect to the NPS program that we want to get going, and since this is to be an implementation program, we would certainly like to get it off to an early start and get moving with it.

So, it seemed to me we're building on a history of experience. Whereas with the 1972 act much of what was being done or asked to be done was plowing of new ground, we won't be in that position with the nonpoint source program.

Mr. SAMPSON. If I could make a point, sir, your 9 month deadline, or whatever deadline, whether it be 9, 12 or 18, does not in fact, limit the more progressive States from coming before the EPA with a program. It simply is a cutoff for those who are less ready to get there.

That is tied to your funding proposal, which I find very constructive, because it does not wait until the last application is in to figure some sort of a sharing formula.

Rather, the funding, by its very nature, is an incentive for people to get on with it quickly, to be first in, to make an application and to move forward.

So all I'm basically saying is I think you need to look at deadlines, not in a way that would slow up the speeders, but in a way that allows more good programs to meet the cutoff. I just fear, from a practical point of view, that too many good State programs couldn't make it in under that short a wire.

Mr. OBERSTAR. That's a very good cautionary statement, and your suggestion of a longer timeframe, nonetheless, would not have the effect of dragging the process out. That is, States who are ready would be encouraged, because funds would be made available sooner, to come in at an earlier date.

Mr. SAMPSON. That would be the intent.

Mr. OBERSTAR. I didn't have any other questions. I just wanted to explore that. If you have some thoughts about how we might, by legislative language, tighten up this matter of regulation writing by the agency, I would certainly welcome your thoughts; how we might reduce the margin-for-error part of overzealous administrators.

I am very mindful, as is our subcommittee chairman, of that four line passage in 92-500 which EPA, exceeding the miracle of the loaves and fishes miraculously transformed into 36 pages in the Federal Register.

Mr. ROE. I remember that.

Mr. OBERSTAR. Yes.

Mr. ROE. The gentleman from California.

Mr. PACKARD. I come out of local government and I don't have very many opportunities to talk to men and women in local government that struggle with the same problems that we did for a long time, and I would like to ask two or three questions that relate to what local government is doing or can do to help alleviate the problem.

I sense that there has been a long-term attitude of looking to the Federal Government for solutions to these major water quality and other pollution problems. At the same time, cities are often pitted against each other and blame each other for the problems that they struggle with in their common body of water.

Really, one city's point pollution is another city's nonpoint pollution in many cases, and in my own case, I saw where we had a serious problem in one of our lagoons with a river running, or a creek running into it, and all the cities along that river stream became a part of the problem.

Yet, because the lagoon was in my city where I was serving as the mayor, it was our problem. And when we look to the other cities, of course, they did not feel that they had responsibility.

Until cities and counties begin to look to themselves to organize and to establish a program of solving some of their problems, I think that we're going to constantly be struggling with the problem.

And if they constantly look to the Federal Government to solve that major problem without any effort on their own, I think that it will be a disservice to the whole system.

Do you feel that options like associations of Governments or joint powers agreements established by and among groups of cities are being utilized adequately in order to help solve local problems with local organizations?

I'll ask Mr. Potter.

Mr. POTTER. We've had a good deal of that experience here in the Washington metropolitan area. The Council of Governments, of course, covers 18 local jurisdictions, I think it is, in three States, if you count the District of Columbia as a State.

And we have a weighted system of voting, and we'll take votes, but the decisions are only advisory. They have no governmental powers. There has been a great deal of resistance to metropolitan government.

Therefore, we have not been able to more than develop cooperative arrangements which sometimes work out but frequently do not when the cost or commitment is pretty heavy, especially on one or two members of that group.

In the case of water pollution control, it wouldn't work at all anyway because the sources of pollution are, as I indicated, for Chesapeake Bay or even the Potomac River, several States, and totally beyond the jurisdiction of the Council of Governments.

Now, we do have interstate compacts, but they don't yet involve all the States that are involved in the Chesapeake Bay.

So many of these things really are interstate problems, that even the Founding Fathers recognized the Federal Government has to have a function here.

Now, the National Association of Counties has long since tried to deal with the problem of overpayment, overcommitment by the Federal Government by saying the Federal commitment does not have to be to growth; initially the grants were made to cover expanded plants to deal with the growth of cities or counties. And we said take that out of it, and focus on the pollution problems where we have recognized a national problem, we've decided to clean up rivers that everybody's been relying on. And that is where we felt the Federal Government could properly provide a majority of the payments.

We were perfectly willing to take out that very advantageous money that was spent on expanding plants, and we feel that we have accepted our local responsibility in that respect, and hope the Federal Government will deal with the interstate pollution problems along with us.

Mr. PACKARD. Of course you're dealing with a lot different circumstance than the average community is dealing with when you're talking about this metropolitan area that does cover several States.

Mr. POTTER. Many are interstate, though.

Mr. PACKARD. Many of the problems are, and they, I recognize, would need to be dealt with at a different level.

But it would appear to be that cities, as they struggle with each other say within one county, they often become quite parochial in their own set of problems at the expense of solutions to the problem.

And I think that's what generated a lot of our environmental groups that out of default have felt that no one is really going to tackle the problem, so they get very much aroused and finally almost become as it were enemies to the cities when in fact they weren't intending to do that, but simply they have tried to find a

solution to the problem of parochial cities not being willing to work together to find a joint solution.

I probably come from a different background geographically than what we see right here in this area, or even in the Minneapolis area. Mine is more of a rural community or a rural county, but nevertheless we found that it became necessary to impose user fees, a portion of which were to be earmarked for new construction or future needs.

Is that being done adequately, do you think, in local jurisdictions? Both counties and local cities? I am speaking of user fees particularly on new development, whereby the new development helps pay for future needs as well as current operating needs?

Mr. ROCKENSTEIN. Mr. Chairman and Representative Packard, I would like to address both of those, I think, from the perspective of the National League.

If I can step back for a moment, the reason that the National League has been a consistent supporter of national standards is in an effort to get the local governments, and in fact local governments and States, if you will, to work out within their own intergovernmental processes a way to meet those standards.

You should have a national standard and then leave the State and local governments the flexibility to work that out where it is an intrastate problem. I think the appropriate role for the Federal Government is to make sure that the standards are met at the appropriate time.

Let State and local governments figure out the best way to organize themselves to do that.

The interstate problem is a different problem, and I can't speak to that as well as the intrastate problem. In Minneapolis-St. Paul, of course, we have one of the most elaborate, and I happen to think one of the most effective intrastate cooperative structures anyplace in the country.

We have a metropolitan council which has more than just advisory capacity. It has identified metropolitan systems and set down standards for those systems. The communities are expected to develop their land use plans and in those land use plans to acknowledge those metropolitan systems and to fit into them. Those include airport, sewer, transportation, hazardous waste, a whole host of systems. We have a separate metropolitan waste control commission which gathers up the particular problem that we're talking about. It has not only responsibility for the wastewater treatment but it has also run the 208 program for the whole 7-county area. There has been a great deal of metropolitan wide cooperation in our area.

And that is the way that Minnesota has chosen to approach the problem, to use a more metropolitan approach. We happen to think that has led to a more efficient and a more cost-effective answer.

I would hesitate, however, to say that that model should be imposed on some other State or some other region. Let them decide what they think is their most cost-efficient model. We believe ours has worked, and worked effectively.

There are a number of incentives, actually in both the Clean Water Act and in the Clean Air Act to foster intergovernmental cooperation and compacts.

I don't think all of those have been recognized by some local jurisdictions, but again the experience on our NLC committee is that most cities are involved in some type of intergovernmental cooperation with their neighbors on these problems.

It may be purely voluntary; it may be an association of governments; it may be something as formal as the metropolitan council, but there are very few who aren't involved in some way in a cooperative effort, either with their State or with another local government.

Mr. PACKARD. Even though they're involved in trying to solve their pollution problems, are they involved in the funding of those programs as strongly as they are in the other aspects of the program?

Mr. ROCKENSTEIN. Depending on the degree of the State match, for instance, in the grant program for publicly owned treatment facilities, it may be as high as 25 percent of local match if your own State does not provide any. In Minnesota the State does provide a portion of the match; but we provide a portion also.

In Minnesota, again I would give you the example of our Metropolitan Waste Control Commission, we not only pay a user fee which is given to the city which we then pass on to individual users on their water and sewer bills, but there is, going to your other question, there is a specific hookup charge for new development which is designed to carry most of the cost of new development.

So if a developer wishes to develop a parcel, and that parcel is in an area that is sewered under the plan for the metropolitan area, then he will be expected to pay those hookup charges for new development. Indeed, if the city of Minneapolis takes a parcel on which there are 15 units and we take down those 15 units, we are given a credit for having taken 15 units off the system.

But if we put back 45, we will have to pay for 45 units. Either we will have to pay for it, or the developer will have to pay for it. And they leave that up to us to decide with the developer.

So again, in our area, and I think in many other areas, we are trying to address the issue that my colleague spoke of, that growth is essentially our problem. If you look back on the changes that were made in the grants program, the league is concerned about the fact that you took out combined sewers and rehabilitation and inflow and infiltration, but it's not a part of our policy to say that you ought to put the growth incentives, or the growth match back in.

That, we believe, is a legitimate cost of local government and should be addressed by local government. And, at least in my State, and I know from experience with other people on our steering committee and other States, it is being addressed by differential charges in the areas where growth is occurring.

Mr. PACKARD. Thank you very much.

Mr. ROE. We want to thank you very much for your testimony. It's been most helpful to us.

Our next panel will be the American Paper Institute, National Forest Products Association, Mr. Dale McGreer, who is a forest hydrologist with the Potlatch Corp., and the National Audubon Soci-

ety, Ms. Hope M. Babcock, who is deputy counsel; and the Conservation Foundation, Dr. Edwin H. Clark, who is a senior associate.

The reason we're grouping you together is because we are concentrating in large measure today on the nonpoint source issue.

We want to welcome you all to our committee, and I know you've had a chance to listen to a lot of the testimony today.

We would appreciate your working summary to the points that you want to specifically make.

The full text of your prepared statement will appear in the record at this point.

[The statement referred to follows:]

STATEMENT FOR THE RECORD OF DALE MCGREER, FOREST HYDROLOGIST POTLATCH CORP.

I. INTRODUCTION

Good morning. I would like to thank Chairman Roe and the members of this Subcommittee for allowing me to testify this morning on behalf of the American Paper Institute and the National Forest Products Association (API/NFPA) with the respect to control of silviculture nonpoint sources of water pollution.

My name is Dale McGreer. I am a forest hydrologist employed by the Potlatch Corporation in Lewiston, Idaho. I also serve on the API/NFPA Nonpoint Water Quality Committee. API/NFPA are national trade associations representing over 2,000 member companies who own and manage forest lands and manufacture pulp, paper, and solid wood products. API/NFPA members have a direct interest in the effective implementation of nonpoint source pollution control programs.

For the past five years I have been involved in the development of nonpoint source control programs on a national basis for my company. In addition, I have coordinated our company's participation in the development of programs in Idaho, Arkansas, and Minnesota to address silviculture nonpoint source pollution under Section 208 of the 1972 Federal Water Pollution Control Act. From 1974 to 1979, I worked as a research scientist studying the relationships of watershed management to erosion, sedimentation, water temperature, and fisheries resources.

I have also participated in designing industry research programs on silviculture nonpoint source problems, working with the National Council of the Paper Industry for Air and Stream Improvement, Inc. (NCASI). NCASI is the environmental, technical studies arm of the forest products industry. Since 1977, NCASI has conducted industry-sponsored research projects on the water quality impacts of forest management activities, the effectiveness of improved management practices to control silviculture nonpoint source pollution, and the implementation of Federal and State silviculture nonpoint source control programs.

Much of the interest in the water quality impacts of forestry activities has been focused, in recent years, through the Clean Water Act's Section 208 program. Through Section 208 EPA fostered active programs in a number of States to: (1) assess the impacts of forestry activities on water quality; and (2) devise management practices and control programs, where necessary, to achieve water quality goals.

The results of State Section 208 planning efforts have shown considerable variation in programs from State to State. This variability makes it very difficult to draw any generalizations about the 176 areawide and 49 State Section 208 planning programs. However, based upon the data accumulated as a result of the Section 208 planning process, we believe that a general perspective of the water quality impacts associated with silviculture activities has been gained by EPA, the States, and the forest industry.

A summary of the impact of forestry activities on water quality was provided by the API/NFPA statement for the record at the Subcommittee's November 2 hearing. In addition, attached to this statement is NCASI's "1982 Review of the Literature on Forest Management Practices, Hydrology, and Water Quality Protection and Management." (Attachment 1).

The results of such surveys—based on existing water quality data (which in many cases are admittedly still incomplete)—suggest that silvicultural activities have not been considered a major, overall, nationwide water quality management issue. In most cases, sediment is considered the primary source of pollution from forestry activities. However, the 1978 study report of the Society of American Foresters' Clean Water Act Task Group indicates that sediment from forest lands is estimated to be

less than 4 percent of the total man-caused sediment in the Nation's waters. This is particularly significant considering that there are 718 million acres of forested land in the United States, constituting approximately one-third of the total land area.

In the balance of this statement, I will review our involvement in the Section 208 process with States that have been active with the silviculture category of nonpoint sources. The data base for this review is provided by NCASI's January 1983 report, "Summary of Silviculture Nonpoint Source Control Programs—1982." A copy of this NCASI report is also attached. (Attachment 2).

Through our review of State Section 208 programs, we have found three basic principles that appear common to the varied State efforts to address water quality problems from forestry activities. These principles include: (1) site-specific application of nonpoint source controls; (2) flexibility in developing control programs; and (3) utilization of existing expertise in nonpoint source control.

II. GENERAL PRINCIPLES FOR THE DEVELOPMENT OF STATE SECTION 208 PROGRAMS

A. Site-specific application of nonpoint source controls

Because of the variability in the nature and types of nonpoint source problems, efforts to address nonpoint source pollution have been focused at the State level. Control of nonpoint source pollution requires solutions that can be applied in a site-specific fashion. EPA's current regulations and guidance laudably recognize the need for this type of focus in the Section 208 program.

EPA's approach to developing Best Management Practices (BMP's) to protect water quality has fostered the concepts that: (1) States, as opposed to Federal agencies, determine whether a practice is indeed a BMP; (2) alternative practices must be examined; and (3) such practices must be technologically and economically practicable before they are adopted. EPA's approach has also supported the notion that the application of Best Management Practices must be tailored to site-specific conditions. BMP's have, therefore, varied from site to site depending on the nature of particular silvicultural activities and related potential water quality problems.

B. Flexibility in developing control programs

In addition to the need for site-specificity in the development of control practices, EPA has laudably provided the States with the option to implement a broad spectrum of control programs. We strongly support EPA's policy of providing the States with sufficient flexibility to consider a variety of alternative control programs for dealing with silviculture as well as other potential nonpoint sources of pollution. In the same way that specific silviculture practices (and any related nonpoint source pollution problems) vary from State to State, so have the control programs that the States are implementing.

For example, a number of States have developed programs emphasizing education of—and training programs for—landowners and forestry operators. This type of program is well adapted to many of the southern States because of the predominance of small, private, non-industrial landowners in these States. In the south, 70 percent of the forest land base is held by non-industrial landowners. The nonregulatory approach, with the subsequent utilization and improvement of existing extension, education, training, and incentive programs is the msot effective way to assure the implementation of Best Management Practices on the ground. In the south, particularly, this approach has proven successful in encouraging good forest management.

In other states, other types of approaches have been developed. The West Coast states have adopted state forest practice acts which are regulatory programs designed to control various aspects of forest management, including water quality impacts. In some of the northeastern states, licensing programs for forest operators and loggers have been implemented as a result of the Section 208 planning program. States should continue to be allowed to evaluate and utilize a wide variety of possible nonregulatory and regulatory programs for the control of nonpoint source pollution.

C. Utilization of Existing Expertise in Nonpoint Source Control

A final important element that has been recognized in the administration of nonpoint source control programs is the need for the application of technical and professional expertise in the development of BMP's and program implementation. The variability in silvicultural activities and potential nonpoint source water quality impacts has made the application of forestry expertise an essential part of the process.

In every state where we have an interest, we have encouraged the state forestry agency—the agency with silviculture expertise in the state—to take the lead in developing the silviculture portion of the Section 208 plan. In many cases, state forestry agencies have been chosen as the implementing agencies for the silviculture por-

tions of the Section 208 plans. Focusing the nonpoint source aspects of Section 208 planning at the state, rather than the areawide level, is one way of taking advantage of the existing expertise of state agencies in dealing with many nonpoint source categories.

In order to provide a more detailed perspective on where state Section 208 efforts have led us, we would like to share the specific findings and conclusions of NCASI's most recent survey of state silviculture nonpoint source control programs. As indicated above, the complete report is attached. We will highlight major points below.

III. SUMMARY OF SPECIFIC RESULTS OF THE 1982 NCASI SURVEY OF STATE PROGRAMS

A. Nature of State program to control nonpoint source contributions from silvicultural activities

1. Regulatory programs

Seven states can now be characterized as having regulatory programs for silvicultural activities. Oregon, Washington, Idaho, and California base much of their nonpoint source control programs on the provisions of forest practice act regulations. The Idaho rules, with which I am most familiar, require prior notification to the Board of Land Commissioners. They restrict activities which would adversely affect beneficial uses of waters.

The Alaska Forest Resources and Practices Act has "advisory" Best Management Practices. The prior notification requirements in this Act also allow for water quality protection.

Nevada has detailed rules under the Nevada Forest Practice act which cover erosion control and stream-protection zones. The mandatory use of performance bonds to assure satisfactory compliance with the Nevada rules qualifies this program as regulatory in nature.

In New Hampshire, an "Intent to Cut" form required for harvesting operations allows an operator to sign an agreement to implement BMP's. The "Intent to Cut" form also permits monitoring of operations for water quality protection. Failure to sign the agreement to use BMP's, followed by subsequent water quality problems, will result in the operator being required to submit plans for future operations.

2. Quasi-regulatory programs

Four states do not have programs specifically covering silvicultural operations, but have opted instead to emphasize existing regulations designed to control sediment or organic debris in streams. These state programs have been designated as quasi-regulatory because state regulations are not comprehensive for forest activities, or are directed mainly at non-silvicultural activities.

Massachusetts, for example, has legislation requiring prior notification before harvesting, as well as a Slash Law requiring that debris be kept out of streams. In Pennsylvania, all activities causing soil disturbance are subject to regulation under a Clean Streams Law. In Maine, road construction BMP's and regulations limiting erosion and sedimentation are enforced, while the balance of the silvicultural program involves mainly educational efforts. Hawaii has strict land-use planning. Under one land-use category, sediment losses are controlled.

3. Nonregulatory programs

Twenty-seven states—a majority—that addressed silviculture have adopted nonregulatory control programs. Almost all of these programs involve education efforts to inform operators about BMP's which have been developed for the state. Educational material used in these programs includes pamphlets, instruction guides, television public-service announcements, newsletters, posters, and slide-tape shows. Workshops, tail-gate lectures, and demonstration projects are also being used.

EPA recently sponsored a workshop to assist state forestry, water quality, and extension-service personnel from 6 states (Arkansas, California, Montana, New Hampshire, Oklahoma, and West Virginia) with their section 208 educational programs. Several states will be using National Training Package (NTP) material developed by EPA and the U.S. Forest Service, which is now available for education purposes.

Another technique used by several states to encourage the use of BMP's involves integrating water quality protection practices into normal forest-extension planning. State studies have shown that professional consulting—provided either by state foresters, industry foresters, or private consultants—results in a higher rate of BMP use and effective water quality protection.

A third technique used in a few state programs involves incentives to promote the use of BMP's. The best developed cost-sharing program is Minnesota's, where $100,000 was used annually, specifically to encourage the use of silvicultural BMP's.

This program, which lasted three years, is now being considered for reinstitution. Several other states are attempting to use federal programs like the Forest Incentive Program (FIP) and the Agricultural Conservation Program (ACP) to encourage BMP

A final technique for voluntary programs might be called a peer-pressure or peer-encouragement approach. For example, in Vermont, when a complaint about a forest operation is received and found to have some basis by a State Water Resources Investigator, a committee from the Vermont Timber Truckers and Producers Association will visit the site and encourage the logger to resolve the problem with appropriate paractices.

4. Other programs

In many western states, federal lands (primarily U.S. Forest Service and U.S. Bureau of Land Management ownership) constitute a large percentage of the commercial forest land. Both of these agencies have regulations protecting water quality. Therefore, agreements of understanding between the designated Section 208 agencies for the state and the major federal land management agencies to continue to implement water quality protection measures are the primary of silvicultural nonpoint source control.

B. State approaches to addressing implementation problems

In 1980, four of the problems most frequently identified by state agencies as impeding progress in their silvicultural nonpoint source control programs were: (1) lack of funds; (2) limitation of agency personnel (both manpower and training); (3) problems in implementing existing controls or statutes; and (4) the difficulties of contracting and informing small landowners. State agencies continue to show a desire and, in many cases, great ingenuity in addressing these problems.

For many state programs, funding will not be available from federal sources to support silvicultural Section 208 programs. However, rather than let these programs lapse, some state forestry agencies are absorbing nonpoint source control responsibility into their normal forestry extension work. Industry cooperation in supporting additional research, hosting workshops, and training company personnel has been noted in several states. A number of these types of company efforts are described in the attached NCASI report on "Industry Programs Dealing with Forestry Management Practices and Environmental Quality." (Attachment 3).

Upgrading the technical skills of agency personnel to deal with forest nonpoint source questions is probably the area most consistently addressed by state agencies. The states appear to recognize that training of agency personnel results in multiplying benefits as these personnel interact with forest opertors.

Some state agencies found that there are existing state laws and regulations to control nonpoint source pollution. In some cases, delays in notification of silviculture activities limited the effectiveness of these controls. In other cases, the agencies with control responsibilities lacked on-site personnel. The EPA-sponsored agency master planning projects addressed these problems by identifying existing nonpoint source controls and fostering cooperation between the state forestry and water resources agencies.

Finally, contacting and educating numerous, small landowners is a management problem which is common to many programs; especially in those states with a high proportion of non-industrial forest land. Surveys of forestry operations have shown that these non-industrial operations are the most likely to create water quality problems.

C. State assessments of section 208 program accomplishments

By 1982, several state programs had been operating for a sufficient time so that judgments about program success (and even surveys or enforcement records to document progress) have become available. The most important step in implementing a lasting nonpoint source control program involves the integration of water quality concerns into normal forest operations. Comments by state agency personnel indicate that this important step is being accomplished for many programs.

State agency personnel report both improvement in water quality concerns, and cooperation with control programs by forest managers. Several states have conducted field assessments of their programs. Most of these assessments have shown effective water quality protection, and an increased awareness of BMP's associated with forestry activities

Another measure of program success or failure is the number of enforcement actions and complaints concerning forest operations. In this respect, program assessments and enforcement records have shown that the regulatory program—in states which used forest practices acts—have been effective.

The NCASI survey did discover, however, that some states are finding additional control needs as they proceed to implement their programs. We plan to continue to work closely with these states to assure that these problems are corrected. The attached NCASI report provides considerable detail on the progress being made in each state with a silviculture nonpoint source control program.

D. Prospects for continued and effective section 208 program implementation

In 1980, some state administrators predicted that nonpoint source control activities under Section 208 would cease unless federal appropriations were provided to support implementation of state programs. While some monies have been made available to state silvicultural nonpoint source control programs (usually as carryover Section 208 funds), most federal support has been, or will shortly be, terminated. Therefore, in 1982, NCASI asked state agency personnel to project the future of their programs.

Of the 40 states with a silvicultural nonpoint source control program, 30 projected that their programs would continue as currently operated. States like Oregon and Washington consider the operation of their programs to be independent of Section 208 funding needs because the forest practice acts are financially supported through the states. However, these programs will be cut back in their ability to conduct extensive studies of complex water quality protection questions that might indicate needed forest practice changes. Washington, for example, used $487,000 in Section 208 grants between 1977 and 1981 to conduct studies on forest roads, stream management zones, slope-stability, compliance with the Washington Forest Practice Act, and other issues.

Other states provide substantial financial support to their forest nonpoint source pollution protection programs so that continued effective programs can be anticipated. Many states will have to reduce their activity levels. However, since educational materials have been produced and BMP's have been developed and evaluated, the continuation of these programs with reduced funds is possible. Extension foresters will be incorporating BMP considerations into their informational efforts in these states.

In some states, including California and Kentucky, agency personnel are anticipating an adjustment period as programs are finalized and implemented. In other states (Georgia, New Hampshire, New York, North Carolina, and West Virginia) agencies will be making decisions about future program direction based on the results of ongoing (or recently completed) assessments.

Some state agency personnel have reported that programs will be downgraded because of lack of funds. In New Jersey, management emphasis is being shifted from private lands to state lands and the activity level of Section 208 is described as "maintenance." In Virginia, agency personnel anticipate a decrease in state activities in silvicultural nonpoint source control, and identify the need for "industry and consultants" to continue the program. In Montana, staff working on an education program has been cut, but most of the educational material for a workshop program is apparently ready. At least part of an educational program will be accomplished.

Summarizing, it appears that the tools (educational material, BMP's) for programs have been developed. Most states will be carrying out their nonpoint source control responsibilities using either state funding, low-cost, industry-state cooperative programs, or by incorporating nonpoint source control recommendations into normal forest planning and extension activities. In my state, for example, we are embarking on a program to audit forestry operations for compliance with BMP's, using volunteered time from state and federal employees, industry personnel, and concerned citizens groups. However, lack of adequate funding will slow program development in some states.

E. Estimates of benefits and costs of section 208 silvicultural nonpoint source control programs

Substantial costs have been incurred and benefits accrued as a result of the nation's silvicultural nonpoint source control programs. A problem in assessing "program worth" has been the lack of cost and benefit data for state programs. An information gap on the costs and benefits of most nonpoint source programs still exists. For example, in response to the question, "are there any estimates of the costs and/or benefits of the silvicultural nonpoint source control programs for your state?" only a few state representatives had cost estimates. No one could provide any benefit estimates.

Costs involve: (1) the Section 208 program development costs of assessing the silvicultural problem and organizing an effective program; (2) implementation and continuing program costs; and (3) add-on costs to operators to comply with guidelines or mandatory Best Management Practices. California, Washington, and Oregon are the

most expensive with annual program costs of $3,400,000; $1,400,000; and $1,350,000, respectively, to cover management and enforcement of Forest Practice Acts. Nonpoint source program personnel for several states like Vermont and South Carolina anticipate no future funds for program operations, but will continue programs using existing resources.

The add-on costs of complying with BMP's can be substantial when considered statewide, even though most BMP's are designed to be cost-effective. For a few states, estimates of add-on costs for compliance with Forest Practice Act rules have been developed. These cost estimates are included in the attached NCASI report.

Direct quantification of benefits resulting from the silvicultural Section 208 programs is not generally available, although a study of Washington's program demonstrates a high rate of compliance with BMP's which, in turn, has resulted in protection of water quality uses. A major emphasis in the EPA strategy for FY-83 is to aid states in securing information to estimate benefits. Although these estimates are not currently available, there are several indirect measures—described in the attachment—of benefits to the forestry community resulting from nonpoint source programs.

Probably the best measures of benefits resulting from the nonpoint source control programs are the generally favorable assessment of program accomplishments by state agencies, and the decrease in citizen complaints about forest practices. These favorable assessments and enforcement records indicate that silvicultural nonpoint source programs are protecting water quality, which is the ultimate benefit and goal of the Section 208 program.

IV. API/NFPA SUPPORT H.R. 4037 WITH MODIFICATIONS

As introduced H.R. 4037 builds on the experience with the Section 208 process described above. The program framed by H.R. 4037 represents a positive step forward in the federal/state partnership to deal with nonpoint source problems. It will provide assistance to states where the lack of federal financial support may slow implementation of best management practices. API/NFPA support H.R. 4037, with two following modifications.

First, H.R. 4037 would add new Sections 319(a)(7) and 319(c) to the Act requiring states to: (1) identify federal activities which would be "inconsistent" with the state nonpoint source implementation program; and (2) recommend modifications to these federal activities. EPA would consolidate the state recommendations, and submit them to the appropriate federal agency. Finally, the affected agency would modify its activities, and "to the extent possible," carry them out in a manner that is consistent with the state program.

API/NFPA support the basic proposition that federal programs should be consistent with state nonpoint source control efforts. However, we are concerned that the proposal framed in H.R. 4037 contains ambiguous requirements which could result in substantial resoruce and program burdens on federal agencies.

For example, it is unclear how the term "inconsistent" would be defined for the purposes of identifying affected programs. Similarly, it is not apparent why EPA should serve as a clearinghouse for state recommendations, or whether other federal agencies would be bound by EPA's interpretation of the states' requests. Finally, we are uncertain as to how the requirement to carry out federal programs, "to the extent possible . . . in a manner which is consistent with" state desires would be interpreted by EPA or the courts.

To provide a greater degree of certainty in the specific federal program requirements imposed through this type of a provision, we prefer the approach outlined in Sections 319(a)(1)(G) and 319(f)(1) S. 2006 as reported by the Senate Committee. S. 2006 references, and gives special deference to, existing federal/state program coordination procedures outlined in Executive Order 12372. EO 12372, signed by President Reagan on July 14, 1982, provides specific procedures for state and local government coordination and review of federal financial assistance and development projects. In this fashion, a good deal of uncertainty concerning the requirements of this portion of the nonpoint source proposal can be eliminated.

Second, proposed Second 319(h) of H.R. 4037 would provide the authority for EPA to convene interstate managment conferences to deal with nonpoint source problems that affect more than one state. API/NFPA suport the special conference approach to dealing with interstate problems. However, we are reluctant to endorse the proposition—as H.R. 4037 appears to do—that such conferences should be granted plenary enforcement responsibilities or unilateral authority, to modify existing state permits and/or plans. Such a proposal would disrupt existing programs. More

data on long range transport of nonpoint sources must be collected before interstate problems can be resolved in such a compulsory fashion.

Mr. Chairman, I would like to thank this Subcommittee for the opportunity to testify. I will be happy to answer any questions you may have.

TESTIMONY OF HOPE M. BABCOCK, DEPUTY COUNSEL, NATIONAL AUDUBON SOCIETY

Good afternoon, Mr. Chairman, distinguished members of this Committee. My name is Hope Babcock. I am Deputy Counsel of the National Audubon Society. Audubon is a nationwide nonprofit organization with over one half million members dedicated to the wise use and conservation of our natural resources and protection of the environment. A high priority of our members is protecting the quality of our nation's waters and their adjacent habitat. Therefore, it is with extreme interest that we have been following this year's debates on reauthorization of the Clean Water Act. I am here today to address two areas of particular concern to us in that debate: nonpoint source pollution and the declining health of our nation's bays and estuaries.

Runoff of pollutants from our nation's farms, mines, cities, construction sites, timbered forests, and over-grazed rangeland, or nonpoint source pollution, is an extremely serious water quality problem. Nonpoint pollution contributes 50% of all pollutants to our nation's waterways: 75% of the sediment, 90% of the fecal and coliform bacteria, 80% of the nitrogen, and 50% of the phosphorus flowing into those waters. Thirty-seven states have reported to the Environmental Protection Agency that nonpoint sources are the major factor interfering with the achievement of water quality objectives in those states.

Ninety percent of the lead entering the Great Lakes comes from nonpoint sources and waterquality in approximately half of our lakes cannot be improved without implementing nonpoint source controls, according to the Council on Environmental Quality. The annual erosion of topsoil from our nation's farmlands fills our waterways not only with sediment but also with chlordane, DDT, DDE, and other organic chemicals. High concentrations of mercury, lead and gold washing off from land in Silicon Valley and pesticides and fertilizers contained in agricultural runoff into the Sacramento and San Joaquin rivers present a significant threat to aquatic life in San Francisco Bay. Drainage from disturbed mining sites in appalachia has increased the acidity, sedimentation, and hardness of the area's streams, contributing sulfates, iron, and manganese to those waters. Within the last two years 13 percent of the fish kills reported in Minnesota were attributed to pesticides in runoff.

Nonpoint source pollution smothers shellfish beds and fish spawning areas, clogs rivers and clouds lakes, artificially enriching the water environment. Nonpoint pollution also increases the risk of flooding by decreasing water storage capacity, necessitating expensive dredging. The principal source of nonpoint pollutants, agricultural soil erosion, decreases the productivity of our farmlands. The Conservation Foundation, in a recent study on agricultural soil erosion, estimated that nonpoint source pollution costs this country in excess of $3.0 billion per year. This number reflects the cost of cleanup activities, such as wastewater treatment and dredging made necessary by the influx of sediment and other nonpoint pollutants.

It seems clear to us that the question is not whether this country can afford the cost of controlling nonpoint source pollution, but whether it can afford to wait any longer before initiating the necessary controls.

Control of nonpoint pollution sources, as opposed to point sources, however, presents some special difficulties. Pollution contributed by point sources, because of basic similarities in industrial and municipal facilities, is more easily identified and lends itself more to federal regulations and uniform national standards. A nonpoint source pollution program, in contrast, must address localized conditions which vary from state to state, watershed to watershed, and even from one stream segment to another. Controls must be developed at the state and local levels to address specific situations on a case by case basis.

Much preliminary work on nonpoint source pollution has been done at the state and local level under Section 208 and 305(b) of the Clean Water Act. As a result of those programs, we know which streams are not meeting current water quality standards because of nonpoint pollution, the significant sources of nonpoint pollution to those streams, and the measures that could be implemented by those sources to reduce nonpoint pollutant loadings to those streams. However, those programs did not go far enough and have been hampered by lack of funds for implementation and enforcement of controls. Therefore, while much has been learned about nonpoint source pollution under the 208 and 305(b) programs, not much has actually

happened on the ground. For this reason, we think EPA is misguided in developing a nonpoint source strategy that relies exclusively on existing authorities under the Clean Water Act and that the agency's current efforts to develop a joint program with the Department of Agriculture to funnel incentive money to farmers to encourage them to employ nonpoint pollution controls, will not be enough. In short, new authorities to deal with nonpoint source pollution are necessary.

Audubon strongly believes that Congress must take the next step now and design at the federal level the framework under which the states can implement what they have learned under the 208 and 305(b) programs. If this is not done soon, we will lose the momentum created over the last decade under the 208 program as well as the resources and institutions developed and now in place at the state and local level as a result of that program.

A balanced combination of incentives and requirements is needed in any program designed to address nonpoint source pollution. Only by striking the right balance will we keep the momentum going in those states already trying to address the problem of nonpoint source pollution and encourage movement in those states where little, if any thing, has happened under the existing programs. We consider the following elements to be essential for striking that balance:

(1) Nonpoint source pollution strategies must be developed and implemented at the state and local level. An effective nonpoint source program must be centered in the states, because that is where the expertise on this issue is and where the fit must be made between legislative concept and on-the-ground implementation of effective control practices. H.R. 4037 implements this approach.

In this regard, we note with interest Section 319(f) of that bill, which extends the state-lead approach to local agencies and organizations, so that they may administer the program when a state elects not to participate. In general, we think that this is a good idea because it will expand the reach of the program. However, we ask that this Committee consider adding language to the bill to assure that local agencies be required to demonstrate that they not only have the requisite expertise and resources to manage the program, but can do so over a sufficiently broad geographic basis to avoid creating many small, ineffective programs around the country. In addition, subsection (f) should make it clear that the local agencies must file the reports and plans called for under subsection (a) and (b) of the bill. We also question whether or not this opportunity should be given to non-public entities, as we infer is intended by the use of the word "organization." In our opinion, only units of government would appear to have the necessary legal authority to implement a nonpoint source control program.

Even though it is beyond dispute that an effective nonpoint source program is dependent upn the state-lead concept, the Federal Government cannot be completely absent from the design and implementation of this program. First and foremost, the Federal Government must provide leadership in elevating the nonpoint source pollution problem to a national water pollution priority. Enactment of H.R. 4037 will achieve that objective. In addition, to assure that federal funds are most effectively allocated, EPA must function in a review and approval capacity over state performance under any nonpoint source pollution control program. Again, the Oberstar bill preserves this function. Finally, EPA must be allowed the prerogative to step in with financial or technical assistance when a state has a critical nonpoint source pollution problem beyond its current resources, or when one state's nonpoint source pollution is preventing another state from achieving its water quality standards. Again, the Oberstar bill addresses these functions.

We do, however, have one concern, which we believe to be more a matter of drafting than intent, with how H.R. 4037 defines the EPA role. To wit, H.R. 4037 authorizes the Administrator of EPA to disapprove a state plan if it does not meet the objectives of the Section, yet those objectives are not defined in the bill. Indeed, the breadth of discretion granted states in subsections (a) and (b) with respect to the scope and contents of their plans enables them to submit a program that may not address the serious nonpoint source problems within their boundaries at all. We do not believe that that is the intent of the drafters of the bill. But, unless a clear statement of objectives is added to the bill or the discretion granted to the states is limited in some way, then this particular standard of approval may be totally ineffective.

Further, while we do not support an influx of federal managers to design and implement a nonpoint source in the event of state program denial, we do believe that EPA should be allowed to identify the nonattainment streams and sources of nonpoint pollution to those streams as well as the practices which could be applied to control those sources in those states that elect not to participate in the nonpoint program. Doing this will assure that critical, uniform data is available in all states

at the end of the statutory program. This will enable the Administrator to make precise recommendations to Congress for all states about what the next steps should be for reducing nonpoint pollutant loadings. Therefore, we recommend that the H.R. 4037 be amended to give EPA this additional authority.

We also note with interest the authority in the Oberstar bill for EPA to approve programs "in part." While we recognize the need for some flexibility for both states and the Administrator in the start-up phase of this program, which partial approval can offer, we believe that there should be some constraint on the Administrator's authority here to assure that states are not allowed to side-step problems in a way that defeats the overall purpose of the program to make a nationwide start at controlling nonpoint pollution. The partnership envisioned in the bill between Federal and State governments is a good way to approaching the problems associated with controlling nonpoint pollution, but the Administrator must retain sufficient authority to assure that the state share of that arrangement results in significant progress being made toward addressing the problem. We, therefore, recommend the addition of language to the bill which would authorize the Administrator to approve programs partially only when he has determined that the limited plan will make significant progress toward arresting the problem of nonpoint pollution.

(2) States should be advised to target streams where the problems of nonpoint source pollution are the most serious, and where the contributors of that pollution can most effectively curtail their practices to reduce pollutant loadings. This is particularly necessary given the limited resources that can be allocated in the present economy to addressing nonpoint pollution.

The Oberstar bill recognizes this problem by authorizing the states to design a program which puts into priority order nonpoint problems. However, H.R. 4037 does not make it clear that the states should be selecting targeted streams and sources of nonpoint pollution based upon the seriousness of the nonattainment problem and the likelihood that application of controls would effectively address the problem. Without this limitation on a state's discretion, there is no assurance that a state program will be applied in the most effective way, which in turn creates a dilemma for the Administrator at the program approval stage, as he will not have the necessary basis to reject a state submittal.

(3) While states must be directed to (a) employ best management practices and (b) apply uniform measures to categories and subcategories of activities, variations in the size, duration or production processes involved as well as localized topographical, climatological and geographical conditions necessitate allowing states flexibility in designing their programs. H.R. 4037 does just that, although, as I have just noted above, we think that the grant of discretion to the states needs some definition so that, at minimum it is goal oriented.

(4) Each state must be required to establish a schedule by which all best management practices will have been implemented and under which all sources from a particular category or subcategory are required to meet the same deadline. Such deadlines will give the sources of nonpoint pollution the certainty they need for planning, assure fairness among the sources and provide EPA with the necessary baseline point from which to measure the effectiveness of the program. For this reason, we support the language in the Oberstar bill which authorizes the Administrator of EPA to disapprove a program in which the implementation schedule is not sufficiently expeditious. This criterion is missing from the Senate Bill and is a welcome addition to the House nonpoint source pollution control program.

(5) Transboundary nonpoint source pollution must be managed, both because it poses a serious problem, especially for the downstream state, and because of the inequities involved in requiring the downstream state to improve water quality when the sources that are contributing to nonattainment are not within its boundaries. It is our position that unless the problem of transboundary pollution is addressed in this program, many of the efforts encouraged in the bill will be for nought.

The Oberstar bill addresses this problem by allowing states to request EPA to convene a management conference for the purpose of developing an agreement among the affected states for reducing the level of nonpoint source pollution. We applaud Cong. Oberstar for creatively seeing the appropriateness of a pre-1972 Act mechanism, the enforcement conference, for addressing this problem.

We do, however, have a few suggested changes to subsection (h). For example, to avoid unnecessary duplication and possible conflict between this program and other programs already in effect, we recommend the addition of language to subsection (h) which would make it clear that in those instances where federal law already requires a joint state effort to address transboundary water pollution problems, such as in the case of the Colorado River, the subsection would not apply.

We also note with some concern that a different and broader standard is used in subsection (h) than elsewhere in the bill for identifying the waters that will be covered by the program. In subsection (h), all navigable waters that are "affected by nonpoint pollution" are included in the program as opposed to those waters which "are not meeting applicable water quality standards or are not attaining a water quality which assures protection of public health, the use and value of such portions for public water supply. . . ." (See, subsection (a)(1)(A)). We question whether the occasion of transboundary nonpoint source pollution requires the application of a different standard and urge the Committee to use the same standard or showing throughout the bill.

(6) States must be given the opportunity to prevent the Federal Government from pursuing financial assistance policies and programs which are inconsistent or interfere with state nonpoint source control programs. Federal consistency gives real practical meaning to the state-lead approach, which we favor and which forms the core of the H.R. 4037. It makes no sense to spend taxpayers' dollars both to control nonpoint source pollution and to cause that pollution.

While H.R. 4037 addresses this problem, we are concerned that the language "to the extent possible" found in subsection 319(c) is not strong enough. We urge this Committee to consider substituting the phrase "shall accommodate," found in the Senate nonpoint source pollution control program, S. 2006, to make it clear that this is a mandatory duty for the federal agencies involved.

Federal consistency also has a positive element in that it can be used, and indeed is so used in H.R. 4037, to encourage the affirmative application of federal programs to assist states in controlling nonpoint source pollution. In order to be sure that such federal programs are brought into the program, subsection (a)(1)(B) should be amended to require states to identify not only those federal programs that conflict with their efforts to control nonpoint source pollution, but also those federal programs, which if applied in a different manner, could actually assist them to control this form of pollution.

(7) Federal money must be authorized to provide states with the incentives and financial assistance to participate in the program. We are pleased to see that H.R. 4037 requires the states to contribute 50 percent of the cost of implementing their nonpoint source pollution control programs and requires states to do more than they are currently doing to control nonpoint source pollution. This latter requirement provides a useful floor below which states may not fall and requires that they do more than they are currently doing to control nonpoint pollution.

However, we do have some suggested changes in the bill to clarify what we believe to be the intent of this part of the program. First, we suggest that the language in subsection (i)(2)(A) be revised to make it clear that 50 percent is not an obligation on the Federal Government, but a ceiling beyond which the federal share of a state's program cannot go. The simple addition of the phrase "not to exceed" before 50 percent will eliminate this confusion. Second, while we support having the states compete for these funds as opposed to granting money to the states based on an allocation formula as in S. 2006, we recommend that the language of the bill be amended to incorporate some standard related to the goal of controlling nonpoint pollution by which the Administrator can judge between states. Without such a standard, the Administrator may not be able to withhold monies from a less deserving state. This problem is complicated by the fact that the annual report required in subsection (b)(3) does not appear to be a basis for funding a state's nonpoint pollution program.

We are also concerned that too much money, under H.R. 4037, may be spent on the planning stage of the program as opposed to its implementation, because there is no limitation in the bill as to how much money will be available to the states for preparation of the report and plan called for in subsections (a) and (b). The primary purpose of the program is to achieve controls in the field. Failing to limit federal money for implementation of controls may seriously impede that effort.

We also wonder whether it was an oversight that led to "demonstration projects" not being excluded from the 10 percent limitation on administrative costs of the program. Under some circumstances, unless directed otherwise, these projects might be considered administrative in nature. We urge that unrestricted monies be available for demonstration projects, as they may be an effective way of tackling some of the more difficult nonpoint source pollution problems.

We also ask the Committee to look at the language in S. 2006 which authorizes the Administrator of EPA to reserve one-third of the monies allocated under the program for his discretionary use. We think that such language would be a useful addition to the House program.

(8) Finally, EPA must report to Congress on the progress made in reducing nonpoint source pollutant loadings nationwide and on what future action needs to be taken by Congress. This is an integral part of the program, for it ensures the compilation and analysis of field data that has been collected in different environments for different activities under different state regimens. Congress will then have an experiential information base for reference should it decide five years from now that more needs to be done, which we think it will. The Oberstar bill provides this function.

While it is clear that H.R. 4037 represents only the first step toward solving the nonpoint source pollution problem, it will serve to give important impetus to efforts toward that end at all levels of government. The hands-on experience that will ensue in the next few years under this type of program will from an invaluable data base from which much more can be learned about nonpoint pollution control. We recognize that it has taken decades for nonpoint pollution to reach its current "critical mass," and it will take more than a few years for us to reach an acceptable level of clean-up nationwide. We commend Congressmen Oberstar for tackling this difficult problem head-on. We are confident that this Committee will approve of his efforts and report our H.R. 4037.

Let me now briefly turn to the problems posed by the declining health of our nation's bays and estuaries. Even after eleven years of progress, water quality problems continue to plague us nationwide. Our estuaries, those areas where fresh water from the land meets salt water from the sea, are not immune. The estuary is an ecotone, a complex buffer zone which shares the characteristics of both fresh and salt water systems, but is identical to neither. A variety of animal and plant species are specially adapted to the wide fluctuations of current flow, salinity and temperature found in the unique estuarine environment.

The ecological importance of estuaries has become apparently only in the last two decades. The primary productivity of the estuarine system is among the highest recorded for any ecosystem. In coastal biotic communities, estuaries are the chief source of nutrients. A number of commercially important species, e.g., oysters, clams, crabs, shrimp, striped bass, and halibut, thrive in estuarine habitat.

Because they empty directly into the ocean, so that wastes seem to disappear, estuaries have customarily been regarded as limitless reservoirs for dumping municipal and industrial wastes. We are finding, however, that some estuaries have reached their limit as flushing basins. The results of a six-year, $28 million EPA study of the world's most productive bay, the Chesapeake, demonstrates this point. Phosphorous from urban sewage treatment plants and nitrogen from rural farms have over-enriched the bay. Toxic metals, mainly from industry, have severely contaminated large areas of the Bay near Baltimore and Norfolk: the consequence—massive algae blooms and steep declines in rooted aquatic plants, leading to dangerously low levels of oxygen in the water and significant changes in the species composition of fish and shellfish populations.

The Chesapeake may be our most extensively studied estuary, but it is not the only one with serious problems. High concentrations of coliform bacteria have forced the closing of sections of Mobile Bay to swimming and shellfish harvesting. Reduced levels of dissolved oxygen in two of the bay's tributaries have led to massive fish kills.

In San Francisco Bay, localized heavy concentrations of mercury, lead, and gold in the Silicon Valley area pose a significant threat to acquatic life, as mentioned previously. There is also strong evidence that pesticides and fertilizers washing in from the Sacramento and San Joaquin Rivers are causing infertility in striped bass—striped bass populations there have declined over 50 percent in the last decade; the current catch is only one-third of what it was twenty years ago.

The total acreage of our estuaries has declined greatly in the last 35 years. Almost half of the estimated 15 million acres has been designated "important habitat" by the U.S. Fish and Wildlife Service. Eight percent of this habitat has been lost nationwide since 1960. Some states, however, have suffered much greater losses than others. California, for instance, recorded a 67 percent decrease—a loss of 192,000 acres—in basic estuarine habitat between 1950 and 1967, when indiscriminate filling was finally halted by the state.

Legislation is needed to recognize the importance of estuaries as unique and critical habitat and to help protect them, not only from pollution, but also from fresh water diversion and overuse, so that their great productive value is not further diminished. Such legislation, to be effective, must:

(1) consider the entire estuarine watershed and all those transitional areas which are essentially influenced by water from an estuary.

(2) tackle the transboundry problems that may arise when an estuary's water quality depends on the control of pollution in more than one state.

(3) provide a management framework under which all states contributing pollution to the estuary and those states affected by that pollution can come together and develop a coordinated enforceable plan to protect the estuary.

(4) provide financial assistance to states involved in the cooperative effort so that they may implement pollution control measures, monitor the health of the estuary and the effectiveness of the controls, and conduct necessay research.

We support the method of estuarine water quality management proposed in the Howard bill. We recognize in this mechanism the sometimes discredited pre-1972 Act enforcement conference. However, we believe that the concept has greater utility in the case of estuaries than when originally put into effect almost a generation ago. The complex nature of multistate relationships lends itself particularly to the negotiation process envisioned in the conference concept; whereas that concept may not have been appropriate for enforcement actions or standard setting in an individual state.

For these reasons, we believe that an esturine management conference convened by EPA is a practical first step toward coordination of pollution control efforts among states. Establishing priorities for action and setting compliance schedules is absolutely necessary, so that serious pollution problems that concern more than one state are most effectively handled. The Howard bill apropriately authorizes financial assistance to the cooperating states for research and implementation, and to EPA for administration and monitoring of the program.

However, we are extremely concerned that the proposed program nowhere includes public participation in review of and comment upon management plan for the estuary. This should not be a process that takes place closed to public scrutiny. Indeed, the public would be expected to have significant contribution to make in protecting these resources. Accordingly, we recommend that Section 319 be amended to require public participation in the process of developing an esutarine management plan.

In addition, we suggest that Section 319 be amended to make clear that the contents of an estuarine management plan be as stringent as or more strigent than existing requirements of law. We are sure that the intent of the Section is not to establish a regimen of controls in conflict with or different from what would otherwise be in place in the individual states without this program, but rather to apply controls that might otherwise not be applied under individual state programs or to impose more stringent controls than might be so applied. While this is implicit in the language of the bill, we would urge that it be made explicit to avoid any future confusion that might be generated.

We recommend one further step for this Committee to consider in the effort to manage and protect our nation's estuaries. Section 402 of the Clean Water Act should be amended to require that NPDES permits contain a cumulative assessment of the impact of a specific downstream discharge on a downstream estuary. Although this requirement can be inferred from the language in Section 402, the fact that it is not specific has resulted in narrowing the scope of the evaluation of the effect of the discharge to the proximate discharge area. The result is that while water quality standards in a single tributary may be met, the impact on the downstream estuary may be significant or even unacceptable unless the combined synergistic effect of its many tributary inflows is considered.

Finally, at the risk of stating the obvious, we assume that if there are existing programs effectively addressing problems in a given estuary, that this program should be in support of those efforts and not require those states to start anew. An example immediately comes to mind in the case of the Chesapeake Bay where millions of dollars have been spent to date and work undertaken to develop a plan comparable in many respects to what is recommended here.

Thank you for your attention to my remarks. I would be pleased to answer any questions that you may have on my testimony.

STATEMENT PRESENTED BEFORE THE HOUSE SUBCOMMITTEE ON WATER RESOURCES, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, BY EDWIN H. CLARK, II, SENIOR ASSOCIATE

My name is Edwin H. Clark, II, and I am pleased to be here to discuss some of the problems of nonpoint source pollution and its impact upon water quality in our streams, rivers, lakes, and reservoirs. I am currently a senior associate at The Conservation Foundation, a not-for-profit environmental policy research organization, where, among other activities, I and my colleagues are completing a comprehensive

study of the types and economic costs of impacts caused by sediment and other pollutants resulting from soil erosion.

In my testimony today I would like first to make some observations about the importance of nonpoint sources of pollution and then summarize for you some of the results of The Conservation Foundation study. They indicate that our failure to control nonpoint source pollution is imposing billions of dollars of costs on the country annually. Finally, I would like to make some observations on the prospects and needs for controlling nonpoint sources.

IMPACT OF NONPOINT SOURCES OF WATER POLLUTION

In 1977, 6.4 billion tons of soil eroded from non-federal lands, above and beyond normal geological erosion. This is equivalent to about 30 tons of soil for each person in the United States, or to an average of more than 220 tons of erosion every second of the year. About 1.5 billion tons of this was wind erosion from cropland and rangeland in the Great Plains states. The rest was water erosion of cropland (39%), pastureland and rangeland (30%), and a variety of other sources including forestland, streambanks, gulleys, roads, and construction sites.

Some simple comparisons on agricultural erosion are instructive. For instance, the state of Iowa is famous for its corn production. But it also produces a lot of erosion. In fact, for every one ton of corn raised by an Iowa farmer in 1977, five tons of soil were eroded by water from that state's cropland. Nationally, for each pound of food consumed in the United States, over 22 pounds of soil were eroded from all agricultural lands by water. The average rate of water erosion of cropland alone was more than 89 tons per second.

Much of this erosion comes from a relatively small portion of the land. This is an important fact to remember when considering the need for erosion control measures. For instance, less than 3 percent of the land, eroding at a rate of more than 25 tons per acre per year, is producing almost a third of the total erosion (and even a higher proportion, almost 60 percent, of the "excess" erosion—this is the erosion in excess of 5 tons per acre which is (somewhat arbitrarily) considered to be safe).

The majority of this eroded soil eventually reaches the nation's waterways, and once there can cause serious problems. In states such as Kansas and Illinois, it is one of their most serious water pollution problems. It can destroy valuable fish populations in streams and bays, increase the cost of water treatment for downstream users, make valuable recreational facilities essentially useless, increase significantly the flood damages along rivers, interfere with navigation, and silt up valuable storage space in lakes and reservoirs. According to different estimates, nonpoint sources of pollution are responsible for 66 to 99 percent of the suspended solids in our water ways. And most of this comes from cropland erosion.

Other, perhaps more serious problems arise because nonpoint sources not only include natural soil but other contaminants such as fertilizers, pesticides, other toxic substances, and oxygen consuming organic materials. Pesticides and other organic and inorganic compounds can be toxic to fish, and potentially to humans. Fertilizers can be a source of potentially toxic nitrites in drinking water supplies, and stimulate algae growth, accelerating the eutrophication of lakes and reservoirs. As algae die and decay, they, along with the plant residues and other organic materials carried into the stream, use up oxygen, often reducing the oxygen level so much that some fish species can no longer survive. These off-site pollution problems are exacerbated when farmers try to compensate for lost productivity by using more fertilizers, pesticides, and other inputs, without reducing the amount of erosion.

Nonpoint sources contribute an estimated 80 to 92 percent of the nitrogen, 42 to 94 percent of the phosphorous, 49 to 76 percent of the BOD loadings, and up to 98 percent of the bacteria entering our waterways. In all cases, a substantial majority of these loadings come from agricultural lands.

In the draft 1981 report required under section 305(b) of the Clean Water Act, nonpoint sources were identified as a contributing factor in 94 percent of the stream accounting units where water quality problems and their likely causes were identified. This report does not indicate the relative importance of nonpoint source pollution problems, but does suggst that it is extensive. Some information on its importance is provided by an analysis conducted by Resources for the Future which concluded that about one-third of the nation's waters that would still not be in compliance with water quality standards after all point sources had installed BPT or, for POTWs, secondary treatment would come into compliance if nonpoint source controls were implemented on cropland.

THE OFF-SITE COSTS OF EROSION

The study being completed by The Conservation Foundation indicates that the total economic costs caused by sediment and pollutants associated with erosion amount to over $3.0 billion dollars a year. We believe that these are conservative estimates. For instance they do not include a number of damages, such as damage to the fish and wildlife in streams, which are particularly difficult to value in dollar terms. Thus, the total costs could well be twice the $3 billion we have estimated.

Some of these costs result from impacts commonly associated with water pollution; for instance, $100 million for increased water treatment costs, another $70 million for damages to inland commercial fisheries, and $120 million in damages to recreational opportunities.

But many of the costs are of a different type, and may not normally be linked to water pollution problems. For instance, about 25 percent are related to dredging. The Corps of Engineers spent $362 million in 1980 dredging harbours and navigation channels. The purpose of the dredging is to remove sediment deposits, and sediment comes from soil erosion. These federal expenditures are matched by like amounts spent for dredging by state and local governments and private firms.

The sediment is also filling up our water supply and flood control reservoirs, and this accounts for about 20 percent of the costs. Twenty percent of the capacity of new reservoirs—$300 million a year—is built for the sole purpose of storing sediment. An estimated one million acre feet of existing reservoir capacity is being filled each year by sediment. That capacity has to be replaced, or someone will be short of water. If we tried to replace this lost capacity as it disappered, the bill would probably be over $300 million a year. In flood control projects and other small reservoirs, the project managers are able to remove the sediment—and probably pay over $200 million a year doing so. And finally, reservoir and lake owners are spending significant amounts—an estimated $30 million a year—to attempt to control algae, seaweed and other problems caused by nutrients associated with soil erosion.

The other major cost area is flood damage. This accounts for over 30 percent of the total costs. Sediment-clogged channels flood more often and the floods are bigger than they would be if there were no erosion. Even more important is the damage caused by sediment—a major portion of urban flood damages are not caused by the water, but rather the sediment and other pollutants it leaves behind. And sediment deposits also destroy millions of dollars worth of agricultural products every year and reduce the long-term productivity of the flood land.

The final type of cost is the cost of removing sediment from drainage ditches and irrigation canals. These channel maintenance costs amount to an estimated $200 million per year.

Again, the sum of all these preliminary estimates is over $3.0 billion a year. And this does not include many impacts for which there is not enough quantitative information to make even crude cost estimates.

In addition to emphasizing that these estimates are still preliminary, I should also point out that even the most complete soil conservation or nonpoint source pollution control program could not result in these costs being entirely eliminated. Many of them are caused, at least in part, by "natural" erosion processes that can never be completely controlled.

Even so, I believe our study demonstrates the very high costs that the nation is experiencing because it has not yet attempted to control nonpoint sources of pollution. If we are serious about attaining our goals of fishable, swimmable waters, we are clearly going to have to do something about these sources.

WHAT CAN BE DONE

Having established that nonpoint source pollution is a serious problem which is imposing significant costs on the nation, the question is what can we do about it? Answering this question requires judgments about technology, knowledge, economics and institutions.

With respect to most sources, the technical problems are largely solved. For most agricultural lands, techniques for reducing soil erosion have proven their effectiveness over the past four decades. Effective erosion control techniques have similarly been demonstrated for construction sites and for surface mining.

However, in some areas the technical answers are not so obvious. For instance, there is still a fair amount of uncertainty about the success of different measures for controlling nonpoint source pollution from urban areas. It is also true that some of these technical solutions may cause problems of their own. There is still some debate, for instance, on whether no-till agriculture decreases or increases the

amount of pesticides (particularly herbicides) carried into our streams or ground water.

Nevertheless, I think it is fair to conclude that in most cases, we have technical solutions to solve the problem.

The next question is do we have sufficient knowledge? For instance, do we know which techniques should be adopted at any particular location and where they should be applied in order to control water quality problems? Here again I conclude that in most cases we do have sufficient information. We do not need to initiate a new planning program. I have personally reviewed hundreds of documents produced by the Section 208 planning process. Many of these demonstrate that the relevant state or local agencies had substantial knowledge about the extent and causes of their water quality problems. The products of the Section 208 planning process, the information collected for the Section 305(b) water quality reports, the knowledge of the local soil conservation officials, and other such sources of information should suffice, I believe, to allow us to take action on these problems.

The next question is whether we can afford to solve these problems. In many cases the answer is clearly yes. For instance, several techniques available for controlling erosion from agricultural lands are not only inexpensive, but may increase a farmer's profits. Of course, these techniques are not suitable in all cases. And in some cases, the required techniques can be quite expensive—probably too expensive for many farmers with their currently depressed incomes or cities with their depressed revenues to afford without financial assistance. Although there does not seem to be a need for another massive grants program to help abate nonpoint source pollution, some such assistance may be required in such special circumstances.

The final question is whether we have the appropriate institutions for achieving this cleanup. This is probably the most uncertain area of all. We have, over the past three decades, spent over $20 billion on federal programs to reduce soil erosion. But we are still losing 2 billion tons of soil a year from our cropland. Our soil erosion control programs have depended primarily upon farmers to volunteer to adopt the erosion control measures. Millions have done so, and the requests for assistance always exceed the amount of funds appropriated. But those farmers suffering the most serious erosion problems are not always the ones most anxious to volunteer. If we are to adequately address the problem of nonpoint source pollution, I believe that we will probably have to go beyond depending only on volunteers. There will need to be measures that can require more reticent land owners creating serious problems to take action as well.

The same is true for urban areas. We have yet to achieve the goals we established for cleaning up municipal sewage. To some extent this is because the federal government has not been able to provide the matching funds that the municipalities need. But there has also been a reluctance on the part of some municipalities to deal with the problem—after all, it does not affect them, only the cities downstream. And, quite understandably, the state and federal governments have been hesitate to force the reluctant cities to take action. These problems would certainly not become simpler if we were to attempt also to control nonpoint source pollution from urban areas.

There are, of course, already a number of federal programs which can and should assist in this process. The Department of Agriculture's soil and water conservation programs should be focused on controlling nonpoint source pollution from agricultural lands. Similarly, the Departments of Interior, Transportation, and Housing and Urban Development have programs which can help control nonpoint source pollution from mines, urbanized areas, and construction sites. And other programs such as the Pesticide Control Law, the Municipal Waste Treatment Grants Program, and the Toxic Substances Control Act can help as well. Any nonpoint source pollution control program should make use of all these existing laws and programs to the maximum extent possible.

And such a program ought to place the major responsibility for its implementation at the state or local level. Controlling nonpoint source pollution requires specific knowledge about specific problems, and this sort of insight cannot be gained by bureaucrats sitting in Washington of in EPA's regional offices. But state and local authorities will require the strong support of the federal government, including, I believe, additional legislation which will help (and in some cases even force) them to do what needs to be done.

This concludes my prepared statement. I would be happy to attempt to answer any questions you might have.

Mr. ROE. Please proceed.

TESTIMONY FROM A PANEL CONSISTING OF DALE McGREER, FOREST HYDROLOGIST, POTLATCH CORP., ON BEHALF OF THE AMERICAN PAPER INSTITUTE AND THE NATIONAL FOREST PRODUCTS ASSOCIATION; HOPE M. BABCOCK, DEPUTY COUNSEL, NATIONAL AUDUBON SOCIETY; AND DR. EDWIN H. CLARK, SENIOR ASSOCIATE, THE CONSERVATION FOUNDATION

Mr. McGREER. Thank you, Mr. Chairman. I will be brief. Again, I am a forest hydrologist for the Potlatch Corp. I appreciate the invitation to testify for the American Paper Institute and the National Forest Products Association concerning the control of silvicultural nonpoint source pollution.

We will also share our views on H.R. 4037, which we generally support.

Our associations have been involved in the Clean Water Act, section 208 process since EPA first emphasized this program as a means for addressing nonpoint source pollution in 1975. Through section 208 EPA fostered State programs to: (1) assess the impacts of forestry activities on water quality; and (2) devise best management practices, BMP's, and control programs where necessary.

Through the section 208 process, States determined that silvicultural activities are not a major, nationwide water quality issue. Nevertheless, localized problems are recognized.

In most cases, sediment is considered the primary source of pollution from forestry activities. However, sediment from forest lands is estimated to be less than 4 percent of the total man-caused sediment in the Nation's waters. This is particularly significant since one-third of this Nation is forested.

There are almost as many types of section 208 programs for silviculture as there are States that worked with this category. The variation strongly suggests: (1) the extent of the problems identified in each State; (2) the nature of ownership of forest lands; (3) differences in the most effective way to reach people causing the problems; and (4), the nature of existing implementation programs

Our experience to date convinces us that three principles are essential to any type of program to address forestry water quality problems.

First: Because of the variability of nonpoint source problems, it's imperative that efforts continue to be focused at the State level. Controls must be applied in a site-specific fashion.

Second: States must continue to have the option to use a wide variety of nonregulatory and regulatory programs for nonpoint source control. The nonregulatory approach is more effective in reaching large numbers of small nonindustrial landowners.

Finally: The variability in silviculture activities and water quality impacts makes forestry expertise an essential part of BMP development and program implementation.

These principles have been embodied in almost all the section 208 silviculture programs adopted to date.

Currently, 40 States have developed silviculture nonpoint source control programs under section 208. Seven of these are regulatory programs. In addition, four States have emphasized existing regulations designed to control all sources of organic debris or sediment in streams.

The majority of States that address silviculture have adopted nonregulatory programs. These programs involve education efforts to inform operators about BMP's which have been developed. They often encourage adoption of BMP's by integrating water quality protection into normal forest extension planning. This type of program occasionally uses financial incentives to promote adoption of BMP's.

In our recent survey of State programs, included for the record, four problems that the States most frequently identified as impeding their progress were: (1) lack of funds; (2) limitation of agency personnel; (3) problems in implementing existing controls; and (4) the difficulties of contacting and informing small landowners.

Of the 40 States with a silviculture program, 30 projected continued operations whether or not Federal funds are available. Some States are anticipating an adjustment period as programs are finalized. Other States will make decisions about future program direction based on the results of ongoing assessments. Finally, a few States have reported their programs will be downgraded because of lack of funds.

In our survey, we also found that several States have conducted field assessments of their programs. Most of these States have shown effective water quality protection, and an increased awareness and implementation of BMP's. Most important, the States indicate that water quality concerns are being integrated into normal forest operations. In summary, the overall status of silviculture programs is good, and the programs are working.

Turning now to H.R. 4037, we believe it builds on the experience gained through the section 208 process. It is a positive step forward in the Federal-State partnership to deal with nonpoint source problems, and provides assistance needed by many States. API-NFPA support H.R. 4037 with two modifications.

First: The bill would require States to identify Federal activities which are not consistent with the State nonpoint source program and recommend modifications. The effective Federal agency would modify its activities to conform with the State program. API-NFPA agree that Federal programs should be consistent with State nonpoint source controls. However, H.R. 4037 appears ambiguous and could result in substantial resource burdens on Federal agencies.

To provide a greater degree of certainty, we prefer the approach outlined in S. 2006, which references current Federal-State program coordination procedures outlined in an existing Executive order and agency regulations.

Second: H.R. 4037 would allow EPA to convene interstate management conferences for nonpoint source problems that affect more than one State. API-NFPA support this general approach to dealing with interstate problems. However, such conferences should not be granted unilateral authority to modify existing State permits or plans. H.R. 4037 appears to provide this authority and could be extremely disruptive to existing programs. More data on long range transport of nonpoint source pollution must be collected before interstate problems can be resolved in this fashion.

Thank you for the opportunity to testify.

Mr. ROE. Ms. Babcock.

Ms. BABCOCK. Good afternoon, Mr. Chairman.

My name is Hope Babcock and I'm here today representing the National Audubon Society, a nationwide nonprofit organization with over one half million members dedicated to the wise use and conservation of our natural resources and protection of the environment.

A high priority of our members is protecting the quality of our Nation's waters and their adjacent habitat. Therefore, it is with extreme interest that we have been following this year's debates on reauthorization of the Clean Water Act.

I have identified two areas of concern in my written testimony: nonpoint source pollution and protection of bays and estuaries. In the interest of time today, I would like to very briefly summarize my remarks on nonpoint source pollution and focus instead on bays and estuaries.

Let me summarize that discussion on the nonpoint source pollution problem by saying that in my written testimony I described the nature and severity of the problem and the need for a Federal program now. I identified what Audubon considers to be eight essential elements of such a program, state our unconditional support for the Oberstar bill, and commend the Congressman for his excellent job in putting together a nonpoint source legislative program, and note some of the areas in the bill where we think minor changes could be made to clarify its intent.

Before I leave the topic of nonpoint source pollution, I would like to blow our own horn a little bit and mention to you an article that appeared in the most recent edition of Audubon Magazine on soil erosion by Peter Steinhart. It contains very graphic illustrations showing the off-farm impacts of soil erosion on water quality.

If the Chairman would like, I would be more than happy to provide copies of the article for insertion into the record.

Mr. ROE. I think it would be good to provide copies, and also, we'll enter a copy of the article into the record at this point if there's no objection.

Ms. BABCOCK. Thank you.

[The article referred to follows:]

The Edge Gets Thinner

by PETER STEINHART

ON A DECEMBER morning in 1977, Sheriff Larry Kleier drove his patrol car southeast from Bakersfield, California, into the Tehachapi Mountains. It was a cold, clear day, but unusually windy. The landscape was vast and lonely. It was the second year of drought, and the farmlands of the San Joaquin Valley were gray and blistered. The irrigated fields had been plowed in anticipation of spring planting. But the foothills rose above them stubbly and gray, tattered ghosts of the usual golden-brown California hills of year's end. Ranchers had taken their cows off the hills for lack of forage.

The road climbed through the barren hills. A half-hour east of town, Kleier crested a ridge and dropped down into the broad, southwest-running valley of Caliente Creek. As he drove up the ridge, he saw only blue sky and sunlight over the hood of the car. But when he started down into the valley, everything changed. "Just as I came over the hill," he says, "it was like someone turned off the lights." The wind became extremely violent, and an enormous dust

After many years of conventional farming, a hillside in Whitman County, Washington, shows signs of severe topsoil erosion—evident in vast areas where a new wheat crop has not begun to grow. On a nearby hillside (inset) where a massive soil slip has occurred, erosion is measured at a rate of 300 tons per acre per year.

TIM McCABE, SCS CONSERVATION SERVICE

Strip-cropping in Maryland alternates corn and soybeans to reduce soil erosion.

cloud enveloped the car. "I started trying to find a way to go back, but I couldn't stop or turn around. I heard the traffic going by on the other side of the road, but I couldn't see it."

A sudden burst of wind raked the windshield with rocks and gravel, instantly frosting it milky white. Kleier could barely see the end of the hood. He knew there was an overpass a mile ahead, and it might shelter him from the vicious wind. "By the time I got there," he says, "I just couldn't drive anymore." The windshield was opaque. "And about that time, too, the rocks started breaking my windows." First the back window shattered. Then the side windows. Dust filled the car. The radio stopped working. It was hard to breathe.

A number of drivers already had taken refuge under the overpass, leaving no room for Kleier's patrol car. He abandoned the cruiser and jumped into a pickup truck at the edge of an orange grove. When the windows of the pickup blew out, he and the driver ran to a motorhome under the overpass. Safe inside, Kleier saw that during his run from patrol car to pickup truck and then to the motorhome, the wind had scoured all the finish off his shoes and sandblasted the handle of his revolver. Etched upon the gun was the clear outline of his holster.

Outside, the dust storm tore open the countryside. Near Arvin, winds over 100 mph broke wooden telephone poles and buckled steel powerline supports. Utility poles left standing had rocks the size of nickels embedded in them twenty feet above ground. Wooden fenceposts were sawed through by wind-driven sand. A 2,000-gallon tank was blown off the Comanche Point Oil Field and never found. Cattle suffocated in the dust at fencelines and were found with the hair and skin sandblasted off their hindquarters. The wind spaded two feet off the tops of freshly plowed fields, lofted the soil high into the atmosphere, and carried it hundreds of miles. It came down days later as red rain in Davis and Red Bluff.

The storm pinned Kleier and other travelers under the overpass for twelve hours. When Kleier returned to his patrol car the next day, all the windows were gone. The interior was filled with rock and sand. Tendrils of sand crept out the windows of the sheltered side and slithered away. In Arvin, groundwater pumps were so choked with silt that there was no drinking water for a week. A grade school stayed closed because no one could free its locks of sand. In the following weeks, residents of the area reported new cases of bronchitis and other lung problems, which many said were caused by pesticides sprayed on the fields and then broadcast with the dust. And a month later, the drought ended abruptly. Overnight, nearly an inch of rain fell. It turned the bare hillsides into rivers of mud which washed down into the valleys, slumped across the roads, closed the interstate highway, and made a travesty of fields and pastures.

The velocity of the wind and the severity of the drought may be dismissed as acts of God. But the volume of dust moved by the storm was due much to human activities. Geologists estimate that the winds carried 25 million tons of soil from foothill areas that the California Department of Conservation had warned were "consistently overgrazed." On the hills, you could look down fencelines and see that heavily grazed lands had lost their topsoil, while on less intensively grazed lands across the fence, both grass and soil were still in place. The geologists estimated that another 25 million tons of soil blew off the freshly plowed fields of the valley. They noted that in recent years the farmers had torn out the windbreaks planted in the 1940s to contain wind erosion.

That year, 1977, was a big one for dust storms. In February, a storm ripped three feet off the tops of some eastern New Mexico wheat fields and sifted the dust across the eastern states and onto the decks of ships hundreds of miles out on the Atlantic. New Mexico, too, had been the victim of drought. But farm-

Plantings of buffalo berry in North Dakota cut wind erosion—and feed wildlife.

JOHN ALEXANDER, SCS CONSERVATION SERVICE

es had recently increased the acreage planted to wheat, and to water new fields they had installed pivot irrigation systems. To accommodate the machinery, they, too, had torn out the old windbreaks.

Such storms are dramatic instances of a process that is going on every day at a more modest, but no less threatening, level. The soil of this continent is being blown, washed, and bulldozed away. Human activity is very much to blame for the loss. And unless we exercise more care, the world's growing population may outstrip the land's ability to provide food and shelter.

Erosion is a natural process. Rainfall washes topsoil into rivers. Deltas plod seaward where the rivers run out of land. Windblown silt polishes the sandstone cliffs of the West. The soil that thus blows and washes away is apt to be replaced as bedrock weathers, plants decay, and dust comes to rest. But human activity accelerates erosion far beyond the replacement rates of nature. Highway construction in Virginia produced 200 times the erosion occurring on undisturbed lands nearby. Off-road vehicles scour soil and bedrock at an annual rate of thirteen tons an acre from parts of the California desert that cannot replace one year's loss in a thousand years. Sediment washing off construction sites in Maryland yielded losses of 670 tons per acre, 36 times the rate of loss on nearby farms and 100 times natural rates. Surface mining near Sheridan, Wyoming, increased erosion elevenfold. Logging near Newport, Oregon, quintupled the amount of sediment carried into creeks.

All that soil out of place causes serious problems. Construction of summer homes around Lake Tahoe has clouded the waters of what was once touted as the clearest lake in the West. Near Salt Lake City, a hillside slid into a residential subdivision after off-road vehicles were allowed to strip it of its vegetation. In Iowa, walleyes and bass, which require clear water, are being replaced by mud-loving carp and catfish. Logging on the edge of Redwood National Park increased the sediment load of creeks to the point that they began to widen, thus undermining the tall trees along their banks. That led to a bitter fight over park expansion. Earl Brabb of the U.S. Geological Survey estimates that landslides cost Americans a billion dollars a year. And there are consequences yet unmeasured. Dust from the San Joaquin Valley storm of 1977 brought valley fever, a potentially disfiguring fungal disease, to the San Francisco Bay area. Clay particles washed off farmlands carry pesticides and herbicides into drinking water.

The loss is most pronounced on the nation's farmlands. On the farms, we are losing more soil than we were losing in the years of the Dust Bowl. The U.S. Department of Agriculture reports that one-third of the nation's cropland is eroding at a rate of more than five tons per acre per year, the "T (or tolerance)

Contour terraces of bromegrass in Iowa hold soil and gently release runoff water.

THE NATURE CONSERVANCY

THE MACLAIN, SOIL CONSERVATION SERVICE

Sediment caused by erosion of fields and construction sites flows into Reelfoot Lake in Tennessee from nearby streams.

value" at which most fields are said to be able to replace soil. The General Accounting Office reports that 84 percent of the nation's farms have losses greater than five tons. In some places, the losses are shocking. In western Tennessee, farms are losing 150 tons per acre per year. In eastern Washington, losses on some farms are said to reach 200 tons. A million acres in the Palouse area of Washington and Idaho are losing an average of 14 tons per acre, or a twelfth of an inch off the top, each year. Some Idaho soils that were originally a foot deep are today only six inches.

Former Iowa Governor Robert Ray says, "For every bushel of corn that we produce in Iowa, we lose about two bushels of soil. It is estimated that the fertile topsoil which once blanketed Iowa like a deep black cover has been reduced from its historic depth of fourteen inches to some six to eight inches in many parts of our state. It takes 250 to 1,000 years to build one inch of topsoil. We have effectively lost soil that took as much as 6,000 years to produce."

The Soil Conservation Service estimates that in 1977, 2.8 billion tons of soil blew and washed off America's croplands, and another 3.6 billion tons slipped away from streambanks, construction sites, rangelands, and forests. The displaced soil clogged drainage ditches, filled ponds and reservoirs, paved streambeds and estuaries with silt, suffocated crops in neighboring fields. It increased the need to dredge and dike against future floods. It carried into the water herbicides and fertilizers, bringing to our household taps chemicals which brawl with the cells inside our bodies.

And perhaps most important, the loss of soil means the loss of agricultural productivity. Says Richard Cruse, professor of agronomy at Iowa State University, "By removing that top layer, we're removing the cream. It's got the most nutrient matter, the best soil structure for aeration, moisture, and temperature. When we remove that, we're substituting the unweathered parent material. Generally such soil has poor aeration, poor infiltration, and poor structure. It just isn't ready for plant growth." In the southern Piedmont, a six-inch loss of soil reduces crop yields by as much as 40 percent. The Department of Agriculture estimates that soil erosion in the past half-century trimmed enough soil nationwide to reduce crop yields by 40 percent. If erosion continues at present rates in the corn belt, corn and soybean yields may decline 30 percent over the next fifty years. Farmers hope to make up for the lost fertility by applying more fertilizer and herbicides. In the past fifteen years, herbicide and pesticide use is up 50 percent, and fertilizer is up 75 percent. But eventually there is not enough soil to hold plant roots and moisture. It becomes too full of clay and too acidic. It may not grow anything.

R. Neil Sampson, executive vice-president of the National Association of Conservation Districts, estimates the current loss from sheet erosion—the movement of soil by water—is equivalent to a million acres of farmland a year. Wind erosion on the Great Plains costs another 250,000 acres. Over the next century, says Sampson, at this rate, we'll lose the equivalent of 62 million acres, an area the size of Oregon and roughly the amount of land we

needed to produce our entire export of food in 1980. Norman Berg, former chief of the Soil Conservation Service, predicts that if present trends continue, world food supplies will be imperiled in less than a century.

Sampson warns that if erosion retires land from food production, there won't be land to replace it. "There isn't any surplus land in the current cropland bags," he says. "Farmers are using virtually all of the cropland they can get a plow into, and using it hard." In 1977, it took America 381 million acres to produce food and fiber to meet its export and domestic needs. By 1997, it will need 440 million acres, assuming improved technology can raise per-acre yields 1.1 percent a year. If technology doesn't improve yields, we'll need 575 million acres. We have only 540 million acres of potential cropland; 51 million of them are now pasture, and 31 million are forest. We may face some difficult choices.

Moreover, says Sampson, we can expect to lose 40 to 50 million acres of current cropland to urban sprawl. He estimates that 320 acres of farmland are urbanized every hour, a rate that by the year 2000 could mean losses equivalent to all the farms in Missouri. In addition, 1,500 acres of rangeland and 2,250 acres of forest are converted to urban use daily. If urbanization continues at this rate, Sampson guesses, we may have only 450 million acres of cropland in the year 2030. And if the soil continues to slip away from the farms, we just won't make it.

It is a worldwide problem. The United Nations predicts that world population will increase from 4.4 billion today to 10.5 billion in 2110. Food demand will triple. The earth could feed all those people if all cultivable land were used efficiently and there were unrestricted movement of the harvested commodities. But that isn't what happens today. And in the rush to produce more food, we are uprooting forests, ravaging marginal lands, and pushing good soils hard. Landslides destroy terraced farms on the hillsides of Nepal as peasants strip the hilltops of firewood, and the silt-charged rivers flood the Indian plains below, washing away grain fields. Lester Brown of the Worldwatch Institute estimates that there is excessive erosion on one-third of the world's cropland. The Global 2000 Report commissioned by President Carter guessed that overuse of cropland and range destroyed six million hectares (nearly 15 million acres) a year, an area about the size of West Virginia, and that the losses were accelerating.

It isn't as if this nation has been ignoring the problem. Since the 1930s, we have built a considerable bulwark of science and bureaucracy to deal with soil erosion. The Soil Conservation Service employs 14,000 full-time workers. There are 3,000 soil conservation districts in America, offering to minister to the owners of almost every inch of American topsoil. They offer scientific advice on how to save soil and money to help farmers get started. The Soil Science Society of America has more than 6,000 members. There are perhaps an equal number of state and local officials charged with solving soil erosion problems. In the past half-century, we have spent $19 billion at the federal level alone to control soil erosion. And yet, the soil keeps slipping away in spring rains, blowing on the winds, falling into creeks. What in the world has gone wrong?

THE PALOUSE of eastern Washington is an immense rolled ocean of hills. The hills are steep. They crest high above you and break away in long, giddy slopes that take your breath to climb and strain your legs to descend. On the crests, there is so much sky that even the birds must feel lonely. It is a treeless, ice-age landscape, which a century ago was carpeted in the green and gold of native bunchgrasses. It still has the vast silence of time. But today the bunchgrass is gone. The sod has been turned over, and the hills

The pollution of Reelfoot Lake begins with runoff from an eroded Tennessee cornfield after a brief but heavy storm.

JIM BRANDENBURG

The catastrophic windstorm of December 1977 in California's San Joaquin Valley sandblasted this fencepost near Arvin. Winds of more than 100 miles per hour carried an estimated 25 million tons of soil from heavily grazed foothills.
Near Lubbock in west Texas, where cotton farmer Larry Shaw inspects his fields during a fierce dust storm, blowing sand from desert farming has nearly buried headstones in a rural cemetery.

are planted in wheat as far as the eye can see.

For thousands of prehistoric years, silt blew into the Palouse from the ancient lakebeds of the Pasco area, where today the Snake River joins the Columbia. The silt blew in unimaginable quantities. It buried the lava flows of the earlier landscape, leaving only a few ragged islands of basalt. In places today the soil is 200 feet deep. But not all of it is productive. "What you're getting your crop off of is the top six feet," says Dusty Eddy, a conservationist with the Soil Conservation Service in Colfax. "And you're producing about 75 percent off of the top eighteen inches. We usually figure two and a half bushels of wheat per acre for every good inch of topsoil. Otherwise, the farmer's getting his yield out of fertilizer."

In February, the hillsides turn emerald green, the color of winter wheat just erupting through the dark-brown soil. It is an excellent baking wheat, and Washington's leading export. But you can see that the land is paying for this greening. The fields have been bared and harrowed to break the clods. The furrows run for miles, up, over, and down the hills. The lines are dictated by the price of fuel and the size of the machines rather than by the contours of the land. There are attempts to run the furrows around the hills, but the fields are vast, and the hills bubble up through them like boiling cream.

"It's really tough to stay with the slope," says Eddy. So, when the rains come in February and March, the furrows rush the water straight down the slopes, gathering it into rills and runnels, gullies and chasms. The gullies spread like cracks across a windowpane. The soil is so yielding that if you press down on it with a thumb, it springs back like fresh-baked bread. A gully in this doughy ground may be three inches across but a foot deep. Below the slopes, where the displaced mud piles, it buries crops. It lumps up to the roads, where the wind from passing cars

shakes it like gelatin. And then it dries into mirror-like playas of silt.

Little by little, the topsoil gets thinner. A tenth of the Palouse, 210,000 acres, has lost all of its topsoil. Another 60 percent has lost from one-fourth to three-fourths of its topsoil. Every year, the rivers carry three million tons of sediment out of the basin.

You can see the loss in what is left behind. In the spring the rivers run the color of fresh cement. Where the hills have been farmed hard, you see the peaks, locally called "clay knobs," standing out rusty red. The slopes beneath them, where the darker topsoils have fallen, are wren-brown. Most of the fences have been taken out to accommodate machines, but where they remain there are dramatic offsets of slope. On the uphill side of a fence, the land may be ten feet higher than it is on the downhill side. Brush at the fenceline traps the soil as it comes down, but tractors move soil away below the fence. Here and there, where the fence has vanished, it looks as if a slip fault has sliced open the slope.

Glen Miller has lived in the Palouse since he was three. Now seventy-seven, he still farms with his children and grandchildren. His farmhouse and barns cluster in a draw out of winter winds, eleven miles west of Colfax. The house is a modest brick building with a sheet-metal roof, ringed by a windbreak of spruce and black walnut. On the road, where his driveway begins, sits an empty herbicide bucket, adorned with a red spray-painted target and several bullet holes. Lining the driveway are fifty large silver yoke bells. Miller is a collector. Nailed to the wall of his workshop are nearly a hundred old tractor seats. Across the driveway, fifty calves stare morosely in a muddy feedlot. In a paddock next to them are three buffalo. Mostly, however, Miller collects farmland. He farms 21,000 acres over a forty-mile radius.

Miller is proud of the size of his operation. "I started in 1942 with zero," he says. In September of that year, he borrowed $3,000 to farm 800 acres. "We paid back the loan in September 1943, and we've been buying ever since."

Behind Miller's house is a hill carpeted in the deep green of newborn wheat. The hill rises steeply 200 feet to a crest from which you can look south into the Blue Mountains, thirty miles away. A dirt track winds up the hill. Gullies four or five inches wide snake up the track, miniature Grand Canyons ten inches deep in places. Miller's farmhand has stuffed them with rocks and old machine parts to try to stop them from grinning wider and sinking deeper. On the hillside to the west, even though Miller has tilled with the contour of the hill, there are freshly washed gullies. The water of a rainstorm overtopped the furrows and carved its way down. If the rills don't get deeper and wider, discing after harvest will fill them in and Miller's machinery will still cross the hillside. But, little by little, the soil will move down the hill.

"Our problem is excessive rains," says Miller. It only rains twenty inches a year here, but, he says, "The rain comes when the ground is frozen and there's very little residue on it to hold

TERRENCE MOORE, OPPOSITE PAGE TOM STACK

In Montana, speculators are breaking up grassland and planting the highly erodible soil in wheat. In California's Salinas Valley, deep furrows form a neat pattern, but plowing bares a lot of soil, and many farmers are switching to no-till practices.

the water. You see the small ditches, maybe two inches deep at intervals of ten inches, from the top of the hill to the bottom. Eventually, your topsoil leaves the top and sides of the hill and moves down. It's a tremendous problem."

Miller is not sitting idly while the soil washes away. "We always contour our ground," he says. "We circle the hill. We don't go up and down. We never use the moldboard plow because that flops the soil over like a pancake. The more residue I can leave on top, the more humus I will have for the plants. And we never burn stubble after it's harvested in the fall. After we harvest, we disc our ground. That throws the dirt first right and then left. Then we follow that with a chisel sixteen inches deep, which leaves furrows four inches in width. That allows the water to penetrate the soil instead of run off."

It sounds simple. But there are complexities. Miller puts most of his land into a three-year rotation. One-third is usually in summer fallow. "It's completely black. Nothing grows on it at all. We seed that in the fall to winter wheat. The following year we put in a spring crop of barley." In summer fallow, the ground is disced to turn the stubble over, then chiseled to pulverize the soil, then herbicided to keep the fields free of weeds. Summer fallow is thought to increase soil moisture by banishing weeds, which otherwise would soak up water. But the bare and pulverized field is vulnerable to wind and rain. Says Eddy, "It's probably the number-one contributor to soil erosion."

"At the present time, conditions are so vicious," says Miller, that some neighbors have gone to a single rotation: wheat in winter and fallow in summer. By "vicious," Miller means that prices have dropped while the costs of production have risen. "Our return is so much out of proportion to the cost of diesel, repairs, or taxes. Last night, I was figuring up my real estate tax. We got about an eight percent increase in our taxes. I've got to get that extra eight percent out of production."

One way to reduce costs, Miller says, is to "move in volume." For example, "We have a man driving a tractor. If he can pull a 90-foot piece of equipment instead of a 50-foot piece of equipment, look at the savings in time and passes across the field." Miller has invested a great deal of money in machinery to make such techniques work. He owns nine $100,000 combines, a small fleet of trucks and tractors, and a spray plane. But a tractor pulling a 90-foot wing of harrows or chisel plows cannot turn as tightly as one pulling a 50-foot wing. When the wider boom is hauled out, the tractor will be that much less able to move with the curves of the landscape, and more furrows will run straight up and down the hills.

One of the costs of production that troubles Miller is the interest he owes the bank for land and machinery. And that is the heart of his soil erosion problem. He farms 21,000 acres; but the only land he owns outright is a pair of cemetery plots. "None of our places is paid for," he says. "They're all under mortgage."

INDEBTEDNESS is a story familiar to farmers. American farming has always been troubled by overproduction, which keeps prices low. The answer has been for the individual farmer to try to produce more and to hope that other farmers will produce less. In 1972, the United States sold grain to the Soviet Union, and the following year Secretary of Agriculture Earl Butz determined that the world market would accommodate the surpluses which had kept prices low. He called upon farmers to "plant fencerow to fencerow." For several years, the price of grain went up as Americans sold overseas and the surpluses declined. It looked like a long-term trend, so the value of farmland rose. And farmers bought more land to take advantage of both higher grain prices and increasing land values. They bought at high interest rates.

They were sanguine. They were eager. The acreage devoted to export crops increased from 50 million in 1950 to 100 million in 1975, to 133 million in 1978. Since 1978, there has been a 39 percent increase in the acreage planted to wheat. One-third of America's farmland is now planted in crops grown for export. Most of the export goes not to feed the world's hungry, but to affluent countries like Japan and Russia, which can afford to buy it.

That expansion, however, caused serious erosion problems. The farmers tore out windbreaks to make more room for crops. They plowed up pastures and banished cows because grain was more profitable than hamburger, and that ended the practice of rotating hay and pasture to rest the land. In Iowa, four million acres formerly planted in hay or pasture were planted in corn or soybeans. Between 1967 and 1977, the land in row crops increased 27 percent nationally, and the land left in hay and pasture dropped 40 percent. Farmers cleared land too steep and dry to farm continuously. Four million acres of dry

rangeland on the high plains have been planted to wheat by speculators who see that once it is planted, they can borrow more money than they paid for the land. In effect, they are using the soil to grow credit.

The expansion had barely gotten under way, however, when the price of grain fell. Foreign competition lowered prices, and then the 1980 boycott of Soviet trade piled huge surpluses in grain elevators. Prices fell to 75 cents below production costs. Meanwhile, fuel and machines cost more, and interest rates stayed high. Farmers found themselves under pressure to squeeze more money out of the land, just to make their payments. They cut up more pasture and bought more fertilizer. Says an Iowa farmer, "A lot of farmers think if they are going to get a low price for their corn, the only thing they can do to maintain their standard of living is plant more acres."

Says Glen Miller, "The only way we're going to be able to stay in the ball game is to keep our production to the nth degree." That means planting land that is steep and prone to erosion. Eddy estimates that farms in Miller's neighborhood average soil losses of ten to thirty tons per acre per year—two to six times replaceable losses. Some of Miller's slopes have lost 100 tons per acre. "He's got some pretty rough ground," says Eddy.

"If I didn't owe anything, that'd be duck soup," says Miller. "I could take these hills and put them all into conservation." He could let them sprout native grasses and graze a few cows on them. "But if we use conservation, I can't meet my payments. In the fall they don't ask you what you got in conservation. Creditors don't care where I get the dollar as long as I pay."

So interlocked are the problems of erosion and bank payments that farmers are often unable to separate them in their rhetoric. "I realize soil is our nation's heritage, and I'm doing everything in my power to conserve the soil and make my payments," says Miller. "I have one wish in life: that the soil that we have purchased remains in my family as long as possible. That's why I'm a firm believer in estate planning."

It is a strange sense of stewardship. Miller will rhapsodize about the soil. "I can take the soil and look at it and get a tremendous satisfaction because you can see everything in it. You can see a beautiful garden. You can see barley. You can see canyons, red hair, fingernails. All that stuff comes from the soil. I came from the soil, and I'm going back to it. I care about soil. It's our God-given heritage. I love it. I cherish it. I relish it."

But while Miller talks, his soil is sneaking away at rates far greater than the land can sustain. If that continues,

A fenceline separating rangeland from an ungrazed highway easement in California's Diablo Range dramatically illustrates the impact of intensive grazing, which leaves soil bare and compacted and vulnerable to erosion during winter rains. In southwestern Nebraska (below), a blowout covered acres in sign resulted from severe overgrazing, then wind erosion.

In California's San Joaquin Valley, a fence is left hanging over a gully cut by the windstorm of December 1977. Less than two months later, another storm of more common intensity blots the midday sun in Bakersfield and whips across denuded fields near Interstate 5, where a sign is whitened by sand.

one side, won't you lose both the productivity and the farm?

"That's the $64 question," he says. "It may go down in years to come. But it's going to take a lot of years, because as your soil erodes at the top, down below more soil is being brought into production. Maybe we'll completely use it up. Either I conserve, myself, as far as maintaining the land and making payments, or I lose the land."

OUR CONFUSIONS about soil erosion aren't merely economic. A large part of the problem is that we don't naturally think about soil. Soil is, to the human mind, an abstraction. When it performs its intended office, it is covered with greenery, invisible, out of sight and mind. When you see soil, it is usually out of place, muddying the water of a flood, tracked onto the living-room carpet, stuck to one's trousers after a slide into home plate. Or it is something dissected and impaired, a road cut sliced through a hillside, its mineral matter stripped of organic life, the mere bones bleached and drying in the sun.

In its proper place, soil doesn't fit the natural shapes of inquiry. It doesn't move. It doesn't have a discernible shape. The minuteness of its constituent particles frustrates the eye. The creatures that dwell inside it are drab and tiny and silent.

There is also a cultural screen between our eyes and the earth. When soil is visible, we think of it as dirt. It is a tradition that comes with the city. Originally, the word "dirt" meant excrement, and "soil," from the Latin *solum*, meant earth or ground. In the eighteenth century, as industrial centers grew and as new distinctions separated urban and rural people, "dirt" began to refer to mud, soil, mold, or earth. And "soil" became a verb, meaning to dirty, to contaminate with filth. In cities, people want to forget their rural roots. City dwellers wish to ride above the unpredictability of the earth and its harvest, because in the city there is already enough uncertainty. So they idealize themselves by wearing white clothing and spit-shined shoes, to show that they are free from the caprices that mire the life of the farmer.

The transformation of soil into dirt was a social change, not a new biological perception. Even before soil became dirt, few people saw deeply into the nature of the ground. Traditional farming is a slash-and-burn business. When you

wear out one plot of land, you move to another. As long as population was sparse, people could get away with shifting agriculture. They didn't think much about soil—if they noticed it at all. Preliterate societies generally classify soils by their color and by what crops grow out of them.

Those categories show only a thin understanding. Soil is lively and extremely varied. There are some 20,000 different soil types in the United States alone, perhaps hundreds of thousands worldwide. They vary by origin, parent materials, age, and climate. There are young soils which, because they have not weathered much, are rich in silicon, iron, and aluminum. There are old soils, like the red soils of the tropics, from which water has borne away most of the soluble aluminum and iron and left behind rust-coloured oxides. There are soils that have been built by exotic processes, such as the midwestern American soils that contain silts blown all the way from Asia.

Soil scientists grasp this complexity by thinking of soils in profile. If you core out a spine of prairie ground and stand it up, you'll see on top a dark, humus-rich "A" horizon nurturing the roots of grasses and the scurrying of worms and beetles. Below that is a lighter "B" horizon. Percolating water has leached out much of its aluminum and iron and carried clay particles down from above. It has less air and water and is more acidic, and so has less of the microscopic life that makes the upper horizon so lively. Below that is a "C" horizon, darker because some of the leached-out metals have come to rest there. But it is poor in organic matter because it lacks air and water. The "C" horizon extends down to bedrock, where the parent material is weathering away. Profiles of different soils show enormous variety of color, texture, depth, and chemical properties.

But to see such a profile is to see an abstraction. For to take a soil profile, you must tear the soil out of its context and look at it sideways. By holding it up to the aridity of air and the power of light, you will destroy much of the life inside it. In time, all that remains are the minerals and the skeletons of the perished.

To see soil as it is, one must think of it from the inside out. One must forgo even the idea of moving through the comparatively airy burrow of mole or gopher. One must shed one's sense of human size and bulk and drop into a lightless world. There will not be the depth, the color, the quickness, the leap and fidget of life on the open plain.

It is, nonetheless, a hospitable world. Soil holds moisture long after the rain has gone. It lets air circulate freely, and a well-aerated soil may be more than half air space by volume. When you pile up billions of grains of sand, silt, and clay, they rest against one another the way ping-pong balls might rest in a carton, with vast amounts of surface area for things to cling to and grow upon. A cubic inch of soil contains acres of surface area, and is inhabited by billions of creatures. And with all its space and air and moisture, soil is chemically active. Clay particles are electrically charged. They attract certain kinds of molecules and foster novel combinations with other kinds of molecules. Scientists study clay particles as a nursery for evolving organic molecules. Some suggest that life itself may first have evolved in the soil, rather than in the sea—that, indeed, as the Bible says, man was made out of clay.

There is movement in this maze of pools and passages. Air sifts through. Water trickles down, bringing minerals and organic matter from decaying leaves and the spent shells of beetles. Ants, gophers, worms, and larvae tunnel through, pushing subsoils up and

In San Jose, California, where a housing development was built on geologically unstable terrain in the foothills, landslides damaged homes and access roads. After repeated repairs, an impassable Boulder Drive was permanently closed.

Iowa farmers Norm Kading (top) and Cliff Stille. "There are, in Iowa, farms so precisely manicured and tended that you cannot find a gully."

pulling topsoils down, mixing and loosening, building ecosystems within ecosystems. Bacteria and fungi float on currents of air through the maze. If you can reduce your sense of scale and color to fit this world, you might compare it to what you would see if you swam over a deeply channeled coral reef. You would see colonies of things, strange shapes and movements sweeping over surfaces, teeming life on the exuberant edge.

You would see hundreds of millions of bacteria. Rod-shaped bacilli form capsules of sticky sugars, which bind particles of clay into barnacle-like clusters. Spherical cocci and spiral-shaped spirilla float among them, swim in ponds, and cling to clay particles. Some bacteria form nodules on the roots of plants, taking nitrogen from the air and passing it on to the plants. Others decompose carbohydrates or fix potassium. There are thousands of species of bacteria in a gram of soil, varied in function but so alike in appearance that a microbiologist may be unable to differentiate species without comparing their DNA. Scientists cannot list the entire bacterial fauna of a tablespoon of earth because once the soil is taken from the ground, its moisture, temperature, and aeration change. Oxygen-intolerant species may vanish and moisture-intolerant species may multiply. Scientists tend to describe bacteria in terms of what they do. Some they infer by the disappearance from the soil of certain carbohydrates or the sudden appearance of nitrogen compounds. Some they know because they cause disease. *Clostridium tetani* causes tetanus, and *Clostridium botulinum* causes botulism.

There are also millions of actinomycetes in a teaspoon of earth. Like bacteria, they are single-celled creatures, but they have rat-like tails with which they propel themselves through the lightless ponds of the soil. Most of them are saprophytic, living off the remains of dead plants and animals. Since they are adapted to life on other creatures, they don't readily grow on agar plates in laboratories, and so were dismissed as unimportant until recent years, when they were found to produce such useful antibiotics as streptomycin and tetracycline. They remain little known. Scientists don't even know how the toxins of disease-causing species work. But their presence is often easy to detect. The sweet aroma of freshly turned soil is the smell of actinomycetes, and evidence that they, like bacteria, are chemical engines, moving molecules from decaying to living plants.

The most abundant soil creatures are fungi. They spread their cottony filaments through grains of sand and clay and silt, binding them together, increasing the soil's ability to hold moisture, and constructing habitat for bacteria and multi-celled organisms. There may be more than 100 meters of thread-like hyphae in a single gram of soil. Fungi have given us medical products such as penicillin. But most fungi are decomposers, breaking apart the tough cellulose and lignin of dead plants, the shells of beetles, or the wings of butterflies, making the molecules available for use by the living.

There is an enormous commerce in chemicals at this microscopic level. That is why the soil is so productive. The fundamental processes of life simmer in the cells of bacteria and fungi. They cook and digest the soups of which we are made, and their interrelationships are exquisitely complex. One creature attacks the cellulose of a dead leaf and breaks apart molecules too tough for other species to dismantle. Another species takes the resulting sugars and turns them into simpler sugars. Yet other species turn the sugars into compounds of carbon or sulfur or potassium that can be used by growing plants. We fertilize the soil to

feed the microbes, which, in turn, tend the plants.

But the exact metabolic pathways are still imperfectly understood. Rachel Carson observed two decades ago, "The critically important subject of the ecology of the soil has been largely neglected, even by scientists." Investigators have tended to unravel the pathways from the top down, from shredded wheat to wheat flour to roots to the bacteria that form nodules on the roots. The unraveling has gone little further than the bottom of the plant.

Our half-knowledge of the soil leaves us with two conflicting views. One is that the earth is the nursery of life—that without the soil, our eyes would not have blossoms or waving fields of grass to gaze upon. Nor would we have food in our bellies or thoughts in our minds.

The other view is that soil destroys what we cause. The soil's ability to consume is immense. The microbes within it reproduce quickly. In one experiment, the number of microbes in a teaspoon of garden soil jumped from 2.4 billion to 3.4 billion in a few hours. With that rapid increase, microbes evolve new forms quickly. Says University of California microbiologist Francis Broadbent, "I guarantee you, if you take a soil sample adjacent to a filling station, you'll find oil-consuming bacteria." Soil, at least theoretically, can consume the insults we pour into it from chemical drums and paint cans.

Soil is where we put things when we no longer want them. When there is waste to dispose of, we toss it into a rubbish heap and let the dirt go to work on it. When our loved ones die, we let the earth devour bones and belly and blue serge suit. We can't see it work. But we know soil robs things of earthly form and energy. We speak of dirt as corruption and decay. We consign to the soil images of death. It is the abode of worms and termites and sightless things.

The two views are a confoundment. Life and death. Hope and decay. It is best not to think too much about the soil. To get things done, we must simplify. And agriculture, up against the complexity of weather and world markets and bankers and seed catalogs, simplifies where it can. It tends to simplify, especially, the natural system with which it must work. Farmers think of soil as it is reflected in the leaves of the plants they cultivate. A purplish seedling means lack of phosphorus in the soil. Yellow leaves mean lack of iron. Lodging in cereals means lack of potassium. It is easier to ignore the microbial middlemen in the soil, to take the life out of it and think of it merely as one of the instruments of production.

And where we are not concerned with growing things, we will not think of soil at all. In California, if one listens, one can hear the ignorance falling off the hillsides of the spreading suburban landscape. California towns were born in the fertile valleys, but they grew quickly, filled the valleys, and climbed the hillsides. It is not exactly a secret that in California the earth moves. Earthquakes are only part of the problem. The hills are steep and the soil on them creeps and slides like skin falling from the ribs of a snake.

In March, as California was wringing itself out from a record wet winter, the streets of San Jose's eastern neighborhoods were muddy. Sandbags were piled at intersections. In storm after storm, the rain poured off the hillsides, carrying tons of silt, which slumped across intersections without regard for the dignity of school buses or shopping carts. It clogged drains and carpeted parking lots with mud. Farther up the hillsides, houses paid a more severe

price. Above San Jose's Alum Rock Park is a subdivision built in the late 1960s. By 1971, it was apparent that the developer had not looked hard enough at the ground. Sidewalks had buckled. Foundations had cracked. Heavy rains slid soil off the hillside in mushy lumps. Utility lines broke. Backyards fell away, leaving homes precariously perched on unanticipated cliffs. One street, Boulder Drive, oozed headlong down the hill. Today, the end of Boulder Drive is an undulating tongue of gray taffy, bubbled and folded and crushed, separated from its main body by fifty feet of gaping crevasse.

The soil will fall off this hillside into Penitencia Creek. The City of San Jose will have to contrive to get the silt out of the creek and keep it from piling in the floodplain below. The floodplain is highly developed. Twenty-acre truck gardens and somnolent farmhouses with sagging porches alternate with the nervous chatter of glass-and-chrome electronics plants in which men and women assemble microprocessors. Nobody in San Jose thought to ask whether there was a floodplain until 1977. As the silt piles on the bed of Coyote Creek, it increases the likelihood of flooding. This year, a levee broke, and the resulting flood left the town of Alviso, where the creeks enter San Francisco Bay, nine feet underwater.

Few California towns have begun to look at ways to reduce landslides. Developers are not required to secure stable building sites. A study done on a 2,700-acre watershed above the town of Saratoga showed that intermittently dry Calabasas Creek dumped more than 12,000 tons of sediment a year into San Francisco Bay. Much of the sediment comes from residential development. It costs the Army Corps of Engineers $32,000 and the county $36,000 a year to take the silt out of sediment basins and to dredge it out of the bay—and that is just the cost of silt from this one small creek. It costs the average homeowner in the watershed $6,700 to stabilize and landscape the soil on his homesite. If he leaves the native vegetation in, he courts the greater danger of brushfire. Households which have no established ground cover face average costs of $14,000. Still, in wet years, the soils beneath the houses expand. Foundations shift. Houses slide downhill.

It's not just a California problem. There are landslides in Boulder and Cincinnati. All over the country, we are building on hillsides without looking at the soil. And if nearly four-fifths of us live in cities, if only 2.4 percent of the population lives on farms, if urban densities increase and gardens shrink, how then will city people know what is going on under the wheat and apples they expect to buy next month at the supermarket?

AS LONG AS man has herded livestock and planted grain, he has plundered the soil. Empires have risen and fallen on the fortunes of the fields. The empires of the Middle East fell when the forests were cut and the hillside soils could no longer hold back the rains. Mayan civilization vanished with its soil. Romans exhausted their own lands and set out to conquer foreign granaries. History is full of lamentations over the abuse of soil. Jeremiah cried, "The ground was chapt, for there was no rain in the earth. The plowmen were ashamed, and they covered their heads. And the wild asses did stand in the high places and snuff up the wind like dragons." Job moaned, "The waters wear the stones. Thou washest away the things which grow out of the dust of the earth and destroyest the hope of man." Plato observed that the mountains of Attica were once "lofty, soil-clad hills," and covered with trees, but had become so barren that they could "keep nothing but bees."

Our own agricultural past recalls a history of bitter farm failures. In 1926, historian Avery Craven traced the collapse of sugar production in the West Indies, tobacco in Virginia and Maryland, cotton in the lower South, corn in the Mississippi Valley, and wheat in the Northwest, all to the overuse of soil. "Men may, because of ignorance or habit, ruin their soils," Craven wrote, "but more often economic or social conditions, entirely outside their control, lead or force them to a treatment of their lands that can only end in ruin." On the American frontier, for example, a woodsman cleared the land and tried various crops until he found one in great enough demand in eastern markets to be worth the costs of transportation, and then he turned his land to the single-minded production of that crop. "The social order," wrote Craven, "has invariably reached the highest degree of complexity in the shortest period of time where the soils have been spent with the freest hand." Always, Craven saw the same pattern. The first settlers cleared the fertile bottomlands, and set high expectations for those who arrived later and cleared the less fertile hillsides. As steeper soils were farmed and uncilled lands vanished, erosion caused yields to decline. The first generation profited. The next generation seemed less blessed.

We think of farming as a way of life, as space and independence and close families. The farmer is apt to think of it as industry. And like industrialists, he is apt to simplify. To keep ahead of the market, he may buy more land and bigger machinery. He may narrow his operations to trim off the industrial fat. He

"Psst! Dump your toxic wastes!"

may give up cows because cows require supervision, while soybeans do not. He stops growing hay to feed livestock. He stops rotating crops. "The farmer is on a treadmill," says writer Frances Moore Lappé. "He has to grow more and more to make the same income. The ideology says produce and you will be rewarded. The truth is grow and you will be rewarded." Farms are increasing in size. One percent of the nation's farms today make two-thirds of the profits. The family farm is fading. By the year 2000, the Department of Agriculture expects 40 percent of the farms to be corporate operations, which tend to concentrate on a single crop.

Writer-farmer Wendell Berry champions small farms because they "tend to be diverse in economy, which is to say complex in structure, whereas the larger the farm the more likely it is to specialize in one or two crops, to have no animals, and to depend on chemicals, purchased supplies, and credit. In agriculture, as in nature and culture, the more complex the system or structure, the more sound and durable it is likely to be. The present industrial system of agriculture is failing because it is too simple to provide even rudimentary methods of soil conservation."

As the soil is used up, the social complexity it has been spent to purchase becomes hard to sustain. Absentee landlords buy up the land to grow tax deductions. Communities decline. Children move west or to the cities. The family farm becomes a literary memory. Farmers and their descendants tend to remember the successes, the 250-bushel wheat, the Green Revolution, the plow that broke the plains. They forget the failures.

We still have, fresh in our minds and in the fiction of John Steinbeck and the photographs of Dorothea Lange, the recent memory of the Dust Bowl. What we remember is the human misery, the long migration west of displaced tenant farmers and sodbusters. We remember their troubled faces and leathery hands, their abandoned and falling farmhouses. We forget the agricultural processes that shook them off the earth. We think of the Dust Bowl as an event of the 1930s. But its roots were established nearly a century before.

Early explorers of the West reported that the Great Plains were too dry to farm. But expansionist dreams crowded their warnings out of the guidebooks. In 1844, Josiah Gregg wondered from New Mexico, "Why may we not suppose that the genial influences of civilization—that extensive cultivation of the earth—might contribute to the multiplication of showers, as it certainly does of fountains? Or that the shady groves, as they advance upon the prairies, may have some effect upon the seasons?" He reported that the older settlers in New Mexico assured him that "rains have much increased of later years," and that the droughts had become "less oppressive." Twenty years later, Ferdinand Hayden suggested in the first report of the "Geological Survey of the Territories" that if settlers would plant ten trees on each quarter-section, they would produce enough rainfall to make the country lush and green. Charles Wilber, a member of the survey, reduced the theory to a slogan. "Rain follows the plow," he declared. "Toiling with his hands, man can persuade the heavens to yield their treasures of dew and rain upon the land. The polished raindrop never fails to fall in answer to the imploring power or prayer of labor."

America was not going to take dry for an answer. In the 1870s, the Great Plains were the empire of the cattleman. But the cows were crowded onto the land too thickly. They ate the grass and consumed the empire. The severe winter of 1886 decimated the herds, and the grass industry collapsed. The small farmers rushed in. By 1890, there were six million of them on the southern plains, a five-state area centering on the Oklahoma Panhandle.

It was droughty. In nineteen 1894, nine out of ten settlers gave up and left. But there was still enough native grass on the ground to hold the soil in place. When the rains returned, so did the settlers. And those who stayed carried off a minor revolution in farm technology. They developed dryland techniques to fit the plains. They plowed deep in the fall, packed the subsoil, let the fields lie fallow in the arid summer months, and left some ground unplanted each year to help restore its moisture. They gave up planting corn and instead raised winter wheat. Their success encouraged them to clear more ground.

When World War I began, the European market for American grain opened wide. The price of wheat went up 250 percent. The government called for more planting and guaranteed a price of at least two dollars a bushel. Plains farmers rushed for their plows. They plowed up a million acres of native grass. Mechanization made it easy. By 1917, there were 200 manufacturers of tractors in America. By 1929, there

"Well, then, perhaps something a little less traditional?"

out of four farmers owned a twenty-horsepower tractor.

Even as farmers bought more land and machinery, the price of grain fell. And lots of farmers found themselves caught between declining prices and the bank loans they had taken out to buy land and machinery. To meet their obligations, farmers on the southern plains sought bigger harvests. They plowed up another five million acres of native grass and planted it to wheat.

No one thought about the soil. In 1909, the chief of the U.S. Bureau of Soils had written, "The soil is the one indestructible, immutable asset that the nation possesses. It is the one resource that cannot be exhausted, that cannot be used up." Soil scientists were little aware, even, of where soil came from. Most thought it was just what happened when bedrock disintegrated. Even George Perkins Marsh did not, in his monumental study of man's effect on nature, single out the loss of soil as a separate and commanding subject.

But at the end of the decade, another drought hit, and it caught the plains with their grass off. It also caught the farmers at the mercy of low prices and big mortgages. The farmers continued to try to outflank fate by clearing more ground. But the winds picked up the dried-out soil and carried it away. In 1934, a storm started in Wyoming, rolled up dust as it swept across the plains, and dumped it like snow on Chicago, Boston, and Atlanta. In Buffalo, the sky darkened at noon. In March 1935, Hugh Hammond Bennett, director of the newly created Soil Erosion Service, stalled a congressional hearing until the dust cloud from a storm in Oklahoma arrived, blotting out the sun. Erosion, he told the legislators, was eating away at all parts of America. It had already destroyed 282 million acres of crop- and rangeland and was gnawing away at another 775 million. Already, he said, "a hundred million acres of the best cropland we have is finished." He warned that unless erosion was halted "it will be impossible to maintain permanent prosperity over large areas of the United States."

WE REMEMBER the human suffering, the rickety trucks bearing dust-ruined sodbusters to California. Fifty years later, New Yorkers and Californians still sneer at Okies for having fallen into a well of hopelessness. We don't remember the causes of their misery. And we don't remember that the essential government program aimed at healing not the migrants but the land. In 1935, Bennett persuaded Congress to pass the Soil Conservation Act, the world's first government program in soil conservation.

The act established the Soil Conservation Service but gave it no regulatory powers. The agency was to work entirely through local conservation districts, in the manner of water and sewage districts. Farmers would become "cooperators," accepting SCS advice and acting independently. Decisions would be made by locally elected commissioners. The lack of power was not due to a lack of conviction that soil erosion was serious. It was due to the complexity of the problem. "No single practice will suffice," declared Bennett. "A physical inventory of the land of the farm should be made, and each acre used in accordance with its adaptability and treated in accordance with its needs." That meant looking at millions of farms, each with different soils, climate, crops, slopes, ownership patterns, and degrees of managerial skill. Fifty years later, we haven't completed the inventory. And the SCS remains alive long after many of the other New Deal agencies have died or been absorbed by newer purposes.

The problem of erosion has never been simple. There is much debate over the most fundamental aspects. For example, experts disagree whether farmers recognize the problem. Says James B. Gulliford, director of the Iowa Department of Soil Conservation, "The farmers realize the need they have and the amount of erosion that's occurring." John Miranowski, an agricultural economist at Iowa State University, adds, "Farmers have a much better feeling for erosion than we've given them credit for." On the other hand, Min Amemiya, Iowa State agronomist, says, "Many farmers think soil erosion is down the road, on another farm." And Peter Nowak, University of Minnesota sociologist, says, "Our research is pointing out that three-quarters of those individuals who say they don't have a problem are exceeding the T values [the rate of natural soil replacement] set for their districts. Farmers underestimate their own soil erosion problems. The evidence is quite clear."

Nowak's surveys show, for example, that only two in a hundred farmers would recognize soil erosion on their own land by lower productivity or by the presence of light-colored soil on ridges. And 38 percent of those surveyed said soil erosion was due to causes, like wind and rain, beyond their control. Nowak says the farmers have for years been shown pictures of gullies, ditches filled with silt, and fenceposts buried in drifted dust. "If I walk out on my farm and don't see those things, I say I don't have a problem. Farmers haven't been taught about sheet erosion."

Sheet erosion—the movement of soil in rain, wind, and runoff—isn't always apparent. A soil loss of ten tons per acre is almost invisible. Says Gulliford, "To get ten tons per acre, all you gotta do is peel off one-fifteenth of an inch. It's a piece about as thin as a dime. You don't see any big gullies out there. But that fifteenth of an inch is the best material. It contains all the best nutrients." And farmers often fail to see the loss of productivity that goes with that layer, because the drop in yield is masked by the use of chemical fertilizers, new hybrid seed, improved planting schemes, and other technological innovations. Says Richard Cruse, Iowa State University agronomist, "If you apply fertilizers, you can take almost the whole top of a hill off and still have productivity."

And a farmer who sees his yield drop is apt to blame the loss on weather, in-

sects, wet soil, late spring, poor seed, inadequate fertilizer. Farming is a complex art, and soil loss is apt to be low on a farmer's list of concerns. Says Cruse, "You can show a farmer what is happening. You can take a dump truck and carry the soil away from his farm. But when the farmer comes back and says, 'I got ten bushels greater than I had a couple of years ago, and fifty bushels greater than my dad had,' you know he's not going to be concerned about erosion."

If education is the problem, no one knows how to solve it. "There is little agreement on what constitutes an educational program in the first place," says Nowak. Farmers get advice from a variety of sources—from the Soil Conservation Service, the agricultural extension services of the land-grant colleges, farm magazines, chemical dealers, neighbors, tradition, and their own experimentation. For fifty years, the SCS has prepared individual management plans for farmers, but fewer than half the nation's farmers have had such plans drawn up. Some farmers are suspicious of any federal officer. Others mistrust agricultural extension agents "because they aren't getting paid for what they produce." Twenty-five percent of Iowa's farmers have never spoken to a local conservation district commissioner, and when Nowak asked some of them why, half replied that they had no reason to meet with one, or that they could handle their own problems. Textbook solutions and farm-magazine articles fall short of solving the problem because all farms are different. Even the backyard fence becomes mysterious and complex when regarded as an educational system. Says Nowak, "There are information cliques in farming communities. A person can find out about an extension program a year before his neighbor who lives across the road finds out."

If an educational system is ever developed, it must deal with almost unimaginable complexity. Farmers vary in their knowledge of agronomy, their managerial skills, and their financial resources. In Iowa, only 40 percent of the farmers own their land, and they account for only 29 percent of the cultivated acreage. About a fifth of the farmers are tenants, whose short-term interest in the land may not urge them to conserve. Farm ownership is changing, and as the family farm becomes a memory, says assistant secretary of agriculture John Crowell, "the traditional motivation of stewardship of the family property for future generations is not as prevalent."

2C-955 10478

Much argument also centers on whether there are economic incentives for a farmer to conserve. Says Miranowski, "Basically, if prices were high and farmers expected them to stay high, there would be a real incentive to conserve soil. If you don't expect prices to stay high, there is an incentive to expand onto marginal lands in thoughts of putting it back into pasture later. In the 1970s, when prices were high, there was a continual decline of investment in conservation, which tends to indicate that the farmer did not view the high prices of the 1970s as a long-term phenomenon." Miranowski expects declining prices in the next few years to convince farmers to retire marginal lands from row crops.

But when prices drop, interest payments stay high, and economic logic may not point to retiring the marginal land. Says Glen Miller, "The only way my family and I can meet our payments is to keep production at the highest." Such things suggest to many observers that the marketplace cannot guide farmers toward conservation. Farmers who don't recognize erosion on their own lands can't be expected to consider its cost. Farmers who live near cities often push the land hard because they expect the farm to be sold for urban development. Speculators in Colorado plow up highly erodible land mainly because planted land gives them increased borrowing power. Federal price subsidies encourage farmers to plant marginal lands to qualify for larger payments in the future. Federal disaster insurance is based on the total acreage planted, and that encourages farmers to hedge their bets on the weather by plowing up pasture. Concludes Gulliford, "If you let the market do it, we'll keep destroying the soil until we run out of food."

Those who feel the marketplace discourages conservation believe farmers deserve subsidies to help pay for soil conservation. Says Gulliford, "The public ought to pay a farmer to take care of his soil." Many would say society already bears the cost of conservation when it provides federal price subsidies. Farmers are paid by the government not to grow certain crops. Until this year, a farmer growing specified crops could set aside 20 percent of his land and receive federal payments equal to what he might have earned by planting that land. For 1983, the subsidy was increased to 50 percent, provided that the farmer accepted payment in surplus commodities, which he could then sell on the open market.

The program, called Payment in Kind (PIK), has been touted as a conservation measure. It was expected to cause one-third of the corn and wheat acreage in America to be zeroed in 1983. But the emphasis was clearly not conservation. There are huge surpluses of wheat, rice, corn, cotton, and sorghum. There is more corn in storage today than was grown in America in 1979. The program aimed to get rid of the surpluses, which hold prices down. It runs only a year, hardly long enough for a farmer to establish a new crop rotation system that includes pasture or native grasses. And farmers can qualify for the subsidies simply by substituting other crops. In California, for example, a cotton grower may plant grapes, even though vineyards are a leading source of erosion in the state.

The PIK program draws attention to conflicting goals at the U.S. Department of Agriculture. On one hand, the department encourages individual farmers to be more productive. To that end, it invests millions of research dollars in high-yielding plants and machinery that will plant and harvest more acres at less cost. At the same time, to fight weak prices, the department seeks to reduce production by paying farmers not to grow certain crops.

Soil conservation has .so often been the stepchild of the effort to reduce production. A year after Congress established the SCS, it passed the Soil Conservation and Domestic Allotment Act, which set up the Agricultural Conservation Program, which pays farmers to shift fields from soil-depleting crops to soil-conserving crops. The ACP also pays farmers part of the cost of installing terraces and check dams to stop erosion. But it has tended all along to concentrate on providing income supports rather than conserving soil, and that has caused tension between the SCS and the ACP. Often, the conflicts are dramatic. For example, in Colfax, Washington, the ACP has helped farmers to buy herbicides for use in summer fallow, arguing that summer fallow reduces overall wheat production and so helps support prices. In the same office, the SCS officials decry summer fallow as the leading cause of soil erosion in the district. Elsewhere, ACP funds are spent to help farmers apply limestone to depleted soils to offset acidity, a practice which many believe merely rewards farmers for abusing their soil.

Designing a program to deal with soil erosion is a complex task. It is apparently more complex than Congress imagined it would be fifty years ago, and possibly more complex than Congress can fathom today. Is the solution, then, to leave the problem to the states? Is the solution to rework the federal programs? Is the solution to leave it to the farmers?

IOWA FARMS are works of art. They clothe the hills in ribbons of bright green and gold. Rows of corn and hay and soybeans run over the undulating landscape. They flow with the gentle curves of nature, drawing your mind dreamily around the hills and valleys. The rows are crisp and distinct, and they tell of pride, confidence, and resolve. The sky is enormous. Clouds walk their shadows over the landscape. Atop a hill, you are an island in a sea of corn, and you feel a space and dominion you do not feel in the city. Here is the visible embodiment of the yeoman's dream, the American farmer's

expansive but tidy coordination with earth and sky. It is harmony and hope, faith and comfort.

Early settlers ventured tentatively out of the forest onto this prairie and found the sod as hard as wood. Only when they pried it open with the moldboard plow, which cut deep and turned the grass under, did they see the wealth beneath their feet. For a century since, Iowa has been heartland, an agricultural wonder. Farming today accounts for at least 80 percent of Iowa's economy. Twenty-six million acres, 72 percent of the surface area of the state, is cultivated.

The intensity of cultivation gives Iowa the highest rate, in brute tonnage, of soil erosion in the nation. Iowa loses 260 million tons of earth a year, an average of nearly ten tons per acre of farmland, enough to bury Chicago twelve feet deep. The soil washes off the steep hills in spring rains. It blows in winter winds off the flat lands of the northern part of the state. Says Gulliford, "There are times when you can drive down the road and hear the particles hitting the windshield."

In the western part of the state, the land is hilly. Fourteen thousand years ago, glaciers slid down from what is now Canada, pulling much of the topsoil with them. As the glaciers receded, the deep silts they left behind were blown on westerly winds that piled huge dunes across Iowa. Wind and water sounded the hills and carved out broad valleys. Near the Missouri River, the silt piled high. Today the hills there are known as the Loess Bluffs, and in places the soil is two hundred feet deep—rich, dark, and well aerated. Farmers there in the past didn't bother to use fertilizers or pesticides. "You just plowed it, planted it, and the grain came up before the weeds," says Gulliford. Plowing was thought to be the essence of Iowa farming, and until the past few years the state Department of Agriculture promoted better farming by sponsoring contests to see who could lay the earth bareest in the straightest rows. But plowing moves a lot of soil. And by the 1930s, not a few Iowa farms were gullied and barren.

You can still see the damage. The tops of some hills are gray, while their slopes are nearly black. The dark topsoil has been moved down, burying the less fertile subsoil. In summer, the corn grows thin and stunted at the tops of such hills. And here and there, farmers still plow up and down the hills. Their fields look industrial and ownedisciplined. And they gully easily. Spring rains can cut up this land dramatically. Last year, near Sioux City, a single cloudburst clawed up gullies three feet deep and carried off as much as 150 tons of soil per acre on nearly a quarter of a million acres.

But there are, in Iowa, farms so precisely manicured and tended that you cannot find a gully. Hilly as western Iowa is, many of the farmers have filled in the ditches, installed underground tile drains, piled up terraces, grafted new skins upon the land so that it looks young and sun-gladdened.

"Welcome to God's country," says Cliff Stille, as he gets out of his pickup.

Stille is sixty-four, but vigorous and straight. Only the rounded belly and the salt-and-pepper gray in his hair give a clue to his age. He wears cowboy boots, a western shirt, and blue jeans, a reminder that this is the beginning of the open West. Sunglasses perch on a sunburnt nose. There are creases at the corners of his mouth, suggestions of disappointments, of cold winters spent talking to cows and dry summers spent talking to bankers. His calloused hands and weathered face tell of hard work, and the work is probably what keeps him looking young.

His 480-acre Macedonia, Iowa, farm unfurls down a hill facing the setting sun, forty miles east of Council Bluffs. He grows corn and soybeans, most of which he feeds to his livestock. He keeps 300 cows and 1,800 hogs. "I'm not one of those rich Iowa farmers," he says. "When my wife and I got married, I gave the preacher my last buck for marrying us. My father-in-law gave her ten bucks, and that's all we had." Stille borrowed $500 from his father to make a down payment on 129 acres near Glenwood and worked for his brother to pay for the use of machinery. In 1941, a tornado tore apart his buildings. He rebuilt. In 1955, he bought the Macedonia farm and started rebuilding it. "It was really run down," he says. "There weren't any good fences. No terraces. Plenty of ditches."

We like to think of farmers sitting in their fields listening to the corn grow. But there are farmers who prefer to think about the lay of their land, its contours and crinkles, the way it rides the Earth's shoulders. Stille is one. He is proud of the way he has sculpted his farm. He has filled in the gullies, gentled the slopes, and built terraces to hold rainwater in place until evaporation takes it away. Stille is a sort of local champion when it comes to terracing. He has twenty-six miles of terraces on his farm, a considerable

investment in earth moving. "Those terraces are improving the shape," he says, as he runs his eye over the graceful curves of his hillsides. "This farm used to be farmed straight north and south. We had ditches everywhere. Now they're filling in."

Stille points toward the southwest boundary of his farm, which is downhill from his neighbor's place. "It was all cut up over there," he says. "It was full of ditches. It took thirty-five cubic yards of dirt per foot of ditch to fill one of them."

HALFWAY ACROSS the state, Norm Kading looks over his 500-acre farm with the same appraising eye. Kading is fifty-nine, soft-voiced and deliberate. The furrows at the corners of his eyes and the sunburn on his cheeks tell of a lifetime in the fields. He was born on the land he farms. His house and outbuildings sit atop a hill three miles east of the Missouri–Mississippi divide, and they look onto a broad vista of rolling hills, broad valleys, and fields of corn and soybeans. "I don't know if it's just this open space," says Kading. "Maybe it's the feeling that there's freedom here and you're not stumbling over people all the time. But there's something about growing up here that stays in your system."

What has stayed in Kading's system is a sense of responsibility to the place. "From the time a farmer gets started to the time he quits," he says, "whatever he has accumulated he has built himself. In a lifetime you know you're kind of building a dynasty. I like to see building up, rather than tearing down. It gives you a feeling of accomplishment. It gives you a sense of being important, a feeling of being of service to God's creation."

Kading has put a lot of effort into building up his farm. "I started right out of high school with contouring," he says. "I was one of the first in this part of the country. I was getting disappointed that the farm was being all cut up with gullies. It got serious in the 1930s and 1940s. Now, I don't think there's a gully on the farm that I can't drive a pickup truck across. We've got waterways in, tile systems in. We're gaining on some terracing work. We're strictly contouring all our planting. We have pretty widespread use of strip crops. And we're getting into no-till rapidly. We're doing pretty much the best we can to whip erosion."

It's an ongoing struggle. "Oh, man, do we get opened up for severe erosion in the spring!" says Kading. "A year ago in May, it was dry, and the land was dry and loose. The twenty-seventh of May came along a real hot, muggy day. We'd had a few rains. The surface was wet. But that afternoon it rained four and a half inches in less than half an hour. There was so much water coming off the land it filled the pond and came over the dam like Niagara Falls. The erosion and the cornstalks and the debris were just sickening to see. It overtopped a new terrace and eroded the crown and washed some of it away."

Both Stille and Kading are commissioners for local conservation districts. Both are drummers for soil conservation, trying to convince their neighbors to work to keep the ground in place. And it is clear that not all of their neighbors see the land as they see it. In winter, when the land seems chalky blue in the sultry light of the stooping sun, you can see the blemishes. Stille points to the end rows of a neighbor's field—strips near the fence where the farmer turns his tractor around. Many farmers plant the end rows after the rest of the field is planted, in order to get more yield from the land. To do so, however, they must run furrows straight up and down the hills. In the field Stille points out, there is a dent in the curve of the hillside. Clearly, a foot of topsoil has washed away from the border of the field.

Kading stops his pickup truck on the road that runs past his farm and looks up the fenceline to the top of a hill. Kading's land is on the uphill side. You can see that the land on his side of the fence is nearly four feet higher than the land on his neighbor's side. The brush growing along the fence is not herbicided, so it traps the soil. Below the fence, his neighbor plows, pulling soil away. "The soil is moving down," says Kading. "Every trip across that hill, the soil is moving down."

Stille points to a neighbor's field and recalls a shower that took so much soil off it that it knocked down Stille's fence and carved a deep gully into his own fields. The neighbor's ridges are light-colored and bare, while on Stille's, stubble from last fall's crop still stands. In the bottomlands of his neighbor's field, the displaced soil is already burying the furrows left by fall tilling. "Whatever work was put on that land has come off that land," says Stille.

In part, Iowa's erosion problems are due to rising costs and declining prices. In part, they are due to progress. Says Kading, "The old practice of contour farming has slipped with some of the farmers. It's so much simpler for a man

with large equipment to go straight across that field." And in part, these problems are due to farmers' not being concerned enough about soil erosion. Kading reports that in Adair County, less than half the acreage is managed according to approved conservation programs, and less than a quarter of the land is adequately treated to control erosion.

Both Stille and Kading concede that they are better able than most of their neighbors to conserve, simply because they started earlier. "We're probably some of the more fortunate people in that we got in and got our land purchased at reasonable prices," says Kading. Stille finished installing his terraces nearly ten years ago. As proud as he is of them, he confesses, "It costs the dickens to put in terraces. It's an insurance policy to guarantee food and fiber for future generations. But it's a project that you're not necessarily going to get your money back on."

Looking around, you can see why some of the neighbors are reluctant to spend money on conservation. You see a lot of empty farmhouses in Iowa. Once-trim two-story buildings now have sagging porches, peeling paint, and boarded windows. Machinery and the economics of scale have favored larger farms. As the old farmers retire, their children are less eager to work the land and less able to make the investment they need to start. Says Kading, "Some old ones don't have a son or daughter who wants to take things over, and they have a tendency to let things run down." Many of those farms are owned by heirs who live in another state and farmed by a tenant who doesn't live on the land; neither party has a long-term interest in the future of the land.

And the young farmer starting out is too deeply in debt to put in terraces or indulge in pastures. "From the time he starts out," says Kading, "a farmer is scrimping and saving to build up that inventory of machinery and land. He's always got places for the money to go, so he doesn't take time off for a vacation or buy a new car. When farmers get together, they'll say, 'Well, I better be getting back to the poor farm.' They might be well-to-do if they sat down and took an inventory of their assets. But it's all tied up. They just don't carry any large bills in their billfolds."

The State of Iowa, seeing that farmers alone can't solve the problem, has developed the most elaborate soil conservation program of any state. The Iowa General Assembly hopes to reduce soil losses to tolerable levels by the year 2000. To this end, it planned to spend $14 million this year on soil conservation. The money goes directly to farmers in the form of grants for permanent practices, such as terraces, drains, and check dams, and into the salaries of clerks in each of the state's 100 soil conservation districts. The state Department of Soil Conservation employs 200 people, including the clerks. They work with 450 federal soil conservationists and approximately 500 locally elected commissioners like Stille and Kading.

While Iowa's hilly terrain and erodible soil clearly need terraces and drains, there is little hope that all the farmers who need them can install them. Says Gulliford, "There are 26 million acres tilled in Iowa, and we've only got soil erosion under control on one-third of them. Like everyone, we're hard-pressed for funds. Last year, our budget for cost sharing was $5.6 million. We could easily use ten times that." He says the district commissioners have grown cautious about talking up the state program because they are afraid that when farmers ask for money and find there isn't enough to help them, they will go away angry and disillusioned.

WHAT IOWA is pinning its highest hopes to is conservation tillage. Conservation tillage is an attempt to conserve soil by keeping plant residues in the ground. The traditional farmer uses a plow to open the soil and eliminate weeds, which compete with crop plants for moisture and nutrition. But weeds also hold the soil in place and absorb the energy of falling raindrops, which otherwise would set soil particles in motion. Conservation tillage keeps a residue of old plant growth on the ground, at least until the crop is established. The purest form is no-till agriculture, in which the farmer leaves cornstalks or wheat stems standing after harvest. He does not plow. In the spring, he slot tills, drawing a knife-like implement across the field to open a narrow incision for planting, or he punch plants, stamping holes into the unplowed ground for seeding. There are a variety of other conservation tillage systems. One may chisel plow, dragging an implement under the surface of the soil to break it apart without turning it over. One may disc stubble into the top layer of the soil. One may chop cornstalks or other residues and strew them as mulch over the surface.

Conservation tillage requires fewer tractor trips across the fields, and so saves labor and fuel. Many farmers have adopted no-till simply because it saves gasoline. But there are problems with conservation tillage. The economic benefits aren't always clear. In Iowa, for example, keeping residues on fields results in a cooler, moister seed bed, in which seeds may take longer to germinate. The farmer may have to switch to short-season varieties of corn, which tend to have lower yields. Some crops don't grow well in their own residues. Corn planted in its own stubble gives lower yields, perhaps because the plant produces toxins which retard the growth of seedlings. And no-till requires farmers to use fertilizer differently. Conventional plowing distributes fertilizer uniformly through the upper layer of soil. No-till concentrates the fertilizer in the upper two inches. It percolates slowly, and in dry years, the crops may have less potassium and phosphorus available.

Many people fear conservation tillage will lead to health and environmental problems, by increasing the use of herbicides and pesticides. Farmers practicing conservation tillage burn the weeds off with herbicides. And the cooler, wetter fields, with the stubble left in, may be more tempting to insects and plant pathogens. A study by Lisa Speer of the Natural Resources Defense Council predicts that herbicide and pesticide use may increase 25 percent or more when farmers take up conservation tillage. With no-till producing less erosion, there may be less pesticide leaving the farms. But, according to research by Maureen Hinkle of the National Audubon Society, total pesticide use may be twice as much in minimum tillage as it could be using traditional conservation practices, such as crop rotations that save soil and discourage insects.

The chief problem with no-till farming, however, is that it is complex. A farmer must know more about weeds, herbicides, planting schedules, seed quality, soil chemistry, and equipment. He must be able to modify conventional machinery so that it doesn't clog with the brush he leaves in his fields. He must time his operations precisely to coincide with changes in soil moisture and temperature, plant development, and weed growth. The complexity is what keeps conservation tillage from being adopted rapidly. Less than five percent of Iowa's farmland is under no-till cultivation.

But, says Kading, "I believe no-till is gaining momentum. In winter, you see fewer and fewer fields with the soil bared, and more and more with the stubble left on." For the last two years, Kading's conservation district has arranged to rent no-till planters to local farmers, and it has convinced the Adair County supervisors to subsidize the cost. And Iowa State University agronomist Gerald Miller says, "The moldboard plow is on its way out. Seventy-five percent of the row cropland is planted without it. That's a major effort." The U.S. Department of Agriculture expects minimum tillage systems to be used, eventually, on half the world's farmlands.

But conservation tillage is not a panacea. "It is not the technological fix that we need, because it is a complex system," says Nowak. "There are more decisions to be made, and the timing is critical. It requires a higher managerial capability." Even under the best of circumstances, it won't work everywhere. It will not compensate for ground that is too steep to be farmed in the first place.

So the more expensive terraces and dams and drains and the less profitable pastures and hay strips are also needed. And the big question is who is going to pay for such practices. Food prices haven't helped the farmer. And government funding hasn't increased to match the increase in land under cultivation. The money spent by the federal government on soil erosion has remained constant in recent years, despite the rapid clearing of land.

Says Kading, "There is a general feeling that the government ought to be concerned enough with soil losses to put up whatever money is necessary to conserve it. I think the funding ought to be unlimited but offered at 50 percent sharing, because handouts are something that are not as valued. After all, farmers are reducing their crop acreage with terraces, and they have to have a maintenance program. So they're being put up at some sacrifice."

And Gulliford says, "In the Dust Bowl days we were losing three billion tons of soil a year. Today we are losing four billion. We are being swept backward with the tide. We're losing ground because we haven't invested the necessary manpower or money. At a national level, we encourage the cheap production of food. We don't value food enough to pay the farmer to put soil conservation practices in place. If you're not going to talk billions at the federal level, you're not even concerned about it."

But spending like that requires a political constituency to woo the money out of Congress. Farmers are reluctant to court legislators because they fear the funds would come with strings attached, regulations governing what crops they can grow and how they can grow them. Where, then, is that constituency to come from?

WE WORRY ABOUT wolves and whales and sea otters and snail darters. But we don't get worked up over soil, even though it is much more an intimacy of our lives. Most of us live in cities, where we are unaware of the problem. We have committees to save butterflies and louseworts, vernal pools and prairie grasslands. But there is no committee to save the Miami silt loam or the Dublin adobe clay.

Movements are built upon ethical values. Most of the logic of soil conservation rests on economic values. Textbooks tell future farmers, "Soil conservation pays. A good soil and water conservation plan results in larger yields per acre." Such statements manacle soil conservation to the idea that soil is, like pesticides and tractors, just another instrument of production, something that can be amended with a little nitrogen or a little terracing. But the economic logic breaks down. In practice, the promised larger yields are a long-term thing, something the farmer may not live to see.

Aldo Leopold, puzzling over why Wisconsin farmers went right back to their old profligacy with the soil once the public subsidies for conservation were ended in the 1930s, held that education wasn't the answer. "The education actually in progress," he wrote, "makes no mention of obligations to land over and above those dictated by self-interest. The net result is that we have more education but less soil." He complained that the soil conservation district "is a beautiful piece of social machinery, but it is coughing along on two cylinders because we have been too timid, and too anxious for quick success, to tell the farmer the true magnitude of his obligations." The farmer's true obligation, Leopold held, was to put soil before profits. What was needed was a new conservation ethic.

More recently, R. Neil Sampson wrote in FARMLAND OR WASTELAND, "We confuse price with value, and money with wealth, and therein lies much of our inability to think straight about the value of land. Land is more than a store of basic wealth—a quarry to be mined for the products needed for

survival, comfort, or pleasure. It is the living, dynamic bridge whereon plants convert solar energy to human food. It spans the gap between death and life, between what was and what is to be." Concluded Sampson, "What is needed in America is a significant change in our attitude toward land," and a new ethic that will "overcome the idea that the rights and privileges of ownership include the right to destroy the land."

But to adopt such an ethic, one must first take notice of the soil, see that it has life and beauty and a character of its own. We accord rights only to things which seem to have personality. And it is rare that a man looks down and sees, beneath his bootheels, something alive and quickening.

I have a friend whose neighbors would be frightened if they heard him talk about the soil. "I love the soil!" he exclaims. "My dream is to have a whole acre that I could go out into and plunge my hands into, up to my elbows. You look at the roots of plants, and you think of how they deal with the soil, how they root through it and hold onto it and drink from it. When a tree falls, it's almost like getting to see a secret you shouldn't get to see. There's this whole life revealed in the roots and the soil clinging to them."

He walks outside at night and lies on his belly to stare into the ground. "If you can get heartbroken over the sight of a turtle trying to climb over a rock, you can love the soil," he says. "There's a tremendous sadness to the soil. A great yearning and longing that you feel when you think about it. There's this whole bank of potential, and it is totally submissive. You'll be walking in the woods and find a jack-in-the-pulpit and you know it is going to go down into the soil and come up again. Think of a toad burying itself. Or of the delicate white seedlings pushing aside the last film of humus to reach the sunlight. Watch a salamander's eye just as it's coming out of the soil. That's wonderful. That's the soil. Any discussion of science, of moisture content or oxygen content, just falls apart when you think about that."

Not many people have looked at soil that way. You can examine landscape paintings from the Renaissance to the present and find few painters who noticed that green things do not erupt out of bare rock. You can search the accounts of anthropologists and find that either they never asked about soil, or their subjects had little to say about it. Soil is as common as air, and apparently as invisible. ❧

Soil scientists have not done much to make it more visible. Most of them approach soil as a tool with which to test chemical and physical laws, or as an instrument of agricultural production. They are chemists, agronomists, or microbiologists first and soil specialists second. They do not urge us to see soil as a living scene, like a mountain meadow or a forest grove.

It takes a generalizing mind with particularizing talent to see the soil as it must be seen if we are to embrace the ethic Leopold and Sampson urge upon us. It takes, in short, an ecologist with an esthetic sense. Such a man is Hans Jenny, eighty-four-year-old emeritus professor of soil science at the University of California at Berkeley. Jenny is small and has a bird-like grace. Born in Switzerland, he retains an accent that suggests the quintessential lecturer. But he has senses other professors lack.

Jenny grew up on a Swiss farm, and he remembers walking behind the plow, breathing deeply the tonsy aroma of newly turned earth. "I saw the thick soil turn and shine in the sunlight," he recalls, "and I knew it was the beginning of new life. Even as a kid I saw it was an important event." That vision led him to become a soil scientist and an authority, particularly, on the way soil forms. He is still flushed with enchantment about the soil. "It breathes. It takes in oxygen. It exhales. Soil is a living system. It is quite beautiful. I have," he confesses, "a soil mystique."

Jenny wants to share that mystique with his colleagues, to make them see the beauty of soil and care for it as they might care for birds and wildflowers. But he knows they tend to look at soil as little more than a substrate with which to exalt mechanical laws.

On a rainy evening in January, Jenny is speaking to a group of soil scientists at the University of California at Davis. The listeners are technicians. They are interested in statements that can be written mathematically—that have certainty. These are flannel-shirted foresters and booted agronomists. But they are scientists, and Jenny speaks first to their facts. He cautions them that when he speaks to such an audience, "I tell people that I think soils are beautiful, and that sort of sets them back. There's always a lot of snickering going on." The audience, obligingly, snickers.

In his high, thin voice, Jenny proposes to show these scientists how beautiful soil is. The lights dim. A slide projector comes on. Jenny displays a picture of himself standing in the dwarf fir forest of the Mendocino coast, among

bogs and leafless scrub. The scene looks like the aftermath of a fire. Jenny explains that his friends in the Sierra Club have been reluctant to try to save this place because they cannot see its esthetic qualities. The problem, he says, is that they have poorly educated eyes.

Jenny now shows pictures of soil profiles, dense black midwestern loams shining with sand and frosted with clay, deep red laterized soils from California's Mother Lode. It is familiar ground to the scientists; they watch with interest. Jenny switches to landscape paintings that hang in American and European museums. There are Mantegnas, Sassettas, Gainsboroughs, and Ruysdaels, but all show scenes of bare rock. "You look for soils," says Jenny. "Again and again, you don't see any."

By now, the audience is growing uncomfortable. They are scientists, and they are not used to Culture with a capital C. It is not something they want to be responsible for. The paintings make them squirm. Some nod off into sleep. Some get up and quietly slip out of the room.

Jenny shows Cézannes and Gauguins. Still, no soil. He shows a painting by Grant Wood, a treeless landscape in Iowa on Arbor Day. In the lower right corner there is a soil profile shown in a road cut. It is, says Jenny, an exception to the general rule of soil ignorance in western painting.

Now comes Jenny's payoff. "There is one great painter of soils," he announces. And he projects onto the screen a painting by the French artist Jean Dubuffet. Dubuffet painted many pictures of soil, he explains. They are detailed observations of the ground with titles like "Humus," "Celebration of the Soil," and "Fear of the Soil." Jenny explains that Dubuffet gets paid $60,000 for such a painting. The scientists look up. Money is more measurable than culture. They laugh.

Finally, Jenny mentions that a German gallery exhibited soil profiles alongside abstract paintings. Clearly, he says, soil does have esthetic qualities. He shows a picture in which a soil profile and an abstract painting hang side by side. There is a filmy aggregate of ocher and charcoal, like making butter and iron shavings. To the right there is a mahogany-like tooth of deep mahogany. It is grainy and rippled. A lady in the audience asks which is the soil and which is the art. Jenny puts it to a vote. Practically everybody identifies the butter and iron shavings as the soil profile. "I congratulate all the soil scientists here," says Jenny with a note of disap-

pointment. "You have picked out nature from abstract art."

Some days after the talk, I looked up Dubuffet's writings to see what he liked about the soil. He wrote, "I cannot help feeling that the things closest to us, the most constantly before our eyes, are also the ones that have at all times been the least perceived, that remain the least known . . . The fact is that these elements, which because they are commonly found everywhere and for that reason do not arrest the eye, fascinate me more than all the others. The voices of the dust, the soul of the dust, interest me far more than the flower, the tree, or the horse because I sense they are *strange*."

Dubuffet proclaimed his art to be "a rehabilitation of disparaged values" and said, "I am obsessed by the idea that there is something both false and unprofitable in looking at things too closely and too long. It is not normal for a human being to stare at objects for the sole purpose of inspecting them and making an inventory of their constituent parts. Such a position in our relation to them seems to me to distort completely the mechanisms of communication that exist between man and the objects around him, the way he perceives them and the way they affect him. Man sees things without trying to see them. While he is looking at one thing, he sees another, as though obliquely."

It has been Jenny's hope that these men and women will see soil as something more than a commodity or a measure of economic and physical laws. He hopes they will discover in the earth something livelier and less instrumental. But there is no resurrection of disparaged values tonight. As Jenny finishes his talk, the scientists applaud politely and warmly. It was nice to see pictures. It was nice to see Culture. But no revolutionary banner unfurls. After the talk, the scientists mill about in small groups, saying good night. I ask several of them whether Jenny's approach may do something to conserve soil.

"I dunno," shrugs one.

"I'm not sure," says another.

"It was interesting to see what was in the paintings," says a third. "I'd never have looked for the soil there." He smiles, as if he were trying to bring into focus the dawning realization that he has misplaced his car keys.

"What will save the soil, then?" I ask.

"As soon as there is no food on their plates, people will start worrying about the soil." ♠

Ms. BABCOCK. Let me now briefly turn to the topic of bays and estuaries. I guess I would roughly start on page 12 of my written testimony.

As you know, even after 11 years of progress, water quality problems continue to plague us nationwide. Our estuaries, those areas where fresh water from the land meets salt water from the sea, are not immune.

The ecological importance of estuaries has become apparent only in the last two decades. The primary productivity of the estuarine system is among the highest recorded for any ecosystem.

In coastal biotic communities, estuaries are the chief source of nutrients. A number of commercially important species, oysters, clams, crabs, shrimp, striped bass and halibut thrive in estuarine habitat.

Because they empty directly into the ocean so that wastes seem to disappear, estuaries have customarily been regarded as limitless reservoirs for dumping municipal and industrial wastes.

We are finding, however, that some estuaries have reached their limit as flushing basins. The results of a 6 year, $28 million EPA study of the world's most productive bay, the Chesapeake, demonstrates this point. And again I would refer you to an article that appeared in the most recent edition of the Water Pollution Control Federation Journal on the Chesapeake Bay called "A Resource In The Balance", in which they summarize the results of that EPA study.

Again, I can provide copies for the record.

Mr. ROE. Oh, yes. At this point, we will enter that into the record, with no objection.

Ms. BABCOCK. Thank you.

[The article referred to follows:]

MONITOR

The Chesapeake Bay

A resource in the balance

The Chesapeake Bay is a delicate balance of freshwater and saltwater, of plants and animals, of farmer and fisherman, of urban sprawl and remote wetlands, of man and the environment. This year marks a turning point, when a gargantuan research effort will be transformed into an active management strategy, and the balance in the Bay can be shifted toward a cleaner, healthier, more abundant resource.

The Chesapeake Bay is one of the largest and most productive estuaries in the world. An estuary is the product of seawater diluted by riverine freshwater, and is the most productive marine environment. The salinity gradients, and the typically complex interactions between river current and tidal flow create a unique habitat that supports a diverse population of aquatic plants and animals.

So rich are the biological resources of the Bay that the Algonquin Indians called it "Chesapiean," the "Great Shellfish Bay." The Bay's 64 000-sq mile drainage basin includes parts of six states and the District of Columbia. The Bay is 195 miles long, between 3.4 and 35 miles wide, and an average of 28 ft deep. There are 50 major rivers that flow into the Chesapeake, six of which contribute 90% of the total freshwater inflow. The largest of these is the Susquehanna River, the headwaters of the Bay.

There are 12 million people in the Maryland–Virginia–Pennsylvania section of the drainage basin. Sixty percent of Virginia's population lives in the tidewater region of that state, only one-third of its total land area. The Bay is a commercial center, home of two of the five major ports in the North Atlantic coast—Baltimore and Hampton Roads. Industrial activities include coal exporting, shipbuilding, manufacturing, and meat, seafood and vegetable processing.

Seafood harvesting and processing are critical to the economy of coastal communities, providing thousands of jobs. The world market for Chesapeake Bay oysters is

second only to those from Japan, and the Bay is one of the largest producers of blue crabs in the world.

The Bay provides a recreational resource unparalleled on the east coast, with 1750 miles of navigable shoreline, and an annual sportfishing value of nearly $300 million. Numerous beaches and safe harbors support swimming and boating activity. The beauty of the region may even begin to rival the Sunbelt as a prime corporate location for major businesses.

What is now characterized as a "moderately healthy estuary" is undergoing rapid and significant deterioration. Decades of piecemeal research were finally coordinated and supplemented with a comprehensive attempt to assess the condition of the Bay and develop a plan to manage this national resource.

The Chesapeake Bay Program

A movement begun in 1973 by Senator Charles Mathias (R-Md.) resulted in the formation of the Chesapeake Bay Program (CBP) as an amendment to the U.S. Environmental Protection Agency (EPA) budget for fiscal year 1976. EPA was charged by Congress to assess the water quality of the Bay, to develop computer models to predict the effect of changes in point source and non-point source pollution, and to make recommendations for beneficial management of the Bay. Of 10 major problem areas, three were selected for in-depth study: nutrient enrichment (eutrophication), toxic substances, and the decline of submerged aquatic vegetation (SAV).

The study, originally funded for 5 years at $25 million, took 6 years and nearly $30 million to complete. The tangible products of the research include: 40 research projects, a primer on the ecology of the Bay, a synthesis of the technical studies, a characterization of the Bay's water quality and resources, and a management plan.

According to Tudor Davies, the director of the CBP until 1982, the primary objective of the program was an integrated approach by federal and state agencies. Davies, impressed by the effective results of the International Joint Commission on the Great Lakes, wanted the program to evolve toward that type of effort. Perhaps the most significant feature of the program is that it was a comprehensive plan to study the entire Bay as a system.

Results of the study

Nutrient enrichment. The nutrients of primary concern in the Bay are nitrogen and phosphorus. Nutrients enter the Bay through a variety of natural (bacterial conversion, plant and animal decay) and man-made sources (agricultural fertilizers, wastewater treatment). Although essential to the health of any aquatic ecosystem, over enrichment can cause excessive algal blooms. Decay of these algae consumes oxygen, and can reduce dissolved oxygen concentrations to harmful levels. Algal growth may also be unsightly and produce unpleasant odors.

The western tributaries (the Patuxent, Potomac, and James rivers), the northern and central main Bay, and two of the eastern tributaries (the Chester and Choptank rivers) are significantly enriched with nutrients. Water quality in the lower Bay is substantially better.The Susquehanna River is the largest riverine (above the head of tide) source of nitrogen and phosphorus, a function of the size of its drainage area and the magnitude of its annual flow. Runoff from agricultural land is responsible for the largest fraction of nutrients from riverine sources, because of the high percentage of land devoted to agriculture and the high unit-area loading of nitrogen and phosphorus fertilizers.

Point sources, discharges from municipalities and industries below

the head of tide, are cited as the major contributors of phosphorus, while nonpoint sources (runoff) contribute the highest proportion of nitrogen. Nutrient loads also vary seasonally. Heavy spring runoff from the Susquehanna makes nitrogen the most abundant nutrient during that season. With the contribution of phosphorus released by the sediments under anoxic summer conditions, phosphorus is most abundant in the summer. Therefore, the study concludes that the limiting nutrient for algal growth—that which is in shortest supply—is phosphorous in the spring and nitrogen in the summer. Nutrient control strategies need to include considerations of nutrient variation by season and by source.

Toxic substances. The study addressed two broad categories of toxic substances, metals and organic chemicals. Both types tend to associate themselves with particulate material, and accumulate in the sediments. Substances in either group may exert their toxic effects directly, or be bioaccumulated in the food chain.

The highest concentrations of metals are in the sediments of Baltimore Harbor and the Elizabeth River. Elevated metal concentrations were also found in the northern main Bay near the western shore. Human sources account for at least half of the total chromium, cadmium, copper, and lead in the Bay. Because metals tend to attach to detritus or silt, increased concentrations frequently exist in water near the surface where biological activity is high, and are readily available for uptake.

Point sources, both industrial and municipal, are the largest sources of metal contamination according to the study. Discharges from Baltimore City and County in Maryland are the most significant, followed by Richmond, Norfolk, and Hopewell, Va. Industrial sources contribute twice the metal concentrations from municipal discharges.

Organic contaminants are most concentrated in the sediments of the northern Bay and Baltimore Harbor. Elevated concentrations also exist at the mouths of the Potomac, the Patapsco, and up to the Susquehanna River. Oysters from around the Bay were sampled and their tissues analyzed for toxic organics. Forty-two compounds at concentrations greater than 50 ppb were detected, particularly in oysters from the James River and Baltimore Harbor.

Human activities account for nearly all the toxic organic materials in the Bay. Almost one-half of the industrial effluents tested in a bioassay produced some mortality in fish or invertebrate test organisms. Toxicity tests showed that the sediments of the Patapsco and Elizabeth Rivers and the northern Bay are potentially the most toxic.

The degree of toxic contamination clearly varies with location in the Bay. In addition, the toxicities of individual metals and organics vary widely. Management of toxic contaminants will probably be based on a priority ranking system which considers the location, the compound of concern, and the organisms potentially impacted.

Submerged aquatic vegetation. A variety of weeds and grasses common to the littoral zone of the Bay are collectively known as submerged aquatic vegetation (SAV). There are about 10 abundant species of these submerged vascular plants, and 10 more that are not as common. The marked decline in SAV observed since the 1960s includes all species in all parts of the Bay.

These plant communities are enormously significant to the health of the Bay for a number of reasons. They are biologically important primary producers, and they provide food and habitat for fish and waterfowl. They also provide protection from predators, and act as a critical nursery ground for the blue crab. They function to physically stabilize the sediments and to control shoreline erosion. In addition, their metabolism chemically buffers the environment from the effects of excess nutrient concentrations.

In 1965, SAV was responsible for 40% of the total primary production in the Bay. By 1975, this figure was only 6%. Although historically, disease has been responsible for short-term or localized declines in SAV density or diversity, disease was not the cause in this case. The CBP report cites studies in other countries that found a positive relationship between deteriorating water quality and decline of SAV. In the Chesapeake, the reduction in SAV correlates with increased nutrient loads and chlorophyll-a concentrations (an indica-

tor of algal activity associated with nutrient enrichment).

Suspended sediment and algal growth contribute to increased turbidity which limits light penetration in the littoral zone. Sunlight, critical to all plant life, is also blocked by epiphytic organisms attached to the surfaces of SAV. Although toxic concentrations of herbicides were at one time thought to be a likely cause of SAV decline, the effects of these chemicals are only significant locally, close to the source.

From research to action

Although the three areas of research chosen as the focus of the technical studies are considered the most serious of the problems in the Bay, they represent a multitude of related concerns—alteration of wetlands, shoreline erosion, effects of dredging, shipping, and boating, shellfish bed closures, and fisheries modification. Effective management of the Bay will depend on development of a program based solidly on available data, but flexible and broad enough in scope to include all of these important aspects.

On October 1, the character of the program changed from research to action. The Chesapeake Bay Liaison Office was established with five permanent EPA positions, and $1.2 million in federal funds. Part of their responsibility is to maintain, refine, and update the computer models and data management systems. It is the largest data base in the world for a single ecosystem, according to Virginia Tippie, CBP director.

The Liaison Office will coordinate all the monitoring activities by the federal and state agencies and academic institutions. They will also assist the states to implement their parts of the management plan.

On September 26, EPA submitted to Congress "Chesapeake Bay Program: An Action Plan," their management recommendations. The recommendations focus on attainment of desired uses in segments of the Bay. By comparing living resource trends to water quality trends, they hope to develop a classification system from which resource objective-based water quality standards can be set. The Action Plan acknowledges the need to consider both point and non-point sources and the assimilative capacity of the Bay. The recomendations include improvement of technological controls through the National Pollution Discharge Elimination System (NPDES). Non-point source controls are presently inadequate, and control of point sources will be directed where lower nutrient concentrations are most needed. If toxic contamination is a potential problem, as with dredge-and-fill activities, specialized control measures may be required.

A similar set of recommendatons are being prepared for submittal to the state governors participating in the December Chesapeake Bay Conference. Five committees are preparing specific recommendations regarding land activities, water activities, fisheries management, habitat preservation, and monitoring. The critical step will be the translation of these recommendations into sound management practices and enforceable regulations.

Perspectives on the Bay program

The key to the success of the Chesapeake Bay Program is that it was designed to be an integrated, comprehensive study. The Bay and its drainage basin—composed of parts of six states and over 150 rivers, creeks, and branches—was considered as one system. In the same way, the people and institutions that participated in the study were coordinated under a single objective. The interests of the various federal, state, and local agencies, and the concerns of watermen, farmers, treatment plant managers, and environmentalists were represented in the process.

Coordinated approach. Tudor Davies feels that these are the characteristics that led to the success of the research effort, and must now be applied to the implementation phase. Davies believes that a "coordinated institutional arrangement is fundamental" to the success of the management program. The governors' conference is a first step toward a viable plan of action. The research effort recognized the separate effects of point and non-point sources on the total system. However, as a practical matter, Davies says that implementation will depend on priority decisions regarding which sources have the greatest impact, and which sources can be controlled most effectively. Recommendations for legislation will have to be made after realistic consideration of the limitations of the regulatory system.

William C. Baker is the director of the Chesapeake Bay Foundation, a privately funded, non-profit environmental organization. Their activities include public education, legal representation for natural resources, and operation of a land conservancy that manages 3200 environmentally sensitive acres. Baker is concerned that the EPA recommendations will focus too closely on the practical, or "do-able." Action which may be desirable, but technologically or financially impossible now, may well be feasible in years to come. He feels it is important to strive for the ideal, and let those responsible for actual implementation, the state agencies for example, determine the priorities. He is gravely concerned that the recommendations will be made as though they were draft regulations.

Baker is very optimistic about the results of the program, and points to the Chesapeake as a textbook example of an estuary. As such, the management of the Bay can serve as a model for other, similar areas such as Galveston, San Francisco, or Narragansett bays. The program also clearly demonstrates the importance of federal involvement to coordinate dialog between the states. Baker feels the

management program can be a model of interstate cooperation. He also stresses that the recommendations should not underestimate public willingness to pay to clean up the Bay.

There is already money available. The 1984 EPA budget contains $4.2 million for implementation, $3 million of which is available as grants to states on a matching basis. A Clean Water Act amendment scheduled for the Senate floor this fall includes $10 million in matching state grants with an additional $3 million for research. It is a long road, however, to authorization and appropriation.

Where to begin?

William M. Eichbaum, assistant secretary for Environmental Programs for Maryland, is likely to be one of those responsible for implementation of the program recommendations. He is impressed with two aspects of the program's approach. The effort was unique among most research studies in that it attempted to assess the relationship between water quality problems and the quantity and quality of living resources in the Bay. He hopes that the issue of toxic contamination will be researched further.

Eichbaum also praises the design of the program that prepared it for the transition to implementation. The Bay program was not designed to produce a report and sit on the shelf, but rather to generate an implementable plan of action. Eichbaum recommends what he calls "legitimate planning" for selecting what to do first. He feels strongly that the emphasis should be placed on the non-point source problem but that action should proceed in stages so that results can be evaluated before further resources are invested.

Austin Librach, director of Environmental Programs for the Metropolitan Washington Council of Governments, points to the success of the cooperative state and federal efforts to control pollution in the Potomac River. The final report on the Chesapeake Bay study specifically notes the substantial improvement of water quality in the lower Potomac River. Librach hopes that the management recommendations will not generalize too broadly from the actual data. He is concerned that the analysis of the data is not yet complete, and that perhaps the research did not go far enough to pinpoint the causes of all the Bay's problems. He stresses that the management plan must avoid "finger-pointing."

The phosphorus issue

Point sources, industrial and municipal discharges, have traditionally been the focus of pollution control efforts. The Bay receives nutrient loading from over 80 industrial discharges, and metal loads from a similar number. There are between 230 and 240 municipal wastewater treatment plants that discharge to the Bay and its tributaries. In 1980 their combined average daily discharge was nearly 1400 mgd. The Susquehanna, Potomac, and James rivers receive by far the most treated wastewater, but at least half the plants in these rivers practice phosphorus removal.

James Borberg, general manager of the Hampton Roads Sanitation District (HRSD), is in charge of eight plants in the Bay area. He supports factual water quality studies such as the Bay program, but is concerned about the tendency for these issues to become emotional. He stresses that a uniform standard for wastewater discharges may not be appropriate. He cites data from the Virginia Institute of Marine Science which he says indicates that light-blocking silt in the water, more than nutrients, may be the limiting factor in algal growth. Furthermore, he says there are indications that the limiting nutrient may be nitrogen in the lower Bay and phosphorus in the upper Bay.

Borberg hopes that if the study recommends what he calls "exotic" treatment (HRSD plants do not use any tertiary processes), that the public will be polled as to their willingness to pay for such treatment. HRSD recycles some of their sludge as fertilizer, and Borberg is concerned that chemical addition for phosphorus removal may effect sludge characteristics and make it unusable. Their reuse program generates income where sludge disposal would increase costs for HRSD.

Other people in the wastewater treatment business would like to see a ban on phosphate-containing detergents. A ban of this type successfully reduced point source contributions of phosphorus in the Great Lakes region. There are two potential benefits, one environmental and one economic. A phosphate ban would reduce the total phosphorus loadings to the Bay without special treatment for its removal. If chemical precipitation of phosphorus were not necessary, millions of dollars a year could be saved at treatment plants by reduced sludge production and chemical costs. Moreover, a phosphate ban would produce an immediate decrease in phosphorus loading. Establishment of a water quality standard or a treatment requirement could take years to produce an effect.

The governors' conference Land Activities Committee, which represents wastewater treatment, among other concerns, plans to focus its recommendations on a need for vigorous nutrient control. In recognition that we have better knowledge of point source control, the committee's recommendations start there. Their goal, says Robert McGarry, former general manager of the Washington Suburban Sanitary Commission and current chairman of the committee, is to reduce overall phosphorus loading to the Bay by 20%. McGarry is aggressively supporting a phosphate ban and hopes his committee will recommend one. A 2 mg/L limitation is proposed for phosphorus from all point source discharges. This level is thought to be practical and rea-

20-955 O—84——192

sonable and likely to contribute significantly to the goal of 20% reduction. The remainder of the reduction would be achieved through non-point source controls.

McGarry praised the Bay program for generating the momentum for improving the water quality of the Chesapeake Bay, but was mildly critical that the results failed to establish a specific quantitative relationship between nutrient concentrations and damage to living resources. He says the committee will recommend that total nitrogen loadings be held to the present level. The EPA 208 planning program will provide the framework for the non-point source strategy recommended by the committee.

Economic incentives

Dan Gill, a farmer from Remlik, Va., is co-chairman of the Land Activities Committee. He has been closely involved with the Chesapeake Bay program for the last 5 years. Gill applauds the research effort, and believes that there is adequate evidence to support the need for expenditure of public funds for nutrient control measures. He is concerned, however, with identifying the source of the problem. Although agricultural land is considered to be the major non-point source of these nutrients, Gill points out that on a per-acre basis, urban use results in much greater loadings than cropland. Gill also stresses the nature of the impact of the different forms of nitrogen associated with point and non-point sources. Municipal discharges are characterized by ammonia as the dominant form of nitrogen. Nitrogen from cropland frequently enters through the groundwater as nitrate nitrogen, which has the potential to be denitrified in the sediments. Ammonia not only functions as a nutrient source but also exerts a significant oxygen demand.

Gill believes strongly that new farming technologies can substantially reduce non-point nutrient loadings. No-till farming leaves residues from previous crops on the soil surface and protects the soil from erosion, as opposed to plowing which continually exposes free soil. New foliage-activated herbicides have been developed that are sprayed at low concentrations and do not go into the soil to be leached or eroded into the water.

George Wolff, a Pennsylvania farmer active in the Bay program, points out that erosion control is not a panacea. Erosion of fertilized soil is the principal mechanism for phosphorus input to the waterways. If erosion is controlled by good soil conservation practice, soil containing nitrogen will be held in place longer—long enough, Wolff fears, to be successfully leached into the groundwater. Wolff emphasizes that erosion control will have to be coupled with careful control of nitrogen application.

Both Gill and Wolff agree that farmers will respond enthusiastically to the economic incentives of agricultural nutrient control. It is certainly in a farmer's best interest to keep his valuable topsoil on his land, together with the expensive fertilizers, pesticides, and herbicides he has applied. Furthermore, it is certainly no advantage to a farmer to apply more of these chemicals than he absolutely needs. Educating farmers about these benefits is likely to be more effective than strapping them with a regulation. Virginia and Pennsylvania both are providing economic incentives to farmers to plant buffer zones of foliage along streams bordering their crops to help stabilize the topsoil.

Controlling agricultural runoff may be easier than controlling that from urban areas, says Gill. In agriculture, one man may control hundreds of acres. He may be easier to motivate to practice pollution control measures than would hundreds of people on half-acre lots. The decline of Bay resources must be recognized as a cost of urban development in the drainage basin.

The importance of toxics

No one depends more heavily on the living resources of the Bay than the watermen. For years they have observed the steady decline in the harvests of fish and shellfish. The results of the Bay program prove that they have not been "crying wolf," says Cranston Morgan. Morgan and his sons run a seafood packing operation in Virginia. Morgan is 64 years old and has made his living from the Bay since 1935. He remembers in the 1950s, Virginia alone produced 3 to 5 million bushels of oysters a year. Now that production figure is down to 600 000. Spot, croaker, perch, shad, and rockfish in the Bay have been reduced significantly. Morgan acknowledges that overharvesting may be partially responsible, together with construction of dams and navigational structures, and pollution. "We have always had runoff, but we had the Bay grasses to help control it. Now we've lost so much shoreline to bulkheads and urban development, it's a direct discharge."

Morgan's main concern is the concentrations of chlorinated organics discharged by municipalities and industries. He says that wastewater treatment plants have done a good job of controlling the chlorine residual in their effluents, but the chlorinated organics formed in the disinfection process are a serious threat to living organisms. He is pleased that the Chesapeake Bay Program evaluated the whole pollutional picture, but feels that the toxics issue was not stressed as strongly as it should be.

Dan Gill described the results of the Bay program as a "snapshot" of the Bay. It is clear that the multitude of groups whose lives and livelihoods are touched by the Bay are satisfied with the results of the program and recognize the need for coordinated action. The goals are obvious. But, as Cranston Morgan put it, "Reducing this to General Assembly action is the name of the game."

Karen B. Carter

Ms. BABCOCK. The Chesapeake Bay may be our most extensively studied estuary, but it is not the only one with serious problems. High concentrations of coliform bacteria have forced the closing of sections of Mobile Bay to swimming and shellfish harvesting.

In San Francisco Bay, localized heavy concentrations of mercury, lead and gold from Silicon Valley pose a significant threat to aquatic life.

There is also strong evidence that pesticides and fertilizers washing in from the Sacramento and San Joaquin rivers are causing infertility in striped bass, resulting in population declines in that species in excess of 50 percent in the last decade.

Our estuaries are also disappearing. Over one million acres has been lost nation-wide since 1960. California recorded a 67 percent decrease in basic estuarine habitat between 1950 and 1967, when indiscriminate filling was finally halted by the State.

Legislation is needed to recognize the importance of estuaries as unique and critical habitat and to help protect them not only from pollution but also from fresh water diversion and overuse, so that their great productive value is not further diminished.

Such legislation to be effective must, first, consider the entire estuarine watershed and all those transitional areas which are essentially influenced by water from an estuary; second: Tackle the transboundary pollution problems that may result when an estuary's water quality depends on the control of pollution in more than one State; three: Provide a management framework under which all States contributing pollution to the estuary and those States affected by that pollution can come together and develop a coordinated enforceable plan to protect the estuary; and fourth: Provide financial assistance to States involved in the cooperative effort so that they may implement pollution control measures, monitor the health of the estuary and the effectiveness of the controls and conduct necessary research.

There certainly are strong parallels between what I'm saying about bays and estuaries and what I said in the other portion of my testimony on nonpoint source pollution.

Section 319 of the Howard bill contains these provisions and therefore it has our support. We specifically support the method of estuarine water quality management proposed in the Howard bill. An estuarine management conference is a practical first step toward coordination of pollution control efforts among sometimes disparate States.

The complex nature of multi-State relationships lends itself particularly to the negotiation process envisioned in the conference concept.

However, development of an estuarine management plan should not be a process that takes place closed to public scrutiny. Accordingly, we recommend that section 319 be amended to add a public participation component in the development of an estuarine management plan.

In addition, we suggest that section 319 be amended to make it clear that the contents of an estuarine management plan be as stringent as or more stringent than existing requirements of law. We are sure that the intent of the section is not to establish a regimen of controls in conflict with or different from what would oth-

erwise be in place in the individual States without this program; but rather, to apply controls that might otherwise not be applied under individual State programs, or to impose more stringent controls than might be implied.

While this is implicit in the language of the bill, we would urge that it be made explicit to avoid any future confusion that might be generated.

We recommend one further step for this committee to consider in the effort to manage and protect our Nation's estuaries. Section 402 of the Clean Water Act should be amended to require that NPDES permits contain a cumulative assessment of the impact of a specific downstream discharge on a downstream estuary.

Although this requirement can again be inferred from the language of section 402, the fact that it is not explicit has resulted sometimes in narrowing the scope of the evaluation of the effect of the discharge to the proximate discharge area.

The result is that while water quality standards in a single tributary may be met, the impact on the downstream estuary may be significant or even unacceptable unless the combined synergistic effect of its many tributary inflows is considered.

Finally, at the risk of stating the obvious, we assume that if there are exiting programs effectively addressing problems in a given estuary, that this program should be in support of those efforts and not require those States to start anew.

An example that immediately comes to mind is the case of the Chesapeake Bay where millions of dollars have been spent to date and work undertaken to develop a plan comparable in many respects to what is recommended here.

Thank you. I would be pleased to answers on both this portion of my testimony as well as on the nonpoint source portion.

Mr. ROE. Dr. Clark.

Dr. CLARK. Thank you, Mr. Chairman, members of the committee. My name is Edwin Clark. I am a senior associate at the Conservation Foundation, an environmental policy research organization here in Washington.

One of the projects we are involved in is an assessment of the off-farm impacts of soil erosion and their costs. I would like to talk to you a little bit today about those.

Recognizing it's late, I think I will summarize very briefly the three major points I made in my written testimony.

The first is that nonpoint source pollution is a very serious problem in the Nation's waterways. It is, by various studies, responsible for 66 to 99 percent of the sediment entering the water, 80 to 92 percent of the nitrogen, 42 to 94 percent of the phosphorus, 49 to 76 percent of the BOD, and up to 98 percent of the bacteria.

Many people underestimate how significant the erosion problem is in the United States. From the 1977 NRI study, some comparisons are interesting. One I like is a comparison in Iowa where for every ton of corn that State produced in 1977, 5 tons of soil eroded from that State's lands.

This is a very significant problem causing very serious problems in many waterways. And many of our waterways will not be able to achieve water quality standards without taking care of nonpoint source pollution.

The second point I wanted to make is that it is very costly. Our study has tried to identify all the different impacts and, where possible, to figure out what their economic costs are. The preliminary results of this study—it is now in its final stages—are that it's costing the Nation somewhat over $3 billion a year from the soil erosion coming off of agricultural and other lands. Much of this cost is experienced in areas that are familiar to people working with water quality, areas like recreational impacts, having to treat drinking water supplies, areas like that.

Much of the cost, though, is experienced in other areas which you may not be familiar with: filling up of reservoirs, increased flood control damages, problems like that. These are all serious problems.

I should also say that it appears to me that our estimates are really very conservative. We have not tried to make estimates for a number of damages for which the attribution of monetary values is very difficult. I think that the total damages could well be twice what we have estimated.

Finally, given the fact that it is a serious problem and that the costs are very high, the question is whether we can or should do something about it.

Here I think the answer is yes we can and yes we should. We certainly have the techniques to control nonpoint sources of pollution in most cases. I think we also have the knowledge about which techniques should be used and where they should be used—again, in most cases.

One item I might point out here which I did not mention in my written testimony is that the first thing we did when we undertook our study was to write to all the 208 agencies to ask for copies of their plans relating to nonpoint source pollution. The most immediate response we got was the return of our letters with addressee unknown in about 10 percent of the cases. There is a lot of information, a lot of work that has been done out there that is being lost because we are not getting on with the job.

We have, over the past three decades, as you are probably aware, spent over $20 billion in the traditional Federal programs to reduce soil erosion. But we are still losing over 2 billion tons of soil a year from our crop land. That indicates to me that, unlike some of the earlier testimony you've heard on this subject, our existing programs are not adequate.

We are going to have to go beyond these traditional programs, and I believe that H.R. 4037 introduced by Mr. Oberstar takes us a good step in that direction.

Thank you for the opportunity to testify.

Mr. ROE. Thank you very much, all of you, for your fine testimony. The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman. Ms. Babcock, I just want to visit with you for a moment on your concern about the estuarine basin.

And I think it's on one of the latter pages—15. Because it came up the other day as well, and it occurred to me—well, the entire estuarine watershed, I think is how you put it.

Ms. BABCOCK. That's correct.

Mr. STANGELAND. Wouldn't Bemidji become a part of the estuarine watershed for New Orleans?

And I understand your concern, and I'm not trying to be facetious or anything. When you look to the last page and your recommendation that an NPDES permit contain cumulative assessment of the impact of a specific downstream discharge on downstrean estuary, that could mean that we would have to go clear to Bemidji and analyze the whole river system for every NPDES permit that we granted, wouldn't we?

It may not be the nightmare that I think it is, but I sense that it can be quite an extreme problem in finally issuing a permit.

Ms. BABCOCK. There is certainly a breadth to my proposal that you have, I think, quite accurately described. And I would certainly hope that a rule of reason would be applied and I'm not talking about when you take a system as large as the one you've just described, accounting for every single NPDES permit that has been issued.

But I know the frustration from having, frankly, litigated cases on the Chesapeake Bay involving the issuance of NPDES permits and being quite concerned about the synergistic effects of that particular discharge with other discharges either from point sources or nonpoint sources entering downstream, and not even being able to look at the water quality downstream as part of the evaluation of the discharge permit that was the subject of the litigation, and feeling that piecemealing was not protecting the resource.

So in both the definition of estuarine watershed you're saying that you really, when you're trying to manage an estuary, that it's critical that you get the major contributors of pollution to that estuary and to reach them you have to move out into the estuarine watershed and pull into the planning process and the management process those contributors.

And you can't do it right now through either the single vehicle of an NPDES permit or looking at an individual State's program for trying to control point or nonpoint sources.

I think what has happened in the Chesapeake Bay is exactly the type of planning model that I was referring to in my description of essential items for an estuarine management program.

When it comes to the more difficult question, say, of issuing an NPDES permit, I would just like to have the discretion both as a representative of a public interest group trying to, let's say, challenge the issuance of a permit, and even more importantly for the administrator who issues the permit to go off the outfall, to go beyond the outfall and look at the water quality far enough downstream and far enough upstream that he can see the effect of the particular discharge on that wider area, and manage accordingly.

Mr. STANGELAND. I can feel sympathy for a downstream State required to clean up water if an upstream State is polluting that water. It's kind of a futile thing. On the one hand I appreciate your comment of the rule of reason, because I think it has to be interjected here, that there has to be some kind of rule of reason.

It's not only clear to Bemidji, but it's clear to Cleveland in that whole watershed. That's a gigantic—that's the whole central part of the United States.

Ms. BABCOCK. You can get most of the United States in some estuarine watershed or another, there's no question about that.

Mr. STANGELAND. Dr. Clark, you make the point that nonpoint sources contribute 80 to 92 percent nitrogen, and up to 94 percent of the phosphorus, 76 percent of the BOD and 98 percent of the bacteria entering our waterways, all nonpoint.

We had somebody testifying, either yesterday or the day before, that while agricultural nonpoint source pollution was a major problem in the overall polluting system, and I hope I'm phrasing this correctly, as far as harming the quality of the water, it wasn't that significant.

I think what would be interesting to know and what I think we have to know is, while these percentages are high of these particular substances entering the waterways, what is the end result of the amount of these substances in the waterway afterward?

If it can be 94 percent, you could still have 1 minute quantity totally in the total water system.

Dr. CLARK. Two comments I might make. One is that those percentages refer to all nonpoint sources, not just agricultural sources. The second one is that if you want to know what the cost of that pollution is, then I would refer you to the study that we are completing which looks at the costs of soil erosion and its associated contaminants.

And that is where we came up with the estimate of $3 billion a year. This is not all in traditional water quality damages as I said. Much of it is in filling up reservoirs, and flood damages, and other damages like that.

Mr. ROE. If the gentleman would yield. I think you are fortifying, Dr. Clark. You are fortifying the testimony from agriculture, in part. The present acceptable water quality standards which we applaud in the revision by Mr. Ruckelshaus does really not speak to the issues of nonpoint source. I just want to get that in there—having to do with, again, the soil erosion and the other issues.

And it seems to me that when we're speaking of nonsource, we have to start to define that more. Because I think the point you were making was extremely well taken. We've had that in testimony, not before this set of hearings, but on the water resources development program, vis a vis the point of filling in of reservoirs, the sedimentation taking place in drainage channels, irrigation channels, and flood control structures.

Dr. CLARK. But there are many types of damages that are associated with water quality criteria. Nonpoint sources, the nutrients and sediment, are killing fish and destroying their spawning areas. They are creating eutrophication in our lakes; they are increasing water treatment costs downstream; they are causing many of these damages which are related to water quality standards.

Mr. ROE. I understand that. Now, what I'm trying to get at is I think we have to look to expanding those water quality standards to get to this issue, you know.

The gentleman from Minnesota.

Mr. STANGELAND. Thank you. You have apparently been here today and have heard the other witnesses. I think the testimony has been that nonpoint source pollution from agricultural runoff is a serious matter. I'm a farmer and, believe me, losing our land is a

serious matter. I think we've had all kinds of other evidence of that in other testimony and in other documents.

It is a concern and there has to be a solution. Hopefully we're moving toward that more rapidly with new technology as far as land management practices on the land. I appreciate your comments.

Dr. CLARK. As I mentioned, one of the things that concerns me is that we will lose the momentum that was created by the 208 process and by some of the other processes if we don't take this next step now.

Mr. STANGELAND. Mr. McGreer, I asked the Agriculture witness this morning about the tremendous changes in agricultural practices and the fact that we don't seem to be able to keep up because we're much more intensely farming the land now. In some ways, after 47 years of a soil conservation program, we seem to be farther behind now than when we started out.

What's happened in silviculture activities over that same period?

Mr. MCGREER. Congressman, I think we have a record of somewhat different experience. I was here this morning and heard the Agriculture response to the question. SCC started out in 1935, and you'll have to appreciate that I was not around then. But I do a lot of reading.

In 1935 or 1940 or 1945 and even 1950, in the West Coast, for instance, the typical way to log was to build a railroad up the stream valley and to cable the logs from the top of the mountain to the stream and haul them out by rail.

We got a little more advanced and industry did that with tractors. If it wasn't taken out by rail, it was brought into the stream; the stream was dammed until it had enough water and enough logs and it was called splashed dammed down the streams.

Now, we've gone from that type of a situation to new technology. We got into a system where we build roads, and haul logs with trucks. We no longer build roads in stream valleys and operate in that kind of a fashion.

It is my personal opinion and I think it's the opinion of all forest hydrologists that the potential problem in silviculture is sediment. And that's what the majority of our best management practices are directed to control. Today we operate truly with best management practices. Roads are designed to reduce the amount of sediment and runoff.

I think we are doing that quite successfully.

Mr. STANGELAND. You stated that 40 States have developed nonpoint control programs. Do you have any information on how they're funded, what kinds of incentives and regulations are involved and how well they're operating?

Mr. MCGREER. Yes, we do, and that will be included in our record. The report prepared by NCASI, our technical arm discusses in greater detail the variety of programs operating at the State level.

Most of those programs are funded internally. They are in place operation, and most of those programs, again, are funded internally by the States, although there are various programs that use, in part, Federal moneys.

My own experience in Idaho right now, we have a Forest Practices Act and rules and regulations which we abide by there, enforced by the State. Right now I'm participating in a team which is composed of various State agencies, some Federal agencies, some interest groups, myself representing the forest industry where we are volunteering our time to actually audit in the field how well the forest industry is performing with respect to management of the land and application of best management practices.

Right now in the whole State of Idaho, we only have five woodland foresters. Half of their time is spent helping the small landowner manage his forests, part of that being, of course protection of public resources like wildlife and water. The other half of their time is spent looking at practices, making sure that the Forest Practices Act is being followed.

I only bring that up to mention to you that there is an example of a State, the level of implementation of at least tracking the BMP program is in some jeopardy because of lack of Federal support.

Mr. STANGELAND. I understand that there are seven State programs which are regulatory. Does the forest products and paper industry have difficulties with those, and if so, what are the potential difficulties with a national program of regulations in the nonpoint area rather than incentives, from your perspective.

Mr. MCGREER. I don't think we necessarily have difficulty with a regulatory program where regulatory program may in fact be necessary.

For instance, most of the regulatory programs are on the West Coast; California, Oregon, Washington, Idaho, where there is a lot of rainfall, a very steep terrain, and there are very high values associated with streams and fisheries and the recreational and commercial values associated with them. Those States chose to go a regulatory route.

On the other hand, particularly in the Southern States of the United States, you have as much as 70 or 75 percent of the entire forested land base that is owned by very small private owners.

In those situations, we don't feel that a regulatory program is the way to go at all. On the contrary, we feel that educational programs, forest extension type of services, where you have an extension agent who is a landowner's friend, and helper, are a much more effective way of insuring good management of the land. This in turn results in good management of water quality.

Mr. STANGELAND. One last question for the panel. You might each want to comment on this. Mr. Ruckelshaus expressed concern that an incentive program might end up being a disincentive to voluntary action from the point of people trying to get in line for money and not doing anything until the money was there in hand.

Would you care to comment on that? What's your perception of that problem? Or isn't it a problem?

Mr. MCGREER. Well, I don't believe that S. 431, or H.R. 4037 are really introducing a very massive program. I don't think we're in danger of spending great amounts of money in those programs. It's certainly not necessary in the silviculture area, No. 1.

No. 2, at least, and again in the case of silviculture, rarely are we actually involved in an incentive program. I really don't see that as a threat to implementation.

Mr. STANGELAND. Ms. Babcock.

Ms. BABCOCK. Yes. I'd just like to amplify on that. I think we heard today very eloquent testimony from regulators, people who have been trying to deal with nonpoint source pollution, recognizing not only the extent of the problem, but their desire to get on with the job of managing the problem.

I would agree that this is clearly not a money program. And therefore, I think the danger is very, very slight that certainly people of good will, as we heard today, would stop whatever they would like to be doing, or are already doing waiting for some trickle down of funding.

I disagree with that concern.

Mr. STANGELAND. I guess I might want to put it in this perspective. Up to this point, there has been virtually no money. But if we were to start a grants program, could that be a disincentive?

Ms. BABCOCK. Well, I think it also reflects a reality situation. There is a flip side to the coin; there is a real need out there for money. In many cases the resources that were there dealing with nonpoint source at a very minimal level under the 208 program have disappeared.

Those resources and people need to be put back. It takes money to make all of that happen.

Mr. MCGREER. Congressman, could I say a couple words on that point?

Mr. STANGELAND. Yes.

Mr. MCGREER. If we regard any Federal moneys as seed money, seed money which could be used to continue to implement existing programs that were developed through 208, I think we should view that as a very constructive use of fairly limited amounts of funds.

Mr. STANGELAND. Dr. Clark.

Dr. CLARK. I would have to concur with my two panelists. I do not see this as a grants program. This is a program to control nonpoint source pollution with some money being given to the States to help them in doing this. But the idea is to come up with a program to do that, and not to get in line for grants.

So, as I understand the proposed legislation, it would not have that effect, and I cannot see it creating disincentives—certainly compared to where we are now.

Mr. STANGELAND. Thank you. No more questions.

Mr. ROE. The gentleman from Minnesota.

Mr. OBERSTAR. Thank you, Mr. Chairman.

I would like to make an observation before I propose some questions. On that matter of the Administrator's testimony and the suggestion that availability of Federal grant funds would be a disincentive to States.

That takes us back 23 years to the veto by President Eisenhower in 1960 of the Federal Water Pollution Control Act amendments which then proposed a matching grant program of 30 percent Federal grants for a total sum of $100 million.

President Eisenhower vetoed it with a message that said that water pollution is a uniquely local blight, and the availability of

Federal funds for grants program will only impede local efforts at clean up.

The history of the water pollution control program since 1960 has disproven rather thoroughly the message of that veto. And I think that we should also dismiss any such statements by the present administration about the availability of Federal grants. It's simply a cover behind which to hide from the obvious responsibility of the Federal Government in an area which is uniquely interstate and uniquely a Federal responsibility.

Sorry I was not here yesterday when Mr. Ruckelshaus was addressing that question.

Mr. STANGELAND. If the gentleman would yield.

Mr. OBERSTAR. I would be happy to yield to my dear colleague.

Mr. STANGELAND. There are those who say that it has been somewhat of an impediment, and I agree with you that the magnitude of the problem and the mandate from the Congress requires that the Federal Government be involved.

But in the case of Bemidji, the biggest impediment was the Federal rules and regulations hampering Bemidji's ability to solve the waste water problem.

Mr. OBERSTAR. That was, however, not the intent of the Eisenhower veto.

Mr. STANGELAND. I understand that.

Mr. OBERSTAR. It was the basis that the Federal grant funds—clearly overburdening regulations and rules have caused delays, no question about it, but not the availability of money. We would not have made the progress we have made today if the Federal Government had not made a massive commitment of funding.

Mr. McGreer, I appreciate your very thorough statement, both your oral and your more detailed accompanying statement, and these two reports which are voluminous and very specific and will provide a substantial data base for the committee as we proceed our review of the pending act.

I noted with some interest your comment that you would prefer the language and approach of the Senate bill on nonpoint source referencing Executive Order 12-372. We had some testimony on that earlier today and something that I want to look into further.

I recall very well the A-95 review authority whose effectiveness had depended more upon who was administering OMB and who were the administrators in the agencies at the time. And I tend rather to trust to specific provisions of law than the comings and goings of Executive orders.

So, I would ask you to consider some language for legislative framework that would incorporate the objectives of that Executive order, and I shall look into it and see what its history has been. We have not had any witnesses who have had any experience with that Executive order thus far.

I certainly would like to know more about it than to trust to some passing concept. But I certainly take note of your concern about ambiguity. We don't want to have a great deal of ambiguity because that does lead to program problems.

You discuss on the last page of your testimony a concern about the grant of authority to an interstate conference, as you put it, unilateral authority to modify existing State permits or plans. And

I can appreciate your concern that existing State permits might be modified.

But as a matter of legislative drafting, since there is no specific grant of authority in the bill, and there would be none unless added at some later time in some subsequent law, should the bill become law, none could be construed.

So there is no authority, no specific grant of authority here to modify any existing permit or plan.

Some States, however, do have regulatory programs for forestry. And I would like you to, if you have an example at the ready, if you could discuss such regulatory plan and how you feel any such conference might affect such a plan, a regulatory program, rather.

Mr. McGREER. Congressman, I think that's probably a question I'm not prepared to deal with. I would have to refer that to the API-NFPA staff.

Mr. OBERSTAR. Could you give us a couple of examples of those States in which there are regulatory programs dealing with forestry and permits that have resulted from such regulatory programs and how your concern would be translated in terms of the conference concept of this bill.

And then we could discuss this matter further to accommodate your concerns.

Mr. McGREER. Certainly.

Mr. OBERSTAR. If you would do that and submit that information to the committee.

Mr. McGREER. We certainly will.

[The information received from Mr. McGreer follows:]

AMERICAN PAPER INSTITUTE,
NATIONAL FOREST PRODUCTS ASSOCIATION,
Washington, D.C., December 13, 1983.

The Honorable JAMES L. OBERSTAR,
Committee on Public Works and Transportation,
U.S. House of Representatives, Washington, D.C.

DEAR CONGRESSMAN OBERSTAR: During the question and answer period following my November 16 testimony before the Water Resources Subcommittee, you asked me to elaborate on, and provide an example of, the concerns I expressed over Section 319(h) of H.R. 4037. You will recall that we supported the special conference approach to dealing with interstate nonpoint source problems. However, we do not believe that the results of such conferences should automatically modify existing state permits and/or plans.

In our view, a better technical understanding of long range transport of nonpoint sources must be collected before States are compelled to adopt the recommendations of an interstate conference, should those recommendations be contrary to existing State efforts. There is also still much to learn about the relationship between the implementation of best management practices and improvements in measures of ambient water quality. We believe that new nonpoint source initiatives should be designed to assist states in implementing best management practices to deal with known nonpoint source problems on priority waterbodies within each state. The interstate conference approach can be useful to develop a consensus for additional action on problems that affect waters in more than one state.

As we read Section 319(h) of H.R. 4037, a downstream State would petition EPA to convene a management conference to address interstate nonpoint source problems. The purpose of the conference would be to develop an interstate agreement to reduce the interstate problem. Each State which contributes to the problem, "shall develop, submit to the Administrator for his approval, and implement" a plan to reduce the level of nonpoint source pollution.

We would be most concerned over a situation where any upstream state does not concur with the findings and recommendations of the interstate conference (which could be dominated by downstream interests). Section 319(h) does not seem to call

for consensus recommendations from the conference. Instead, Section 319(h)(2) appears to create a mandatory requirement that the upstream state "shall implement" the recommendations of the conference. Presumably, this requirement would be subject to the citizen suit provisions of the Clean Water Act.

Your question on November 16 was specifically directed at the impact of proposed Section 319(h) on regulatory state forest practices acts. Using the Columbia River Basin as an example, Oregon and Washington could agree on the need to modify state forest practice regulations in the basin, and put forward this proposal as a recommendation from an interstate conference convened under Section 319(h). The language of Section 319(h) could be read to compel Idaho to modify its own state forest practices rules, whether or not Idaho concurs with the assessment that this is necessary to reduce interstate transport of nonpoint sources. Idaho's refusal to implement the conference recommendation would appear to be reviewable under the provisions of Section 505 of the Act.

During Senate deliberations on the nonpoint source issue, the American Paper Institute and the National Forest Products Association worked with the National Association of Conservation Districts to develop language for an interstate conference provision, emphasizing a consensus approach among affected states. A copy of this proposal is attached. This provision was deleted during Senate Committee deliberations because of concerns over its impact on existing interstate compacts. Consequently, the attached proposal may need to be modified to address this concern.

Please contact me, Mark Rey, or Pat Hill of the API/NFPA staff if you have any questions on the above or attached materials. We look forward to working with you on the Clean Water Act amendments of 1984.

Sincerely,

DALE MCGREER,
Forest Hydrologist, Potlatch Corp.

Attachment.

PROPOSED INTERSTATE CONFERENCE PROVISION

"( ) (1) Where the waters of more than one state are affected by nonpoint source pollution, the downstream state, or states, may petition the Administrator to convene an interstate management conference. The Administrator may convene such a conference in any case where the waters of the petitioning state or states cannot reasonably be expected to attain or maintain applicable water quality standards without additional action to control nonpoint sources of pollution in the upstream state or states.

(2) The members of such conference shall include the Administrator, a representation of each of the states whose waters are affected by a petition filed under paragraph (1) of this subsection, and a representative of each interested federal agency as determined appropriate by the Administrator.

(3) The purposes of any interstate management conference convened in response to a petition filed with the Administrator in accordance with paragraph (1) of this subsection shall include:

(A) to review the plans submitted under subsection ( ) by each state affected by a petition filed under this subsection to assess the impact of the plan on downstream waters of the petitioning state or states;

(B) to recommend priority corrective actions and implementation schedules to the implementations plans of affected states; and

(C) to develop, where appropriate, a comprehensive interstate implementation plan for the control of nonpoint sources of pollution affecting interstate waters.

(4) For any new or revised state or interstate implementation plans developed under this subsection, the Administrator may provide grants pursuant to subsection ( ) of this section.

Mr. OBERSTAR. I do commend you on a very thorough, professional statement and analysis of the program in general and of this pending legislation.

Ms. Babcock, I must say you went through H.R. 4037 with a fine-toothed comb. I give you the electron microscope award for analysis of legislation.

I'll not go through all of the points that you raised. On page 6, though, you suggest addition of language to the bill to authorize

the Administrator to approve programs in part only when there is a determination that such limited plan would make progress.

That is certainly the intent that we would not approve a whole program, but only parts. The purpose of this legislation is to get an implementation going and so we—perhaps you would have some suggestion of legislative language that might accomplish that intent.

Ms. BABCOCK. I would certainly be glad to provide that language later. I don't have it at my fingertips. It's difficult language to come up with.

Mr. OBERSTAR. Yes.

Ms. BABCOCK. I presume that was the intent, and the only reason I frankly made that comment is having worked with a program where, one, partial approval was not part of the program, but was then grafted onto the statute by administrative fiat, and then I saw how that process became somewhat abused.

I had the concern that unless the loophole was closed, the same kind of process might occur here under this program.

So it's an abundance of caution.

Mr. OBERSTAR. On the next page you suggest that States should target streams where the problems are the most serious. And yet in other testimony, we received today, the State of Wisconsin suggested targeting by watershed or area. That has been the thrust of my approach on the nonpoint source, that you can't go farm by farm, or creek by creek, but by watershed.

What would be your reaction to stream approach versus watershed approach.

Ms. BABCOCK. By stream approach, I didn't mean a term of limitation there. I certainly agree with testimony from Wisconsin that you are dealing with a watershed. It's an interrelated series of streams or tributaries. Once again my concern there was that unless there was a clear direction to the States that they ought to be targeting the problem area watershed, you know, in a watershed, or an entire watershed, that there be a specific direction that they pick in their priorities the most serious problems and the problems which can be affected by the application of best management practices.

And it was just a concern to put that kind of a driving standard into the bill as I did not see it, and not really a statement that it ought to be stream by stream as opposed to by watershed.

I certainly favor the broader watershed approach.

Mr. OBERSTAR. You continue to raise a question that where there already is a requirement in Federal law to address transboundary pollution problems, that provisions of H.R. 4037 should not apply. I certainly would have no quarrel with that. If you think there is some ambiguity on that point and have some suggestion of clarification or report language that would so clarify we would appreciate your comments.

Ms. BABCOCK. That, quite frankly, was reacting to a problem that occurred on the Senate side concerning the Colorado situation.

Mr. OBERSTAR. Yes.

Ms. BABCOCK. And I thought rather than losing a very valuable concept but not running afoul of a very legitimate concern, that the application of the multi-State transboundary approach might

disrupt arrangements that were basically solidified in law, you could simply solve that problem by exempting from the application of that section those arrangements.

Mr. OBERSTAR. What is your experience if any exists with this Executive order replacing A-95? That goes to the matter of Federal consistency. I think it's extremely important. I wonder if you have had any experience with this Executive order.

Ms. BABCOCK. When I was in the Government, I did not have experience with that Executive order, but I do have a concern about drafting an Executive order into Federal law.

Does that mean the President can at any point in time rescind or modify the order? If that is the solution, that is going to be applied, as seeming to be the solution they came up with on the Senate side, it should be written carefully enough so that one does not have a constitutional powers problem. You do not want to have a practical problem where conditions have changed; you do not want to be frozen in amber in the process.

Mr. OBERSTAR. I have not seen the exact language or proposed language of the Senate bill, but if you incorporate into law Executive order, then give the Executive the authority to change that order, then you are giving the Executive by fiat authority to change Federal law, and you are abandoning the prerogatives of the legislative branch.

Ms. BABCOCK. Or vice versa. He cannot rescind it because the law governs. I am sure it is something that can be drafted around. I am not sure the concept is a bad one, and this would certainly touch the necessary bases, so you would serve the necessary purpose of identifying the programs and achieving a mechanism to be sure they are consistent.

Mr. OBERSTAR. Perhaps you could review the Executive order and suggest some thoughts of legislative language without reference to a legislative order.

Ms. BABCOCK. I will never again go through one of your bills with a fine tooth comb.

Mr. OBERSTAR. I take note of your suggestion about a limit on planning. Clearly we did not intend for the agency to spend a lot of time on plans to develop an implementation program but to get on with the plans to put these programs into effect.

I am concerned about the demonstration programs and the discretionary use. I know you look with some favor on the Senate approach of giving one-third of the funds to the Administrator for his discretionary use.

My reservation is that on my own creative instincts. In squeezing money out of Federal agencies through the back door of their discretionary authority, I am concerned that we could not get in the front door on their regular program. I am very leery of establishing language slush funds for administrators to use even though I must say I have been very successful in squeezing out the money for my own district, but it is not the best policy.

Ms. BABCOCK. I agree that money that is set aside for discretionary use might be used in a way that might not be 100 percent consistent with achieving water quality goals. However, I think it is a good idea to give the Administrator some discretion which would enable him to reward a State that is making a very good effort to

address a difficult problem. It may be as much psychological as financial.

Mr. OBERSTAR. There are those extraordinary cases. For example, the Red River of the North that flows to Canada. Mr. Stangeland might have some unique problems in his district with waters flowing north and water is frozen in Canada and water does not move in that direction, and you have serious back-up problems. That might be one of the cases where discretionary authority a Secretary or Administrator would use to come in and do something unusual.

Ms. BABCOCK. That would cause the State to apply innovative practices, and they might not otherwise feel comfortable in taking an economic risk.

Mr. OBERSTAR. I would like to have something more limited in scope than proposed by the other body.

Those are the principal questions I have and points I wanted to discuss with you, and I appreciate very much your careful examination of the bill, and I appreciate the comments by all of the panel members. Thank you very much.

Mr. ROE. Thank you very much. We appreciate your being with us today and you have added to our thought processes.

Our next panel will be Ms. Merilyn B. Reeves, second vice president, League of Women Voters of the United States, and Mr. Eben Chesebrough, president, North American Lake Management Society.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF MERILYN B. REEVES, NATURAL RESOURCES COORDINATOR LEAGUE OF WOMEN VOTERS OF THE UNITED STATES

I am Merilyn B. Reeves, second vice-president and natural resources coordinator of the League of Women Voters of the United States. I am here today representing more than 200,000 league members and supporters in 1,300 communities in every State in the union, the District of Columbia, the Virgin Islands and Puerto Rico. Our members have a long history of active involvement in environmental work at the local, State and national levels. We worked hard for passage of the Federal Water Pollution Control Act Amendments in 1972 and the Clean Water Act in 1977, and leagues have been striving for full implementation of these laws since their passage.

The Clean Water Act has been a tremendous success and stands as a monument to Congressional leadership in the environmental field. We urge you to continue that leadership by maintaining the integrity of the Act. Chairman Howard's bill, H.R. 3282, is an outstanding bill that should be enacted by Congress with the one major addition of nonpoint source controls.

Numerous challenges to the law's basic integrity—from attacks on technology-based standards and the pretreatment program to attempts to weaken wetlands protection—will be faced by this committee. In considering proposed changes, we would like to remind the committee that the vast majority of the American public—94 percent—believe the Clean Water Act should be kept as it is or made even stricter, according to a December, 1982 Louis Harris survey.

The League's views on many of the Clean Water Act issues are set out later in my statement. I would like to concentrate now, though, on those measures that need to be taken to improve the Clean Water Act.

After installation of Best Available Technology (BAT) controls, implementation of pretreatment standards, and the construction and operation of a large number of municipal sewage treatment systems, the goals of the Clean Water Act will not have been achieved. This should come as no suprise. When the Act was passed in 1972, Congress knew that pollution from diffuse, nonpoint sources would have to be

controlled. And Congress knew that controls beyond the basic technology standards would be needed to control toxic pollutants. Now, Congress must develop enforceable programs to control surface runoff and to gain additional controls on toxic discharges. In this round of the Clean Water Act reauthorization, the law must not only be protected; it must be strengthened.

Our message to you today is very simple: pollution from nonpoint sources has reached critical stages in watersheds nationwide and Congress must enact an enforceable program to control it.

WHAT IS NEEDED

League leaders from across the country report that nonpoint pollution control efforts are at a standstill. Although state and local governments have identified the seriousness of uncontrolled runoff and have identified best management practices to control nonpoint source pollution, they lack the stimulus of federal leadership that a Congressional mandate would provide.

Through past initiatives mandated by Congress, such as the Section 208 planning program, the National Urban Runoff Program (NURP), and the Chesapeake Bay and Great Lakes regional research and demonstration projects, states have developed a data base and identified workable, practicable control measures.

Now, Congress must state that implementation of nonpoint pollution control measures is essential, not only for protection of water quality, but also for prevention of soil erosion and cleanup of dirty city streets. At this time, there should be no doubt that control of nonpoint pollution is a cost effective investment in the future.

Rep. Oberstar's bill, H.R. 4037, is a commendable first step toward addressing the problem, and my testimony today will focus on how the bill should be improved. But first, let me briefly review the status of the problem.

Nonpoint source problems differ widely from region to region. Farming practices that result in soil erosion vary depending on topography and climate. Construction practices and urban runoff patterns are regionally variable as well. Clearly states and local units of government are in the best position to assess their problems and develop best management practices (BMPs) for their control. However, experience over the last 10 years has shown that state or local governments cannot do it alone and that nonpoint source pollution problems are too severe to continue uncontrolled. It is time for the federal government to step in: to build on the federal investment made and experience gained in the 208 program; to mandate that all state and local governments address their most serious pollution problems and ahve access to the tools and resources they need for success; to ensure that cleanup efforts by one state or locality are not thwarted by poor conservation practices upstream; to promote better coordination among the numerous federal agencies; and to set firm deadlines and establish sanctions for failure to act.

We know what needs to be done. We need effective, enforceable programs and adequate funding. We need carrots and we need sticks. We need to move from planning to implementation.

NONPOINT SOURCE POLLUTION

To appreciate the scope of the federal program needed, a brief review of the facts is in order. The General Accounting Office has estimated more than half of the pollutants entering the nation's waters come from agricultural, silvicultural urban, mining and construction runoff; from saltwater intrusion and subsurface excavations (such as septic tanks); and from activities that cause modification of water flow (dam building, diversion projects, etc.)—in short from nonpoint sources. Some of the pollutants, such as those contained in urban and agricultural runoff may be contaminated with toxic substances and pesticides that can cause severe damage to ecosystems even in small quantities.

The seriousness of the problems caused by nonpoint source pollution is becoming more and more apparent as the nation progresses in the control of pollution from point sources such as industrial and municipal outfalls. In "Environmental Outlook 1980," EPA's Office of Research and Development estimated that the sediment load entering water bodies from nonpoint sources was 360 times higher than that from treated point sources; BOD—5 times higher than treated point sources, nitrogen—4 times higher, and fecal coliform—50 times higher.

Nonpoint pollution affects most areas of the country. A 1977 EPA Report to Congress stressed that of the 246 river basins, 68 percent from the effects of agricultural runoff; 52 percent from urban runoff; 30 percent from mining; and 15 percent from forestry runoff. In a report released in July 1982, GAO listed nonpoint source pollution along with acid rain, groundwater contamination and ocean dumping as major

unresolved issues that must be addressed if key environmental goals are to be met, if progress in environmental cleanup is to be maintained, and if the benefits from the nation's investment in environmental cleanup are to be maximized. A 1983 EPA study concluded that in six of the ten EPA regions, nonpoint pollution is the principal cause of water quality standards violations, and "a national, coordinated commitment" is needed to stem the pollution. I would like to note parenthetically that nonpoint source contribution to water pollution does not argue for relaxing point source control. Instead it indicates that strict controls are needed on all sources.

In 1972, with passage of the Federal Pollution Control Act Amendments, Congress acknowledged the growing nonpoint pollution problems and directed under Section 208 that states draw up plans identifying these sources of pollution and specifying available control measures. Important work was done under 208 in developing data on nonpoint problems and identifying best management practices to curb nonpoint source problems. But most of these efforts came to a sudden halt at the end of the planning stage since there was no federal mandate for implementation. Since the demise of 208, some states and localities have initiated programs to control the most serious nonpoint problems, but it has been a struggle because of the absence of both federal leadership and federal funding. We urge this committee to re-establish federal leadership in this area to shore up existing state and local efforts and to require states to tackle their most damaging nonpoint problems.

I would like to briefly address the two areas considered to be the greatest contributors to nonpoint source pollution: urban runoff and agricultural runoff.

URBAN RUNOFF

The runoff from our city streets contains many harmful pollutants. EPA's National Urban Runoff Program (NURP) sampled pollutants in test urban centers and found lead, zinc, copper, cadmium, asbestos, selenium, nickel, chromium, arsenic, oil and paint. Examples of the problem abound:

Large percentages of the heavy metals occuring in New York Harbor—such as 69 percent of all zinc—come from runoff from New York City streets. (The Comptroller General's Report to Congress, "Cleaning up the Environment: Progress Achieved but Major Issues Remain," July 1982.)

In Dallas, rainwater runoff, particularly in spring and fall, contributes three times a much Biological Oxygen Demand (BOD) as effluent from sewage treatment plants (Comptroller General's Report).

Nationally, urban runoff contributes more suspended solids to our waterways than all the combined sewer overflow plus effluent from secondary and tertiary sewage treatment plants (Director of Arkansas Department of Pollution Control and Ecology).

About one-half of the 127 priority pollutants listed by EPA are found in sampling of urban runoff at one time or another (EPA data, March 30, 1983).

Conventional pollutants found in the urban runoff in every part of the nation include suspended solids, nutrients, coliform bacteria and oxygen demanding materials (EPA data, March 30, 1983).

EPA data show that urban runoff from 22 test sites contributes an annual median loading of 380 kilos per hectare of chemical oxygen-demanding material plus 62 kilos per hectare of biological oxygen-demanding material and 630 kilos per hectare of suspended solids (EPA data, March 30, 1983).

City debris and contaminated dirt wash into streams, but there is another kind of pollution that is a major component of urban runoff: sediment from construction. Each time another highway is constructed or a shopping center is built, more sediment is washed into our waterways. According to "The Nation's Water Resources 1975–2000" by the U.S. Water Resources Council, small construction sites in eastern urban areas increase the soil washed into waterways 5,000 times. Studies in Maryland and Virginia show that urban construction projects add 40–50 tons of sediment per acre to runoff. White Flint Shopping Center in Rockville, Maryland was constructed with proper safeguards to prevent sedimemtation of Rock Creek. This sediment control system trapped 2,600 tons of soil from only one shopping mall!

These sources of urban pollution can be controlled. Street cleaning with vacuum sweepers or other means of picking up debris rather than washing it into sewers will keep many pollutants out of waterways. More frequent and improved trash pick-up service is another comparatively low cost practice. Sediment control ordinances for construction sites that require preservation of natural drainage patterns, and prompt revegetation of disturbed landscapes, and construction of storage basins will keep tons of silt out of streambeds. Practices as simple as moving hay bales around construction sites can reduce runoff significantly.

AGRICULTURAL RUNOFF

Estimates by EPA indicate that the largest nonpoint pollution problem by volume is sediment entering streams, rivers, and lakes: one-half of that sediment comes from soil erosion from cropland. This sediment carries other pollutants such as pesticides, herbicides, excess nutrients, toxic metals, viruses and pathogens. It smothers feeding and spawning areas and it raises stream beds, causing flood waters to reach higher levels.

Soil erosion and its attendant water quality problems are most acute on marginal cropland where erosion rates are highest and where larger quantities of fertilizers and pesticides may be required to make the land productive. Estimates vary, but according to the Department of Agriculture (USDA), 54% of all soil erosion takes place on 10% of the cropland. Most of this cropland is of marginal quality.

Nutrient runoff is a large problem because nitrogen and phosphorus applied to the land ends up in water bodies disrupting their natural ecology. Pesticide runoff can poison receiving waters even in small quantities.

In addition, return flows from irrigation cause special problems with increased salinity or dissolved solids. In western states, where irrigation is extensive, 90 to 100 million tons of salt enter surface waters each year according to the Department of Agriculture. At high levels, salinity can impair future uses of water for irrigation or for drinking water.

There are many methods available to control agricultural runoff. Conservation tillage, terracing, crop rotation, integrated pest management, sediment dams, and less wasteful irrigation systems all are readily available cost-effective means. In some instances, implementation of BMPs will actually result in cost savings to farmers. For example, USDA estimates that more than 15 percent of the fertilizers applied to croplands are washed away wasting millions of dollars each year.

Although the Department of Agriculture does have numerous cost-sharing programs to promote conservation, funding for these programs is low considering the magnitude of the problem. And the resoruces for these programs have been allocated equally throughout the country rather than targeted to those lands with the worst problems—primarily the marginal lands mentioned earlier. We applaud recent efforts of the Soil Conservation Service to rectify these problems. However, even if the benefits of existing programs are maximized, they still will not go far enough.

We realize that farmers today face difficult economic conditions. We are not proposing measures that would add unduly to their burdens. But we do think that new steps should be taken to ensure the future productivity of farmland and prevent further degredation of water quality—two goals that in the long run will perhaps benefit farmers as much as or more than any other segment of the population. One such step is cross-compliance, or making good soil conservation practices a prerequisite for receiving federal subsidies. The federal government should stop giving mixed signals to farmers, encouraging conservation on the one hand and rewarding poor erosion control practices on the other through loans and price supports.

CONTROL OF NONPOINT SOURCE POLLUTION

We believe that Congress must amend the Clean Water Act to create a program to implement controls on nonpoint source pollution. Rep. Oberstar's bill, H.R. 4037, is a good beginning towards stemming the tide of pollutants from surface runoff, but it needs to be strengthened with firm deadlines backed up by sanctions to make the program enforceable. There are four elements of the Oberstar bill that with some adjustments will constitute a workable, cost-effective program:

The bill focuses the nonpoint control program on those water bodies with severe water pollution problems. It applies only to water bodies which fail to meet water quality standards or the goals of the Clean Water Act due to nonpoint source pollution—other areas would not be affected by the program.

The bill requires that management practices be set by the states, with the cooperation of local agencies and organizations. The information developed under Section 208 would assist, but not constrain, the setting of management practices. The practices would originate at the local level rather than being impsoed from Washington, D.C.

The bill provides monetary incentives to states without making the duty to control pollution dependent on the availability of funds. The League supports the provision for providing fifty-fifty cost sharing grants for state costs over and above what the state spent on nonpoint pollution controls in the two years prior to the enactment of the law. The bill should be amended to make clear that the bulk of the money authorized will be targeted for program implementation rather than plan-

ning. The federal government has already committed millions of dollars to planning for planning's sake with the 208 program. The Oberstar amendment should put a cap on such future spending.

In addition, the League believes that the Oberstar bill should be amended to make clear that the major purpose of the federal grants is to finance the administration of state control programs. The amount of funding provided is very limited, and should not be spent to subsidize the actual installation or operation of BMPs. Also, since the amount of funding authorized—up to $150 million—is so minimal, we oppose special set-asides as provided in the Senate bill.

The bill includes a mechanism for the resolution of interstate water quality problems. The bill allows states to petition EPA to convene a management conference of all states which contribute nonpoint pollution to a water body. This section should be strengthened by requiring EPA to assume the responsibility for interstate coordination in the development of enforceable plans for nonpoint pollution control. Experience with past water quality management conferences has proven that the approach needs to be backed up by an enforcement mechanism such as sanctions.

The Oberstar bill needs to be strengthened in several key respects, however, to duplicate the effective strategies employed by the Clear Air Act and other environmental laws.

First, the bill should require that states implement management practices within four years after enactment. Firm deadlines are necessary to force action and four years would provide adequate time for management practices to be put in place. A date certain for compliance is essential if the nation is not to repeat the experience of waiting decades to achieve clean water. The date certain must be within the reauthorization period of the Clean Water Act if the Congress is to meaningfully review progress under the program when the Clean Water Act is next reauthorized.

Secondly, the bill should require federal activities to conform to state BMPs. The bill does require state plans to identify federal programs and financial support for activities that are inconsistent with state nonpoint control plans. But simple identification does not go far enough. The language of this section must be strengthened to make clear that federally funded projects must be fully consistent with state plans and requirements for BMPs. It makes no sense for the federal government to encourage or fund activities which will directly interfere with federal water quality goals and state programs to achieve those goals.

Thirdly, the bill should require EPA to implement a nonpoint control program if the state fails to submit one. This key element is necessary to ensure that national goals are achieved. Without back-up federal implementation, there is no assurance that state programs will be developed. This mechanism is incorporated in virtually every other federal environmental program and has proven to be an effective incentive to prompt action.

Fourthly, to make the program mandatory rather than voluntary, the bill must provide sanctions to deter the possibility of state inaction. The League recommends such measures as withholding construction grants and other federal monies from states that fail to implement controls on nonpoint sources. Water pollution control will not be effective if carried out in a piecemeal fashion. Control of point sources such as sewage treatment plants must be fully coordinated with the state's plan for addressing nonpoint sources. Construction grants and other federal awards should be contingent on the implementation of control strategies for both categories of pollution sources—point and nonpoint—that are impeding progress toward meeting the Clean Water Act's goals.

With these four improvements—deadlines, federal consistency, back-up implementation, and sanctions—the Oberstar bill will make a fine complement to H.R. 3282, the Water Quality Renewal Act introduced by Rep. Howard. The Howard bill makes many of the other changes we are seeking in the Clean Water Act. I would like to briefly outline for the record the League's views on those changes.

H.R. 3282 maintains EPA's existing pretreatment program, which is necessary to protect water quality, prevent costly damage to municipal sewage treatment works, and avoid contamination of municipal sludge. Congress should keep the pretreatment program in place and should reject proposals for variances that would weaken protection against discharges of toxic effluents or would put the costs of control on municipalities rather than on the generators of toxic wastes. Pollution should be controlled at its source, before it goes down the drain. The pretreatment program is not yet fully in place. Let's give it a chance to work.

The requirement for the use of best available technology (BAT) for industrial sources discharging directly into waters of the United States is also a key element of the Clean Water Act. H.R. 3282 preserves this fundamental program. Because of delays at EPA in promulgating BAT standards, H.R. 3282 extends deadlines to re-

quire control of toxic pollutants within three years, after EPA issues industry specific effluent guidelines. This is sufficient time to allow compliance. Because uniform, technology-based standards are at the heart of the Clean Water Act, we are opposed to industry proposals to allow variances from BAT standards.

The Section 404 dredge and fill permit program helps protect wetlands from destruction and H.R. 3282 maintains the integrity of this program. Numerous attempts over the years have been made to scale back protection of wetlands. Wetlands serve as groundwater recharge areas, flood buffer zones, fish wildife habitat, and natural water purification plants. The Section 404 program should not be cut back. Rather, it must be strengthened to make clear that its protective provisions apply to clearing and draining of wetlands and to give citizens the right to go to court to enforce the law.

H.R. 3282 amends the Clean Water Act to incorporate strong language governing water quality regulations. The League supports this provision to prevent any future attempts by EPA to weaken the regulations.

In addition to the nonpoint source controls discussed earlier, there are two other areas where Congress should take affirmative action. The Howard bill's provisions are paramount in our estimation.

Even after industries meet BAT standards, stream segments around a number of major industrialized sites will still suffer serious toxic water pollution problems. H.R. 3282 amends the Clean Water Act to set a time schedule for identifying these toxic hotspots and taking the necessary steps to further limit toxic effluents.

Estuaries are among our most productive natural resources, but many of them are severely stressed. Polluted shellfish beds have been closed and striped bass and other fish populations are in serious decline. The current law does not address these problems. State lack the resources, incentives, and management tools to solve the problems alone. H.R. 3282 authorizes EPA to convene interstate management conferences, to develop master plans to protect estuaries and authorizes funds to implement them, a provision strongly supported by the League of Women Voters.

The Clean Water Act is a federal legislative success story. With a few improvements, such as better control of toxics and implementation of best management practices for nonpoint sources, Congress can ensure that we continue to make progress toward our national goals of attaining fishable/swimmable waters throughout the country.

Statement of Eben Chesebrough, President, North American Lake Management Society

Mr. Chairman and Members of the Subcommittee: My name is Eben Chesebrough and I am president of the North American Lake Management Society (NALMS), a national organization made up of citizens, scientists, lake associations, and water pollution control professionals who are concerned about poor water quality in our Nation's lakes. We are here today to comment on reauthorization of the Clean Water Act and to apprise you of how serious the nonpoint source problem really is across this country. States and EPA know where these problems are. Scientific studies are demonstrating that best management practices can be effective in reducing nonpoint pollution. What is needed is simply the authority and the mandate to implement what we know now. Human lives are being lost, lakes are being destroyed, public drinking water supplies are being threatened, and massive social costs are being borne by the public. Futher generations of Americans will be forced to pay cleanup costs if this issue is not properly addressed.

NATIONAL SCOPE OF LAKE POLLUTION

This Subcommittee is aware that the lakes and impoundments of this Nation are vital not only for their ecological functions in supporting fish and wildlife but also for the economic basis—measured in the billions of dollars—to many local, state, and national businesses. Unfortunately, our Nation is losing the battle to keep its lakes clean and the damage may be irreversible in many cases because of the high cost of cleanup. In 1971, the University of Wisconsin used a questionnaire to survey the extent of lake quality problems in the United States. Based on 40 responding States, 394 problem lakes were identified. More than 300 were reported to have excessive algal growth or nuisance weeds and 7 were noted to have toxics contamination.

In early June 1983, NALMS sent a questionnaire about lake quality problems to each State water pollution control administrator. Thirty-eight States responded with a grim assessment of what has happened to the quality of our lakes and impound-

ments. More than 10 times more problem lakes were found in 1983 than in 1971 and 40 times more lakes—12,000—were reported by the States to be suffering from nuisance growths of weeds and algae. More than 4,200 lakes were identified with impaired use that adversely affects more than 4 million acres of lakes and impoundments. The NALMS survey found that we are also losing the battle against toxic substances. From 7 contaminated lakes 10 years ago, the 38 responding States now have 120 lakes contaminated with toxics. More than 9,000 lakes were reported to be experiencing excessive nutrient loading. Wisconsin, Massachusetts, Minnesota, Florida, Louisiana, and California lead the way with many impaired lakes. The damage that is occuring is staggering and action needs to be taken not before more lakes are lost.

H.R. 3282—THE CLEAN WATER ACT

The Society would like to voice its support for H.R. 3282 introduced by Mr. Howard. Lakes are more susceptible to pollution than flowing waters because of their ability to trap pollutants. Congress recognized this in 1972 and established the section 314 Clean Lakes Program to clean up polluted lakes. While we applaud H.R. 3282 for including a $30 million authorization for section 314, we would like to advise the Congress that this program has almost been zeroed out of appropriations the last three years. As a result, the Nation is not only not restoring its dirty lakes, but we are rapidly losing our cleaner ones. The authorization you provide, if full appropriations are received, should be adequate to support an orderly process for encouraging States to develop their own expertise and authority in lake restoration. Our recent survey indicates they want to do this.

NALMS also stresses the importance of proposed section 10 of H.R. 3282 for protecting our Nation's few remaining wetlands. These wetlands are essential for the production of fish and wildlife, and research has also shown that they are valuable in trapping and assimilating water pollutants so that adjacent and downstream lakes as well as estuaries are protected. These wetlands are useful as treatment systems for point and nonpoint discharges of pollutants.

Section 9 proposes the establishment of an estuary protection program, including the development of water quality standards applicable to estuaries. This is a significant concept that applies to both estuaries and lakes. Estuaries and lakes are different from running waters, and standards developed for running waters are often not applicable. Unfortunately, many States have not adopted numerical criteria applicable to lakes and estuaries. This gap in our Nation's water quality management programs is likely the largest impediment to restoring and protecting water quality in lakes and estuaries.

NALMS members urge this Subcommittee to act in remedying this deficiency by amending section 303(c)(2) of the Act to emphasize Congressional concern for the adoption of appropriate water quality standards to protect different types of waters. NALMS respectfully requests that the following sentence be added to the end of section 303(c)(2): "Such standards shall reflect the inherent differences among running waters, lakes, impoundments, and estuaries and shall contain appropriate numerical criteria to protect the designated uses os such waters." In the absence of such a Congressional mandate, States will likely not adopt specific numerical criteria to protect these sensitive lakes and estuaries.

Such specific numerical criteria can be successfully adopted as standards and have been used by a limited number of States. The State of North Carolina has a water quality standard of 40 ug/1 of chlorophyll *a* to delineate waters which may be experiencing accelerated eutrophication and a nutrient sensitive waters classification that gives the water quality regulatory agency authority to require abatement of point and nonpoint sources of nutrients. North Carolina has used this to initiate clean up or protection of one estuary and two lakes in three different river basins. A description of the process is included in a paper presented at a recent conference sponsored by NALMS and the U.S. Environmental Portection Agency (EPA) and transmitted to Congress by EPA under section 304(j) of the Clean Water Act. The paper is included as Attachment I to this testimony. A congressional mandate, however, is needed to gain State adoption of specific water quality standards that are designed to protect lakes and estuaries.

Also, we recommend that the Congress ask for a report from EPA on the status of lake quality in the United States. The report should be sufficient to allow Congress and the American public to understand the magnitude of the pollution loading to our freshwater lakes, how this loading has changed over the past 10 years, and the consequences of such pollution both economically and ecologically to our fragile lake resources.

The Congress should ask for this report within one year of reauthorization and should provide a separate authorization for it under 304(j) of the Act. We recommend that the authorization for this report be $1 million.

H.R. 4037—NONPOINT SOURCE POLLUTION

A national program to control nonpoint sources is desperately needed to mitigate economic damage caused by the pollution, to restore designated uses, to protect water quality for future generations, and to preserve valuable land and water resources. Because of nonpoint source pollution, human lives are being lost, lakes are being destroyed, public drinking water supplies are being threatened, and massive social costs are being borne by the public. This Subcommittee has heard that an estimated $3 billion of economic damage is being caused by sediment each year. Of the over 6 billion tons of eroded soil reaching our waterways, about three-quarters comes from agriculture land. In a latter part of this testimony, we provide some specific examples of damage to lakes that has occurred because no national, enforceable program exists to control diffuse pollutants. The damage is staggering and more lakes will be lost if a strong national program is not established.

NALMS supported the original Durenburger-Chaffee concept, but we are reluctant to support the revised, substantially weakened bill, S. 2006. We support H.R. 4037 and do so with recommendations for several revisions to strengthen Mr. Oberstar's proposal. However, our support is given with the realization that the mechanisms proposed in H.R. 4037 may not be sufficient to restore water quality so that standards and designated uses may be attained.

This Subcommittee is aware that 10 years ago a change in Federal policy encouraged farmers to plant "fencerow to fencerow" to feed the world's hungry. Cropland devoted to producing crops for export has increased about 300 percent to about 150 million acres over the last several decades. About one-third of our farmland is planted in crops for export. This Federal policy, the Federal commodity set-aside program, and other programs provides disincentives for nonpoint control. In fact, they provide Federal subsidies for and consequently reward farmers who plow marginal land and cause nonpoint source problems. H.R. 4037 will provide help to some waters, but Congress will not make an appreciable dent in this Nation's serious nonpoint problem until the Federal government provides leadership. It could do so by ensuring that its programs do not cause—and certainly do not promote—nonpoint source pollution and by utilizing the potential loss of Federal grants as an inducement for States to achieve and maintain water quality objectives.

While nonpoint sources are causing critical water quality problems across the Nation, research and demonstration projects have shown that cost effective abatement strategies do exist and are workable. A subsequent portion of this testimony highlights some recent success stories. This Subcommittee is trying to work toward a legislative solution that has a chance of passage and NALMS commends you for that. Pollution loads to some lakes will decrease with passage of H.R. 4037 and we support it with the following revisions for strengthening and focusing its approach. Without these revisions, we fear that the approach is too open-ended and that public funds may not be spent in the most cost-effective manner.

In several subsections, H.R. 4037 states as its purpose reduction of the level of pollution from nonpoint sources. Reduction of some pollution without attaining standards or restoring designated uses will prove to be a waste of the taxpayer's money. NALMS recommends that the criteria set out in 319(a)(1)(A), i.e., attaining standards and achieving designated uses, be considered as the water quality objective of the bill, not just some reduction of pollution. This water quality objective should be inserted in sections 319(a)(1)(D), (b)(1)(A), (b)(2)(B), (b)(2)(D), and (h). Specific wording is included in Attachment II.

Mr. Oberstar's bill suggests in section 319(b) that each State should submit one plan for all the nonpoint work that it proposes to undertake. Such a plan, not focused or tailor made to each river basin or watershed needing abatement, may spread resources too thin to achieve water quality objectives. NALMS recommends that a priority area implementation plan, with specific milestones toward achievement of water quality goals, be prepared for each watershed or river basin that has a priority nonpoint source problem and that these implementation plans then become part of the State plan under 319(b). Resources should be targeted or focused on the sources of concern in the watersheds, not statewide and not on all nonpoint sources. This approach is essential for achieving cost-effective use of public funds and for restoring suitable water quality to support designated uses. NALMS recommends a new section 319(b)(1)(C) be included with wording similar to the following: "(C) a separate priority area implementation plan shall be submitted for the water-

shed of each priority portion of navigable waters proposed for nonpoint source control implementation as part of the State plan."

No time limit for achieving BMP implementation is currently included in H.R. 4037. Without a specific deadline being included, States may not participate effectively in the program. NALMS suggests that six years is an adequate timeframe for BMP implementation in a river basin or watershed. We recommend the phrase "as expeditiously as possible but no longer than six years" be used in section 319(b)(2)(C).

The Federal oversight role in H.R. 4037 does not appear to be consistent with other major environmental legislation, including other sections of the Clean Water act. In other legislation, if States do not choose to accept delegation of an environmental program, or if they fail to properly implement it, a Federal program is established for those States. NALMS sees no reason why a national nonpoint source abatement program should be different. NALMS respectfully requests that section 319(f) be revised to authorize the Administrator to prepare and implement the plan under subsection (b) for any State that fails to submit an approved plan or fails to implement it.

NALMS is also concerned that the proposed provision regarding interstate nonpoint source pollution may be insufficient to achieve attainment and maintenance of water quality standards and designated uses. This interstate pollution causes priority problems across the country, from the Snake and Colorado Rivers to Palisades Reservoir (Idaho and Wyoming), Greenwood Lake (New York and New Jersey), Big Stone Lake (South Dakota and Minnesota), Reelfoot Lake (Kentucky and Tennessee), and the Chowan River (Virginia and North Carolina). The reauthorization bill introduced by Mr. Howard contains the concept of a master plan for specifying control measures to be implemented to restore and protect estuarine waters draining several States. This excellent idea of a master plan, which is made up of component State plans with specific compliance schedules for implementation, should be followed in all interstate waters. NALMS suggests that Mr. Oberstar's bill be revised to include this concept of a master plan (made up of State plans) as part of resolving interstate nonpoint source problems in section 319(h). Specific language in recommended in Attachment II.

The Society is fearful that the public will not have sufficient opportunity to understand, analyze, and comment on the adequacy of State designated priority waters under 319(a)(1)(A), State management plans, or EPA approval of these plans. Mr. Oberstar's bill only requires a description of public participation rather than a requirement for up-front public involvement. In order to avoid essentially after the fact public hearings on State proposals, NALMS urges the Subcommittee to be more specific in 319(a)(1)(D) about the need for public participation throughout the process.

The longer Congress waits to deal with the tough issue of nonpoint sources, the greater will be the cost of restoring polluted lakes because more will become damaged. Once pollutant loads are reduced, dirty lakes will still need to be cleaned up and this will require more funding if these valuable resources are to remain usable for future generations of Americans. The Society wishes to reiterate that without strong Federal leadership, specific milestone dates to measure progress, and a targeted approach to areas with the worst water quality problems, nonpoint sources will continue to cause widespread damage across the country and additional lake resources may become essentially irretrievably lost.

ECONOMIC IMPACT OF NONPOINT SOURCES

Lake Apopka in Florida and Ocean Lake in Wyoming were national treasures in the 1950s. People were attracted from across the Nation for water-based recreation, and the fisheries were of national significance. In the last two decades, massive loads of nutrients from agricultural activities have turned both lakes into pea soup blooms of algae. The famed fisheries have collapsed under the eutrophic conditions, recreation is impaired, and tourism has been seriously affected. The economic losses in tourism have not been estimated, but the price for restoring Lake Apopka is nearly $25 million.

A potentially more serious economic problem is being faced in south Florida because of serious eutrophication problems in Lake Okeechobee. The lake serves as a primary water source for south Florida. Very large loads of nutrients from agricultural activites reach the lake and cause the water quality problems. Measures to reduce the nutrient loading 34–40 percent are projected to cost more than $160 million, with $100 million of that to restore wetland areas in the channelized Kissimmee River enabling it to absorb nutrients from upland agricultural activities.

These channelization projects not only destroy aquatic life but they eliminate wetlands that are valuable in filtering pollutants from runoff water. Channel projects are often used to remove sediment deposits that cause flooding and the costs of such projects should be considered as damage caused by soil erosion. The North Carolina 208 plan indicated that millions of dollars had to be expended in channelization projects in that state to remove eroded sediment that was swamping previously productive cropland. A similar situation exists in west Tennessee. In the Obion-Forked Deer River basin, the U.S. Corps of Engineers reported that upland erosion deposited in channels has caused extensive economic damage by killing 54,000 acres of timber and turning 5,000 acres of productive cropland into swamp. Cropland erosion rates in this area of Tennessee are among the highest in the Nation (averaging 40 tons/acre/year). With tens of millions of dollars of public funds already expended for channel projects, with tens of millions of dollars of economic loss suffered by the private sector each year, and with additional proposals for channelization work on the order of $75 million in this one river basin, the extent of economic damage caused by soil erosion is clear.

The deposition of eroded soil in west Tennessee has destroyed aquatic populations to the point that the rivers do not meet the goals of the Clean Water Act. In addition, levels of pesticides such as methoxychlor, toxaphene, and parathion exceed EPA criteria in the rivers, and fish in Reelfoot Lake are contaminated with several pesticides. Tragedies have also occurred. Eight bridges over channelized streams in west Tennessee have collapsed in the last five years killing six people. A recent analysis made by the U.S. Geological Survey attributes bridge collapses in the area to the channelization projects.

Other economic costs are borne by the public. Flood damage and dredging costs are extremely high. Almost three million dollars are expended each year to keep waters open for navigation. Federal water projects such as Fishtrap and Dewey Reservoirs in Kentucky are filling with sediment. In the West, sediment is deposited in Federal water projects and displaces water that could be stored for irrigation. The state of Wyoming has identified Boysen Lake as such an example suffering from accelerated sedimentation. Some lakes such as Herman in South Dakota, Temescal in California, McQueeny in Texas, and Mirror in Montana have established limited Federal assistance to slow down the sedimentation problems. Other lakes are less lucky and are being filled in or have already been filled; among these are Davy Crockett and Reelfoot in Tennessee, Oakwood and Kampeska in South Dakota, Cameahwait and Boysen in Wyoming, Charleston and Taylorville in Illinois, and Wallenpaupack in Pennsylvania. Must the public lose the benefits and enjoyment of these lakes before action is taken? Must their public water supplies be filled with sediment and new expensive reservoirs built? Raleigh, Durham, and Chapel Hill, North Carolina face this. Lake Charleston in Illinois has filled. Eighty-six percent of Illinois's 84 public water supply reservoirs are filling at excessive rates and agricultural erosion is the major cause. $18 million would need to be spent annually to dredge these Illinois reservoirs to keep this current, albeit reduced storage capacity.

An additional type of economic damage results when expenditures are made for point source controls when principal contributors to the water quality problem were nonpoint sources. Examples include phosphorous controls imposed in the Great Lakes on point sources, the expensive advanced wastewater plant constructed in the Occoquan Basin of Virginia, and requirements for land disposal of municipal effluent in the eutrophic Chowan River basin of North Carolina. And damage is also caused to land resources because of nonpoint sources. The swamping of productive cropland has already been mentioned. Loss of soil productivity and concomitant loss of expensive fertilizers and pesticides threatens the Nation's ability to supply food to feed the hungry in other countries. Irrigation return flows in the West not only seriously affect water quality of major rivers but salt is accumulating on downstream land and may threaten soil productivity. Recent studies on the South Platte River in Wyoming, Colorado, and Nebraska confirm this soil salinity problem.

PUBLIC HEALTH CONCERNS

The public is very concerned about contamination of its recreational areas, its food resources, and its drinking water. Urban runoff and sewer leakages have caused public health concerns about bacterial contamination across the country, from Lake Houston in Texas, Sloan's Lake in Wyoming, and Temescal Lake in California to Fort Loudoun in Tennessee, bays of the Great Lakes, and Myrtle Beach. Concerns are also expressed about bacterial contamination of shellfish waters from animal waste as well as failing septic tank systems. More than 20 percent of North Carolina's shellfish waters are closed due to bacterial pollution. Other southeastern

states have higher percentages closed to shellfishing. The economic effect of the closuers has been reported to be in millions of dollars annually for single coastal counties with a majority of waters closed.

Fish are contaminated in urban areas as well as rural. Lake George in New York and Summit Lake in Ohio have fish contaminated with toxics from urban runoff; and fish have been eliminated from Como Lake in Michigan. In rural areas such as Reelfoot Lake in Tennessee and Old Town Lake in Arkansas, pesticides contaminate fish. The public is concerned not only from a fisheries standpoint but also from the standpoint of biological indicators of conditions that may be toxic to humans. The state of Tennessee 305(b) Report to Congress notes that water quality criteria for copper and zinc are violated in Parksville Lake downstream of thousands of acres of eroding land surrounding a copper smelter. Fish populations and algae are essentially nonexistent in the 2,000 acre lake because of the toxicity problem. Should not this biological indication of a serious problem be a warning to us about toxic substances?

The public is especially concerned about its drinking water supply. We understand that EPA is considering making the statement that a serious potential exists for adverse impacts from urban runoff on drinking water supplies located downstream of urban areas. This is based on the results of the EPA Nationwide Urban Runoff Program (NURP). A good example of the problem involves Rapid City, South Dakota. The NURP effort in that city documented that lead from urban runoff exceeded drinking water standards in the downstream water supply.

Concerns also exist for drinking supplies with eutrophication problems. This nutrient loading results in nuisance weed growth, pea soup algal blooms, fishkills, impaired recreation, and taste and odor problems in finished drinking water. Examples can be drawn from across the country of these troubled water supplies: Occoquan Reservoir in Virginia, Deer Creek Reservoir in Utah, Loch Raven in Maryland, Liberty in Oklahoma, Dillon in Colorado, and Myna in South Dakota. When this algae filled water is chlorinated for water supply, the organic matter may combine with chlorine to form chlorinaated hydrocarbons such as trihalomethanes, which are suspected to be weak carcinogens. Use of multimillion dollar treatment systems such as granulated activated carbon may be necessary in the future if such organic compounds pose actual threats to health. In extreme cases, water supplies must be abandoned because of the extra cost and poor quality finished water. Vandalia Lake and Ureka Lake in Illinois are examples. The City of Twin Forks on the Snake River was forced to abandon its water supply as Milner Reservoir became infested with pea soup algal blooms. Intensive agricultural activities were upstream. Such agricultural activities also affect water supplies in the East. A survey of 380 water supplies in the Southeast found that more than 10 percent suffer from poor water quality caused by upstream agricultural and livestock activities. In Illinois, 80 percent of the 84 public water supply reservoirs must use copper sulfate to combat the algae problems. The cost is staggering. Lake Marion must apply 3,000 pounds six times a year and water treatment costs are greatly increased.

MEETING CLEAN WATER ACT GOALS

The 1983 interim goal of the Act involves ensuring a water quality for the protection and propagation of aquatic life and recreation in and on the water. Unfortunately, this goal is not being met across the country in rivers, streams, lakes, and estuaries and not only imposes social costs on the public, but it also causes actual economic damage. A good illustration involves the results of an EPA analysis of the benefits that accrue when good quality water is restored to degraded lakes. The analysis showed that on the average $8 of benefits accrued from each Federal dollar expended. On only four lakes that were restored in Washington State, California, Virginia, and Maine, benefits from recreation, water supply, property values, and fish/wildlife that resulted from water quality improvements totaled $90 in discounted benefits for each Federal dollar invested. Clear economic damage results when state designated uses of waters are impaired.

Nonpoint source pollutants from agricultural activities and urban areas cause the majority of nonpoint problems in our Nation. It is said that the Missouri basin, with its high density of livestock operations, has an organic pollution wasteload equivalent to the population of China. Some of these operations are classified as point sources, many are classified as nonpoint sources. Excessive loadings of nutrients from animal waste and cropland have caused serious eutrophication previously mentioned in lakes (algal blooms, weeds, fishkills) that concern the public. The problems previously mentioned in Lake Apopka and Okeechobee in Florida and Ocean Lake in Wyoming are related to this excessive nutrient loading. Other serious problems

have been caused from Cobbossee Lake in Maine, Cannonsville Reservoir in New York, and Black Hawk Lake in Iowa. Such problems involving algal blooms and fishkills occur in Boysen Lake, Wyoming, and EPA estimates that 94 percent of the phosphorus loading in this lake comes from nonpoint sources, mostly agricultural in nature. And now, the State of Wyoming is concerned about pea soup blooms of algae on Flaming Gorge Reservoir, the most recreationally important lake in Wyoming with its nationally recognized fishery. The problem is getting worse according to the state and 90 percent of nutrient loading is attributed to nonpoint sources, again much of it agricultural in origin.

Similar eutrophication problems related to excessive nutrient loading from agriculture are also evident in North Carolina. While citizens are concerned about Phelps Lake and Lake Waccamaw in the coastal area, they are more concerned about damage in the estuarine areas. A good example involves the Chowan River basin. For the last decade, massive blooms of algae have been implicated in causing fishkills, reducing commercial and sports fisheries, impairing recreation, and decreasing property values. Scientific investigations by the State of North Carolina have shown that nonpoint sources, mostly agriculture, contribute more than 95 percent of nitrogen and phosphorus in the river. The problem is not limited to this basin but it occurs throughout the coastal waters. Entire populations of commercial fisheries have been eliminated in some coastal waters. I am attaching to this testimony a report on this serious nonpoint source problem in North Carolina that recently appeared n a peer-reviewed scientific journal. As the algae die, oxygen is used up in the waters. This deoxygenation resulted in eight fishkills of greater than 25,000 fish or crabs in North Carolina estuaries during the summer of 1978 and 1979.

Part of coastal North Carolina's problem can be attributed to the development of corporate "superfarms," farms of greater than 100,000 acres in areas that were once wetlands but were drained for agriculture. The drainage canals deliver storm water to fish and shellfish nursery areas and shrimp and oysters are especially affected. Rose Bay oysters were famous on the East coast years ago, but they no longer can flourish because of the agricultural canals and poor water quality. Serious economic impacts may soon be felt by the coastal fishing industry if best management practices are not ultilized.

In contrast to the lack of salinity caused by stormwater drainage in coastal North Carolina is the increase in salinity caused by irrigation practices in the West. The Arkansas River in Colorado increases in salinity from a trace to 2,000 parts per million in 120 miles and the Pecos River in New Mexico increases salinity threefold to 2,000 parts per million in only 30 miles. This salinity damages fisheries and impairs use of the water. An example of damage comes from the State of Wyoming. Fishkills and physiological problems in the fish occur in Soda Lake because best management practices are not utilized.

DO BEST MANAGEMENT PRACTICES WORK?

It is clear that economic damage of national importance is being caused by nonpoint sources. The public is concerned about health implications of water quality problems caused by these diffuse sources, and goals of the Clean Water Act are not being attained across the Nation because of this pollution. Similar to the debate over acid precipitation, opponents of BMP implementation say that not enough information is known about cause and effect, cost effectiveness, or social acceptability of BMPs. I would answer these concerns by saying that the nonpoint problems are known and are causing unacceptable economic damage, scientists have shown BMPs to be effective in reducing nonpoint source loads, and it is time to simply implement what we know before our valuable lakes and estuaries are irretrievably lost.

The EPA Clean Lakes Program was a leader in years past in funding implementation of urban and agricultural best management practices to protect lake quality. Enough experience has been gained from that program to know that BMPs are effective in protecting water quality. Diversion of the first flush of urban stormwater to recharge basins was effective at Lake Eola, Florida. Wetlands can even be created to filter urban runoff in certain areas. This was done at Lake Jackson, Florida. Retention basins and wetlands were utilized effectively to remove urban stormwater pollutants at Clear Lake and Phalen Lake in Minnesota. Diversion of stormwater at Mirror Lake in Wisconsin reduced phosphorus concentrations 65 percent and algal blooms did not recur. Settling ponds were effective at Hylan Lake, Minnesota, and Temescal Lake, California. The EPA Nationwide Urban Runoff Program is finding detention basins to be quite effective in improving stormwater quality. Suspended solids reductions commonly exceed 70 percent, nutrient reductions exceed 50 per-

cent, and heavy metals reductions exceed 70 percent. BMPs have also been developed to abate combined sewer overflow problems. The BMP program for Syracuse, New York to protect Onandaga Lake is a good example of cost-effective sewer overflow abatement to protect lake quality.

Agricultural BMPs have also been implemented under EPA's Clean Lakes Program. Agricultural BMP implementation has been funded for agricultural pollution control in the watersheds of Spiritwood Lake (North Dakota), Chochrane Lake and Herman Lake (South Dakota), Cobbossee Lake (Maine), Skinner Lake (Wisconsin), Broadway Lake (South Carolina), and Rivanna Lake (Virginia). At White Clay Lake, BMPs resulted in about 60 percent reductions in annual phosphorus loading. Results are also available from USDA's Model Implementation Program (MIP). BMPs helped to reduce nutrient and sediment loads at Cannonsville Reservoir (New York), Lake Herman (South Dakota), and Pittsfield Lake (Illinois).

Other information on agricultural BMP effectiveness is available from the Black Creek study in Indiana and other research from the Great Lakes region. In North Carolina, soil conservation practices were implemented in a watershed and sediment transport was reduced 70 percent. Near Raleigh, North Carolina, best management practices in a small watershed were recently shown to reduce sediment loss 99 percent, nitrogen loss 92 percent, and phosphorus loss 90 percent. Use of buffer strips in Minnesota reduced solids and nutrients from animal feedlots by greater than 75 percent. Use of biological filters downstream of cropland in Florida reduced nutrient loads by greater than 70 percent. Effectiveness of conservation tillage, grassed waterways and other conservation practices has been known for decades. Likewise, water conservation techniques have been known for years to reduce salinity problems from irrigated agricultural land in the West. Simple retention ponds in irrigation lateral ditches were monitored for five years near Milner Reservoir in Idaho. About 75 percent of sediment and 30 percent of phosphorus was removed and better pond designs would likely provide more removal efficiency. In both the northern and southern Great Plains, limited tillage has been shown to reduce erosion and phosphorus delivery to rivers, and in Texas it has been shown to increase profits almost threefold on limited irrigation of crops while minimizing pollutant generation. Research and actual field experience have shown BMPs to be effective in abating combined sewer overflows, urban runoff, and agricultural pollution. Currently, the public is being forced to bear the billions of dollars of damage caused by this pollution. It is now simply a matter of deciding whether our Nation's waters should remain polluted by nonpoint sources or whether we should utilize existing knowledge to eliminate these water quality problems.

The North American Lake Management Society appreciates the opportunity to speak on behalf of our Nation's water resources before this Subcommittee. This concludes my testimony.

ATTACHMENT I

KEYS TO LAKE WATER QUALITY: LAKE QUALITY STANDARDS AND POINT/NONPOINT SOURCE ABATEMENT TRADEOFFS

ALFRED M. DUDA
ROBERT J. JOHNSON
Office of Natural Resources
Tennessee Valley Authority
Knoxville, Tennessee

ABSTRACT

During the last year, many issues of uncertainty have been raised about water quality management strategies in the United States. These issues directly affect efforts to restore acceptable quality water to our Nation's lakes and to maintain lake-related public benefits for future generations. Based on an examination of the nature of these uncertainties, several activities are identified as key tools for restoring and protecting lake water quality. The development of scientifically defensible lake (or impoundment) water quality criteria/standards is one of these activities. An example of such an approach adopted by the State of North Carolina to resolve eutrophication problems is highlighted. The implementation of point/nonpoint source abatement tradeoffs is the other key activity needed for protecting lake quality. Such determinations of tradeoffs in controlling point and nonpoint source pollutants are essential for achieving cost-effective improvements in lake quality.

INTRODUCTION

This year has been marked by uncertainty in the field of water quality management in the United States. The Nation's fundamental approach to pollution control was challenged by proposed new approaches for establishing water quality standards. Proposals to withdraw effluent limitations and pretreatment regulations have been made by the U. S. Environmental Protection Agency (EPA). Amendments to the Clean Water Act were proposed, and drastic Federal funding cuts in Federal and State water quality programs made them difficult, if not impossible, to implement. In particular, proposed Federal and State budget cuts have seriously affected lake restoration and protection efforts.

This uncertainty comes at a time when lake restoration efforts should be accelerated, not stopped. The general public is entitled to a whole host of socioeconomic benefits from lakes—benefits that involve not only fishing, recreation, and aesthetic enjoyment, but also public water supplies, industrial and agricultural water supplies, flood control, wastewater assimilation, and economic development. But these public benefits are now in jeopardy.

The U. S. Council on Environmental Quality noted that more than 80 percent of urban lakes are degraded and in need of restoration and fully one third of all lakes and impoundments are adversely impacted by pollution (Counc. Environ. Qual., 1980). When lakes that are threatened by acidification are included in this assessment, the national extent of this pressing lake quality problem comes into focus. The economic impact of these problems may be staggering. For instance, in the Tennessee River Valley, eutrophication is aggravating a low dissolved oxygen problem in lakes and rivers of the Tennessee River system, posing a very real hindrance to economic development (Tenn. Valley Auth., 1980).

This paper examines the nature of some of the uncertainties that have recently been raised about water quality management in the United States. It appears these uncertainties are meant to challenge the course set by Congress and to delay water quality improvement even longer. Based on this examination, two activities are identified as key tools for restoring and protecting the socioeconomic benefits that the public is entitled to from our Nation's lakes. They are the development of lake (or impoundment) water quality criteria/standards and the implementation of point/nonpoint source pollution abatement tradeoffs. Legislation is not needed to authorize these two key activities; they can be accomplished under existing provisions of the Clean Water Act.

HISTORICAL PERSPECTIVE

To better appreciate the significance of questions currently being raised about water quality management strategies in the United States, one must understand past pollution control efforts. The approach chosen by Congress in 1972 to direct the Nation's water quality improvement effort resulted from 40 years of experience in trying to solve pollution problems. Until 1948, State and local governments were primarily responsible for pollution control. While numerous bills were introduced into Congress in the 1930s to authorize Federal pollution control planning and enforcement, the issues of States' rights and financial impacts were used to defeat the legislation.

In 1948 the first major Federal legislation was passed, but it proved unworkable because State consent was required before enforcement could be initiated. By 1965 Congress became discontented with the slow pace of pollution control and passed the Water Quality Act of 1965. This compromise statute used violations of water quality standards as the basis for enforcement, but States were hard pressed to demonstrate in court that a certain discharger was responsible for violations of standards. Very few States succeeded with the water quality standards approach, and Congress recognized that an effective nationwide approach would have to involve national minimum effluent criteria. This new approach was established in the 1972 amendments (P. L. 92-500) and was fine-tuned in the 1977 Clean Water Act.

Consequently, it is because of this very slow progress over the last half century that Congress mandated national minimum standards for point source treatment (technology-based effluent limitations and categorical pretreatment standards) and nonpoint source controls (best management practices (BMPs)). This strategy is designed so that economic advan-

tages are not created among different industries, different municipalities, or different regions of the Nation. And because Congress specified a phased approach to pollution control, many types of controls have not yet been implemented. Conventional pollutants have been addressed and some progress has been made. Toxics and nonconventional pollutants (such as nutrients) remain to be addressed in the coming years and are of utmost importance to lake quality management.

TECHNICAL UNCERTAINTY

With the Clean Water Act scheduled for reauthorization during 1982, special interest groups have raised numerous technical questions about the scientific adequacy of water quality management strategies in the United States. Among these uncertainties are questions about: unnecessary treatment associated with technology-based effluent standards; scientific inadequacy of water quality criteria and standards; the controllability of nonpoint source pollutants; and the lack of cause/effect predictive relationships between pollution control and water quality improvement. Each issue merits a short discussion.

Technology-based Standards

Some groups may point out that the effectiveness of categorical technology-based standards for controlling toxics and nonconventional pollutants is not well documented. They may feel that implementation of such controls will result in unnecessary expenditures and treatment for treatment's sake. Since the need for using such treatment has not been proven in every case across the country, the proposed solution is to remove the requirements and allow States to set effluent limitations based on site-specific water quality conditions and local needs.

Water Quality Standards

Other groups criticize Federal water quality criteria and the resulting State standards for their lack of scientific adequacy. Cox (1980) presented a spirited discussion of this view. The criteria are alleged to be too stringent, too uncertain, too costly to meet, and based on too primitive a science (aquatic toxicology). In addition, criticisms are leveled at the margin of safety associated with the use of worst case conditions and at laboratory development of criteria for use in ambient waters (Lee et al. 1982). The proposed solution to such uncertainty is once again a return to State flexibility to set standards that reflect local interests, goals, needs, conditions, etc., rather than using the best available data assembled on a nationwide basis. Other suggestions are being made to ignore criteria and standards for protecting water-related public benefits. In place of standards, state officials may be given authority to subjectively judge whether or not uses of public waters are "significantly impaired."

Nonpoint Source Pollution

In a recent study, the U. S. General Accounting Office (1982) identified nonpoint source pollution as a major contributor to the overall lack of significant water quality improvement in the country. The findings noted that the extent of the nonpoint pollution problem is unknown, data on its effects are inadequate, and funding is now sadly lacking (since the ill-fated section 208 planning has concluded).

Some groups logically ask why point source controls should be implemented when nonpoint source controls are voluntary in nature and, indeed, may overshadow point source inputs. However, when controls are suggested for nonpoint sources, others voice opposing arguments and once again raise uncertainty. A good example involves highly eutrophic coastal rivers in eastern North Carolina that drain extensive amounts of agricultural land. Agricultural groups continue to raise issues of uncertainty about agricultural nutrient inputs and question whether nutrient control measures could really improve downstream water quality (Gilliam et al. 1978; Humenik, 1980).It took a very costly, intensive monitoring investigation to produce scientifically defensible data that implicated agricultural runoff as a major contributor to the eutrophication problems in eastern North Carolina (Duda, 1982).

It is clear that sufficient monitoring strategies need to be employed to accurately assess the contribution of both point source and nonpoint source pollutants. Unfortunately, adequate water quality monitoring strategies are rarely used. In fact, the U. S. General Accounting Office (1981) recently criticized the fixed station/fixed sampling interval strategy used virtually around the country as grossly insufficient for determining true water quality conditions. If inadequate monitoring and analysis strategies continue to be used just because they are less costly, the result will be the familiar old refrain that more data are needed before widespread implementation of best management practices can be required.

Cause and Effect Relationships

Closely related to the problem of inadequate data is an imperfect knowledge of cause and effect relationships between pollution control measures and water quality improvement. While some professionals may believe that such relationships must be thoroughly documented before spending money for pollution controls, others may question the government's ability to shoulder this burden. Some may even question whether scientists can ever know the complex ecosystem impacts that occur from wastewater discharges.

A good example involves eutrophication in Cherokee Reservoir, an impoundment of the Holston River in east Tennessee. The Holston drains the most industrialized area of Tennessee, and Cherokee Reservoir—with its 9,000 km^2 drainage area—is located directly downstream of many wastewater discharges. Numerous water quality problems were noted in Cherokee Reservoir in a report by the Tennessee Valley Authority (Iwanski et al. 1980): interference with public water supplies from the reservoir (taste/odor and iron/manganese); nuisance growths of algae (up to 30 million cells per liter dominated by the blue-greens *Oscillatoria* and *Anacystis*); fishkills; diseased fish; and hypolimnetic oxygen depletion that resulted in dissolved oxygen below the 5 mg/l standard for more than 50 miles downstream from the reservoir.

Some professionals might point toward the water quality improvement that has occurred in the Holston River over the last decade (as controls for conventional pollutants were implemented) as proof that very little further improvement can be made. Figure 1 illustrates the reduction in biochemical oxygen demand (BOD_5), total nitrogen (TN), and total phosphorus (TP) over a number of years in the river as it flows into Cherokee Reservoir. Note that almost 70 percent reductions in BOD_5 and 50 percent reductions in TN and TP have occurred. Some improvement in hypolimnetic dissolved oxygen levels was noted for the days with dissolved oxygen less than one mg/l. Despite these improvements, the problems listed in the previous paragraph still occurred.

The Tennessee Valley Authority undertook an intensive investigation of the eutrophication problem in Cherokee Reservoir. Point and nonpoint source nutrient loadings were estimated (more than 50 percent of annual TP loading was attributed to point sources) and a state-of-the-

Figure 1.—Trends of water quality flowing into Cherokee Reservoir and dissolved oxygen depletion in the reservoir releases.

art simulation model was used to predict improvement following implementation of control measures (Iwanski et al. 1980). Yet, control measures were not implemented because the modeling exercise only raised more questions about cause and effect relationships: Is a two or three dimensional model needed to improve predictions? While history can be simulated using calibrated model coefficients and literature values for rate constraints, are predictions of improvement following waste load reductions valid? Do nutrient and organic matter inputs from extensive upstream macrophyte beds greatly influence trophic conditions? What influence do bottom-feeding fish or zooplankton have on nutrient dynamics? What is the significance of sediment oxygen demand, anaerobic processes, or internal nutrient cycling?

There will always be questions about cause and effect relationships because monitoring resources are limited, as is our ability to understand natural processes. Consequently, some professionals such as Beasley et al. (1982) conclude that state-of-the-art simulation models should be accepted for use in basing environmental management decisions.

But simulation models have become more and more complicated. While some modelers pile complex algorithm on algorithm and rate constant upon rate constant in an attempt to force complex models to mimic calibration data, they invariably add a disclaimer proclaiming the model to be valid only for the specific modeled condition. If such models can't be used for making predictions and decisions, they become only useless intellectual toys as suggested by Baski (1979) for entertaining intellectuals.

Based on uncertainties in nature, should pollution control efforts stop until scientists agree on the usefulness of predictive tools? Can different scientists ever agree on the scientific acceptability of tools for predicting the impact of control measures? In 1972, Congress decided that water quality improvement could not wait until—or if ever—scientists resolve such uncertainties. The public's use of the common property resource known as water was in jeopardy, and the Nation must act to restore these uses.

COMMON PROPERTY RESOURCES

Common property resources are those held in common by the public—water, air, fisheries, and government-owned land resources. It is government's job to protect the public's interest in these resources. Competition in the free marketplace ends up in exploitation of common property resources as industry attempts to externalize production costs. It is profitable to pollute because individual control costs are usually much larger than the polluter's proportionate share of readily quantifiable damage to common property.

A good example of this situation involves a Tennessee Valley Authority impoundment on the Nolichucky River in Tennessee. The reservoir has filled with sediment associated primarily with feldspar and mica mining in North Carolina. In addition to interfering with public water supply intakes and treatment facilities, destroying game fishery and other aquatic life in 110 miles of river, and increasing flooding, the sediment forced abandonment of the electric generating facility (Tenn. Valley Auth., 1981).

Not only has the public had to forego benefits of the river and the lake, but they now must pay much more for replacement electricity. Assuming that the hydropower facility generated 75 percent of the time, the cost of replacing this lost electricity over 10 years with more expensive coal power would be at least $15 million over the cost of hydropower; actual replacement or dredging of the reservoir would cost millions more.

This inevitable situation involving the abuse of common property resources was termed the "Tragedy of the Commons" by Garrett Hardin (1968). He likened the situation to a "commons" or pasture used by a community for grazing. In self interest, herdsmen would keep adding cattle to graze on the commons until the numbers exceeded the carrying capacity. As a result of each herdsman trying to maximize his gain, the commons was overexploited and erosion and weed dominance eventually ruined the resource.

This situation arises because real costs of producing a product are not always being incorporated into the marketplace and the external costs are being borne by the public. Hardin concluded that the only way to avoid this dilemma of abused resources was to enact laws so that there would be "mutual coercion mutually agreed upon." When laws are enacted, a danger still exists because enforcement is delegated to bureaus that might not follow the intent of the law. In the words of Hardin (1968):

> The result is administrative law, which is rightly feared for an ancient reason—*Quis custodiet ipsos custodes?*—"Who shall watch the watchers themselves?" John Adams said that we must have "a government of laws and not men." Bureau administrators, trying to evaluate the morality of acts in the total system, are singularly liable to corruption, producing a government by men, not laws.

In passing the 1972 and 1977 clean water statutes, Congress recognized that water quality is a common property resource and that the public should not bear the social costs and risks of polluted water. Congress also recognized that the government (as custodian of this public property) cannot bear the unreasonable, impossible burden of proving that a certain source is responsible for a certain pollution problem.

Congress decided that the mutual coercion that Hardin spoke of should take the form of national minimum pollution control standards for all sources for the first round of water quality improvement. For those waters still dirty after implementing the minimum controls, an additional level of control would be required based on violations of water quality standards and on the benefits and costs of improvement. These site-specific determinations would take place under section 302 of the act, placing the burden of proof for determining that controls are not needed on dischargers.

While we engineers often pride ourselves on our modeling prowess and our wasteload allocations, we do not have the resources, time, or technical knowledge to make sure that just the right allocation of toxic chemicals or other

pollutants is made all across the country. We have major problems in determining actual impacts on individual species let alone ecosystem impacts and we cannot even detect the significance of many pollutants. Congress understood this when it changed the course of the Nation's water pollution control effort in 1972. The challenge facing water quality management professionals today is to use the tools that Congress has provided in a cost-effective manner to restore and maintain public benefits from this common property resource.

KEYS TO LAKE QUALITY MANAGEMENT

The Clean Water Act contains many provisions that are essential for restoring acceptable water quality to our Nation's lakes. Certainly the promulgation of effluent guidelines for toxic substances and nonconventional pollutants (such as nutrients) in the coming years will improve the point source abatement program. In addition, lake waters requiring controls beyond technology-based limits to restore acceptable quality will benefit from proper implementation of section 302 of the act. While these provisions may improve influent water quality, section 314 Clean Lakes Program must continue to be emphasized to deal with in-place pollutants that have accumulated for decades and still influence lake quality. Appropriate levels of Federal and State funding are needed to accomplish these programs. Beyond these efforts, two activities authorized by the Clean Water Act—but not effectively implemented nationwide—are necessary for lake quality improvement. These key activities involve criteria/standards for protecting lake and impoundment water quality and effective implementation of point/nonpoint source abatement tradeoffs.

Lake Quality Standards

A recent survey by the National Governors' Association (1982) found that almost 50 percent of all State water quality program budgets are supported by Federal funds. With funding cuts proposed on both the Federal and State levels, it is likely that priorities will have to be established for addressing water quality matters. While local residents may feel their lake is degraded, unless a water quality standard has been violated, such concerns may generate little government attention to do something about the problem.

Criteria must be established to protect public uses of lakes and impoundments. This will allow State water quality standards to be used to maintain clean waters and provide a priority to address dirty waters. These criteria will vary across the country, from natural lakes in Maine to those in Florida and from impoundments in the West to those in the Southeast.

Many States have not adopted the necessary criteria to protect public uses in the variety of lakes and impoundments that exist. Criteria developed for flowing waters may not be appropriate for still waters. Likewise, criteria for natural lakes may be inappropriate for impounded waters with less hydraulic retention time. Since pollution problems are most often biologically related, it makes sense that these criteria involve biological parameters rather than just measurements of water chemistry; aesthetic considerations may also be appropriate. In the future, as funding resources diminish, authorities may overlook water quality problems in lakes unless a water quality standard has been violated.

A good example of the use of such a standard for determining water quality improvement priorities is the approach used by the State of North Carolina in dealing with eutrophication. The State adopted a chlorophyll *a* water quality standard for lakes and reservoirs to indicate whether accelerated eutrophication may be occurring. This standard is a simple growing season maximum limit of 40 $\mu g/l$ for warm waters and 15 $\mu g/l$ for cold waters. If this standard is exceeded, the State begins an analysis of seasonal algal diversity to determine whether desirable algae (indicative of a balanced, highly productive system) or noxious algae (indicative of nutrient overenrichment) predominate. If noxious algae are impairing use, the entire watershed upstream of the problem water may be declared nutrient sensitive, and scientific investigations conducted to determine major sources of nutrient loading and to identify cost-effective abatement actions.

The key to this approach is the adoption of the chlorophyll *a* water quality standard so that the eutrophication problem can be declared a priority problem. However, the State must also have authority to require abatement of the problem. In North Carolina, the establishment of a "nutrient sensitive waters" classification gives broad authority to the Environmental Management Commission to correct nutrient-related problems. This regulation (included as Appendix A to this paper) is activated by a violation of the chlorophyll *a* standard and provides a means for controlling both point source and nonpoint source inputs of nutrients in a nutrient sensitive river basin.

While some professionals may agree that chlorophyll *a* contents of different types of algae vary widely (and therefore make it an inappropriate tool), the criteria value of 40 $\mu g/l$ represents a very large bloom of algae that would certainly merit further investigation. This practical approach is quite simplistic, but it is also scientifically defensible because of the three-step process involved: a violation of a standard occurs, a scientific investigation into the significance of the problem is conducted, and if evidence merits it the waters are declared nutrient sensitive.

The establishment of a lake quality standard is a key not only for dealing with eutrophication but also for other lake quality problems. Lakes are more sensitive to accumulation of toxic substances than are flowing waters. Lake quality standards, based on criteria that may differ from those in rivers, will be necessary to avoid bioaccumulation of toxic substances similar to the accumulation of selenium in Belews Lake, N. C., that decimated the resident fish population (Cumbie, 1978). A cooperative effort between the States, EPA, and the research community will be needed to establish such criteria for different types of lakes and impoundments on a regional basis in order to pool resources and eliminate duplication of effort. It is up to those professionals interested in restoring and maintaining public benefits from lakes and impoundments to see to it that these criteria and subsequent standards are established.

Point/Nonpoint Source Abatement Tradeoffs

Once violations of a water quality standard occur, threatening or impairing the use of lake waters, the key to cost-effective water quality improvement is the implementation of point source and/or nonpoint source control measures necessary to correct the problem. Determination of these tradeoffs is often an exceedingly difficult task. Section 208 of the Clean Water Act contains the provisions for determining tradeoffs between point source and nonpoint source abatement strategies. Unfortunately, the 208 planning process evolved into something different than an examination of tradeoffs; for the reasons explained by Duda et al. (1982) the program did not fulfill its expectations and funding has been eliminated.

It is clear that such tradeoffs need to be considered to provide cost-effective water quality improvement. A good example involves a highly eutrophic reservoir in northern Virginia, the Occoquan Reservoir. An extensive monitoring study was undertaken to determine the significance of different nutrient sources in the watershed. Randall et al. (1978)

reported the investigation found only 5 percent of annual nitrogen loading and 7 percent of annual phosphorus loading to the reservoir came from point source discharges. In this case, strategies to control nonpoint source contributions would be most appropriate.

Obviously, a strong monitoring program is essential to accomplish such a determination. In addition, the monitoring, analysis, and simulation investigations should be conducted in cooperation with major dischargers and special interest groups in the area. Whatever techniques are employed, they need to be discussed with all parties before the investigations begin to ensure that state-of-the-art techniques are used and to resolve reasonable questions of uncertainty.

An example of the importance of implementing point/nonpoint source abatement tradeoffs can be seen with the eutrophication problem in the Chowan River basin of North Carolina. While an extensive description of the problem has been given elsewhere (Duda, 1982), a short discussion will be included here. For the last decade noxious blooms of blue-green algae have depressed recreation activities, caused odor problems, and been suspected of contributing to a drastic decline in commercial fishing in slow-moving waters of the basin. Fish populations have been devastated by both red sore disease and fishkills from oxygen depletion following bloom collapse. *Aphanizomenon flos-aquae*, *Microcystis firma*, and *Anabaena circinalis* are the blue-green algae of concern. While the State of North Carolina water quality standard for chlorophyll *a* (40 μg/l) is commonly exceeded during the growing season, massive blooms with chlorophyll *a* values exceeding 200 μg/l are not uncommon.

Extensive water quality investigations as described by Duda (1982) were conducted in the late 1970s. While 130 point source dischargers were identified in the 13,000 km² watershed of Virginia and North Carolina, the basin is mostly rural-agricultural in nature and only four of the point sources discharge more than one million gallons a day. The total loading of nutrients in the main river was determined as was the contribution of point source dischargers. The result is given in Figure 2 in terms of average daily loading of phosphorus and nitrogen. For the 1979 water year, point source dis-

Figure 2.—Average daily loading of nutrients to the Chowan River at Holiday Island on a monthly basis.

chargers were estimated to contribute only 3 percent of total nitrogen loading and 6 percent of total phosphorus loading.

Concurrent with determination of river nutrient loading, automated samplers were placed in small agricultural watersheds (1.6–13 km² in area) to provide estimates of relative significance of nutrient contributions from agricultural watersheds in different physiographic areas, with different amounts of livestock and different drainage characteristics. Nutrient levels in these watersheds were compared with nutrient levels monitored in a concurrent study by the U. S. Geological Survey of forested watersheds in North Carolina (Simmons and Heath, 1979). Once again, details of the comparison may befound elsewhere (Duda, 1982).

One way to represent the results is by plotting the variation of average stormflow nutrient concentration recorded in the watershed with the number of livestock in the watershed. Figure 3 gives an example of such a relationship for

Figure 3.—Variation of mean stormflow total phosphorus concentrations with estimated livestock density recorded in small North Carolina agricultural watersheds.

total phosphorus. Note that as more livestock are present, average concentrations greatly increase over levels recorded in forested watersheds. In addition, much greater concentrations arefound in the watershed that has extensive drainage improvements such as channelization.

This exercise for determining tradeoffs in controlling point and nonpoint source pollutants was very valuable. It suggested that agricultural activities contributed much to the eutrophication problem. To reduce nutrient loading, extensive point source controls would not be effective. Rather, nutrient control measures for agricultural activities would be more appropriate and should be implemented in the following priority: controls for livestock waste, controls for nutrients from cropland in watersheds with extensive drainage improvements, and controls for nutrients from cropland draining directly to watercourses (without buffer zones).

Implementation of those control measures should first be attempted through voluntary means. Multiagency, cooperative projects are appropriate for seeking the use of such control measures on a watershed-wide basis. If these efforts prove futile, State and Federal regulatory actions should be taken under section 302 of the Clean Water Act or under State authority (such as the nutrient sensitive waters regulation). The challenge for regulatory agencies is to use the tools they already have to achieve cost-effective cleanup and protection of our Nation's lakes.

CONCLUSIONS

Improving lake water quality will be a challenging task in the years ahead. Professionals will face crippling budget cuts, changes in regulations, and the nagging cry of technical uncertainty from opponents of clean water. Attempts will be made to ignore criteria and standards and to replace them with subjective judgements whether uses of public waters are significantly impaired. While changes in legislation are called for in the name of economic and procedural efficiency, and scientific uncertainty, many professionals recognize

that such reasons have been used in the past to delay water quality improvement. By enacting the 1972 statute, Congress rejected the old vagaries of administrative law that had failed to protect the public's common property water resources. Instead, Congress established a local-State-Federal partnership that is quite cumbersome and quite complex, yet it represents the only strategy that will work to clean up public waters. The existing Clean Water Act is workable and necessary; it is essential to public welfare and to the restoration and protection of suitable lake quality.

The real challenge facing those concerned about lake quality is to ensure that the tools Congress has provided to cost-effectively restore and protect lake waters are properly used by water quality management professionals. This paper has identified two of these key tools: lake quality criteria/standards and point/nonpoint source abatement tradeoffs.

With pending budget cuts, priorities will be set in dealing with pollution problems. Without sufficient criteria and standards to protect the use of lake waters, public complaints may fall on deaf ears. A nationwide cooperative effort between the States, EPA, and the regulated community is needed to establish defensible standards on a regional basis to protect public uses of different types of lakes and impoundments.

Once a water quality standard is violated and use of lake waters is threatened or impaired, the key to cost-effective water quality improvement is the implementation of point source and/or nonpoint source control measures necessary to correct the problem. While this is often a difficult task, it is not impossible if sufficient resources are devoted to collecting the needed information and to conducting scientifically defensible analyses. An example was given to illustrate how such tradeoffs were determined for a eutrophication problem in North Carolina.

For implementation of these tradeoffs in control strategies, point source controls can be readily specified under section 402 of the Clean Water Act. If nonpoint source controls are needed, many States do not have appropriate authority to require implementation. In this case, multiagency, cooperative projects involving all levels of government and the private sector need to be undertaken in the watershed upstream of the lake or impoundment to address the pollutants of concern. Those interested in protecting lake quality need to assure that sufficient funds are appropriated to support such cooperative, watershed-wide projects, or alternatively that authority is established to require implementation of needed controls.

APPENDIX 1

Regulation 15 North Carolina Administrative Code 2B .0214; NUTRIENT SENSITIVE WATERS; has been adopted and reads as follows:

.0214 NUTRIENT SENSITIVE WATERS

(a) In addition to existing classifications, the commission may classify any surface waters of the State as nutrient sensitive waters (NSW) upon a finding that such waters are experiencing or are subject to excessive growths of microscopic or macroscopic vegetation. Excessive growths are growths which the commission in its discretion finds to substantially impair the use of the water for its best usage as determined by the classification applied to such waters.

(b) NSW may include any or all waters within a particular river basin as the commission deems necessary to effectively control excessive growths of microscopic or macroscopic vegetation.

(c) For the purpose of this rule, the term "nutrients" shall mean phosphorous and/or nitrogen. When considering the assignment of this classification the commission may specify as a "nutrient" any other chemical parameter or combination of parameters which it determines to be essential for the growth of microscopic and macroscopic vegetation.

(d) Those waters additionally classified as nutrient sensitive shall be identified in the appropriate schedule of classifications as referenced in Section .0300 of this Subchapter.

(e) For the purpose of this rule the term "background levels" shall mean the concentration(s), taking into account seasonal variations, of the specific nutrient or nutrients upstream of a nutrient source.

(f) Quality Standards applicable to NSW: No increase in nutrients over background levels unless it is shown to the satisfaction of the director that the increase

(1) is the result of natural variations, or
(2) will not endanger human health, safety or welfare and that preventing the increase would cause a serious economic hardship without equal or greater benefit to the public.

1 nonpoint sources to each such portion of the navigable
2 waters, including but not limited to those programs
3 which are receiving Federal assistance under subsec-
4 tion (i); and
5 "(D) describes the process, including intergovern-
6 mental coordination and public participation, for identi-
7 fying waters under subparagraph (A) and best management practices and measures to con-
8 trol each category and subcategory of nonpoint sources
9 identified under subparagraph (B) and to reduce, to the
10 maximum extent practicable, the level of pollution re-
11 sulting from such category or subcategory so that subsection (a)(1)(A) water quality objectives shall be attained.
12 "(2)(A) Each State shall annually update in writing the
13 report submitted by such State under paragraph (1) with the
14 most recent information available.
15 "(B) Each report submitted under paragraph (1) and
16 each update submitted under this paragraph shall be based on
17 available information including, but not limited to, informa-
18 tion available under sections 208, 303(e), 304(f), and 305(b)
19 of this Act, and may include all or part of an existing water
20 quality management program approved under section 208 or
21 303 of this Act.
22 "(b)(1) Not later than two hundred and seventy days
23 after the date of enactment of this section, the Governor of
24 each State shall prepare and submit to the Administrator for
25 his approval—

1 "(A) a plan, developed in cooperation with local
2 agencies and organizations with expertise in control of
3 nonpoint sources of pollution, which such State pro-
4 poses to implement in the four-fiscal-year period begin-
5 ning after the date of submission of such report for
6 controlling pollutant loadings added from nonpoint
7 sources to the navigable waters within the State (so that subsection (a)(1)(A) water quality objectives shall be attained) and
8 "(B) a report which identifies each department,
9 agency, or instrumentality of the United States which
10 will be engaging in, supporting, or providing financial
11 assistance for any activity or program within the State
12 in the four-fiscal-year period beginning after such date
13 of submission which, if carried out, would be inconsist-
14 ent with implementation of such plan in such period
15 and recommends to the Administrator methods by
16 which such department, agency, or instrumentality
17 could modify administration of such activity or program
18 so that such activity or program is consistent with, and
19 assists the State in implementation of, such plan.
20 "(c) — See Wording in Testimony
"(2) Each plan proposed for implementation under this
21 subsection shall include—
22 "(A) a list of those specific portions of navigable
23 waters in the order in which the State plans to begin
24 control of pollution added from nonpoint sources in the
25 four-fiscal-year period beginning after the date of sub-

1 mission of such plan and, with respect to each such
2 portion, those categories and subcategories of nonpoint
3 sources of pollution with respect to which the State
4 proposes to implement control measures in such period;
5 "(B) a description of proposed best management
6 practices and measures which the State proposes to
7 implement in each fiscal year of such period to reduce
8 pollution resulting from nonpoint sources;
9 "(C) a schedule which requires each category or
10 subcategory of nonpoint sources of pollution to imple-
11 ment as expeditiously as possible (but no longer than 6 years) the practices and
12 measures identified in subparagraph (B) of this para-
13 graph and indicates estimated dates for implementation
14 of these practices and measures in each such year;
15 "(D) an identification of methods (including, as
16 appropriate, programs for enforcement, technical assist-
17 ance, education, training, and cost-sharing) for encour-
18 aging, assisting, or requiring implementation of such
19 practices and measures in such period so that subsection (a)(1)(A) water quality objectives shall be attained
20 "(E) an identification, description, and estimated
21 cost of such practices and measures proposed to be im-
22 plemented with Federal assistance provided to the
23 State under subsection (i) in each such year;
24 "(F) an identification of sources of Federal and
25 other assistance (other than assistance provided under

The Administrator shall prepare and implement the plan under subsection (b).

9

1 period. Upon request of a local agency or organization which
2 has expertise in, and authority to, control pollution resulting
3 from nonpoint sources in any area of such State and after
4 approval of such State, the Administrator shall provide tech-
5 nical assistance to such agency or organization in developing
6 for such period for such area a plan described in subsection
7 (b) which meets ~~the requirements of subsection (e)~~ and shall become part of the Federal plan. After de-
8 velopment of such plan, such agency or organization shall be
9 eligible to receive in such year assistance under subsection (i)
10 for implementation of such plan.

11 "(g) Upon request of a State, the Administrator shall
12 provide technical assistance to such State in developing a
13 plan referred to in subsection (b) for those portions of the
14 navigable waters requested by such State.

15 "(h) If any portion of the navigable waters in any State
16 which is implementing a plan approved under this section is
17 affected by pollution resulting from nonpoint sources in an-
18 other State, such State may petition the Administrator to
19 convene and the Administrator shall convene a management
20 conference of all States which contribute pollution resulting
21 from nonpoint sources to such portion. The purpose of such
22 conference shall be to develop ~~an agreement~~ and achieve implementation of a Master Plan among such
23 States to reduce the level of pollution in such portion result-
24 ing from nonpoint sources so that section (a)(1)(A) water quality objectives shall be attained. Each State which contributes sig-

1 nificant pollutant loadings from nonpoint sources to such por-
2 tion in amounts which contribute to such portion—
3 "(1) not meeting applicable water quality stand-
4 ards; or
5 "(2) not attaining a water quality which ensures
6 protection of public health, the use and value of such
7 portions for public water supply, agricultural, industri-
8 al, and other purposes, and propagation of a balanced
9 indigenous population of shellfish, fish, wildlife, and
10 plants and which allows recreational activities in and
11 on the water;
12 shall develop, submit to the Administrator for his approval,
13 and implement a plan referred to in subsection (b) (That is the State's portion of the Master Plan) to reduce
14 the level of pollution in such portion resulting from nonpoint
15 sources in such State.
16 "(i)(1) Upon application, the Administrator shall make
17 grants to each State for which a report, or an update of a
18 report, submitted under subsection (a) and a plan submitted
19 under subsection (b) of such subsection is approved under this
20 section for any fiscal year. Any such grant shall be made to
21 carry out in any fiscal year such plan for controlling in such
22 year pollution added to the navigable waters from nonpoint
23 sources. An application for a grant under this subsection shall
24 be in such form and shall contain such information as the
25 Administrator may require.

1 organization with authority to control pollution from nonpoint
2 sources in any area of such State.
3 "(5) There is authorized to be appropriated to carry out
4 this subsection not to exceed $150,000,000 per fiscal year for
5 the fiscal years ending September 30, 1984, September 30,
6 1985, September 30, 1986, September 30, 1987, and Sep-
7 tember 30, 1988.
8 "(j)(1) Not later than January 1, 1985, and each Janu-
9 ary 1 thereafter the Administrator shall transmit to the Com-
10 mittee on Public Works and Transportation of the House of
11 Representatives and the Committee on Environment and
12 Public Works of the Senate, a report for the preceding fiscal
13 year on the activities carried out under this section and the
14 progress made in reducing pollution in the navigable waters
15 resulting from nonpoint sources.
16 "(2) Not later than January 1, 1988, the Administrator
17 shall transmit to Congress a final report on the activities car-
18 ried out under this section. Such report, at a minimum, shall
19 include—
20 "(A) an analysis of the effectiveness of plans car-
21 ried out under this section and of the best management
22 practices and measures utilized under those plans in
23 controlling nonpoint sources of pollution;
24 "(B) an analysis of the level of State participation
25 in implementing such plans; and
"(C) an analysis of which waters not originally meeting subsection (a)(1)(A) objectives have attained those water quality objectives;

WATER RESOURCES BULLETIN
VOL. 18, NO. 3 AMERICAN WATER RESOURCES ASSOCIATION JUNE 1982

MUNICIPAL POINT SOURCE AND AGRICULTURAL NONPOINT SOURCE CONTRIBUTIONS TO COASTAL EUTROPHICATION[1]

Alfred M. Duda[2]

ABSTRACT: Tidally influenced reaches of several coastal rivers in eastern North Carolina are suffering from very serious water quality problems – massive surface blooms of noxious blue-green algae, major fish kills from anoxic water, epidemics of red sore disease among fish, fresh water intrusion into estuarine waters, and declining commercial and sports fisheries. An intensive investigation of point source and nonpoint source inputs of nutrients was conducted in one of the eutrophic rivers, the Chowan River. Nonpoint source loading dominated the estimated annual flux of nutrients from the river basin. Automated water quality samplers were utilized to record nutrient levels in stormflow and baseflow from several small agricultural watershed in the basin. Levels of nitrate nitrogen and total phosphorus were from five to 40 times greater in these agricultural watersheds than levels in mostly forested watersheds. Existing water quality data in these eutrophic river basins implicate agricultural activities – particularly animal operations and cropland in watersheds with extensive drainage improvements – as the major contributing factor to the water quality problems.
(KEY TERMS: point/nonpoint source tradeoffs; eutrophication; agricultural nonpoint source runoff; nutrient loading; algae; water quality management.)

INTRODUCTION

While the eutrophic nature of many lakes has been well documented in the United States (EPA, 1980), much less information is available concerning the eutrophic status of coastal waters. Tidally influenced rivers are particularly susceptible to eutrophication. They serve as a repository for legal and illegal point source discharges as well as all nonpoint source discharges from activities such as agriculture and urban runoff that occur in their entire watersheds. While the serious nutrient problem in the Potomac River has received national attention due to extremely large point source discharges (Feliciano, 1979), problems in other coastal rivers have escaped widespread attention.

In areas where eutrophication problems are known to exist, the implementation of nutrient controls has been given a low priority due to pressing problems from toxic substances, the elimination of advanced treatment (nutrient removal) from the EPA Construction Grants Program, and the complexity of identifying contributing sources (point/nonpoint source tradeoffs). In particular, the contribution of agricultural activities to eutrophication problems has been disputed by some agricultural interests. While Omernik (1977) clearly demonstrated significant increases in nutrient concentrations draining agricultural versus forested watersheds across the country, some interests claim that such an analysis does not imply cause and effect relationships due to natural differences in nutrient concentrations of soils (Taylor, 1977). In other cases the use of inadequate data bases and inappropriate statistical methods have resulted in not being able to demonstrate significant differences in nutrient levels draining forested and agricultural land (Haith, 1976; Humenik, *et al.*, 1980; Thomas and Crutchfield, 1974). In all too many cases, however, deficiencies in cause and effect relationships, the need to conduct more studies, and the need to collect more data have been used to delay widespread implementation of nutrient control measures on agricultural land (Agricultural Task Force, 1979; Gilliam, *et al.*, 1978; Humenik, *et al.*, 1978; Loehr, 1979).

This paper presents the results of an investigation of point source and nonpoint source inputs of nutrients to the Chowan River in eastern North Carolina. The very serious eutrophication problem in this coastal river has been extensively researched by the State of North Carolina and is only one example of the nutrient problem plaguing a series of eutrophic coastal rivers in the state. Based on the extensive amount of data collected, a description of the nature and extent of the eutrophication problem is presented and agricultural activities are implicated as a major contributor to the water quality problem. In addition, comparisons are made between the nutrient problem in the Chowan River and similar problems in adjacent coastal rivers that also receive drainage from extensive amounts of agricultural land.

DESCRIPTION OF STUDY AREA

Location

The presence of a chain of barrier islands along the North Carolina coast shields much of the state's estuarine waters from the effects of ocean tides. This has resulted in longer

[1]Paper No. 81138 of the *Water Resources Bulletin*. Discussions are open until February 1, 1983.
[2]Supervisor, Nonpoint Source Management Unit, North Carolina Division of Environmental Management, P.O. Box 27687, Raleigh, North Carolina 27611 (Present address: Tennessee Valley Authority, Knoxville, Tennessee, 37902.)

residence times for nutrients and has made several coastal rivers more susceptible to eutrophication. Figure 1 illustrates the position of these barrier islands and the location of the three major rivers (Chowan, Pamlico, and Neuse) that are experiencing accelerated eutrophication.

Figure 1. Location of Eutrophic Coastal Rivers in Eastern North Carolina.

This paper focuses on the nutrient problem in the northernmost of these tidal rivers, the Chowan. Draining about 12,700 km^2 in southern Virginia and eastern North Carolina, the Chowan River is tidally influenced from the border between the two states to its mouth at Edenton, North Carolina (Figure 2). The river varies in width from several hundred meters in its upper reaches to 8 km at Edenton. The shallow lower river from Holiday Island to Edenton (averaging 4 m. in depth) has a very long retention time and acts more like a lake than a river with summer flushing times on the order of two months (Daniel, 1977).

Figure 2. Map of the Chowan River Basin.

The watershed is very rural in nature, with a population of less than 275,000 people and with only small towns – all less than 10,000 people. While the eutrophication problem is manifested in the North Carolina portion of the river basin, almost three quarters of the watershed is located in Virginia, and about 20 percent of it is estimated to be agricultural land – about 150,000 ha. in Virginia and 81,900 ha. in North Carolina (Division of Environmental Management, 1980). The most widely grown crops are tobacco, soybeans, peanuts, and corn. Hog production is common in several North Carolina counties in the basin.

The Water Quality Problem

The Chowan River is very important to the livelihood of many North Carolina residents because of the significance of the sport fishing, commercial fishing, and tourism industries to this historic area of the state. For the last decade, blooms of noxious blue-green algae have depressed water based recreation activities, caused odor problems, fouled swimming beaches with 15 centimeter deep piles of decaying algae, caused tourism to slacken, and are suspected of being linked to the drastic decline in fishing success. In addition to fish kills, the important commercial herring fishery in the river is down 60 percent over normal catches, striped bass catches are down 80 percent, and catfish catches are down 50 percent according to studies by the North Carolina Division of Marine Fisheries (Johnson, 1980).

In addition to the algal blooms, epidemics of red sore disease have devastated fish populations in the area in 1976 and 1979. Caused by a bacterial infection, the disease causes lesions to develop on the fish and commonly results in death. During the epidemics, many commercial and game fish catches had to be discarded due to 70-100 percent contamination with the disease. Very high levels of the disease causing bacterium as well as infected fish were noted in the Chowan during 197[illegible] (Esch and Hazen, 1980). The public outcry that has arisen from these water quality problems has made the restoration of the Chowan River the top priority environmental goal of the Governor of North Carolina (Division of Environmental Management, 1980).

WATER QUALITY MONITORING STRATEGY

Since a devastating bloom of algae occurred in 1978, the North Carolina Division of Environmental Management has conducted extensive sampling in the Chowan River for nitrogen and phosphorus levels as well as algal biomass. Twenty four stations on the river from Virginia to Edenton are monitored weekly and eighteen tributary stations, encompassing the major North Carolina inputs to the main river, are monitored every other week. Chemical samples are collected from the entire water column by depth integrating techniques. Samples are placed on ice and delivered to the Biological and Agriculture Engineering Department Laboratory at North Carolina State University where the nutrient analyses are run on Technicon Autoanalyzer II using standard methods (Overcash *et al.*, 1975). Algal samples are collected by depth integrati[illegible]

techniques through the top meter to represent the photic zone of the tea colored water. The algal samples are analyzed at North Carolina State University as specified in Witherspoon, *et al.* (1979). Estimates of river flow rates were provided by the U.S. Geological Survey based on recorded flows in the watershed and stage measurements in the lower river (Daniel, 1977).

In addition, four small watersheds (1.6-12.9 km^2) with at least 50 percent of each watershed in agricultural use have been instrumented in the basin to monitor nutrient loadings. A recording rainfall gage, a digital stage recorder, and an automated stage activated sampler were installed on each stream during late 1979. The sampler (ISCO Model 1680) collects a water sample at each 7.6 cm rise or fall in stage and stores it in acid washed, plastic bottles with sulfuric acid used as preservative. These samples were collected several times weekly and delivered to the North Carolina Division of Environmental Management's Central Water Quality Laboratory for nutrient analysis with a Technicon Autoanalyzer using EPA approved methods (American Public Health Association, 1976). Nutrient levels recorded during wet weather and dry weather conditions were compared to nutrient concentrations draining almost completely forested watersheds in the North Carolina Coastal Plain. These low flow and storm flow levels of nutrients in forested watersheds were recorded by the U.S. Geological Survey and have previously been summarized by Simmons and Heath (1979).

RESULTS

Dynamics of Algal Populations

In response to the first massive surface bloom on the river in 1972, the State of North Carolina funded several studies that investigated the dynamics of the eutrophication problem in the Chowan River. Based on these investigations (Stanley and Hobbie, 1977; Witherspoon, *et al.*, 1979), three types of blooms appear to occur in the river. The spring bloom, consisting of a mixture of unicellular species dominated by diatoms such as *Melosira* and dinoflagellates such as *Peridinium*, blends in well with the tea colored water and does not usually form nuisance surface blooms. While the magnitude of this bloom is symptomatic of the nutrient overenrichment, it is not noticed by the public. From early summer to fall (depending on temperature and flow), a second type of bloom, the visible blue-green bloom, is presentt in the water column. Each of the three nuisance species (*Anabaena circinalis*, *Microcystis firma*, and *Aphanizomenon flos-aquae*) appears to gain a competitive advantage over the unicellular species in different sections of the river based on the flow regime and presence of nutrients in that section.

Wind action and flow conditions normally keep these blue-green algae dispersed throughout the water column and only small, localized surface blooms occur. However, when the wind slackens, river flow decreases and air temperatures increase in the "dog days" of late summer, the blue-greens come to the surface, aggregate into mats, and then turn portions of the river into "peasoup." This surface manifestation of th blue-green bloom can be referred to as a "sociopolitical" nui sance bloom (third type of bloom) because this is the bloom that the public is worried about and is the one that provoke political action. This nuisance bloom, which reached massiv proportions in 1972 and 1978, is very transient, and within several hours, a massive surface bloom can disappear as wind mix the cells throughout the water column. Dissolved oxygen depletion and fish kills may follow this collapse just as they do elsewhere in the country (Barica, 1978).

It is clear from the observations that physical factors control the occurrence of massive surface blooms in the river Water flow, channel geometry, retention time, and wind all play important roles in determining when and where surface blooms will occur. During a summer with low flow, a parcel of water entering the lower river at Holiday Island may not enter Albemarle Sound until late fall (Figure 2). In fact, daily evapotranspiration from the water surface and the surrounding riverine swamps can account for as much as the entire river flow into the lower river at Holiday Island (Daniel, 1977). This very long retention time fosters the efficient utilization of nutrients by the algae.

Following the massive bloom of July 1978, weekly measurements of algal biomass (as reflected by chlorophyll *a* determinations) and nutrient levels were made in the river. Figure 3 presents the variation of chlorophyll *a* with levels of orthophosphate and nitrate nitrogen at the sampling station near Holiday Island for a two-year period. The average flow of the river at this point is also presented on a monthly basis. Note that algal biomass increases greatly whenever flow is low during the warm season and decreases during high flows. Nitrate concentrations were found to be greatest during winter and spring, and a post agricultural fertilization peak in both nitrate and ortho-phosphate was evident in May and early June 1979. The very explosive growth in algae in late spring depletes these two nutrients down to undetectable limits (< 0.01 mg/l). Chlorophyll *a* concentrations exceeded the state water quality standard of 40 $\mu g/l$ for seven weeks during the summer of 1979 at this station despite the absence of the nuisance surface bloom. Frequent cloudiness, winds, and rain from tropical depressions seemed to prevent the buildup of surface mats.

During 1980, the bloom was much less noticeable than in 1979 and appears to be linked to the magnitude of spring inputs of agricultural nutrients to the river. During spring of 1978, very high amounts of rainfall occurred, and weather conditions were such during summer that massive blooms resulted (chlorophyll *a* levels exceeded 230 $\mu g/l$ at several points in the lower river). In contrast, May and June 1980 were abnormally dry and the spring peak in nutrient transport did not occur. This caused nutrients in the river to reach very low levels more than two months earlier than they did in 1979. The decline in algal biomass during June 1980 (the decline continued throughout summer) shows a nutrient limitation during this dry year. More detailed analyses of nutrient and biomass data are available elsewhere (Division of Environmental Management, 1979).

Figure 3. Variation of Chlorophyll *a* and Nutrient Concentrations with Average Flow in the Chowan River at Holiday Island.

River Nutrient Loading

Average daily loadings of nitrogen and phosphorus in the Chowan River at Holiday Island (at this point receiving drainage from over 95 percent of the watershed) were estimated on a monthly basis for the period September 1978 to March 1980. The loading rates were developed from the monthly average of weekly measurements of nutrients and the flow rates provided by the U.S. Geological Survey and are presented in Figure 4. The shaded portion of each estimated average daily loading represents point source discharges from the entire basin.

This point source loading was estimated from sampling conducted on effluent from the larger discharges and extrapolations made for smaller dischargers based on existing levels of treatment. The details of this analysis are given in a summary report (Division of Environmental Management, 1980). In this rural river basin, 130 point source discharges of nutrients were identified in Virginia and North Carolina – most of them being very small discharges such as from schools. Only four point sources discharge more than one million gallons/day (3.79 million liters/day), another three discharge between one-half and one million gallons/day, and 62 have discharges less than 0.01 million gallons/day. The increase in loading during winter (December-March) results from the seasonal discharge from Union Camp waste water lagoons in Franklin, Virginia. The waste water is treated and stored in large holding ponds until the high flows of winter occur. Of the total point source load of nutrients discharged in the Chowan basin, 63 percent of the load of total nitrogen and 83 percent of the load of total phosphorus was estimated to be contributed by dischargers in Virginia.

Figure 4. Average Daily Loading of Nutrients to the Chowan River at Holiday Island on a Monthly Basis.

An estimate of annual nutrient flux to the lower river Holiday Island was made for the 1979 water year (Octo 1978 to September 1979) by summing up the monthly loa presented in Figure 4. Total nitrogen loading for the low river at Holiday Island was estimated as 61.3 x 10^5 kg/y and total phosphorus loading at 6.3 x 10^5 kg/year. Of th values, point source discharges were estimated to contrib only 3 percent of the total nitrogen load and 6 percent of t total phosphorus load. While these estimates would be grea in high flow years and lower in low flow years, they indic that most of the nutrient load can be attributed to nonpo sources – 97 percent of the nitrogen load and 94 percent the phosphorus load for water year 1979. Of the nitrog load 36 percent was inorganic nitrogen and 64 percent w organic nitrogen. Of the phosphorus load, 49 percent was the reactive form of ortho-phosphate. In a detailed study eutrophication in a northern Virginia river impoundment l cated in the same physiographic area as the Chowan Ri basin), Randall, *et al.* (1978) found that 5 percent of the nit gen and 7 percent of the phosphorus loading on an ann basis came from point source discharges and the rest from n point sources.

Nonpoint Source Nutrients

Given the major contribution of nonpoint source dischar to total nutrient loading, it was necessary to determine whet agricultural or forested areas contribute greater levels of trients in the river basin. Storm event monitoring of nutri

levels in the four small agricultural watersheds began late in 1979. The monitoring stations were established as part of a cooperative demonstration with North Carolina State University to document the extent of water quality improvement once farmers implement "Best Management Practices" (BMP's).

Two watersheds were located in the well drained Coastal Plain, which is characterized by cropland in the uplands that drains to low lying swamps bordering the creeks. The other two watersheds were located in the poorly drained Coastal Plain, characterized by clayey soils and flat land requiring extensive drainage improvements and channelization to allow crop production. Each of the four study watersheds was at least 50 percent agricultural land, and general characteristics of each are given in Table 1. In this portion of eastern North Carolina, totally forested watersheds are scarce, except for managed pine stands on forest industry land. Fortunately, the U.S. Geological Survey had just completed detailed monitoring of water quality in a number of totally forested watersheds in the North Carolina Coastal Plain, and this data base provided a suitable comparison with nutrient levels in the agricultural watersheds.

Table 2 contrasts mean values for low flow and storm flow nutrient concentrations in the agricultural and the forested watersheds. The agricultural values represent data from the first year of sampling, which yielded between 7 and 12 storm events for each watershed. In general, variability of the mean values, as measured by the relative standard deviation, was greater for storm event concentrations than for low flow levels of the four primary nutrient parameters (ammonia, nitrate, Kjeldahl nitrogen, and total phosphorus). Of the four agricultural watersheds, the catchment with less livestock, WD-1, had the least variable level of nutrients – with relative standard deviations ranging from 20-60 percent for low flow values and 35-90 percent for storm flow values. PD-2, with the variability introduced by the swine, had the largest relative standard deviations, ranging between 70-160 percent for storm flow concentrations. For all watersheds, Kjeldahl nitrogen concentrations were most stable (ranging from 30-60 percent of mean values), while phosphorus values were the most variable (40-160 percent). The forested watersheds, with their very low mean concentrations, had the smallest absolute values for standard deviations, yet due to the low concentrations their relative values approached 100 percent of the mean.

The difference in mean concentrations of nitrate and total phosphorus between the paired watersheds WD-1 and WD-2 may be the result of greater amounts of livestock. Five-fold increases in average low flow and storm flow concentrations of nitrate were found in WD-2. Watershed PD-1, the extensively channelized watershed, had several-fold increases in nitrate, organic nitrogen, and total phosphorus over the swamp lined agricultural catchment WD-1. When swine were present in stream side areas of PD-2, very large increases in nitrate and storm flow concentrations of organic nitrogen and total phosphorus resulted (Table 2).

TABLE 1. Characteristics of Small Agricultural Watersheds Monitored in the Chowan River Basin.

Watershed	Drainage Area (ha)	Land Use (percent of watershed)			Livestock Population	Major Crops
		Forest	Cropland	Pasture/Idle		
WD-1	1890	50	46	4	none	peanuts, corn
WD-2	2639	51	48	1	32,000 broilers 400 swine 90 cattle	corn, peanuts, beans
PD-1	293	45	53	2	6 swine	corn, beans
PD-2	196	39	56	5	50 swine (near creek)	corn, beans

TABLE 2. Comparison of Mean Low Flow and Storm Flow Concentrations of Nutrients (mg/l) in Small Forested and Agricultural Watersheds in the North Carolina Coastal Plain.

Constituent	USGS Forested Watersheds		WD-1 (Swamp Lined)		WD-2 (Some Livestock)		PD-1 (Channelized)		PD-2 (Hoglot)	
	Low	Storm	Low	Storm	Low	Storm	Low	Storm	Low	Storm
Number of Samples	24	25	21	43	24	35	10	51	7	63
Ammonia	0.01	0.01	0.14	0.06	0.08	0.12	0.08	0.07	0.10	0.18
Nitrite plus Nitrate	0.03	0.06	0.06	0.17	0.42	0.69	0.14	0.42	1.93	1.47
Total Kjeldahl Nitrogen	0.38	0.48	0.69	0.50	0.52	0.73	0.96	1.08	0.54	1.83
Total Nitrogen	0.41	0.54	0.75	0.67	0.94	1.42	1.10	1.50	2.47	3.30
Total Inorganic Nitrogen	0.04	0.07	0.20	0.23	0.50	0.81	0.22	0.49	2.03	1.65
Organic Nitrogen	0.37	0.47	0.55	0.44	0.44	0.61	0.88	1.01	0.44	1.65
Total Phosphorus	0.01	0.02	0.09	0.09	0.10	0.19	0.25	0.32	0.09	0.78

When compared to mean nutrient levels in the U.S. Geological Survey forested watersheds, organic nitrogen values were about the same in the two well drained watersheds (with agricultural drainage leading to the wooded swamps) but were higher in the poorly drained areas. However, very large increases were noted in total phosphorus (TP) and total inorganic nitrogen (TIN) concentrations for the four agricultural catchments. The increases over the forested situation were 5-10 fold for WD-1 and about 10 fold for WD-2, with its moderate livestock population. In the channelized watershed, 5-7 fold increases occurred in TIN concentrations, and due to greater surface runoff and erosion, 15-20 fold increases occurred in TP levels. With the small hoglot in FD-2, 20 to 40 fold increases in mean TIN and TP concentrations were found over mean levels recorded in forested watersheds. Since water export from these agricultural watersheds is probably greater than from totally forested catchments, the increase in nutrient loads should be greater than the simple increases in concentration. Rigorous statistical anlayses and loading estimates will await completion of the second year of sampling.

Very high concentrations of nutrients have been found in many other Coastal Plain agricultural watersheds from Georgia (Jackson, *et al*, 1973) to North Carolina (Gambrell, *et al*, 1975; Kuenzler, *et al*, 1977; Skaggs, *et al*, 1980) and Delaware (Ritter, *et al*, 1979). The presence of livestock wastes (Kuenzler, *et al*, 1979; Liebhardt, *et al*, 1979), and the use of drainage improvements such as tile drains or channelization (Gambrell, *et al*, 1975; Kuenzler, *et al*, 1977; Humenik, *et al*, 1980) have been found to greatly increase nutrient levels of Coastal Plain waters. In particular, values of inorganic nitrogen species – normally the limiting nutrient in estuarine waters – are greatly elevated over the forested situation. The comparison of nutrient levels in forested and agricultural watersheds suggests that nutrient levels (especially nitrate nitrogen and total phosphorus) are much higher in agricultural watersheds. These increases may be up to five fold for watersheds with extensive swamps, ten fold for swampy watersheds with significant populations of livestock or extensive amounts of drainage improvements, and up to 20-40 fold increases when livestock wastes are poorly managed in the agricultural watersheds.

Delivery of Agricultural Nutrients

Despite the high levels of agricultural nutrients that have been found to be present in Coastal Plain streams, some agricultural interests "doubt that reduction of nutrient loss from cropland would be noticed at the estuary" due to the "natural" loss of nutrients that occurs between agricultural fields and coastal waters (Gilliam, *et al*, 1978). Such interests maintain that processes such as denitrification, assimilation, and overbank deposition prevent the nutrients from reaching coastal waters (Gambrell, *et al*, 1975; Agricultural Task Force, 1979). While some reduction certainly occurs through denitrification and assimilation in swamps, the extensive amounts of agricultural drainage improvements and transformation of nutrient species to other forms appears to ensure that agricultural nutrients do reach coastal waters of eastern North Carolina.

From the upland Piedmont and the upper Coastal Plain, some overbank deposition and assimilation does occur, but the confined stream channels on an annual basis should flush nutrients and transformed nutrients (algae and detritus) to coastal waters. It is in the Coastal Plain swamp lined streams (well drained areas) or swamps in the streams (poorly drained areas) that the potential for assimilation is greater. There is ample evidence from South Carolina (Kitchens, *et al*, 1975) and Louisiana (Patrick, *et al*, 1976) that Coastal Plain swamps do remove pollutants, assimilate nutrients, and therefore protect water quality of coastal waters. It is when these natural nutrient removal systems are overloaded by agricultural drainage improvements and animal wastes or are eliminated by channelization that increased amounts of nutrients are delivered to estuarine areas.

Agricultural drainage improvements and channelization projects have been conducted all across eastern North Carolina. More than 70 percent of the cropland in the 17 coastal counties has been artificially drained (Doucette and Phillips, 1978), and millions of additional hectares in the inner Coastal Plain have also had improved drainage. In the North Carolina portion of Chowan basin, five channelization projects (with over 600 kilometers of channel excavations) have been completed by the U.S. Soil Conservation Service and others are planned. The data presented in this paper as well as other monitoring results reported by Kuenzler, *et al* (1977), and Humenik, *et al* (1980), show much higher delivery of nutrients from watersheds with channel improvements than those with intact swamps.

Even in large (150 square kilometers) watersheds, increases in annual flux of nutrients (20 fold for inorganic nitrogen and 30 fold for total phosphorus) have been documented in channelized streams compared to similar agricultural watersheds draining to swamps (Kuenzler, *et al*, 1977). Five to ten fold increases in annual inorganic nitrogen and phosphorus flux were also found in large agricultural watersheds with intact swamps when substantial populations of livestock (hogs) were present in the watershed (Kuenzler, *et al*, 1977). It is clear that livestock runoff and drainage improvements dramatically increase downstream nutrient delivery, especially when channel improvements destroy the assimilative capacity of poorly drained, swampy areas in small watersheds.

Additional support for this hypothesis that smaller swamp associated watersheds are more important in nutrient assimilation than larger coastal rivers that receive agricultural drainage comes from an analysis of suspended sediment transport measurements made by the U.S. Geological Survey in two large creeks in the Chowan basin. Ahoskie Creek (with a 150 km^2 drainage area) was extensively channelized several decades ago. Potecasi Creek is a larger stream (with a 495 km^2 drainage area) and is lined by swamps along much of its channel. It receives at least one-third of its drainage from channelized agricultural watersheds. Figure 5 illustrates the variation of normalized sediment transport (metric tons/day/km^2) with normalized flow (cubic meters/second/km^2) for the two creeks as well as four other creeks that flow through swampy areas. South River (No. 1) and Drowning Creek (No. 2) represent larger watersheds the size of Potecasi Creek (No. 3), when

Creeping Swamp (No. 4) and Black River (No. 5) represent smaller watersheds the size of Ahoskie Creek (No. 6). The suspended sediment measurements were taken from the U.S. Geological Survey's annual data reports (*Water Resources Data for North Carolina*) for water years 1974 to 1979.

Figure 5. Variation of Normalized Sediment Transport With Normalized Flow for Coastal Plain Streams With and Without Extensive Drainage Improvements.

The four unchannelized creeks, despite having different amounts of agricultural land and different size drainage areas, are all clustered with much lower normalized solids transport at a given normalized flow than Ahoskie and Potecasi Creeks. The difference is less at lower flows due to the large amount of nonfilterable residue (detritus) that is present in these swampy, black water streams. Logarithmic regressions were run to generate least squares equations for each of the relationships and the best fit for each creek is depicted in Figure 5. Very high R^2 values resulted (from 0.77 to 0.82 for the four natural creeks and 0.92-0.96 for Potecasi and Ahoskie Creeks). An analysis of covariance was also conducted to detect differences between the relationships. Each of the natural streams was found to be significantly different ($p = 0.01$) from Ahoskie Creek and Potecasi Creek.

Despite having a larger watershed and some adjacent swamps, the suspended solids transport in Potecasi was not significantly different ($p = 0.01$) from that in smaller, mostly channelized Ahoskie Creek. This suggests that once the pollutant assimilative capacity of small, swampy watersheds is destroyed or overwhelmed, less assimilation of particulate pollutants occurs in the confined, downstream channels of larger creeks. The statistically significant difference in pollutant transport in Potecasi Creek compared to the two other larger creeks also suggests that larger creeks serve more as transmission zones rather than as zones for assimilating agricultural pollutants (suspended solids, probably phosphorous, maybe nitrogen). In fact, ten fold increases in total phosphorus and total inorganic nitrogen (compared to forested watersheds) are normally monitored in Potecasi Creek as it empties into the tidally influenced Chowan River despite the absence of significant point source discharges (Division of Environmental Management, 1979).

Timing of Agricultural Nutrient Inputs

The timing of agricultural inputs to the main river may be the most significant factor in initiating the massive surface blooms of blue-green algae. Earlier analyses pointed out that large amounts of reactive nitrogen and reactive phosphorus are transported to the river in late winter and spring – very likely from agricultural sources. Researchers suggest that the spring pulse blooms of diatoms and dinoflagellates trap some of those nutrients for remineralization, recycling, and uptake by the noxious blue-greens in the Chowan during summer (Stanley and Hobbie, 1977). Davis, *et al.* (1978), noted a similar "storage of nutrients and subsequent remineralization" in the nearby eutrophic Pamlico River.

Algal growth is commonly observed during spring at agricultural tile outlets and in drainage ditches, and nuisance plant growth commonly chokes stream channels below agricultural drainage improvements in the Coastal Plain during early summer (Swicegood and Kriz, 1973). It is obvious that this growth assimilates some nutrients during spring and early summer, but depressed dissolved oxygen and stagnant conditions may cause remineralization and recycling in these tributaries. Moderate summer storm flows may just flush the nutrients and plant material down to the main river and provide a boost for the nuisance algae to develop into massive surface mats.

The larger the spring contribution of nutrients, the more massive the noxious algal bloom appears to be in the Chowan River if optimum weather conditions exist during summer. The two years with massive surface blooms (1972 and 1978) were characterized by very wet spring seasons and dry summers with little wind. While above average rainfall also occurred during spring of 1975 and 1979, tropical depressions and frequent summer rainfall washed much of the blue-green algae out of the river and prevented massive surface blooms in 1975 and 1979. In contrast, 1980 spring rains were very much below normal and little rain fell after May. Despite the continued input of point source discharges, no massive blooms occurred in the Chowan River during summer, 1980, indicating nutrient limiting conditions when nonpoint source agricultural nutrients do not overload the river. The lack of blooms during the dry year of 1980 implicates nonpoint source agricultural nutrients as a significant contributor to the eutrophication problem in

the lower Chowan River and perhaps in adjacent eutrophic rivers. Additional discussions of the importance of weather and flow conditions to the occurrence of algal blooms in the Chowan are presented by Witherspoon, *et al.* (1979).

ADJACENT COASTAL RIVERS

The findings of this investigation in the Chowan River basin document what has been suspected for nearly a decade in North Carolina – that nutrient controls need to be implemented throughout drainage basins (especially in agricultural areas) to reverse the eutrophication of North Carolina coastal waters. This management strategy applies not only to the Chowan but also to the Neuse and Pamlico River basins. The very serious eutrophication problem in the Chowan is expressed in a different manner than the problems in the more saline Neuse and Pamlico estuaries. In these more saline estuaries, the deoxygenation that accompanies blooms of blue-green algae and dinoflagellates results in massive fish and shellfish kills when certain weather conditions persist. In an intensive study of this eutrophication problem, Davis, *et al.* (1978), noted seven fish kills during a 40-day period in June and July 1977. This phenomenon has also occurred in the Neuse. During summer 1978 and 1979, the Division of Environmental Management investigated eight of these massive (greater than 25,000 fish) kills in both the Neuse and the Pamlico. Bluefish, shad, croaker, flounder, spot, menhaden, and crabs have perished in these massive kills.

In the Neuse, an intensive study found that the estuary has lower species diversity than other southeastern estuaries (Hester and Copeland, 1975). Furthermore, the researchers documented that there is not a resident population of fish in the Neuse during the summer, which is unlike other estuaries in the Southeast, and that the migratory population leaves the area just as the deoxygenation develops in early summer. This absence of a normal population of fish in the Neuse during summer is indicative of the very serious water quality problem that exists there.

The Coastal Plain of the Neuse and Pamlico River basins is also intensively used for agriculture. More than a dozen large scale channelization projects have been completed or authorized and tens of thousands of kilometers of tile drains and open ditches have been installed. The Coastal Plain of these two basins has the highest densities of cropland, tobacco, corn, and swine in the state (Agricultural Task Force, 1979).

The Neuse and Pamlico Rivers are located adjacent to the Albemarle-Pamlico peninsula of eastern North Carolina. This very flat area is made up of several types of wetlands and has extensive deposits of peat. The wetlands have been intensively drained and are being converted to cropland. More than 20 percent of wetlands in coastal counties of North Carolina have been drained and converted to agricultural use (Doucette and Phillips, 1978). Corporate farms, containing up to 145,000 hectares of contiguous agricultural land and having clearings up to 20 kilometers long, have been developed in the coastal counties (Taylor, 1978). Drainage canals five meters deep and field ditches spaced on an 30-meter grid are used to drain the wetlands. Figure 6 illustrates the larger canals in one of th affected counties as mapped from aerial photos by the U.S Geological Survey (Daniel, 1978). Figure 6 covers an area of 36,0 hectares.

Figure 6. Major Agricultural Canals in Close Proximity to Coastal Waters.

These extensive agricultural drainage systems, the appl tion of fertilizer, and wastes from beef cattle and swine op tions appear to be having a profound influence on w quality in portions of the Neuse and Pamlico estuaries. I drainage improvements have been found to cause 3-5 t increases in peak flows following rainfall (Skaggs, *et al.*, 198 These slugs of fresh water have reduced salinity in prime tuarine nursery areas, resulting in reductions of shrimp pop tions and the elimination of oysters from entire bays (Sn and McCloes, 1981). This decrease of salinity in estuarine ters can make the waters more susceptible to blooms of bl green algae and infestations of red sore disease (Esch and Hazen, 1980). Entire populations of commercially impor fish species have perished from red sore disease in sect of coastal North Carolina (Esch and Hazen, 1980). In addit high levels of nutrients and fecal coliform bacteria have b recorded in waters leaving these corporate farms (Kirby-S and Barber, 1979; Skaggs, *et al.*, 1980).

These coastal water quality problems have not been fined to North Carolina. Livingston (1975) reported that tensive agricultural drainage has impacted water qualit Apalachicola Bay, Florida. Increased peak storm flows i

reduced salinity levels and increased sedimentation to the point that shrimp resources are no longer plentiful. Also in Florida, the contribution of agricultural runoff to the algal problems and fish kills in Lake Apopka are well known (Schneider and Little, 1972). In addition, agricultural drainage improvements have been implicated in the increase of eutrophication problems in the Kissimmee River basin (Carter, 1974).

MANAGEMENT IMPLICATIONS

As noted by Stanley and Hobbie (1977), levels of nutrients in the Chowan River are not much different than in other North Carolina estuaries. Due to differences in salinity, retention time, and physical factors, the eutrophication problem is manifested in different ways and appears to be getting worse in each estuary. However, common to each estuary is a very large late winter-spring slug of inorganic nitrogen that appears to have as its source agricultural activities. As suggested by Stanley and Hobbie (1977), spring blooms may "store" these nutrients until they are recycled later in the summer, resulting in nuisance algal blooms and fish kills from dissolved oxygen depletion.

It is apparent from existing water quality data that nutrient abatement in these three river basins needs to be focused on agricultural livestock operations, cropland located in the well drained Coastal Plain, and cropland in poorly drained watersheds that have been subjected to extensive agricultural drainage improvements. While municipal point source discharges undoubtedly contribute to these eutrophication problems, it is likely that expensive point source nutrient control programs will not alleviate the problem without the abatement of agricultural nutrients. This issue of point/nonpoint source tradeoffs will remain the major obstacle to the solution of eutrophication problems during the 1980's.

As a result of a 1975 court decision, each state was required by Section 208 of the Federal Water Pollution Control Act Amendments to produce a plan for controlling critical water quality problems from both point and nonpoint source pollutants. The Section 208 planning process was relied on by citizens of North Carolina to initiate abatement programs for solving these agricultural nonpoint source water pollution problems. However, agricultural interests were given responsibility to prepare the "208 Agricultural Plan" (Agricultural Task Force, 1979), and a purely voluntary program was the result. The Plan recommended that existing programs (S.C.S., Agricultural Extension, etc.) continue to do what they can to educate agricultural interests in the voluntary use of practices for minimizing pollutant generation. This voluntary program was highlighted by several studies that would be undertaken if additional funds became available.

Such a low profile, voluntary program may not be successful in addressing agricultural nonpoint source pollution problems in coastal areas. Likewise, regulatory programs will be of little utility in solving coastal water quality problems in North Carolina because state legislation has been systematically enacted to exempt agricultural activities from existing regulatory programs. Agricultural activities are now exempt from the North Carolina Coastal Area Management Act and the Sedimentation Pollution Control Act. Agricultural activities, including livestock operations, were recently exempted by the North Carolina state legislature from "Special Orders" issued by the North Carolina Environmental Management Commission under state water quality legislation, and the authority for approval of watershed workplans (P.L. 566) and the use of channelization in agricultural watersheds was deleted from the powers of the Environmental Management Commission.

The wholesale exemption of agricultural activities from state environmental regulations and inadequate funding for agricultural education and assistance programs ensures that existing programs will not be able to solve coastal eutrophication problems. If aggressive, new programs are not implemented to reduce the loading of agricultural nonpoint source pollutants, coastal water quality will continue to decline in North Carolina. Such inaction should be accompanied by a downgrading in the classification of these coastal waters so citizens understand that the approved use of the waters is for "pollution disposal" rather than for the protection and propagation of indigenous aquatic life.

CONCLUSIONS

With the current reduced level of expenditures for water quality management, abatement efforts must first focus on waters whose designated use has been impaired. A watershed-by-watershed approach is needed to implement the most cost effective tradeoff in point/nonpoint source control programs to optimize water quality improvements. This paper examined the nature and extent of the nutrient enrichment problem in one of several eutrophic coastal rivers in eastern North Carolina. Detailed monitoring conducted during water year 1979 illustrated that nonpoint source loadings dominated the annual flux of nutrients from the more than 12,000 square kilometer Chowan River watershed, with 97 percent of the nitrogen and 94 percent of the phosphorus load estimated to come from nonpoint sources.

The results of storm event water quality sampling undertaken in small agricultural watersheds in the basin were compared to concentrations of nutrients draining mostly forested watersheds. The data demonstrate that widespread agricultural fertilization of cropland in the Coastal Plain may increase average concentrations of inorganic nitrogen and total phosphorus five fold over the forested situation. Large populations of agricultural livestock may increase the values from 20-40 fold over forested basins. In agricultural watersheds which have extensive drainage improvements (including channelization, average concentrations of some nutrients may be increased up to 20 fold over forested watersheds depending upon the soils.

The timing of the spring input of nutrients from nonpoint sources and the high levels of nutrients recorded in agricultural watersheds implicate agricultural sources as an important factor in determining whether massive blooms of blue-green algae occur in the Chowan River during a given year. In years with high spring precipitation, massive surface blooms of algae have occurred. However, in years with low spring flows, such

as 1980, the noxious blooms of blue-green algae do not occur despite continued input of municipal and industrial point source discharges. Evidence was presented suggesting that the large spring load of nutrients delivered to coastal waters may be assimilated by spring blooms of algae such as diatoms and that these nutrients are temporarily stored in algal biomass until recycling later in summer makes them available to nuisance types of algae.

Agricultural drainage improvements such as tile drains, intensive ditch systems, and channelization projects through wetlands were identified as being responsible for increasing the delivery of agricultural nutrients to coastal waters. Wetlands in small watersheds were postulated as being most important for assimilating nutrients, but drainage improvements have commonly overloaded or reduced their assimilative capacity. Existing water quality data support the need to (1) focus nutrient abatement on agricultural livestock operations, cropland in the well drained Coastal Plain, and cropland in watersheds that have extensive agricultural drainage improvements as well as to (2) preserve swamp land (and limit agricultural drainage improvements) in small Coastal Plain watersheds to protect estuarine water quality.

State water quality standards for levels of algae (chlorophyll *a*) and dissolved oxygen are violated in the Chowan, Neuse, and Pamlico Rivers of coastal North Carolina. The designated use of these waters by the citizens of North Carolina (for the protection and propagation of indigenous aquatic life) has been impaired through accelerated eutrophication. Reduced sport and commercial fishing success, diseased fish, massive finfish and shellfish kills, fresh water intrusion, floating mats of noxious blue-green algae, and affected tourism and recreation industries are symptoms of the water quality problem that may worsen as agricultural nonpoint source pollutants continue to reach coastal waters – especially in the vicinity of rapidly expanding corporate "superfarms."

While scientists still cannot explain some of their observations associated with eutrophication problems (Golterman, 1979), enough is known about the overenrichment problem in coastal North Carolina to warrant an accelerated nutrient abatement program. These waters do not have sufficiently good quality water to support their classified best use, and agricultural nonpoint sources of nutrients are implicated as being much greater contributors of nutrients than municipal point source discharges. If common sense nutrient control practices are not implemented in short order, the state must be prepared to downgrade the designated uses of the waters to reflect their degraded water quality condition – an alternative indicating that the approved use of the waters is for "pollution disposal" rather than for the uses that citizens have been accustomed to.

ACKNOWLEDGMENTS

This work was supported by the U.S. Environmental Protection Agency through a Statewide 208 Wastewater Treatment Management Planning Grant. Many individuals contributed to the success of this investigation. Dr. Robert Holman, North Carolina Division of Environmental Management, collected the water and algal samples, and Dr. Augustus Witherspoon, North Carolina State University, conducted the algal analyses. Macon Jackson, U.S. Geological Survey, assisted in the design and construction of the automated sampling stations, and Fred Koehler, North Carolina Agricultural Extension Service, provided the inventory of agricultural land and animal operations in the four agricultural watersheds.

Mr. ROE. Please proceed.

TESTIMONY OF MERILYN B. REEVES, NATURAL RESOURCES COORDINATOR AND SECOND VICE PRESIDENT, LEAGUE OF WOMEN VOTERS OF THE UNITED STATES; AND EBEN CHESEBROUGH, PRESIDENT, NORTH AMERICAN LAKE MANAGEMENT SOCIETY

Ms. REEVES. Thank you very much, Mr. Chairman.

I am Merilyn B. Reeves, second vice president and natural resources coordinator of the League of Women Voters of the United States. The members of our organization participate in the planning and publicly participate in activities involving water quality projects, and particularly the 208 projects that occurred across this country.

I am reminded perhaps that the diligence of our members on 208 might be comparable to the diligence of this committee in the hearing process today and on other days, and the thoroughness by which you are trying to seek out facts for some very difficult issues. On behalf of my organization, I would like to commend you for the very careful and thoughtful way you are doing this.

I will briefly summarize my basic points. I would like to begin by indicating to you that we recognize this is a very severe problem, and it is a difficult problem which you address. Our members have told us that the nonpoint pollution efforts are at a standstill. Our members know very well that State and local governments have identified the seriousness of the problem, both in urban as well as rural areas, and have also identified best management practices to begin to attack the problem, to begin to control this pollution. We believe that those elements of government now lack the stimulus that is badly needed and we believe a Congressional mandate will provide this stimulus.

Clearly, the chairman's bill, Representative Howard's bill, is one we can wholeheartedly support, and we are very pleased to see that Representative Oberstar's bill, H.R. 4037, has been introduced because it is a very, very commendable first step toward addressing the problem.

In looking at the nonpoint source problems, our members clearly understand how these problems differ from region to region, from an urban dirty street to the runoff from rural farmland. Farming practices that result in soil erosion vary depending on topography and climate; and the construction practices and the urban runoff patterns are regionally variable as well. We believe clearly that State and local units of government are in the best position to assess their problems and to develop the best management practices for their control.

Again, I must reiterate, we believe the experience over the last 10 years has shown that State or local governments cannot do this alone, and nonpoint source pollution problems are too severe to continue uncontrolled.

So we really believe it is time for the Federal Government to step in. We have a Federal investment which has been made and experience gained in the 208 program. We need to build on this. We need to mandate that all State and local governments address

the most serious pollution problems and we need to provide them with tools, give them access to tools and resources to help them to be successful in doing this. So, naturally, we support the incentives.

We believe it is time for the Federal Government to assure the cleanup efforts of one State or locality are not thwarted by poor conservation practices upstream. There has to be better coordination among the numerous Federal agencies and Congress has to set firm deadlines. Although we recognize that deadlines are not always met, we support amendments to set firm deadlines and to establish sanctions for failure to act.

In other words, we need to move from planning to implementation.

Beginning at the bottom of page 10 and going to page 14, I have some specific comments I would like to make in terms of some suggestions that we have and some support that we would like to offer to H.R. 4037.

We believe that the Congress must amend the Clean Water Act to create a program to implement controls on nonpoint source pollution. Representative Oberstar's bill, H.R. 4037, is a good beginning towards stemming the tide of pollutants from surface runoff, but it needs to be strengthened with firm deadlines backed up by sanctions to make the program enforceable. There are four elements of the Oberstar bill that with some adjustments, will constitute a workable cost-effective program:

The bill focuses the nonpoint control program on those water bodies with severe water pollution problems. It applies only to water bodies which fail to meet water quality standards or the goals of the Clean Water Act due to nonpoint source pollution—other areas would not be affected by the program.

There has been discussion today as to whether that should be a watershed, a watershed approach, or just what this should be.

We would like to remind you we believe that this is the responsibility of the local and State entities to define which this may be, and it may be a segment of a watershed or a watershed approach, or it may be a body of water.

The bill requires that management practices be set by the States, with the cooperation of local agencies and organizations. The information developed under section 208 would assist, but not constrain, the setting of management practices. The practices would originate at the local level rather than being imposed from Washington, D.C. We believe this is a very key element.

The bill provides monetary incentives to the States without making the duty to control pollution dependent on the availability of funds. The league supports the provision for providing 50-50 cost-sharing grants for State costs over and above what the State spent on nonpoint pollution controls in the 2 years prior to the enactment of the law.

The bill should be amended to make clear that the bulk of the money authorized will be targeted for program implementation rather than planning. The Federal Government has already committed millions of dollars to planning for planning's sake with the 208 program. The Oberstar amendment should put a cap on such future spending.

In addition, the league believes that the Oberstar bill should be amended to make clear that the major purpose of the Federal grants is to finance the administration of State control programs. The amount of funding provided is very limited and should not be spent to subsidize the actual installation or operation of best management practices. Also since the amount of funding authorized—up to $150 million—is so minimal, we oppose the special set-aside as provided in the Senate bill.

The bill includes a mechanism for the resolution of interstate water quality problems. The bill allows States to petition EPA to convene a management conference of all States which contribute nonpoint pollution to a water body. This section should be strengthened by requiring EPA to assume the responsibility for interstate coordination in the development of enforceable plans for nonpoint pollution control. Experience with past water quality management conferences has proven that the approach needs to be backed up by an enforcement mechanism such as sanctions or the ability of EPA to affect something after the conference is held.

I want to make it clear we participated through the sixties on the enforcement conferences, and we recognize this as a very important means of communication, but this has been many years ago and we are well beyond this now. We still need the means for communication, and we need that means of communication with some ability to be able to implement after the communication and to get on with the job at hand.

We believe there are four basic areas, other areas in which we would like to see some strength.

First, the bill should require that States implement management practices within 4 years after enactment. Firm deadlines are necessary to enforce action, and 4 years would provide adequate time for management practices to be put in place. We have chosen the 4 years because we believe it would provide adequate time for management practices to be put into place. A certain date for compliance is essential if the Nation is not to repeat the experience of waiting decades to achieve clean water. The date certain must be within the reauthorization period of the Clean Water Act if the Congress is to meaningfully review progress under the program when the Clean Water Act is next reauthorized

Second, we would like to have you consider that the bill should require Federal activities to conform to State best management practices. We recognize the bill does not require State plans to identify Federal programs and financial support for activities that are inconsistent with State nonpoint control plans. We believe that simple identification does not go far enough. The language of this section must be strengthened to make it clear that federally funded projects must be fully consistent with State plans and requirements for best management practices. Our members clearly believe that it makes no sense for the Federal Government to encourage or fund activities which will directly interfere with Federal water quality goals and State programs to achieve those goals.

Third, we believe the bill should require EPA to implement a nonpoint control program if the State fails to submit one. This key element is necessary to insure that national goals are achieved, and our members affirmed long ago the need for these national

goals that do not recognize State boundaries. Without backup Federal implementation, there is no assurance that State programs will be developed. This mechanism is incorporated in virtually every other Federal environmental program and has proven to be an effective incentive to prompt action.

Fourth, to make the program mandatory rather than voluntary, the bill must provide sanctions to deter the possibility of State inaction. The league recommends such measures as withholding construction grants and other Federal moneys from States that fail to implement controls on nonpoint sources. Control of point sources, such as sewage treatment plants, must be fully coordinated with the State's plan for addressing nonpoint sources. Construction grants and other Federal awards should be contingent on the implementation of control strategies for both categories of pollution sources—point and nonpoint—that are impeding progress toward meeting the Clean Water Act's goals.

With these four improvements—deadlines, Federal consistency, backup implementation, and sanctions—the Oberstar bill will make a fine complement to H.R. 3282, the Water Quality Renewal Act introduced by Representative Howard. The Howard bill makes many of the other changes we are seeking in the Clean Water Act.

We will support these and we urge your consideration for strengthening this. We believe the problem is severe enough for some severe action.

Thank you very much.

Mr. ROE. Thank you very much.

Mr. Chesebrough.

Mr. CHESEBROUGH. Thank you, Mr. Chairman and members of this distinguished subcommittee.

My name is Eben Chesebrough and I am president of the North American Lake Management Society, a national organization made up of citizens, scientists, lake associations, and water pollution control professionals who are concerned about poor water quality in our Nation's lakes.

We appreciate very much this opportunity to share with you our concerns.

I would like to add I also represent and speak on behalf of Massachusetts and the New England Association of Environmental Biologists, all of whom support our position.

My comments today address the bill introduced by Mr. Howard relative to the reauthorization of the Clean Water Act, and the bill introduced by Mr. Oberstar relative to amending the Clean Water Act for the purpose of addressing nonpoint source pollution.

My comments will be brief, and I refer you to our comprehensive statement for specific information in support of documentation.

I would like to begin by highlighting the result of a nationwide survey our organization conducted this past summer. In this survey, 38 States responded with a grim assessment of our lake water quality. More than 4,200 lakes were declared impaired due to pollution, and 4 million acres of lakes and impoundments were declared in worse shape than when a similar survey was conducted 10 years ago. Ten years ago, there were found to be seven lakes contaminated by toxics. The 38 States responding to our survey indicated we now have 120 lakes contaminated with toxics, and

12,000 lakes were reported by the States to suffer from nuisance growth of algae and weeds, impairing public recreation. Estuaries such as Chesapeake Bay are now getting attention through their nutrient and pollution overloads, but we must not forget the thousands of lakes suffering a similar fate.

The society supports H.R. 3282 introduced by Mr. Howard as an effective measure to address lake pollution.

We specifically applaud Mr. Howard for including a $30 million authorization for section 314 of the clean lakes program. Although the amount is rather small, it is an immensely popular program.

We also applaud the provision to strengthen wetlands protection. Our wetlands play an important role in protecting lakes and estuaries.

Section 9 of Mr. Howard's bill establishes an estuary protection program which includes the development of water quality standards applicable to estuaries. The society feels our Nation's lakes also need a system of water quality standards.

In my own State of Massachusetts, we have numerical standards for rivers and streams but none for lakes.

Such a system would be valuable for prioritizing our efforts for effectuating control through our State's clean lake program.

In our prepared statement, we propose amending section 303 of the Act to provide a congressional mandate for the State's adoption of water quality standards appropriate to protect lakes. We feel this to be a constructive and positive step in protecting and enhancing the protection of our lakes. Quite clearly, an ounce of protection is worth a pound of restoration. Water quality standards would certainly help in this regard.

The second major topic I would like to address here is the subject of nonpoint source pollution. All but one of the 38 States responding to the State survey stated that nonpoint source pollution was seriously affecting their lakes and reservoirs.

As manager of the Massachusetts clean lakes program, I can honestly state nonpoint sources of sediments and nutrients are the principal factors affecting our lakes. We believe that a strong national nonpoint abatement program is needed to control the serious damage that is occurring to our Nation's waters.

States and the EPA know where and why this damage is occurring. Our statement provides specific documentation on the economic damage of lakes caused by nonpoint sources.

Numerous scientific studies have shown the best management practices can be effective in controlling inputs from agriculture, mining, urban runoff, forestry, construction, septic systems, and the like. Our statement provides specific information on where and how BMP's have worked to protect water quality. Let me mention a few examples.

In Tennessee, conservation tillage reduced soil loss by 90 percent, and saved farmers 95 percent fuel costs, and provided higher yields.

In North Carolina, soil conservation practices were implemented in a watershed, and sediment loss was reduced 99 percent and nitrogen and phosphorous loss was reduced 90 percent.

In Minnesota, use of buffer strips reduced solids and nutrients from animal feed lots by greater than 75 percent. Use of biological

filters downstream of cropland in Florida reduced nutrient loads by greater than 70 percent.

BMP's reduced suspended solids by 70 percent, nutrients by 50 percent, heavy metals by 70 percent. That data is supported by many studies documented in our written statement.

Nationwide, you have heard the Conservation Foundation estimate that $3 billion damages caused by soil erosion and sedimentation annually. Almost three-quarters of it is from agricultural land.

Among other things, I am also a farmer, albeit a small one. I till some 48 acres in Massachusetts, into hay and feed corn. I personally understand and appreciate the diverse problems facing the agricultural community.

In New England, you have to look for the soil under the rocks. Once you find it and till it, by God you don't want to lose it.

The North American Lake Management Society supports Mr. Oberstar's bill, H.R. 4037, with some qualifications. Like Mr. Oberstar, we believe it has a reasonable chance of passage, and it will provide some good to a limited number of lakes.

Our statement recommends a priority area implementation plan for achieving cost-effective use of public funds and for restoring suitable water quality to support designated uses.

First, we recommend that accent be placed on attaining standards and achieving designated uses because abatement of only some nonpoint pollution without achieving water quality controls is not cost effective. This would add accountability to those receiving public funds.

Second, we recommend the specific implementation plans with milestone schedules for achiving standards and uses be prepared for each watershed area, with priority nonpoint problems.

Then, each of these plans would become part of the entire State plan under 319(b). This would allow the more efficient use of limited resources, and would be essential to achieve standards and designated uses.

Third, we feel that there should be a deadline for implementation of BMP's to assure cost-effective expenditure of the public funds. We recommend 6 years as a workable deadline for each priority watershed area.

Fourth, in order to be consistent with other environmental legislation enacted by Congress, we feel there must be an element of Federal oversight.

We recommend that the Administrator of EPA be authorized to take steps to insure implementation of plans in negligent States.

Finally, on the important subject of interstate waters, we feel that the bill's approach can be strengthened and improved.

We recommend a Federal master plan be developed in a manner similar to the concept in Mr. Howard's bill for estuaries.

Specific plans with specific schedules, coupled with EPA oversight, are needed if interstate pollution problems are to be remedied.

In summary, nonpoint source pollution is the major cause for degradation of our lakes.

As a State program manager and president of this society, I constantly meet and talk with the public, I can assure you that clean lakes is a very dear and important issue with them.

We appreciate the opportunity to speak before you.

Thank you.

Mr. ROE. We want to thank you both for your excellent testimony. We have learned a lot today in listening to the dialog.

One point that has been going through my mind is that both of you have talked to the issue of sanctions, sort of like the carrot and the stick, when we talk about strong Federal leadership. I think Federal leadership has been strong in developing the legislative process since 1972, albeit there was programing before that as to point source sewage grants that were involved.

I think you are right, Ms. Reeves. If you are going to do anything, it has to be mandated. Many States are not going to get into sanctions, in the first place, and that will change the entire interstate relationship. That is No. 1.

No. 2, if you were to mandate, you could bonus the issue for someone's expediting their program. We found that to be partially effective in the public works program a couple of years ago, versus the point of reducing or mandating a proportionate share of the State money has to go toward the implementation of management programs and nonpoint discharge.

What do you think of that—literally mandating it?

Ms. REEVES. We believe the problem is very serious. We testified on the Senate side that one such step is cross compliance, and we recognize the political reality of such a program. We recognize the severity of it, but we also believe we need to talk about this, and we need to talk about what kind of sanctions might work. Bonuses might work, but there still need to be a bottom line, and you still have to mandate.

We believe we are at the point to implement. To implement means you are just beyond planning. Now you are into the implementation stage and there has to be equity across this country, and I think the eloquent testimony that came from the State of Wisconsin described that very well, and again, that is part of the sanctions.

I do not know if I answered your question.

Mr. ROE. Bonusing is where someone reaches out for the bonus. If it is a political problem, they could lose money because they did not participate.

Ms. REEVES. Both elements could be used, but we addressed sanctions.

Mr. ROE. I get letters sometimes from the voters of my own State which sometimes exasperate me. So I would hope you would tell your representatives out there what we are doing here.

Ms. REEVES. I will call her up and tell her how helpful you have been.

Mr. ROE. In thinking about next year, I have to be realistic.

I participated from the very beginning in this program. It is all well and good.

Mr. OBERSTAR. If the chairman will yield, I must excuse myself. I have to go to the Rules Committee to testify.

I wanted to express my appreciation to the witnesses for the very thorough analysis they have given to this legislation which is pending, and to my bill.

Mr. ROE. Do not take anything away from public works.

This is what I am trying to get at. In my judgment, the reason that some of our legislative proposals have failed, or have not been as productive as they could or should have been, is because Congress did not speak adroitly enough to the issues. It could be that Congress did not know how to speak to the issues, and maybe no one else did in 1972. But we do have, and both of you expressed in your testimony that we do now have an extraordinary wealth of information. None of us is going into this blind.

I admire when you said put a ceiling on any more planning. We have planned until we are green in the face, the same as with our clean lakes program.

Having said that, I can see a lot of fine tuning that is needed to the language now to achieve the goals. Both of you said we are not just looking for language euphemisms and philosophy now. We are looking for specific language that is going to tell people, including the agencies that are supposed to do the administrating, to do specific things.

Do you think that we should be that firm?

Mr. CHESEBROUGH. I do, yes, sir. I think it is time to get on with it.

Ms. REEVES. We clearly recognize the difficulty, and our members are very supportive of this approach as best they possibly can be, in notifying our members of Congress that this is how we feel.

We also feel the opinion polls continue to show us the American public is now behind any effort, so there needs to be a message sent there, that the American public is interested and clearly sanctions indicate a firmness, and indicate a resolve, and we believe the Congressional mandate is very important.

Mr. ROE. You both also used time elements. You were dealing with time elements, and I notice you smiled when one of you talked about 4 years, and one of you talked about 6 years. That gives rise to a point that we have been able to keep the heat on this issue, because the authorization periods were relatively short.

Now, I am wondering if we should consider as part of the dynamics that we need now to take the next steps that have to be taken if, instead of authorizing a 3-year bill, only authorize a 2-year bill.

Think about that a moment before you respond.

Ms. REEVES. I would have to think about it, because I am cognizant of the length of time for startup, and I am sympathetic with too short a deadline under which things do not get underway.

The Government works very slowly, and it trickles down, and State governments face many problems now.

Mr. ROE. If you understand the process—and I am just asking because sometimes we shut ourselves out of the process by longer authorizations—there have been many issues that have been included in the original legislation. And even amendments, through the appropriations process, which have not been implemented. We were set back a year and a half in the EPA shakeup, and it did not give us a chance to address that so that we could move faster.

I want to get it down, however, so that we can get it done.

The gentleman from Minnesota.

Mr. STANGELAND. Thank you very much, Mr. Chairman.

I think you will find a great deal of support on this committee for the clean lakes program, realizing it is not all as we would like it to be.

Support was evidenced by the chairman's efforts on behalf of the clean lakes earlier this year, when we had the appropriations bill on the floor. I think you should be commended for that.

Mr. CHESEBROUGH. I was working on that yesterday, Mr. Chairman.

Mr. STANGELAND. In Wisconsin, I have been concerned about the clean lakes program.

Do you feel we need to have more implementation, rather than identification of study?

Mr. CHESEBROUGH. The diagnostic feasibility study has to remain, and be an integral part of a complete project. What is important is the monitoring of the implementation project so we have a clear understanding of the various technologies now being used to clean up these lakes.

Mr. ROE. If the gentleman will yield, we have been trying to convince—here we go again—those in the decisionmaking process—the connotation that a clean lake is the figment of someone's imagination, vis-a-vis use for boating and swimming. We are trying to say that is a totally erroneous point of view, that the lakes are an integral part of the water supply system, and should be treated as such.

Do not fall off the chair at this point.

Suppose we should speak to the lakes per se as being points of pollution, and should be considered point sources of pollution.

In view of the long length of testimony we have received, not only today, but the last couple of weeks, saying that because of watershed runoffs, and runoff from river basin systems, become basins of concentrations of pollution, if we want to call sedimentation pollution.

I am wondering if we want to treat them with an equal relationship to any grant funds that come back for cleaning up these areas. Not as a third finger on the left hand way out here to make the decision. Yes, we will placate the lakes, because the boaters live on the lakes, we use them for recreational purposes, and it is popular, and we will give them $150 million to solve a $2 million problem. That is total nonsense versus the point of view saying, OK, we have forced the concentration of materials into those lakes by the processes that took place. However they took place, as is the case of concentrating domestic or industrial sewage.

If we are going to deal with that, we should deal with it as a point source of pollution.

Mr. CHESEBROUGH. It is an interesting point. I believe there was, recently, within the past year, a court case in this district concerning reservoirs and their discharge that addressed that, whether it is nonpoint or point.

Mr. ROE. That was the dam structure issue.

Mr. CHESEBROUGH. As I understand the ruling, they declared it an ongoing source.

Mr. ROE. Because that is something the courts determined. If they declared it to be a concentration in lakes, what would you think about that?

Mr. CHESEBROUGH. Yes, if I may comment on lakes being entire integral water supply. That argument held a lot of weight with our legislative endeavors prior to the passage of our clean lakes program.

We were providing for future water when the groundwater is hard to get at.

Mr. STANGELAND. To the extent that total pollution comes from nonpoint sources, do you have any information that shows to what extent lake pollution problems come from point and nonpoint?

I am looking at lakes up in my area, in northwest Minnesota. It would seem that, for many if not most of them, the primary type of pollution would be more point pollution than nonpoint.

I think of Coronis at Paynesville. The bulk of the pollution is from wastewater treatment facilities, septic tanks, and that has been a problem in Minnesota.

We have a zoning law forcing septic tanks back where you have a high concentration.

Do you have any information which would show what percent of the pollution problems are point, and which are nonpoint?

Mr. CHESEBROUGH. I do not have specific figures available at this time, but I would certainly be very happy to provide this committee with data pertinent to that.

Are these river impoundments, or bona fide lakes, in your area?

Mr. STANGELAND. They are bona fide natural lakes.

Mr. CHESEBROUGH. It is the reverse in Massachusetts. All of the pollution is in the brooks, streams, and rivers.

Mr. STANGELAND. I have just one last question.

In Mr. Ruckelshaus' testimony, he felt that the voluntary action would be a disincentive. Could you comment on that?

Mr. CHESEBROUGH. In my experience, it would be the reverse. There would be an aggressive interest taken on.

Mr. STANGELAND. I guess his point was people would wait in line before they would get going.

Mr. CHESEBROUGH. No. I think they would get their thoughts going and hustle.

Ms. REEVES. I would like to also indicate that it is our experience when we look at the long history particularly with respect to pollution control on water and considering the construction grants program, while it has received much criticism as a massive incentive program to clean up, we believe there has been a tremendous amount of water cleanup success. We attribute this to the incentive the Federal Government has given, and we do believe in the carrot and the stick approach, and the carrot is the incentive.

The other aspect I would like to point out is that if, in fact, this Congress mandates a nonpoint pollution program and you gear up for it, I believe we have individuals who will work very diligently on the 208 on the public participation programs, and they will have no anticipation of letting their States sit idly by but will want to immediately gear up.

Mr. STANGELAND. Thank you very much for your extensive testimony and the contribution you have made to this hearing.

Mr. ROE. Again I want to echo those statements of our distinguished member from Minnesota. We appreciate you taking the

time to be here today and we will be calling upon you to do some spade work in some other areas.

Mr. CHESEBROUGH. We would be more than willing to do so.

Mr. ROE. Our next two witnesses are Mr. Les Coy, chairman of the National Cattlemen's Association 208 Water Quality Subcommittee, and Mr. Bruce Hawley, assistant director of the Washington office of the American Farm Bureau Federation.

If there is no objection, your statements will be placed in full in the record and we invite you to summarize.

[Statements referred to follow:]

STATEMENT OF THE NATIONAL CATTLEMEN'S ASSOCIATION,[1] BY LES COY, CHAIRMAN

Mr. Chairman, Members of the Committee: My name is Les Coy. I am a farmer and cattle feeder from Iowa. I currently am in my second year as chairman of the National Cattlemen's Association (NCA) 208 Water Quality Subcomittee, as well as serving on NCA's Private Lands and Water Committee. In addition, I am a chairman of the Public Lands, Private Lands and Water Committee of the Iowa Cattlemen's Association.

The National Cattlemen's Association and I want to compliment this subcommittee for holding these hearings. It is reassuring to know that you, like us, are vitally interested in controlling nonpoint source pollution. Congressional hearings such as this provide an opportunity for all interested groups to consciously and constructively work together to solve our problems related to nonpoint source pollution. We are exteremly pleased to have a part in these hearings and we trust that our thoughts and ideas will merit your earnest consideration. Our comments will relate to the cropland management practices of cattle feeders and producers and the grazing land management practices of producers.

The National Cattlemens Association recognizes the need and desirability of improving, maintaining and protecting our nation's land and water from erosion and sedimentation. It is further recognized that agricultural nonpoint source pollution does exist and a nonpoint source program is needed. We believe that such a program for agriculatural lands should have the following principles in mind:

1. Nonpoint sources of pollution cannot always be corrected in a one-time cleanup operation.

2. Agriculture nonpoint source pollution may be improved, but is a problem that will exist into infinity because of ever changing variables. Adverse weather causes a fluctuation on pollution levels. Even with implementation of best management practices, adverse weather may cause excessive pollution for a period of time.

3. To maintain satisfactory levels of pollution control continuous funding and technical assistance will be required.

4. Members of the ranching and farming industries have been voluntarily carrying out the best management practives for many years to improve the quality of the nation's environment. Continued efforts need to encourage the continued use of these best management practices. As of this date, past and current research is and has been adequate to scientifically evaluate and provide concrete data relative to needs of providing sound guidance on the many facets related to nonpoint source pollution.

5. Generally, unconfined livestock operations are very compatible with a high-quality environment. However, there is a potential for problems where vegetation is excessively grazed, excess and undesirable wooky species have invaded, and in areas where animals tend to concentrate.

6. The cornerstone of our nation's conservation efforts related to water quality has been successful under a flexible voluntary program. The NCA desires that policies and programs related to agricultural nonpoint source pollution be kept and carried out through a voluntary approach.

The nation's ranching and farming industries have been consistent supporters and active participants in helping to control nonpoint source water pollution on agricultural lands. The conservation measures that ranchers and farmers have and

[1] The National Cattlemen's Association is the national spokesman for all segments of the nation's beef cattle industry—including cattle breeders, producers, and feeders. The NCA represents approximately 245,000 professional cattlemen throughout the country. Membership includes individual members as well as 50 affiliated state cattle associations and 19 affiliated national breed organizations.

are carrying out have not only improved their own resources, but enhanced fish and wildlife habitat, erosion control, and improved both water quantity and quality. We have often been disappointed that the public benefits from private conservation efforts are overlooked. Out interest in and dedication to controlling nonpoint source pollution are rooted in moral, economic, and ecological reasons.

We fully recognize that our nation's number one pollutant, silt and sediment, results from past land abuse or current neglect. Our industry largely depends upon forages and grasses grown on cropland, rangeland, and forestland, all of which are soil conserving land uses. However, overgrazing of these lands for prolonged periods reduces the quantity and quality of protective plant cover, leaving the soil surface bare. This exposed soil is then at the mercy of nature's erosive processes. Not only is precious topsoil lost, but the soil that is washed away also carries with it nutrients, pesticides, salts, and other potential pollutants. As stewards of nearly 61 percent of the land area of the United States, cattlemen feel a moral obligation to care for this land which is vital to mankind's existence now and which is essential for the sustenance of future generations of Americans. We view conservation of our soil, water, plant and wildlife resources as a never-ending task.

The conservation of our natural resources is inseparably linked to our efforts to control nonpoint source pollution. You simply cannot have one without the other. Each farmer and rancher is a practicing ecologist who employes knowledge of the interaction of soil, plants, water and animals (including wildlife) in managing this land for its maintenance and perpetuation and for a sustained economic return from his investment.

America's animal agriculture is anchored in thousands of small, family business operations across this great land, and continues to serve as an impetus for economic productivity. Every livestock farm and ranch is a dynamic ecosystem and economic system. Our work toward achieving nonpoint water pollution control has kept these principles in mind.

Earlier I pointed out that cattlemen are stewards of nearly 61 percent of the land area in the United States. Much of this is rangeland that can only produce crops for grazing. However, cattlemen also manage a sizable portion of the land in many major crop producing areas. A typical cattle operation in a crop producing region also has pasture and forage acres. These cattlemen do not plant every available acre to row crops. They rotate their crops and use their more erodable acres for pasture and hay production to produce feedstuffs for their cattle. This contributes significantly to improved soil conservation in these areas. This is done voluntarily by the cattlemen and is in the best interests of us all. Current federal farm programs have discouraged the continuation of these practices. The federal government needs to analyze the impact of their programs and be sure that producers are not paid to discontinue sound soil conservation practices.

Other natural occuring obstacles contribute to nonpoint source pollution in grazing regions of the United States. Noxious woody plants known as brush, compete directly with desirable plants which cover the ground. The result of this competition is bare ground and resultant erosion. The established brush also utilizes water that could go to recharge underground aquifers. Thus, the result of heavy brush densities is accelerated erosion, reduced water quality and a reduced supply of clean water. Our best estimate is that more than 100,000,000 acres of grazing lands in the United States need brush management applied to control the nonpoint source pollution problem. At today's prices, the cost of reducing the density of brush on these acres would cost between $4 billion and $6 billion depending upon the methods of control required. A recent report issued by the Office of Technology Assessment cautions that brush encroachment and invasion poses a major long-term threat to range productivity in addition to increasing nonpoint source pollution.

The cost of controlling excessive brush has skyrocketed in recent years. Both chemical and mechanical brush control methods in Texas and the southwestern rangelands have increased six to tendold in the past few years. We believe that integrated brush management systems which employ combinations of brush control methods including mechanical means and environmentally safe chemicals offer the most cost-effective approach to solving our U.S. brush problem, and resultant environmental degradation.

The approach we have found to be most successful in implementing nonpoint source control programs is founded upon a voluntary approach with educational and technical assistance and where needed, financial assistance. This assistance is made available through locally-elected and governed soil and water conservation districts. Water pollution abatement plans are developed with individual landowners within the framework of a comprehensive soil and water conservation plan for each farm or ranch in the district. Full landowner involvement in this on-the-land planning

process helps insure the full implementation of the plan. The plan thus developed with the landowner and not for him is one which he supports and is committed to carrying out on a voluntary basis.

We believe the results speak for themselves and reflect the success of this approach. As an example in Texas data supplied by the Texas State Soil and Water Conservation Board shows an upward trend in land adequately treated since that agency developed its statewide control strategy for agricultural nonpoint source pollution.

LAND ADEQUATELY TREATED ANNUALLY IN TEXAS

Year:	*Acres (millions)*
1979	9.4
1982	10.7

In Iowa the Soil Conservation Service reports that out of 22 million crop acres, 16 million control soil erosion by having crop residue left on the soil surface. The following tillage practices in Iowa are compared in 1980 and 1983 in the following table:

	1980	1983
Conservation tillage:		
Number of farms	38,000	48,000
Acres (million)	5.5	6.5
No-till:		
Number of farms	1,400	5,500
Acres	110,000	420,000
Initial acres affected by terracing	40,000	89,000

It is noteworthy that these accomplishments have been made in spite of reduced technical and financial assistance and severely depressed prices for agricultural products.

Our industry has also taken a major initiative to inform all of our members on steps to take in achieving water pollution control from point and nonpoint sources through a publication entitled "A Cattlemen's Guide to Water Pollution Control and 208 Water Quality Planning." Mr. Chairman, I am submitting a copy of this guide developed by the National Cattlemen's Association for the record. We are also submitting for the record an article which recently appeared in the Ranch magazine which illustrates the success of a range management program in Texas.

The purpose of a nonpoint source pollution program should be to improve both quality and quantity of water. When such a program is implemented, the result is more clean, clear water for municipal, industrial, agricultural, wildlife, and aquatic uses. Water quality means many things to many people, but seldom is the term well defined. Water, and especially good water, is taken for granted perhaps because water is so abundant on our planet. However, the ranching and farming industries know the value of good, clean water since water is typically in short supply on our nation's grazing lands. Our livestock and our families depend on a continuous supply of water of the highest quality. As scarce as our water supply is, its useable quantity must be increased and pollution reduced or maintained at an acceptable level. Water is our survival.

NCA RECOMMENDATIONS

1. The National Cattlemen's Association supports the need for a nonpoint source pollution control program to improve water quality and quantity and to conserve our natural resource base.

2. The cornerstone of our nation's successful environmental and conservation efforts related to water quality has been a voluntary program carried out through nearly 3,000 locally-governed soil and water conservation districts. The NCA desires that policies and programs related to agricultural nonpoint source pollution be kept and carried out through a voluntary approach. Existing agencies and structural arrangements should be utilized for program implementation. As an example, use soil and water conservation districts with assistance provided by the Soil Conservation Service, Cooperative Extension Service, Agricultural Stabilization and Conservation Service, U.S. Forest Service, and cooperative research agencies and institutions.

20-955 O—84——196

3. The Clean Water Act amendment relating to a nonpoint source pollution control program should be so structured as to address nonpoint source pollution of agricultural lands in one section and nonpoint source pollution of nonagricultural lands in another. The problems and treatments of these two uses of land are generally nonrelated.

4. A provision for demonstration projects on small hydrologic units (50,000 acres or less) should be included in the nonpoint source control program on agricultural lands. Education and technical assistance should be provided through local soil and water conservation districts.

5. Research studies to identify and quantify the movement and fate of pollutants on agricultural lands under different resource management systems and to test the economic viability of different best management practices should be authorized in any program to control nonpoint source pollution. Whenever possible these studies should be carried out on a small watershed area (100,000-300,000 acres in size).

6. If the private sector implements a sound nonpoint source pollution program the federal agencies responsible for federal lands should also implement a sound nonpoint source pollution program. We believe the lessee of federal lands should be permitted to carry out sound nonpoint source pollution programs.

7. Re-define the criteria for making grants to states to also include acreage needing treatment on a watershed basis.

8. Any funds for this program should be new funds. Funds should not be taken away from existing programs that don't have enough funds or technical personnel to carry out programs that are now directly improving nonpoint source pollution.

9. We believe it is important to utilize already established terminology in the nonpoint source control program. For example, "best management practices" is a commonly understood term and should be retained.

10. Consider funding the Rural Clean Water Program authorized in the 1977 amendments to the Federal Water Pollution Control Act.

11. Consideration must be given to increasing useable water quantity—not just quality alone.

Rocky Creek Lives

(By Mark Mosely, Range Conservationist, U.S. Department of Agriculture, San Angelo, Tex.)

A West Texas creek, dry for decades, has started flowing again and residents of nearby San Angelo, Texas, can thank ranchers and their conservation work in a 74,000-acre watershed.

In the early 1960s landowners on five ranches, covering about half the watershed, began rootplowing, reseeding, treedozing, aerial spraying and chaining. The ranchers received technical assistance and cost-sharing for the work through the Great Plains Conservation Program. The program is administered through the local Soil and Water Conservation Districts in selected Great Plains counties by USDA's Soil Conservation Service. The ranchers did not start out to prove anything—it just happened.

West Rocky Creek flowed yearlong until the drought of 1918-1919, when it became an intermittent stream. By 1935, springs feeding the creek has been dried up by mesquite and other invading woody plants.

Located in the Edwards Plateau region, West Rocky Creek is a tributary of the Middle Concho and about 20 miles west of San Angelo. Average annual precipitation is about 18 inches. Shallow soils formed over limestone and caliche are characteristic of the plateau regions, and early day travelers described the rough, rolling hills as barren. The only timber was along the draws and the need for firewood was a real concern to these pioneers.

Before the area was settled, prairie fires were common—set naturally by thunderstorms and also by Indians. Early travelers reported seeing prairie fires that would burn for miles prior to being extinguished by either a lack of fuel or by rainfall. Fires suppressed the brush. As the early pioneers began to fence the rangeland, several things triggered. Their apparent lack of understanding about grazing management depleted the cover of prairie grass such as sideoats gramma, the state grass of Texas. In pristine condition, most of the watershed supported a plant cover averaging 2,000 pounds of production per acre—mostly grasses.

Settling of the land stopped the wildfire for two reasons—one—they fought the wildfires and—two—there was no longer enough grass to burn. This lack of ground cover allowed erosion to take place and held little water on the land. Not only did

the reduced ground cover short circuit the aquifer recharge cycle but it provided a favorable environment for the establishment of brush plants. The brush first encroached the deeper soils and then gradually moved up the draws to the hillsides. The watershed now would support only about 500 pounds per acre of protective grasses.

Mesquite was the main brush problem. With its extensive root system it can draw water from far below the five foot depth that is generally the limit for native grasses such as sideoats gramma, buffalo grass, curly mesquite and tobosa. Its thirst for water is much greater than that of the native grasses. In fact, it takes about 1,725 pounds of water to grow a pound of mesquite but only 705 pounds of water to grow a pound of sideoats gramma. It is interesting to note that scientists estimate that 38 percent of the rainfall in Texas is used up by non-economic plants. This equates to about 138 million acre feet per year.

In 1964, following the accelerated range conservation program, one of the five ranchers noticed that a spring—dry since 1935—had started flowing again. By replacing the water hungry brush with a good grass cover, more rainfall soaked into the aquifer, recharging the dormant springs. By 1970, springs had begun flowing on all five ranches. West Rocky Creek, which now flows at a rate of 475 to 4,000 gallons per minute is not big by most standards but its sparkling waters are a welcome sight in this part of Texas. All the conservation work was done in a manner that would benefit whitetailed deer and turkey—a valuable hunting resource.

The role of sound grazing management cannot be overlooked. The ongoing grazing management on each ranch enhances the cover of grasses on the watershed. The soils now, under good grazing management, are producing an estimated 2,000–2,500 pounds of forage per acre—still mostly grasses.

This grass cover retards the re-invasion of brush and helps hold water and soil on the land. The turf decreases the sediment load in surface water supplies. Sediments reduce water quality and the storage capacity of reservoirs and streams. Although the brush succession is retarded, these ranchers periodically must do maintenance brush work just to keep things in the desired balance.

Even though the rangeland improvements have reduced erosion in the watershed and increased forage production for the ranchers' livestock, the story of West Rocky Creek may be more important to the 70,000 residents of San Angelo. Water from the creek supplements the city's water supply reservoirs. Currently, water in San Angelo homes costs $3.05 for the first 2,000 gallons and 67 cents for each 1,000 gallons thereafter. The West Rocky Creek Watershed yields an estimated 525,600 gallons annually. If water costs are calculated at $1.50 per 1,000 gallons, the West Rocky Creek Watershed yields $788,400 of clear water annually. In other words, each acre of West Rocky Creek Watershed yields approximately $10.63 worth of water annually.

West Rocky Creek now contributes approximately seven percent of San Angelo's total water needs. Its watershed occupies three percent of the entire watershed that supports the municipal and recreation supplies of San Angelo.

If the West Rocky Creed treatment were expanded to the entire watershed above San Angelo, one could predict a long lasting supply of clear water, increased livestock and wildlife production and decreased sedimentation of downstream water supplies.

FOREWORD

The National Cattlemen's Association (NCA) is interested in the improvement of the nation's waters as are most U. S. citizens.

The nation's concern for water quality improvement was brought to focus when Public Law 92-500, the Federal Water Pollution Control Act (FWPCA) Amendments of 1972, was passed by Congress. Several sections of that legislation directly or indirectly related to the nation's farms and ranches. Sections 208 and 402 on nonpoint and point sources of pollution and the Section 404 dredged and fill permit program have the most potential impact on cattlemen. The FWPCA was extended by the Clean Water Act of 1977.

This guide has been prepared to explain how these sections affect cattlemen and to offer some suggestions on what cattlemen can do to help the nation meet its water quality goals.

Cattlemen as conservationists are interested in the soil and water resources. They are interested in improving the quality of life for them and their neighbors. Many have voluntarily joined in the nation's program for water quality improvement. Today, livestock operators have a high level of compliance with the state and federal water pollution programs. I am pleased with this record.

The need to increase world food production makes it most urgent that we all cooperate: cattlemen, environmentalists, government officials, researchers, educators, land managers and the general public. Together we can solve ranch management and environmental issues for the benefit of all mankind.

The 208 Water Quality Subcommittee of NCA's Environmental Management Committee had the responsibility for developing and publishing the guide and I want to express my special thanks to Committee Chairman Bob Bliss and Subcommittee Chairman Walter LeFevre.

INTRODUCTION

Many water quality laws and programs apply to ranching and feedlot operations and this guide is written to explain: (1) how these laws and the water quality management programs might affect you; (2) where you can go to get more information; (3) how you can avoid causing water pollution; and (4) ways you can participate in water pollution decisions affecting your operations. Forms you can use to evaluate your present operations and to plan your future efforts are also provided.

What water pollutants might arise from your ranching or feedlot operations? The experts have identified six major pollutants that might result from agricultural activities: (1) sediment, (2) nutrients, (3) salts, (4) pesticides and herbicides, (5) organic materials, and (6) disease-producing organisms (pathogens). Some examples of pollution: rain washing fertilizers, pesticides or topsoil into streams, rivers or lakes; animal wastes from feedlots spilling into a waterway; irrigation return flows that carry pollutants. These problems, and what you can do to prevent them, are discussed in this guide.

Although the major national law in water pollution control mandates an unprecedented public role in the

development and enforcement of water pollution programs there has been relatively little informed public participation in the decision-making processes. This is understandable because with the maze of ever-changing laws and regulations (federal, state and local), the plethora of public hearings and conferences, and the tendency to overuse technical jargon, only those who have closely studied and followed these programs could begin to understand the implications of these programs. For that matter, even the experts are confused at times because the basic laws and policies are not all that clear and there are uncertain purposes and responsibilities in the programs.

It is unwise, however, for cattlemen to let this built-in confusion and complexity discourage them from expressing their views in the public participation process. The issues are too important to you to let them remain the providence of the so-called experts.

Actually, you have the expertise that most of these pollution experts don't have: an intimate knowledge of your business and what is feasible or practical as far as your operations are concerned.

This booklet will not make you an expert in water pollution control programs or clarify all the confusion. It is intended as a

basic guide, or starting point, for cattlemen who want to better understand current water quality programs and their impact on cattle raising and feeding. It is an outline of the basics and an explanation of some of the specialized terms that are often used in connection with water quality programs.

It is important for cattlemen to become more aware of water quality programs and issues because we are entering an era of increased attention to the effect of agricultural activities on water quality. As pollution from industries and municipalities are being alleviated, more questions are being asked about what can be done to identify and control pollution from agricultural, forestry and mining activities. These questions also are being prompted because the states are now deeply involved in the areawide planning processes called for in Section 208 of the 1972 Federal Water Pollution Control Act (FWPCA), which, among other things, must consider actions to reduce pollution from agricultural activities. This areawide planning process offers the most potential for public participation and it is crucial for agricultural interests to be represented if they wish their viewpoints and concerns to be adequately considered.

As a matter of fact, the impetus for this booklet arose from the perceived need for cattlemen to better understand this planning process. It was later decided to expand the scope of the booklet to other water quality provisions and programs affecting cattlemen, especially since this would help explain the areawide planning process by placing it in context with these other programs.

HISTORY OF WATER POLLUTION PROGRAMS

Some historical perspective is helpful in understanding today's water pollution programs.

In the early days of this country, America's interest in its waters focused on its use. We were more interested in water quantity than quality. Early legislation dealt with how our waters were to be used for navigation, power, agriculture, recreation, industrial processes and home supplies. We were concerned about water shortgages and water surplus, i.e., floods.

In the past few decades, however, more and more people became concerned that human activities were causing undesirable elements to enter the nation's waters jeopardizing some water uses and perhaps even causing health hazards. One of the first water pollution laws was the Refuse Act of 1899 which outlawed the discharge of pollutants other than municipal sewage into navigable

waters without a permit from the Army Corps of Engineers which, while ostensibly a military branch, had begun to take jurisdiction over navigation and flood control projects on such waters. (In 1970, President Nixon used that 1899 law to greatly expand the requirement to obtain a permit before discharges into waters could be made. This extension was based on a broader definition of what constituted "navigable waters.")

It was not until the 1950's however, that water pollution control, or water quality, became more important politically than water development. Congress responded to the increasing public concern over water pollution by passing several laws which increased federal funds for construction of waste treatment plants and sewers and which required states to establish so-called water quality standards for their interstate waters, meaning that the states were to decide what pollutants must be abated to support a chosen water use and were to draw up a plan for achieving that end. If a state didn't do this, or its standards weren't acceptable to the Federal agency, the Federal agency was to step in and set federal standards.

Development of these standards, however, engendered bitter disputes and controversies over what they should be, how the standards should be enforced, what were water "pollutants," and how "clean" must our water be. Although it became clear by the end of the 1970's that considerably more scientific and eco-

nomic knowledge was necessary to determine what could be done to clean up our waters, this did not deter public interest and public demands that "something be done."

Congress responded - as it usually does when there is public interest - by enacting another bill: the Federal Water Pollution Control Act of 1972 (FWPCA), the most sweeping Federal law on water pollution to date. This Act builds on and "strengthens" past anti-pollution laws. Despite is many provisions, however, this Act does not lay out a precise roadmap of how "clean water" will be achieved. Rather, its approach is to establish some goals and general procedures, with the details to be worked out later by federal, state and local agencies and by legislative refinement at a later date. (The Act's unclear language has led to a number of court decisions regarding the meaning of certain sections.)

The provisions in the law of most interest to cattlemen are reviewed in this guide.

WATER QUALITY GOALS

The overall "objective" and the two "goals" established in the Water Pollution Control Act of 1972 are important because they influence or "drive" the development of programs and policies to curb water pollution. The Act states that the objective of all water quality programs must be:

To "restore and maintain the chemical, physical, and biological integrity of the Nation's waters."

Of perhaps more practical effect are the following two national goals in the Act:

1) To reach, "wherever attainable," a water quality that "provides for the protection and propagation of fish, shellfish, and wildlife" and "for recreation in and on the water" by July 1, 1983. This is usually referred to as the interim "fishable and swimmable" goal.

2) To eliminate the discharge of pollutants into navigable waters by 1985. This final goal is generally called the "no-discharge" goal.

Congress establishes these 1983 and 1985 goals even though sponsors of the Act admitted that there were uncertainties as to whether we had the technologies or the institutional systems - or whether in fact our economy can stand the enormous expense - to meet these deadlines. Until they are changed, however, they remain the "marching orders" that guide policy formation and planning. (Budget reductions at the federal and state levels have caused cutbacks in program planning and implementation which make it questionable that these deadlines can be met.)

TYPES OF WATER POLLUTION SOURCES

There are three types of water pollution sources identified in the federal law that are of interest to cattlemen:

(1) point sources, (2) nonpoint sources, and (3) dredge and fill discharges. It is important for cattlemen to understand these terms and the distinctions among them as federal and state governments deal with each in different ways. Drainage from feedlots, particularly larger feedlots, may fall under the point source type. Cattle grazing operations generally would fall in the nonpoint category. Some activities and projects on a farm or ranch could come under dredge and fill regulation.

CONTROL OF POINT SOURCE POLLUTION

Point sources originate from man's activities and are discharges from a specific point, such as the end of a pipe from sewage or industrial plants. Section 402 of the FWPCA requires those who discharge water from such "points" to obtain a federal EPA or state permit (with some exceptions). Permits specify the types and amounts of pollutants that can be discharged into waterways. Violators of the permit provisions are subject to fines and civil penalties.

Federal law has identified cattle feedlots as potential point source of pollution. Every feedlot of 1,000 or more head must obtain a permit. Some smaller feedlots must obtain permits depending upon certain conditions. The table on the following page summarizes which operations must obtain permits.

The pollutants most closely associated with feedlot or confined cat-

20-955 O—84——197

tle operations are nutrients, organics, salts, and pathogens. Unless controlled, such pollutants may cause water quality problems. The livestock industry has worked closely and cooperatively with the Environmental Protection Agency and other public interests and it is estimated that more than 96% of the nation's cattle feeding operations has already achieved the 1983 national water quality goal.

EPA REGULATIONS FOR FEEDLOTS

Concentrated animal feeding operations. Exemption: No animal feeding operation requir a NPDES permit if it discharges only in the event of a 25-year, 24-hour storm.

Operations With 1,000 or More Animal Units	*Operations With Less Than 1,000 But With 300 or More Animal Units*	*Operations With Less Than 300 Animal Units*
Permit required for all operations with discharges of pollutants	Permit required if operation (1) discharges pollutants through a man-made conveyance, *or* (2) discharges pollutants into waters passing through or coming into contact with animals in the confined area.	No permit required (unless case-by-case designation as provided below)
	Operations subject to case-by-case designation requiring an individual permit only after onsite inspection and notice to the owner or operator.	Case-by-case designation only if operation (1) discharges pollutants through a man-made conveyance, *or* (2) discharges pollutants into waters passing through or coming into direct contact with the animals in the confined area; *and* after on-site inspection, written notice is transmitted to the owner or operator.

CONTROL OF DREDGE AND FILL ACTIVITIES

(3) Dredge and fill activities may also cause water pollution and Section 404 of the FWPCA requires enforceable permits be obtained from the Corps of Engineers of the U. S. Army for discharges of dredged or fill materials into streams, swamps, marshes and wetlands. Dredged material means material excavated from a stream or waterway. Fill material means material used to create dry land from an aquatic area or used to raise the bottom of a body of water.

Normal farming and ranching activities do not require a permit. Material resulting from usual plowing or harvesting, or from the construction of roads, terraces, stock ponds, settling basins, etc., are not covered.

If a construction activity will involve direct discharge of dredged or fill material into navigable waters or a water body, however, you should confer with the District Engineer of Corps of Engineers, the State Pollution control agency, or one of the local USDA agencies as to whether a permit is needed. A permit will be needed if you change the water course and also in some cases where construction activity will occur in an artificial wetlands such as those created by excess waters from irrigation. (NCA is not satisfied with

the exemption language in Section 404, as amended by the 1970 law, and is working on legislative language that would redefine navigable waters so as to make the exemption more meaningful.)

EPA in conjunction with the Corps of Engineers is required to develop guidelines for use in specifying disposal sites for dredge and fill material covered by a permit. EPA may prohibit use of an area as a disposal site based on environmental considerations.

Obtaining a dredge or fill permit often takes a long time. Notices must be given and opportunity for public hearings provided. By regulation in 1977 and in September, 1980, the Corps of Engineers provided for some activities to be allowed under general and nationwide permits. Also, in states where the Governor has requested, and the Corps of Engineers have approved the state plan, the granting of permits has been transferred to the state.

CONTROL OF NONPOINT SOURCE POLLUTION

Nonpoint sources of water pollution refers to runoffs and seepage of pollutants into groundwater and waterways; that is, they are not specific, identifiable points as point sources are. Nonpoint pollution originates from rainwater and melting snow which carry pollutants along dispersed pathways. Some

examples: water running off urban buildings and streets carrying oil, salts, lead, trash, and other pollutants; earth washed into waterways from construction sites; acids drained from mining areas; rain washing fertilizers, pesticides, and topsoil from croplands and pastures.

Runoffs from cattle operations associated with range or pasture grazing (where cattle are not confined for long periods of time in a small area) are potential nonpoint sources of pollution. The 1977 Amendments to the FWCA specified that irrigation return flows would be considered as nonpoint sources.

Generally, unconfined cattle operations are very compatible with a high quality environment. However, there is a potential for problems in areas where animals tend to congregate. If that results in reduced vegetation cover, the area would be susceptible to runoffs that could impact water quality. (See section below on grazing management steps you can take to help maintain water quality or to avoid adverse impacts.)

The 1972 Federal Water Pollution Control Act singles out "urban-industrial concentrations" as a major cause of water pollution and the main focus of the law is on the construction of waste treatment facilities and the regulation of point sources (i.e., industrial and municipal discharges.)

Congress wasn't quite sure how to deal with nonpoint sources of pol-

lution which aren't as easy to define or regulate as point sources are. The federal Act did not establish any regulatory or enforcement system for nonpoint sources such as the permit system which applies to point sources. Rather, it required each state under (Section 305) to evaluate the extent of nonpoint pollution within its borders and to develop some recommendations for controlling such pollution (Section 304 requires EPA to issue guidelines). The Act also required the state management plans or areawide plans prepared under Section 208 to consider feasible measures for reducing nonpoint source pollution.

Although the federal law did not specify any time requirement or level of control for the abatement of nonpoint sources, it has become clear that the national water quality goals (and the state water quality standards required by Section 303) cannot be achieved solely through abatement of point sources. (EPA estimates that more than 50% of the pollutants entering the waterways are from nonpoint sources.) It also should be noted that while the states are given the primary responsibility for pollution abatement, the Act does give EPA the authority to take certain actions if the states do not respond.

The planning and management processes established by Section 208 have become the vehicle for addressing nonpoint source pollution, including that arising from agricultural activities. Therefore, the next section presents summary of the 208 process.

208 WATER QUALITY PLANNING

Although Section 208 of the FWPCA is entitled "Areawide Waste Treatment Management," it pertains to much more than just waste treatment technology. It also covers other approaches to the improvement of water quality.

Section 208 and some other sections of the Act have been hailed as a preservation and protection of the rights of the states and local communities to deal with pollution problems. However, there is a catch: state and local plans and programs must follow guidelines issued by the federal Environmental Protection Agency and must be approved by EPA. EPA has the authority to step in where plans or programs are disapproved.

In summary, these are the main steps in the required 208 process. The Governor in each state must identify specific areas in his state that have serious water quality problems and at the same time designate an organization in each such area to develop a continuing management planning process for the area. If the Governor declines to act, the chief elected officials of local governments in an area may act in his stead. The state is to act as the planning agency for areas not designated by the Governor or local officials.

The designated planning agency must prepare a detailed plan (subject to EPA approval) for dealing with the most important water pollution problems in that area. (Federal grants are made to help pay for the cost of the planning process.) Section 208 area plans must be incorporated into the statewide continuing planning process which Section 303 of the Act requires each state to have. The states must develop and implement State Water Quality Management Plans that will meet the immediate requirements of the FWPCA and eventually the long-range goals of the Act.

Unless the Governor decides a statewide plan for the following is necessary, the 208 area plan must include: "a process to" (1) "identify, if appropriate, agriculturally and siliviculturally related nonpoint sources of pollution, including runoff from manure disposal areas, and from land used for livestock and crop production, and" (2) "set forth procedures and methods (including land use requirements) to control to the extent feasible such sources."

It is EPA policy that the type of regulation appropriate for each nonpoint source category (such as agricultural activities) should be established by the state (208 planning agencies may also suggest regulatory actions for state approval). The nonpoint source program must

consider encouraging or requiring so-called "Best Management Practices" on farms or ranches which have pollution problems. This term means the most practical and effective management actions that will minimize water pollution. These include conservation practices such as terraces, contour strips, minimum tillage, etc. (Of course, if there is no nonpoint pollution problem associated with a farm or ranch, then no change in operations are necessary.)

The 1977 amendments to the FWPCA authorized the Department of Agriculture (through the Soil Conservation Service and other selected agencies) to enter into 5- to 10-year cost-share contracts with rural land owners and operators for the purpose of installing and maintaining measures incorporating the best management practices specified in an approved 208 plan. This is called the Rural Clean Water Program.

There continues to be some controversy over how much regulation, or what kind of regulation, is needed to abate water pollution from nonpoint sources. States have taken different approaches. Eighty-four percent of the states now have approved agricultural nonpoint source programs in their water quality management plans and most of these depend on voluntary compliance by the land owner or operator. Only

13 states have adopted land management regulations but most of these depend on voluntary compliance and informal resolution of nonpoint problems before attempts at enforcement are made. Thirty-seven states do not mandate land management or conservation practices (according to a July, 1981 report prepared for the National Association of Conservation Districts.

Sediment, of course, is one of the major pollutants from nonpoint sources and on the following pages is an outline of state laws relating to erosion and sediment control, as prepared by the National Association of Conservation Districts in October, 1979.

SUMMARY OF PRINCIPAL PROVISIONS OF STATE LAWS PROVIDING FOR EROSION AND SEDIMENT CONTROL

(A reference to the particular law will be essential for complete explanation of provisions)

PROVISIONS	Model Act & Ill. Provisions	Delaware	District of Columbia	Georgia	Hawaii	Illinois	Iowa	Maine	Maryland	Michigan	Minnesota	Montana	Nevada	New Hampshire	New Jersey	New York	North Carolina	Ohio	Pennsylvania	South Carolina	South Dakota	Virginia	Virgin Islands

NOTE: An "x" indicates that the respective law contains the provision listed; numbers refer to footnotes.

SUMMARY OF PRINCIPAL PROVISIONS OF STATE LAWS PROVIDING FOR EROSION AND SEDIMENT CONTROL

PROVISIONS	Model Act & All Provisions	Delaware	District of Columbia	Georgia	Hawaii	Illinois	Iowa	Maine	Maryland	Michigan	Minnesota	Montana	Nevada	New Hampshire	New Jersey	New York	North Carolina	Ohio	Pennsylvania	South Carolina	South Dakota	Virginia	Virgin Islands

FOOTNOTES

1. Authorities contained in laws and regulations
2. Acceptable plan required at site of activity
3. Erosion control practices may not be required on land used for such purposes only
4. Exempted from permit requirements only
5. Except as to grading, excavating, or filling
6. Except in Calvert County
7. Within city limits
8. Department of Fish and Game
9. Department of Environmental Resources
10. May include permits, inspection, complaints, violation procedures, fines, other legal actions
11. In municipalities not within a district
12. Special provisions for emergency actions
13. Division of Soil and Water Districts
14. Air and other resources
15. Division of Environmental Protection of the Department of Natural Resources
16. Established by law
17. And other resources
18. Department of Health
19. Persons engaged in agriculture who have agreements with conservation districts are not subject to site plans, land use plans, or permits, but are subject to enforcement procedures
20. Department of Agriculture
21. Secretary of Agriculture and Commissioner of Environmental Protection
22. May assist with grants
23. Certification
24. Emergency repairs
25. Agricultural land as described in the law
26. Required where district determines that an agricultural land-disturbing activity is violating adopted standards
27. Permit issuing authorities must require compliance with district standards
28. Department of Public Works
29. MC Sedimentation Control Commission
30. DC Department of Environmental Services
31. DC Agencies engaged in land disturbing activities
32. State Department of Agriculture
33. Certain specified exceptions
34. Department of Natural Resources and Environmental Control
35. Political subdivisions not precluded from adopting more stringent programs
36. Waste discharge license required for discharge of any pollutant
37. For agricultural activities having an approved erosion and sediment control plan or conservation plan
38. Board of Environmental Protection
39. Initial design of project must provide measures to prevent pollution
40. State Environmental Commission
41. State Department of Conservation and Natural Resources may delegate authority as to diffuse sources (non-point)
42. NH Water Supply and Pollution Control Commission.

CATTLEMEN'S ROLE IN 208 PROCESS

Good public involvement at the local level is one of the goals of the 208 process in developing strategies for abating nonpoint pollution. Citizens with varied occupations and interests are invited to participate in the process, including public meetings and serving on various committees or task forces. Much of this process has been completed; but in many areas there is still opportunity for involvement. In addition, there may be future revisions of present plans. Cattlemen should be involved in these local effors. Information on future meetings may be obtained from one of the agencies listed on page or from your state water quality agency.

CATTLEMEN AS ENVIRONMENTALISTS

Cattlemen who depend on soil and water resources to produce the nation's supply of beef must maintain the quality and productivity of these resources. Conservation and water quality measures they take or install not only improve their own resources, but the enhanced fish and wildlife habitat, erosion, control, and improved water quality benefit vs all. (The public benefits from private conservation efforts are often overlooked!)

MANAGEMENT RECOMMENDATIONS FOR CATTLEMEN

A. Grazing Management:

Properly managed, grazing activities will not have adverse impacts on water quality. Good range and pasture management will not only increase forage but improve water quality.

When adverse impacts do occur, they are most often due to soil, salts, or pathogens being washed into streams or lakes. Here are some common-sense suggestions for avoiding pollution problems:

1. *Maintain adequate vegetative cover.* Vegetative cover reduces runoff and controls erosion. Management practices which help to maintain vegetative cover usually involve distributing cattle so they don't overgraze some areas and varying periods of use. Some examples of management techniques that would minimize the impact of grazing in sensitive watersheds would be use of grazing systems (such as rotation grazing), development of alternate water sources to attract animals away from streams, placement of minerals and salt away from water areas.

2. *Carefully plan your watering and feeding sites.* Most nonpoint source pollution problems occur in the vicinity of watering, feeding, or loafing areas where animals tend to

congregate most often. Such concentrations can have an impact on vegetation and on the condition of the soil so that erosion is likely. You should place supplemental feeding and salting stations a reasonable distance from sensitive water quality areas (streams and water courses). Likewise, you should try to plan your shading facilities so as to keep cattle away from such areas as much as possible.

3. *Use structural techniques to abate pollution.* Sometimes it may be impossible to locate winter-holding, supplemental feeding, or shade facilities outside of sensitive water quality areas. In such cases, diversion terraces and vegetative filter strips can be used to help keep sediment, nutrients, salts and organic matter out of the water.

4. *Follow the instructions on pesticide labels.* Pesticides must have a EPA-approved label indicating whether they are for general use (under specified conditions) or for certain limited or local uses. The label guidelines should be carefully followed so as to avoid nonpoint pollution runoff. Caution should be taken to prevent accidental spills and in the disposal of empty containers.

20-955 O—84——198

5. *Be wary of toxic substances.* Toxic pollutants can come from pesticides, chemical and oil spills, and urban sewage sludge or waste water applied to your land has been properly treated in accordance with state water pollution requirements.

B. Feedlot Management:

Good management, is also important in preventing water pollution from feedlot operations. The major potential pollutant, of course, is livestock waste and the goal of good management is to prevent such waste from getting into natural waters. As previously indicated, almost all feedlots are in compliance with the 1983 national water quality goal and most operators are current with the latest waste management techniques. A full review of these techniques are beyond the scope of this guide but appropriate management practices include:

1. *Use of diking or other means to divert runoff from entry into the feedlot.*

2. *Control feedlot runoff and detain in ponds or lagoons.*

3. *Prevent build-up of solid wastes on feedlots by periodic removal.*

4. *Dispose wastes through land utilization or by other environmentally sound means.*

5. *Take steps to avoid creating a "nuisance."* Odors and flies associated with animal wastes and, ironically, with holding ponds used to abate water pollution have sometimes led to nuisance complaints and lawsuits. If such a lawsuit develops, a cattleman may need to document actions he has taken to avoid the problem. Appendix B of this guide is a detailed discussion of this issue.

ASSISTANCE AVAILABLE TO CATTLEMEN

Since the 1930's a number of federal, state, and local programs of assistance to farmers and ranchers have been funded. These programs have resulted in increased research, education, technical assistance, cost-sharing for measures installed, loans, tax incentives, etc. They have encouraged and assisted farmers and ranchers in carrying our conservation and water quality measures which generally have long term public benefits.

Some funding by the private owner or operator is generally required for such a person to receive any federal, state, or local incentives assistance. Currently many of these cost-share programs are not available. Others have rigid program compliance requirements as a condition. Before applying for cost-share assistance funds, cattlemen should first find out whether there are any strings attached to such aid.

Information on available assistance may be obtained from the following agencies:

	Type of Assistance
1. Soil and Water Conservation District	- Conservation and water quality planning for area.
	- Technical assistance.
	- Conservation measures.

		Type of Assistance
		- Cost-sharing in some instances.
		- Information on local programs.
2.	Local pollution control or water quality agency	- Information on local programs that they administer, including any 208 program.
		- Technical guidance, in some instances.
3.	County Board of Supervisors	- Information on any local regulatory program.
4.	Soil Conservation Service, USDA	- Technical assistance for designing and planning conservation and water quality improvement practices.
		- Range improvement advice.
		- Cost-sharing for conservation practices in Great Plains area and in some watersheds.

		Type of Assistance
5.	Agricultural Stablization and Conservation Service, USDA	- Cost-sharing for conservation, and water quality improvement practices, including certain range improvements. - Assistance varies depending on locally-developed program plans.
6.	Forest Service, USDA	- Through state forestry agency: technical assistance for tree planting. - Range management plans and technical guidance on FS lands. Information on incentives programs
7.	Farmers Home Administration, USDA	- Loans for installation of conservation practices. - Operator loans.
8.	Cooperative Agriculture Extension Service, USDA	- Information on range improvement, conservation, water quality, pesticide useage and related issues.

		Type of Assistance
9.	Bureau of Land Management District Office	- Range management plans and guidance on BLM lands.
		- Technical assistance.
		- Information on incentives programs.

A CATTLEMAN'S SELF-EVALUATION FORM

This self-evaluation form is designed for your convenience in reviewing your cattle operation in regard to the water quality issues previously discussed in this guide. Give each statement below a rating of 0 to 5, with 5 being the ideal. Thus, the lower-scoring situations are areas where you may need or want to make some changes.

		Score
1.	The pasture or range has a good vegetative cover overall.	_____
2.	A good vegetative cover is found near all streams.	_____
3.	There is no soil erosion from salting areas.	_____
4.	Animal holding areas are located 200 or more feet from any streams or sensitive water quality areas.	_____
5.	Land between streams and holding area has good vegetative cover at all times.	_____
6.	Rainfall runoff concentrations are diverted from feedlots or holding areas.	_____

		Score
7.	Runoffs from roadways and buildings are diverted away from feedlot or holding areas.	_____
8.	There are no water courses through holding areas.	_____
9.	Diversion terraces or special vegetation filter strips are maintained between working or salting areas and sensitive water quality areas.	_____
10.	Cattle watering tanks have water controlled drainages.	_____
11.	Manure is spread on unfrozen land early in day and plowed under within one to two weeks.	_____
12.	The spreading of manure on steeply sloping land without a cover is avoided.	_____
13.	Watershed areas having soil erosion problems are getting special attention.	_____

		Score
14.	A grazing management plan is being carried out to improve quantity and quality of vegetative cover, and hereby reduce pollutant runoff from the pasture or range.	_____
15.	Special attention is given to disposal of empty pesticide containers.	_____
16.	Special care is being taken to avoid nuisance complaints from the community (flies, odors, etc.).	_____

A CATTLEMAN'S PLANNING FORM: CONSERVATION AND ENVIRONMENTAL GOALS

In the previous section, a form for evaluating your present operations was presented. Here we present a form that you may want to use to make some private resolutions to yourself about what you plan to do in the future to help improve water quality. (You may want to check the completed form a year or two from now to see how well you've carried out your resolutions!)

It is my desire to assist the Nation in meeting it's conservation and environmental goals as I carry out my cattle production operations.

During the past two years I have assisted by _____

_____

_____

_____

_____

_____

_____

(such as member of conservation board, attending local water quality meetings, developing erosion control plan, carried out improved pasture or range measures, etc.)

Some of the areas where I can become more involved in the next two years (check)

Attend local meetings ____
Member of local Water Quality Committee ____
Give speeches to civic and local groups ____

Attend state meetings ____
Invite visitors to farm or ranch ____

To improve water quality and the environment from my operations in the next two years I plan to _____

_____

_____

_____

_____

_____

_____

APPENDIX A

Definitions

Point Sources - End of pipe discharges from municipalities, industries, farms or ranches, and mines.

Nonpoint Sources - Diffuse type runoff of pollution caused by rainfall, including stormwater runoff from cities, farms, ranches, and forest, erosion at construction sites, and irrigation return flows.

Dredge Material - Material that is excavated or dredged from waters of the United States.

Fill Material - Any material used for primary purpose of replacing an aquatic area with dry land or of changing the bottom elevation of a water body.

Navigable Water - Waters of the U.S. subject to ebb and flow of the tide and/or are presently used or have been used in the past to transport interstate commerce.

Wetlands - Those areas that are inundated or saturated by surface or ground water at a duration sufficient to support a prevalence of vegetation typically adapted for life in saturated soil conditions. This may include swamps, marshes, bogs, and similar areas.

APPENDIX B

WHAT FEEDLOTS CAN DO TO HELP AVOID NUISANCE LAWSUITS

(A technical bulletin prepared for the NATIONAL CATTLEMEN'S ASSOCIATION)

By
John M. Sweeten
Texas A & M University

J. Ronald Miner
Oregon State University

EDITOR'S NOTE: *Control of odors, water pollution, dust and flies has been and will be an increasing problem for many feedlot operators. In the accompanying article, two consultants to NCA's Environmental Management Committee discuss these problems and offer suggestions to cattlemen. Particular attention is given to steps to be taken to avoid odor nuisance lawsuits, but other problems in relations with the public also are discussed. One difficulty now is that legal problems may grow because there has not been enough basic research to make possible needed technical advances in control. Dr. Sweeten is extension agricultural engineer-waste management, Texas Agricultural Extension Service, College Station, Tex. Dr. Miner is head of the agricultural engineering department at Oregon State University, Corvallis, Ore. This article is an expanded version of an article which appeared in the July 6 BBB. It is suggested that members save this article for future reference if nuisance complaints are a possibility.*

Cattle operations are often the target of nuisance complaints resulting from odors, flies, dust, noise or water pollution. Recent nuisance lawsuits decided against cattle feedlots have aroused new interest in ways to avoid such legal actions. When a lawsuit is encountered, the best possible defense needs to be made to document that a nuisance does not exist, to avoid an injunction or to minimize assessed damages. Technical and legal aspects of odor nuisance are reviewed in this paper. Also discussed is control of water pollution, dust and flies.

Legal Concept of Nuisance

Nuisance is broadly defined as anything which unreasonably interferes with the normal use and enjoyment of property. A **private nuisance** is one keeping only a few persons from enjoyment of private property. A **public nuisance** is one that keeps a considerable number of people from enjoying rights of the public as a whole.

Public nuisance suits are usually carried by state or local agencies to the courts. Relief may consist of a moderate fine, specific corrective orders and/or an injunction. By contrast, private nuisance suits, which are carried out by one or a limited group of neighbors against a person or company, often ask for large sums of money for alleged actual damages, such as decreased property values, and perhaps punitive damages or an injunction. Damages are more frequently awarded than is an injunction.

Questions of degree are crucial: How many persons are affected? How severe is the nuisance? Is it temporary or permanent, continuous or intermittent? Can it be corrected? Evidence supplied to answer these questions will have a large bearing on the outcome. A cattleman needs to hire the best trial attorney and best available consultants to develop and present evidence favorable to his side. An expense of $15,000 to $20,000 would be typical. Therefore, the cattleman and his attorney need to decide very early if a successful defense can be developed and whether it is worth the cost.

In the public sector, odors and dust are usually prosecuted under nuisance provisions of State Clean Air Acts. Fly and rodent problems in many states are handled by separate agencies as a public health nuisance, often regulated by local government. Water pollution problems are seldom handled as nuisance suits, but rather under state and federal water quality laws that prohibit discharge without a permit. State agencies try to work with the producer to help solve his problem, but, in the final analysis, they will bring suit if a severe problem incapable of permanent solution persists.

The U.S. Environmental Protection Agency has neither the authority nor any plans to regulate odors at this time.

Innovative approaches designed to regulate feedlot odors and dust include:

a. County agricultural zoning (Nebraska).
b. Construction permits for new feedlots (Texas) or lagoons (Iowa).
c. Property line odor intensity limits (Colorado and Wyoming).
d. Objectionability criteria (Iowa)—number of people affected, frequency, duration, etc.

The North Carolina legislature recently passed a law (HB 481) that states: "No agricultural operation or any of its appurtenances shall be or become a nuisance, private or public, by any changed conditions in or about the locality thereof after the same has been in operation for more than one year, when such operation was not a nuisance at the time the operation began; provided the provisions of this subsection shall not apply whenever a nuisance results from the negligent or improper operation of any such agricultural operation or its appurtenances."

In another important section, the law invalidates "any and all ordinances of any unit of local government now in effect or hereafter adopted that would make the operation of any such agricultural operation or its appurtenances a nuisance in the circumstances set forth . . ." The Alabama legislature previously had enacted a similar bill to protect against encroachment of non-agricultural land uses.

Some Recent Nuisance Cases

Case law is informative but not conclusive on the subject of nuisance. As a Massachusetts court said in 1914, "The law of nuisance affords no rigid rule that can be applied to all instances."

In early 1979, a Nebraska jury awarded a farm family--themselves cattle producers—about $50,000 in damages for odor, rodent and dust related nuisance allegedly created by a nearby 10,000-head feedlot. In March 1979, the Texas Court of Civil Appeals upheld a trial court decision that livestock pens, built 80 years ago to receive, sort, and ship livestock, are producing odors "by processes other than natural." Further, the court stated that concentration of livestock "would not now be normal in this vicinity," since homes and businesses have sprung up around the livestock facility. An El Paso District Court closed down an old feedlot in 1975 that had been engulfed by residential, commercial, and industrial property.

On the other hand, a large new Texas meat packing plant was successfully defended in 1978 against claims of property value reduction brought by an adjacent farmer who "was there first" and who allegedly suffered nuisance from odors and flies.

In a famous nuisance case, the Arizona Supreme Court decided in 1972 that Spur Feedlot should be closed but that the suing land developer had to pay the feedlot "for a reasonable amount of the cost of moving or shutting down." Payment to Spur Feedlot was necessary because the developer had brought homeowners into a previously agricultural area.

FIGURE 1. Surface wind rose diagram for Amarillo, Texas, showing average annual probability of wind from a given direction. (Average wind speed = 12.1 knots, or 13.9 mph.)

A Kansas court held in 1958 that a residential landowner may not have relief if he knowingly came into a neighborhood reserved for industrial or agricultural endeavors and has been damaged thereby. Similarly, during the mid-1970's, would-be land developers were unsuccessful in claiming damages for reduced property value attributable to odors and flies from two established feedlots in Taylor and Hood Counties, Texas.

20-955 O—84——199

With the uncertainty of the outcome and the sure expense of defending against nuisances, cattle producers need to understand certain technical principles and practices involved in avoiding and abating nuisance conditions.

Response to Odors

Human response to odors is primarily subjective. Livestock odors are not hazardous to human health at the concentrations at which the compounds have been measured adjacent to a feeding facility. Rather, odors constitute an annoyance.

Odors can be characterized according to their frequency, intensity, duration and offensiveness (the so-called "FIDO factors"). Nuisance complaints result when these characteristics exceed reasonable limits. For instance, the Iowa Air Quality Commission stated that for a complaint to be "actionable," the odor must occur at a **frequency** of 10 or more days per 30-day period for a **duration** of 12 or more hours on each of these days. Experience has shown that an odor **intensity** above 7 dilutions to threshold (DT) will cause complaints, while an odor intensity above 31 DT may be described as a serious nuisance if it persists. Cattle feedlots rarely get below 7 DT.

Odor intensity is usually measured by using a Scentometer (a portable, plexiglass, hand-held device costing about $150) which establishes different dilution ratios of odorous air to odor-free air. The human nose is used to select the highest dilution at which odors can be detected. Odor **offensiveness**, on the other hand, is very difficult to quantify for purposes of writing standards.

Approaches to Odor Control

Odor control methods are imperfect to say the least. But cattlemen can and should strive to minimize odor frequency, intensity, duration, and offensiveness.

Separation of the odor source (feedlot) from the receptor (neighbors) is the best method. Odor concentrations diminish rapidly with distance downwind of an odor source. For example, ammonia levels decreased by 80-95 percent within 400 feet of a cattle corral in a California study. Odors from a ground-level source are calculated to undergo 99 percent reduction in odor concentration over a distance of one to two miles, depending on atmospheric stability. A distance of 300 feet will usually produce an order of magnitude reduction in odor intensity. But, experience has shown that odors can drift for several miles at low, yet detectable, intensities. So distance alone is not a complete answer.

Prevailing winds can be determined from hourly observations recorded at major U.S. Weather Service installations. Computerized summaries showing probability of a given wind direction, wind speed and atmospheric stability class ("STAR Program") are available for about $25 from the National Climatic Center, U.S. Department of Commerce, Federal Building, Asheville, N.C. For example, the wind direction frequency chart for Amarillo (FIGURE 1) shows that there is only an 11% chance of wind out of the quadrant Northeast to East-Southeast. But, the wind blows 48 percent of the time out of the South-Southeast to Southwest quadrant. In this instance, feedlot location could make a lot of difference to both neighbors and juries.

The second basic approach to odor control is to keep manure dry as much of the time as possible. Odorous compound formation is generally the product of bacterial decomposition of manure. Offensive odors are released when manure is allowed to undergo anaerobic (or septic) decomposition. This occurs when oxygen is excluded. By maintaining a manure-covered surface in a relatively dry condition (less than 40 percent moisture) anaerobic decomposition at the feedlot surface is minimized.

TABLE 1. Summary of Odor Intensities at 17 Texas Cattle Feedlors, 1973-75

Location		Condition	Odor Intensity, DT
1.	Feedlot surface	Dry	7
2.	Feedlot surface	Well-Drained; Moist	7-31
3.	Feedlot surface	Poorly-Drained; Damp	31
4.	Feedlot surface	Wet; Ponded	31-170
5.	Runoff retention ponds	------	31-170
6.	Manure stockpiles	------	7-170

Intense, offensive odors are most prevalent when pens are drying out after rainfall, when water stands on the feedlot surface, or when runoff holding ponds contain relatively fresh solids. Odor intensities of 170 dilutions to threshold (DT) are common under these conditions. This means that it takes 170 cubic feet of odor-free air to dilute one cubic foot of odorous feedlot air to the point where half the human panelists can detect the odor and half cannot.

Odor intensity values measured at 17 Texas feedlots (TABLE 1) suggest that the lowest attainable odor intensity for an open cattle feedlot may be 7 DT. Under damp conditions an odor intensity of 31 DT is typical. Water ponding on the feedlot surface can cause higher readings. Odor levels of 31 to 170 DT are typical near runoff settling basins and retention ponds soon after rainfall.

A strategy to lessen the intensity and duration of feedlot odors after rainfall consists of these steps:

1. Maintain rapid pen drainage—pen slopes should be 3-4%, ideally with no potholes.
2. Keep manure solids out of runoff holding ponds—runoff collection ditches should empty into an easily-maintained settling basin or channel (0.1-0.3% slope) to capture settleable solids before liquids are drained to holding ponds.
3. Water trough maintenance to prevent overflows and leaks.
4. Maintaining dust control systems to prevent leaks, nozzle stoppage, and low pressure that cause wet spots around sprinkler nozzles.

Another Basic Approach

The third basic approach to odor control consists of keeping a minimum quantity of manure and wastewater on hand. This involves:

1. Rapid dewatering of runoff holding ponds.
2. Prompt removal of settled solids from debris basins and channels.
3. Frequent collection of loose surface manure which soaks up rainfall and delays recovery after rainfall.
4. Maintain an undisturbed manure pack 2 to 3 inches thick just above the soil surface to seal off infiltration and to maximize surface runoff. Elevating scrapers and road graders can collect the aerobic manure layer and leave an undisturbed manure pack. However, wheel loaders are not designed for such precise manure collection.
5. Maintain markets for manure to limit the manure inventory, and limit the size of the working face of stockpiles.
6. Haul manure to fields promptly after stacking in pens. Freshly stacked manure produces odor intensities measured at 170 DT at the same time that 7 DT may be registered in an adjacent uncollected pen.

Manure spread on cropland produces temporary odors until drying occurs. Ways to avoid odor complaints from land application include:

1. Select a field downwind of neighboring residences.
2. Spread manure in the morning to allow maximum drying time.
3. Spread manure when the wind speed exceeds 9 mph for maximum dispersion and do not spread when wind is less than 5 mph.
4. Plow under surface-spread manure to control odors and conserve nitrogen.

Confinement cattle feeding facilities with liquid manure management systems have different types of odor control problems, but control technologies are available nonetheless. Special manure handling methods must be used to keep cattle clean and dry and prevent anaerobic conditions. Successful practices include daily scraping of solid floors; use of slatted floors with hydraulic flushing or cable scraping of underfloor pits; and flume floors with continuous low-volume flushing. Covered manure storage tanks control the release of odorous gases generated in stored manure. When the soil is suitable and neighbors are close, direct soil injection is a valuable technique for liquid manure disposal. Mechanically aerated lagoons can be effectively used to maintain low odor intensities where biological treatment is required and odor control is important.

Anaerobic lagoon systems, where permissible to install, need to be designed with adequate capacity and managed carefully to avoid overloading, which is accompanied by fly and odor problems. Design criteria vary from state to state, primarily because of climate.

Additional Practices

Some additional practices worthy of consideration include:

1. Landscaping to shield feedlots and holding ponds from the public view;
2. Chemical treatment of wet areas on the feedlot surface with oxidizing chemicals such as potassium permanganate or hydrogen peroxide, odor absorption chemicals such as zeolite, or bacterial/enzymatic products (digestive deodorants).

Odor control chemicals are widely available. From limited data, their effectiveness has appeared promising in some instances and disappointing in others. Field trials are suggested before major expenditures are made in this area.

Judges and juries are generally sensitive to not only the severity and frequency of an odor nuisance, but to the degree to which the feedlot management has attempted to control odors. Hence, it is appropriate to document and publicize whatever odor control steps are taken. These measures further document the positive intention of management and further reduce the possibility of punitive damages being assigned.

Managing Water Pollution Abatement Systems

The cardinal rule for water pollution contol is very simple: "Keep the crap out of the creek." Essentially all major cattle feedlots have installed adequate water pollution abatement systems designed to protect against discharge from the 10-year or 25-year frequency, 24-hour duration storm. However, maintenance of these systems remains a problem. Many feedyards simply do not dewater holding ponds on schedule, as required. In Texas, for example, 14 days are allowed for dewatering after the ponds get 75 percent full. Delayed pumpdown of holding ponds increases the likelihood of an illegal discharge and prolongs odor production. Therefore, cattle feeders should not try to save runoff, but rather should dispose of it as soon as the soil is dry enough to accept it.

Because of its salt content, feedlot runoff generally does not make good irrigation water without dilution water being added. Salinity increases the disposal problem. Professional guidance may be needed to design a runoff disposal plan to fit your soils, crops and water quality.

Continuous overflow watering systems tend to keep holding ponds half-full of water and to keep settled solids wet and odoriferous. On the positive side, they add valuable dilution water for disposal and runoff. If overflow drinking water systems are used, a special effort is needed to keep the holding ponds pumped down to less than 25 percent full.

Settled solids carried by feedlot runoff pose a special management problem as well. It is inefficient and expensive to remove these solids from runoff holding ponds. The most commonly used equipment has been draglines, wheel loaders and elevating scrapers. It often takes a major drought to dry up the holding ponds enough to collect and haul settled material in a solid form. Hydraulic dredges and trailer-mounted centrifugal pumps have been used to pump out settled solids in a slurry form.

The best solution is to remove settleable solids before they reach the holding pond. Research shows that debris basins and flat baffled channels can be designed to remove 75% of total solids. Moreover, these facilities are much easier to clean than holding ponds.

Groundwater pollution is another frequent complaint against feedlots. Data are available, however, which document that operating cattle feedlot surfaces are impermeable and hence do not contribute. If runoff retention ponds are well sealed, their contribution should also be slight. Where groundwater contributions do occur, nitrates are the best indicator. Samples collected from feedlot and surrounding wells can be used to document whether such a problem exists. The pollution of groundwater is generally much less frequent than the number of accusations.

On balance, feedlots are doing a good job of water pollution control. For example, in Texas the last in-stream fish kill attribued to a

cattle operation occurred seven years ago. But odors and management problems from these water pollution control systems still cause concern.

Dust Control

Research sponsored by the California Cattle Feeders Assn. showed that properly sprinkled feedlots generated 18 times less dust than untreated lots. Dust levels rose 850% when water treatment was discontinued for seven days. Steps to feedlot dust control consist first of removing excess manure before the dry season arrives. The second step is to apply water when the surface manure moisture content falls to around 20%. Recommended initial application rates should be at least one gallon of water per square yard per day (0.18 in. per day) until 25 to 30% moisture content is reached. Thereafter, water should be applied at 1/2 to 3/4 gallon per square yard per day (0.09 to 0.13 in. per day) as long as dry weather persists. As little as 1/4 gallon per square yard per day may be needed for recently scraped pens. Daily watering is better than alternate day watering.

Water application equipment consists basically of permanent (solid-set) sprinklers, portable sprinklers (large bore), water tankers and water trucks. Increased cattle stocking rates apparently provide some relief also.

Fly Control

Flies originating from feedlots pose a nuisance problem primarily, and to a lesser extent serve as potential vectors of pathogens. Complaints about flies at livestock feedlots are common and are usually associated with odor complaints.

Complaining neighbors, lawyers, and health authorities often fail to recognize that cattlemen have significant economic incentives to control flies and may already be spending large sums of money to accomplish this. Nor are complainants likely to distinguish between flies produced at the feeding operation and flies that migrate several miles upwind toward the feedlot. Some professional entomologists believe that well-managed feedlots kill more flies than they produce.

Extension field studies in Nebraska demonstrated that a stable fly population of 50 flies per animal reduced average daily gains by 0.2 and 0.4 lbs/day when cattle were on growing and finishing rations, respectively. Other economic incentives for fly control include employee irritation and feeder-customer relations.

The fly breeding potential around feedlots is enormous. A pound of manure solids can yield 650 to 700 fly larvae in a week under ideal conditions. Under warm summer temperatures, approximately 10 days are required for development of the housefly from egg to adult. The life cycle is usually completed in 20-30 days, during which time females may deposit as many as 1,000-2,000 eggs total. It is common to get 10-12 generations of flies in one summer.

Control at the larval stage (days 1 through 5) is the key. Good control is dependent upon removing three factors that contribute to larval development: food, moisture, and/or shelter. Food materials—spilled feed, horse and cattle manure—need to be removed frequently. Larvae will not develop if manure is too dry (less than 30% moisture) or is in a liquid state (over 95% moisture). Larvae can be desiccated if manure is collected and thinly spread under dry conditions. Wet spots should not be allowed to develop on the feedlot surface.

Trampling that occurs in feed pens minimizes larval development. Fly larvae are no match for a 1,000-pound steer! However, places where manure falls but cattle hooves seldom reach prove especially troublesome as fly breeding sites. These locations include fencelines, feedbunks, hospital pens, horse pens, cattle processing areas, feed mills, runoff settling basins and runoff holding ponds.

Recommendations

From the available information on feedlot fly control, several recommendations can be made:

1. Design feedlot to allow proper surface drainage and easy waste removal. Prevention of potential fly breeding areas affords the best means of control.
2. Correct pen drainage problems to avoid potholes where odors and fly breeding can occur.
3. Correct overflowing water troughs.
4. Remove manure from pens within five days after cattle removal in order to prevent larval development.
5. Frequently remove manure and spilled feed from important fly breeding areas such as fence lines, feed bunks, hospital pens, horse pens, truck washing stations and receiving and shipping areas.
6. If sprinkling is used to control dust or relieve cattle heat stress, make sure sprinkler heads do not leak. Proper waste management becomes even more important in fly control if a sprinkler system is utilized.

7. Prevention of floating crusts on manure treatment lagoons, used in connection with confinement buildings, by providing the proper lagoon liquid volume. Control fly breeding along lagoon banks by refilling with water after pumping and by reducing excess vegetation along the banks.

8. Remove settled solids from feedlot runoff collection channels, debris basins and embankments surrounding runoff holding ponds.

9. Use chemical controls in conjunction with a good sanitation program and not as the sole means of control.

a. Use of space sprays will generally reduce adult fly populations for short periods of time.

b. Use of residual sprays on the resting sites of flies provides the most lasting control.

c. The use of baits is a questionable control effort.

d. Apply larvicides to areas of intense larval development such as manure stockpiles, hospital and horse pens.

The majonty of feedlot managers are utilizing these fly control methods, according to a 1979 survey conducted by the Texas Cattle Feeders Assn. and the Texas Agricultural Extension Service. The feedlots that responded to the survey customarily apply pesticides at 1 to 7 day intervals by methods that include (in order of preference) fly bait, ground sprayers, ground foggers, aerial application and feed-grade larvacide.

The Future

Many unresolved problems regarding nuisance will be carried forward into the 1980's. Cattlemen have an enormous stake in deciding issues such as establishment of agricultural zoning or enactment of odor intensity standards. Broad protection against nuisance suits afforded by new laws in Alabama and North Carolina looks appealing.

Unhappily, one thing is certain—legal developments are far more likely to occur than technical breakthroughs at the present pitifully low levels of research funding on odors. Basic research is needed to unlock secrets of how odors are generated and how they can be affordably controlled. Applied research to evaluate these discoveries in the field could swiftly follow. Reliable data on odor transport and guidelines concerning "safe" separation distances are sorely needed. Understanding the complexities of molecular interactions that transform odors will take more time.

Lately, leading odor researchers have agreed that complex odors such as manure vapors can best be measured by human perception. Several useful devices are available now to achieve this. Debates over exactly which instrument and set of procedures are optimum may run into the 1990's.

Can the livestock industry afford to wait until the scientists complete their work or EPA decides to dictate the methodology, technology and standards? Would it not be better to "get the facts" and be in the driver's seat if and when state and federal odor regulations are written?

STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION, BY BRUCE HAWLEY, ASSISTANT DIRECTOR, WASHINGTON OFFICE, NOVEMBER 16, 1983

The American Farm Bureau Federation is a general farm organization in 48 states and Puerto Rico. Farm Bureau membership exceeds 3.2 million member families representing more than half the production of every major commodity produced in the United States. We have been actively involved in water quality issues for many years. We appreciate the committee's willingness to provide this opportunity for consideration of agricultural concerns.

Since the passage of the Federal Water Pollution Control Act of 1972, all states have participated in a comprehensive process to study non-point source pollution problems, to identify their sources and to identify management practices most likely to result in reduced non-point pollution. The 208 planning process of which the non-point source study activities were a part has entailed nearly a billion dollars of federally appropriated funds.

We believe the time for further planning and study of water pollution and water quality issues has passed. It is not time for action. We in agriculture are prepared to do our part to address the agricultural portions of this nation's water quality problem. As this committee is aware, nearly every state in the country has current, ongoing water quality management programs aimed at mitigating agricultural run-off problems. The water pollution problem is a long way from a solution, but substantial efforts are being made.

Much has been learned from the studying and monitoring that has been undertaken in the past decade with regard to the agricultural contribution to water pollution problems. An example . . . The Chesapeake Bay loss of vegetation was of serious consequence to the future aquatic environment. Many picked up the cry that agricultural herbicides were an important contributor to the decline in aquatic vegetation and related marine life in the bay. As the bay was intensively studied under the Chesapeake Bay Project, the researchers discovered, somewhat to their surprise, in virtually no portion of the bay were herbicides or other agricultural pesticides implicated as a problem. Rather, the decline in vegetation was associated with a buildup of toxics associated with industry or other problems. Our point is not to suggest that agriculture is without its responsibilities in the non-point source area, but rather that we now know more precisely the nature of the agricultural contribution to non-point problems than we did a decade ago.

We have historically viewed the agricultural pollution problem as a soil conservation problem, a run-off control program. Increasingly, we recognize that this is an incomplete answer and that other agricultural problems must be accommodated. Again, by way of example, Lancaster County, Pennsylvania, is an area of high dairy concentration. It has been determined that there is a dairy livestock waste production equivalent to 13 tons per cultivated crop acre. Livestock waste land application at that rate has some surface run-off implications, but of far greater concern is the nitrogen leaching potential. In fact nitrogen leaching factor in ground water has been discovered. They have come to realize water quality associated with agricultural activities is more than a run-off control program. Now under study is a methane powered electric generating facility as a possible alternative to the land disposal of livestock wastes. Whether this solution proves to be efficient remains to be seen. The point is they have identified their problem and are aggressively seeking solutions to it. The solutions are outside the run-off control arena and solutions that could not have been anticipated at the time of passage of the Federal Water Pollution Control Act of 1972. In that context, we applaud the Congress's foresight at that time in not specifying rigid legislative answers of federal regulatory requirements detailing the nature of state non-point source control programs. Non-point source control continues to evolve in cost-effective, efficient and workable technologies on the farm. The flexibility must be preserved for future growth and evolution in this control technology area.

Within the past decade, land subjected to no-till practices in the Midwest corn belt region has more than doubled. This dramatic increase in no-till technology for corn and beans has proven to be an effective means for reducing run-off from the fields at approximately a 90 percent level—a run-off control program that makes money for farmers rather than costing them money, reduces fertilizer and pesticide run-off and is readily acceptable by farmers. A major key to the dramatic growth in no-till farming has been the increased cost of energy, thus making soil tillage increasingly expensive. Even with that fact, demonstration projects conducted by the private sector and by the conservation districts have been an effective tool to demonstrate to farmers that there is a better way. These are the kinds of solutions that

will gain wide-spread acceptance in agriculture and will give us our most dramatic progress towards non-point source control.

We commend Congressman Oberstar for providing leadership before this committee in an effort to encourage further consideration of nonpoint source control programs. Mr. Oberstar's bill is a cost-share bill to assist farmers in implementing nonpoint source control practices. It is a useful tool for initiating discussion on what might constitute the most effective pollution control program for agriculture, mining, forestry and construction activities. We encourage this committee to also consider a cost-share program a demonstration program. This committee is well aware that the Extension program of the Department of Agriculture, operated in conjunction with the land grant institutions, has been of tremendous assistance in transferring technology from the research lab to the land and has been an important component in bringing this country into the forefront of world-wide agricultural production. We encourage the committee to build on this past experience and supplement it to make it more responsive to non-point source control needs.

We have utilized cost-share program for soil conservation practices in agriculture for the past fifty years. Recent studies indicate that inadequately funded cost-share programs may serve as a detriment to rapid implementation of soil conservation programs. Farmers have approached the Soil Conservation Service with requests for cost-share participation in the implementation of conservation programs on their land only to discover that insufficient funds are available from the government's offices. This has led farmers to defer necessary conservation activities under the promise of insufficiently funded cost-share program were initiated under the auspices of this legislation.

Much of the discussion surrounding further progress in the non-point source area has centered around the need for additional planning, studies, and monitoring. Certainly, there is a place for all of these activities; however, considering the magnitude of funds that have been spent for planning already, considering the updating of those planning and needs' studies that was accomplished by the Department of Agriculture's Resource Conservation Assessment, and considering the significant progress that is being made on a farm-to-farm basis across the country in addressing non-point programs, we urge this committee to minimize the requirement for resubmission of plans. Further planning and studies can become an end of its own—and end that does not lead to an improvement in water quality. This committee has made clear its feeling that now is the time for action rather than further planning. In that context, we suggest that any legislation reported minimize planning requirements and make clear to the states that the responsibility for any planning rests solely on their shoulders. We also recommend that no more federal funds be authorized for planning purposes. If states are obligated to fund any further planning activity, it will serve as a significant incentive to the states to minimize the magnitude of those planning activities and move as rapidly as possible into the implementation phase of non-point source control.

Mr. ROE. Please proceed.

TESTIMONY OF LES COY, CHAIRMAN, 208 WATER QUALITY SUBCOMMITTEE, NATIONAL CATTLEMEN'S ASSOCIATION, AND BRUCE HAWLEY, ASSISTANT DIRECTOR, WASHINGTON OFFICE, AMERICAN FARM BUREAU

Mr. COY. Thank you very much, Mr. Chairman. We appreciate the opportunity to be here before this subcommittee today.

I am a farmer and cattlefeeder from Iowa.

The National Cattlemen's Association recognizes that agriculture nonpoint source pollution does exist and a nonpoint source program is needed. We believe that such a program for agricultural lands should have the following principles in mind:

One, nonpoint sources of pollution cannot always be corrected in a one-time cleanup operation.

Two, agriculture nonpoint source pollution may be improved, but it is a problem that will exist into infinity because of everchanging variables. Adverse weather causes a fluctuation of pollution levels.

Even with implementation of best management practices, adverse weather may cause excessive pollution for a period of time.

Three, to maintain satisfactory levels of pollution control, continuous funding and technical assistance will be required.

Four, members of the ranching and farming industries have been voluntarily carrying out the best management practices for many years to improve the quality of the Nation's environment. Continued efforts need to encourage the continued use of these best management practices. As of this date, past and current research is and has been inadequate to scientifically evaluate and provide concrete data relative to needs of providing sound guidance on the many facets related to nonpoint source pollution.

Five, generally, unconfined livestock operations are very compatible with a high-quality environment. However, there is a potential for problems where vegetation is excessively grazed, excess and undesirable woody species have invaded, and in areas where animals tend to concentrate.

Six the cornerstone of our Nation's conservation efforts related to water quality has been successful under a flexible voluntary program. The NCA desires that policies and programs related to agricultural nonpoint source pollution be kept and carried out through a voluntary approach.

We want antipollution efforts to be site specific, basically.

One area is different from another. One farm is different from another. Even in my own county, best management practices at one end of the county are not applicable to the other end of the county.

The Nation's ranching and farming industries have been consistent supporters and active participants in helping to control nonpoint source water pollution on agricultural lands. The conservation measures that ranchers and farmers have and are carrying out have not only improved their own resources, but enhanced fish and wildlife habitat, erosion control, and improved both water quantity and quality. We have often been disappointed that the public benefits from private conservation efforts are overlooked. Our interest in and dedication to controlling nonpoint source pollution are rooted in moral, economic, and ecological reasons.

We fully recognize that our Nation's No. 1 pollutant, silt and sediment, results from past land abuse or current neglect. Our industry largely depends upon forages and grasses grown on cropland, rangeland, pastureland, and forest land, all of which are soil conserving land uses. However, overgrazing of these lands for prolonged periods reduces the quantity and quality of protective plant cover, leaving the soil surface bare. This exposed soil is then at the mercy of nature's erosive processes. Not only is precious topsoil lost, but the soil that is washed away also carries with it nutrients, pesticides, salts, and other potential pollutants. As stewards of nearly 61 percent of the land area of the United States, cattlemen feel a moral obligation to care for this land which is vital to mankind's existence now and which is essential for the sustenance of future generations of Americans. We view conservation of our soil, water, plant, and wildlife resources as a never-ending task.

The conservation of our natural resources is inseparably linked to our efforts to control nonpoint source pollution. You simply

cannot have one without the other. Each farmer and rancher is a practicing ecologist who employs knowledge of the interaction of soil, plants, water, and animals, including wildlife, in managing this land for its maintenance and perpetuation and for a sustained economic return from his investment.

America's animal agriculture is anchored in thousands of small family business operations across this great land, and continues to serve as an impetus for economic productivity. Every livestock farm and ranch is a dynamic ecosystem and economic system. Our work toward achieving nonpoint water pollution control has kept these principles in mind.

Earlier I pointed out that cattlemen are stewards of nearly 61 percent of the land area in the United States. Much of this is rangeland that can only produce crops for grazing. However, cattlemen also manage a sizable portion of the land in many major crop producing areas. A typical cattle operation in a crop producing region also has pasture and forage acres. These cattlemen do not plant every available acre to row crops. They rotate their crops and use their more erodable acres for pasture and hay production to produce feedstuffs for their cattle. This contributes significantly to improved soil conservation in these areas. This is done voluntarily by the cattlemen and is in the best interests of us all. Current Federal farm programs have discouraged the continuation of these practices. The Federal Government needs to analyze the impact of their programs and be sure that producers are not paid to discontinue sound soil conservation practices.

Other naturally occurring obstacles contribute to nonpoint source pollution in grazing regions of the United States. Noxious woody plants known as brush compete directly with desirable plants which cover the ground. The result of this competition is bare ground and resultant erosion. The established brush also utilizes water that could go to recharge underground aquifers. Thus, the result of heavy brush densities is accelerated erosion, reduced water quality and a reduced supply of clear water. Our best estimate is that more than 100 million acres of grazing lands in the United States need brush management applied to control the nonpoint source pollution problem. At today's prices, the cost of reducing the density of brush on these acres would cost between $4 billion and $6 billion depending upon the methods of control required. A recent report issued by the Office of Technology Assessment cautions that brush encroachment and invasion poses a major long-term threat to range productivity in addition to increasing nonpoint source pollution.

The cost of controlling excessive brush has skyrocketed in recent years. Both chemical and mechanical brush control methods in Texas and the southwestern rangelands have increased six to tenfold in the past few years. We believe that integrated brush management systems which employ combinations of brush control methods including mechanical means and environmentally safe chemicals offer the most cost-effective approach to solving our U.S. brush problem, and resultant environmental degradation.

The approach we have found to be most successful in implementing nonpoint source control programs is founded upon a voluntary approach with educational and technical assistance and, where

needed, financial assistance. This assistance is made available through locally elected and governed soil and water conservation districts. Water pollution abatement plans are developed with individual landowners within the framework of a comprehensive soil and water conservation plan for each farm, or ranch in the district. Full landowner involvement in this on-the-land planning process helps insure the full implementation of the plan. The plan thus developed with the landowner and not for him is one which he supports and is committed to carrying out on a voluntary basis.

We believe the results speak for themselves and reflect the success of this approach. As an example, in Texas, data supplied by the Texas State Soil and Water Conservation Board shows an upward trend in land adequately treated since that agency developed its statewide control strategy for agricultural nonpoint source pollution.

Mr. Chairman, in my prepared statement on page 5, you will see that we have listed some statistics which may be of interest to members of the committee.

It is noteworthy that these accomplishments have been made in spite of reduced technical and financial assistance and severely depressed prices for agricultural products.

Our industry has also taken a major initiative to inform all of our members on steps to take in achieving water pollution control from point and nonpoint sources through a publication entitled "A Cattlemen's Guide to Water Pollution Control and 208 Water Quality Planning." Mr. Chairman, I am submitting for the record a copy of this guide developed by the National Cattlemen's Association. We are also submitting for the record an article which recently appeared in the Ranch magazine which illustrates the success of a range management program in Texas.

We also have another publication to be published shortly that summarizes a 208 water quality seminar proceedings conducted at our last annual meeting.

The purpose of a nonpoint source pollution program should be to improve both quality and quantity of water. When such a program is implemented, the result is more clean clear water for municipal, industrial, agricultural, wildlife, and aquatic uses. Water quality means many things to many people, but seldom is the term well defined. Water, and especially good water, is taken for granted perhaps because water is so abundant on our planet. However, the ranching and farming industries know the value of good clean water since water is typically in short supply on our Nation's grazing lands. Our livestock and our families depend on a continuous supply of water of the highest quality. As scarce as our water supply is, its usable quantity must be increased and pollution reduced or maintained at an acceptable level. Water is our survival.

In my prepared remarks, I have a list of 11 recommendations of the National Cattlemen's Association for a nonpoint source pollution control program.

We appreciate this opportunity to testify, and we hope you will consider our recommendations.

Thank you.

Mr. ROE. Mr. Hawley. Your statement will appear in full in the record.

Mr. HAWLEY. Thank you, Mr. Chairman. I will try to be brief and to the point.

I have submitted my statement and I will summarize a few brief comments, some of which may be responsive to questions raised by Members earlier today and some of which have not been discussed.

We believe that the 1972 Clean Water Act was probably the most major contribution the Congress can make to the nonpoint source issue. We say that because the major function of the act, in addition to stimulating planning and studies and monitoring and activities of that nature, has been to raise the visibility, public interest concern, and agricultural interest in nonpoint source control areas.

Out of the previous decade's history under the Clean Water Act, we have learned that, among other things, nonpoint source control is more than a runoff control program.

By way of example, in Lancaster County, Pa., which is an intensive dairy area, the livestock waste generated in that county is the equivalent of about 13 tons per acre per crop.

The historic best management practice was to return that waste to the land for the purpose of soil fertilization. They had come to understand in Lancaster County, Pa., aside from what other runoff problems they may have from that livestock waste disposal system, a far greater problem, a problem that has captured their imagination the concern has become a ground water problem with nitrogen. It was as a result of that problem they perceived to be of a major local concern, that they undertook a major project to determine if it is feasible to have a centrally located methane powered electric generating system.

When various people testified before this committee and talked about nonsource control in agriculture, they normally thought of it in the context of runoff control. That is an important dimension, but it is not the answer to problem.

We further learned that nonpoint source control in agriculture can be a money making venture for farmers rather than a cost item for farmers.

Let me reference parenthetically one of the previous witnesses used 1977 Iowa runoff data to illustrate the seriousness of the soil erosion problem.

Back to my point about nonpoint source control mechanisms paying rather than costing, since that 1977 study was done, there has been nearly a 100-percent increase in the acres of corn and beans in Iowa with no-till planning. No-till planning is a plan which reduces a farmer's production expense his energy consumption, and reduces runoff problems about 90 percent over non-no-till technology.

We get substantial water quality benefits plus some economic advantages for farmers where that technology is applicable. I emphasize that, because no-till technology is not uniformly applicable in every State in every crop across the country.

The solution to the nonpoint source problems, as we see it, is to provide an opportunity for farmers to identify the practices in their regions that truly make sense on the farm.

There has been a strong cry from some people who have testified here today for regulatory programs, for mandatory implementation, for deadlines, and carrots and sticks and other things.

We urge the committee to consider an entirely different approach. We urge the committee to recognize that point source is a normally closed system problem. If you have a factory, you do not have influences of weather. You have a closed, manageable system that that can be and has been effectively dealt with by regulatory programs, by permit, by effluent limits, and all of those technologies you are familiar with.

Agriculture is different. Agriculture is different because we get hit with a rainfall we cannot anticipate. One area may get 10 or 15 inches of rainfall in a season or in 1 day. Nonpoint source pollution is possible that day.

Sometimes we have such problems imposed upon us by Government action. I do not mean to be a nay sayer about Government actions, but not many years ago the Government, for what it perceived to be important reasons took off a control for corn routworm in the Corn Belt. Farmers plowed all of the cornstalks down that fall so there would not be a habitat for the insect to reinfest the crop next year. In the Indiana-Illinois area, they had a snowfall which melted off one day in a big rain, and it took literally hundreds of thousands of tons of Midwest soil away as these farmers tried to manage their farms by the best technology tools they had.

We are doing better now than we did then because we know more about the problem. We have new solutions.

These solutions have been brought to agriculture in a variety of techniques from across the country.

One narrow and not intended to be a self-serving example, a year ago, my organization, the American Farm Bureau, launched a nationwide program to encourage States on a county-by-county basis to develop demonstration projects utilizing our own money to encourage farmers to consider this new technology of no-till planning where it will work. We believe this will make farmers money and, coincidently, solve the runoff control problem to a great extent.

I would be happy to respond to any questions.

Mr. ROE. The Chair recognizes Mr. Daub of Nebraska.

Mr. DAUB. I thank the chairman very much.

I want to thank Mr. Hawley particularly for appearing before the subcommittee today to address the issue of nonpoint source pollution.

I had the privilege of serving on Nebraska's environmental program for 2 years, and we dealt with agricultural issues which you have raised.

I have read your testimony carefully. It is clear to me the issue has to be addressed. Yet, those of us representing constituents that make their livelihood with the land remain concerned about any action taken at the Federal level. At least it has to be practical and realistic.

I think every committee and subcommittee I belong to has been meeting all day long. But in the interest of time, I would just like to ask Mr. Hawley if I sent him three questions which I have personally prepared for this hearing, he would respond, and that the answers be included at this point in the record.

Mr. ROE. Without objection, they will be included.

Mr. DAUB. They deal with funding demonstration projects and State initiatives that were undertaken without any nudge from the

Federal Government, and they deal particularly with how they might be more encouraging.

You said a moment ago carrot and stick. I would like you to answer those three questions, and you have been given permission by the chairman to answer them and include them in the record at this point.

[The questions posed and responses received follows:]

AMERICAN FARM BUREAU FEDERATION,
Washington, D.C., November 18, 1983.

Hon. ROBERT A. ROE,
Chairman, Water Resources Subcommittee, Committee on Public Works and Transportation, Washington, D.C.

DEAR CONGRESSMAN ROE: Enclosed for your information are the responses to the three questions addressed to me by Congressman Daub with regard to non point source pollution.

Sincerely,

BRUCE HAWLEY,
Assistant Director, Washington Office.

QUESTIONS FOR BRUCE HAWLEY—AMERICAN FARM BUREAU FEDERATION, WATER RESOURCES SUBCOMMITTEE—NOVEMBER 16, 1983—NONPOINT SOURCE POLLUTION

Preface: I'd like to thank Mr. Hawley for taking time to appear before the subcommittee to address the issue of non-point source pollution. It is clear that this issue must be addressed, yet those of us representing constituents who make their livelihoods from the land remain concerned that any action taken at the federal level must be practical and realistic. I therefore appreciated your comments on the issue.

1. Q: Mr. Hawley, your testimony alluded to the ineffectiveness of cost-share programs operated by USDA's soil conservation service, in reducing soil erosion. Long a concern of mine, I wonder if you could elaborate as to the advantages of funding demonstration projects, as opposed to providing cost-sharing as a means of reducing agricultural non-point source pollution.

2. Q: You also indicated that some states have made gains in combating non-point source pollution, on their own initiative. Could you provide the committee with a few examples?

3. Q: Other witnesses before this subcommittee have expressed the belief that non-point sources may contribute as much as 50 percent of the known pollution levels in many areas, so we are well aware that the problem needs addressing. Nonetheless, many have been hesitant or unable to prescribe federal remedies. Other than funding demonstration projects, how do you believe the Federal Government could encourage activities at the State and local levels to deal with non-point source pollution?

Again, Mr. Hawley, let me express my thanks for your testimony. I'm sure your comments will be helpful to the subcommittee.

Response to Question 1: I did not mean to appear to be totally negative with regard to the SCS program. In fairness, they have been given an ambitious task, level funding for the past decade, an an expanded list of objectives, including energy self-sufficiency on the farm, enhanced wildlife habitat, urban run-off control, and more. It's probably no wonder they currently achieve only 13 percent of their money as "on the land" practices on land identified as having serious erosion problems, according to USDA's 1980 Resource Conservation Assessment.

By contrast, in Wabash County, Indiana and Livingston County, Illinois, demonstration projects on soil conservation began at 300 acres the first year, 600 acres the second year, and during the third and fourth year, farmers adopted the practices on 3,000 acres and 6,000 acres respectively. The "multiplier effect" of these demonstration projects has been 10 fold in only four years, with no limit in sight. Incidently, these programs were local initiatives, tailored to local soil types, cropping practices, and farmer needs—a key factor in their success.

Response to Question 2: The state of Mississippi ranks third in the nation for annual cropland loss per acre. They have responded with an ambitious demonstration program involving 19 agencies and organizations. The program will custom tailor conservation plans for selected farms to combine a variety of run-off control measures. The project's aim is to reduce by 50 precent the total state-wide soil loss in five years.

20-955 O—84——200

In the Old Town Creek watershed in Mason County, West Virginia, cooperating agencies and agricultural groups worked together to implement "best management practices" over the entire 27,000 acre watershed. The two-year program involved educational work among farmers and implementation of 114 vegetative practices and 32 engineering practices. The program has included grassed waterways, stream bank erosion control, and pasture management with a net gain of 10 percent per year.

Response to Question 3: Without intending any disrespect of federal intentions, the federal government could help best by keeping out of the way of the substantial progress currently being made. Any federal "assistance" is necessarily coupled with a requirement of plans submitted and approved prior to any action—probably costing a year or more and quite a bit of money—and follow-up reports of expenditures, monitoring results, needs' assessments, and more. These paper pushing activities divert needed manpower, money, and time from ongoing programs. We don't believe federal intervention into the process will help, and may substantially harm current progress.

Mr. ROE. The gentleman from Minnesota.

Mr. STANGELAND. I want to thank both gentlemen for their testimony. I think most of the testimony confirms, or reaffirms much of what we heard from both the Department and from the TVA, Mr. Coy, and I can assure you your suggestions and recommendations will be gone through carefully, since you did not take the time to read them into the record.

I would ask both of you, and particularly you, Mr. Coy, since you are a practicing farmer, how familiar are you with the ACP program? As you look ahead, can you find ways that ACP money can be made more beneficial to our conservation end, as opposed to the gentleman from the TVA who testified that the ACP money often was used on the production side rather than on the conservation side?

Being a farmer, you are familiar with the programs, and you and the Cattlemen's Association can come to us as to how to better use ACP to stimulate farmers better to participate in conservation practices.

Mr. COY. I agree with you that we have to concentrate on the conservation practices, and you are absolutely correct in stating that, in the past, a lot of them have actually been production incentives, and I really agree with you that we need to stress conservation practices more.

Mr. HAWLEY. If I might respond to that also, the ACP program has been frozen at its existing fund level for the last decade, meaning that we have a lesser Federal commitment to the Federal conservation program, as witnessed by dollars.

Even more disturbing, in that past decade, there have been a number of congressionally mandated responsibilities loaded into that program. The conflict may not be so much between conservation activities versus production activities, as the fact that the conservation program has been mandated as well, to include wildlife habitat programs, urban runoff programs, and a whole host of other things, all of which may be important issues, but all of which, incidentally, detract from that program serving its original purpose of agricultural runoff control.

Mr. STANGELAND. I am a farmer myself, and we all have our little sacred cows. When we start to monkey around with programs in those fields, that community comes in and says, hey, don't touch our program.

I think if the agricultural community would recognize we really do not need stimuluses through an ACP program for production, but a program to assist the farmers, and make it easy for us to put it into conservation and cite the need for nonsource pollution control, and be able to provide more money into that program for the future, then I would like to have both of you address your attention to the future to the bill introduced in the Senate and House, known as the sodbusters' bill.

It is a disincentive for people to go in and break up large tracts of fragile rangeland, and put it into production, and become part of the farm's program of farm supports and deficiency payments in the cropping area.

As cattlemen I should think you would be concerned. I am a cattleman, as well, and that has not been a very profitable enterprise over the last few years, and a lot of fellows have been getting out.

I do want to thank you for your testimony. You have been of great help to us, in looking at some of this other legislative language, and I think the sodbusters' bill will go directly to the question of nonpoint source pollution in the end, eventually, and the question of land conservation.

Thank you very much.

Mr. COY. If I may comment on the sodbuster issue, basically our industry has been more conservation minded with crop rotations, as I said in my testimony. We have more forages, so the livestock industry has been keeping land in forage, on its own, voluntarily, and actually we are not getting paid for it.

Mr. HAWLEY. The American Farm Bureau Federation have been aggressively supporting the sodbusters' bill for the last 2 years. That would not have happened 10 years ago. There has been a substantial evolution in the philosophy of farm groups and farm people about our responsibility in the area of environmental issues.

We ask that Congress take note of that, as it fashions this legislation. The farmers have come to the right place, and are doing the right thing, as rapidly as they can, and more rapid progress will be made if things do not get polarized in trying to ram something down the farmers throat, that may not work as well as what is already being done.

Mr. ROE. We want to thank both of you very much.

One more point for clarification.

In Mr. Coy's testimony, he spoke to the issue that when we are considering the Clean Water Act relating to nonpoint source pollution, control programs should be so structured as to address nonpoint source pollution of agricultural lands in one section, and nonpoint source pollution of nonagricultural lands in another.

I think that is a very important point. Would you just like to comment on that a moment?

Mr. COY. Yes; I would.

It goes back to the same site specific point I alluded to in my testimony that a federally mandated program will not work in all areas in all States. It goes back to the point that one farm will not be able to use the same practices that another farm in the same State, or in the same section of the State, because they will have different practices.

In fact, even within agriculture grazing and raising crops are actually two different operations, and we have differences in operations in my State of Iowa, and the practices would not apply to one farm, where they could apply to another.

Mr. ROE. You sat through a lot of testimony today.

Mr. COY. Yes.

Mr. ROE. What I am trying to develop in my own mind is where we spoke to the issue that everything that was not considered to be point source, meaning municipal or industrial outfalls, were thrown into the nonpoint sources, that's what it amounted to.

In Wisconsin's experience, in the work they have been doing, they have been able to and I hate to get into the details of this, get from the acid waters and things of that nature which would all fall in the other category.

It seems to me that when we listen to the testimony further from the Agriculture Department, and you both elucidated on that in your testimony, there had been ongoing programs for years in management and conservation and improvement of farm production, and so forth.

So it seems it would be logical now to look to the issue and say, in view of the fact that we are not, in fact, breaking new ground in the agricultural field, that we have a program to build on, so let us not reinvent the wheel.

What do we do to strengthen the conservation programs and the soil erosion programs that are existing, and refine them, or whatever we need to do to improve the conservation of our farmlands?

We have something going there. In the other areas, nonpoint source runoff, we do not have the laws, or the mechanisms in place.

So, therefore, there is an element of logic, in fact, in your suggestion that the agricultural should at least be a subsection, or whatever, and treat it differently.

Mr. HAWLEY. We very much believe the answer to your question is demonstration projects. To put it in the context of the land grant institutions and the extension service, which has been a tool that has brought agriculture into the forefront of production worldwide, a nonparalleled example, we can do that in the nonpoint source control program. We do not need regulatory programs. They will probably be counterproductive, for the simple reason that it is not possible to write in Washington a regulatory program, a specific program, that will work across the country.

Instead, on a local basis, the Federal Government's role could very well be restricted to assisting the local people, and providing demonstration and education projects on the farm that the farmers will, in fact, adopt.

Mr. ROE. I understand that, but when Washington decides an issue, they regrettably do not consider the Nation to be different. Everybody is supposed to all be the same.

You have provided a mechanism, in my judgment, in your testimony, and in the testimony in the last 2 days particularly, which has fortified your position that if there is any treatment of nonpoint source to be involved, let us not put everybody in the same bucket, and say that is going to be the solution. Or is it going to work that way?

You both testified to that. All I am suggesting is, there is a good, valid reason to separate those two. Is that a reasonable point to make?

Mr. COY. That is correct.

Mr. HAWLEY. That is correct.

Mr. STANGELAND. I have been asking everybody this same last question, about the incentive programs with grants turning out to be disincentives.

In your testimony, Mr. Hawley, on the cost-share programs for soil conservation practices, farmers have been known to hold back with practices until the money was available for cost sharing, and then go ahead with them.

So, you can see if there is not enough money in the program to go around, it can be a disincentive to progress, despite what other have said.

Mr. Coy, would you care to comment on that?

Mr. COY. Yes; I think probably if there are any Federal funds, or Federal assistance, it should be a type of seed money. We should really concentrate on research, education, and small pilot projects on some of these watersheds, small watersheds, to see the effects of some of these practices, and what is really happening.

For example, we have some reservations about the use of the universal soil equation [USLE] in a small watershed area, or on a small farm. When we think about soil: If it moves just 1 foot, can we say that 5 tons have moved off? When you begin to consider larger watersheds—from the streams to the rivers—if you apply that same principle, well, the Mississippi River would be completely plugged with sediment, if you really lost that many tons of soil.

So there are some discrepancies in that soil loss equation. That is one subject on which we need to do some work.

Mr. STANGELAND. What county are you from?

Mr. COY. My mailing address is Elmore, Minn., so I am as far north in Iowa as you can get.

Mr. STANGELAND. Thank you.

Mr. ROE. Again, we want to thank you for your splendid testimony. You have been a big help to us, and we appreciate your efforts and patience.

Now the one who gets the medallion for patience and fortitude is the representative of the National Association of Manufacturers, Mr. Harold Jensen, who is director of energy conservation and environmental control of Warner-Lambert Co., Morris Plains, N.J.

Again, we want to particularly thank you for taking your time because we are coming down the homestretch now.

You gentlemen are the last witnesses today, but tomorrow we intend to round out, as best we can, all of the backlog of witnesses.

Of course, we have had the advantage of hearing from the administration, both from the EPA and the Department of Agriculture and the Department of the Army, and all of the administrative agencies that are involved.

Now, you are returning with some of the observations we asked for.

Mr. Jensen, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY BY HAROLD JENSEN, DIRECTOR, ENERGY CONSERVATION AND ENVIRONMENTAL CONTROL, WARNER-LAMBERT CO.

INTRODUCTION

Mr. Chairman, we at the National Association of Manufacturers (NAM) appreciate being called back for additional testimony on Clean Water Act reauthorization by this distinguished House Subcommittee on Water Resources. We have previously stated facts concerning the importance of water to manufacturing processes and the fact that NAM is the most representative organization of water-using manufacturing companies.

The National Association of Manufacturers is a voluntary business association of over 13,000 corporations, large and small, located in every state. Eighty percent of the firms are considered to be small businesses. NAM member companies employ 85 percent of the nation's manufacturing and produce over 80 percent of the nations manufactured goods. NAM is affiliated with an additional 158,000 businesses through its Associations Council and the National Industrial Council.

I am Harold L. Jensen, Director of Energy Conservation and Environmental Control For Warner-Lambert Company, Morris Plains, New Jersey, and Chairman of the NAM Water Task Force. I am accompanied by Louis C. Gilde, Director of Environmental Programs, Campbell Soup Company, and Daniel W. Cannon, Director of Environmental Affairs, National Association of Manufacturers.

NONPOINT SOURCES OF WATER POLLUTION

One of the points we were asked to expand upon is that of control of nonpoint sources of pollution. These remarks are made from a business management viewpoint and not from a political science standpoint. There are several classes of nonpoint sources of water pollution, such as construction projects; drainage from streets, roads, and parking lots; drainage from tilled land; and drainage from untilled land. Each class will respond to a different program, and there should be a different mix of programs in different watersheds. Frequently, the most effective programs will be operating practices rather than high cost capital projects. Examples of operating practices are construction controls, street sweeping, anti-litter campaigns, pet control in cities, sound fertilizing practices, and sound chemical application practices.

EPA can play an important role in technical assistance, but administration of nonpoint source control programs should be at the local, State, or interstate level. Each class of nonpoint sources in each watershed can best determine the most effective incentive for that class of sources. In the case of farming, the Soil Conservation Service and county agents are ideal agencies already in place to provide training in these practices. Some successful case histories should be helpful.

One such example is Lake Quinsigamond of Massachusetts where water quality sampling revealed nonpoint source problems on the lake in the late 1960's and early 1970's. The lake is transected by two major east-west highways. Algal blooms flourished in the summer months and bacterial counts were abnormally high often forcing swimming areas to close.

Winter salting on the highways was reduced, and the state and the local community shared the cost of applying copper sulfate to control the remaining algae at the lake's lower end. The lake quality commission sponsored spring and summer street clean up days. All of that has helped. Dissolved oxygen levels now meet standards, suspended solids, ammonia, nitrates, phosphorus, and bacterial counts are all within acceptable levels. Fishing, boating, and swimming are all on the increase.

Another project involved the Black Creek Watershed in Allen County Indiana. The project was designed to show whether traditional soil and water conservation programs have a significant beneficial impact on water quality, and whether voluntary programs, encourage by incentive payments produce land use practices effective in improving water quality. The study was a research and demonstration project funded by a grant from EPA and carried out by the Allen County Soil and Water Conservation District, with assistance from the U.S. Department of Agriculture Soil Conservation Service, Purdue University, and the University of Illinois.

After 5 years of effort, investigators were able to draw some tentative conclusions concerning the impact of agriculture and land use on the Black Creek environment. The project showed that nitrate loading typical of agricultural watersheds was not high enough to threaten drinking water standards if conventional controls on nitrate use were applied, but phosphate concentrations were high enough to threaten the water quality goals for Lake Erie. As expected, significantly greater sediment loadings were produced during high runoff periods. The conventional methods for

controlling nitrates include careful scheduling of fertilizer application and reducing the amount of nitrogen in the fertilizer used.

Although phosphate levels were high enough to be of concern, the study indicated that significant reductions of phosphate levels can be achieved through control of sediment. Simulated rainfall tests demonstrated that raindrop impact is of principal importance in the detachment of soil particles, which in turn results in the erosion of high sediment in the stream. Farming techniques which maximize surface residue, thereby providing better soil cover and subsequent protection from the erosive effects of rainfall, were found to be the most important practices in preventing erosion.

Another practice found to prevent sediment from reaching waterways included establishing vegetative borders around fields, constructing terrace systems to shorten slopes, and constructing sediment basins.

The investigators developed a computer model called ANSWERS to simulate sediment particles in transportation. It helps identify areas with small watersheds that have proportionally greater impact on water quality. The model is useful for those who need to identify areas within a basin where control of erosion is most critical to success of the areawide plan. The Black Creek project has provided a data base that gives a better understanding of the facts contributing to nonpoint source pollution from agriculture and the best methods for keeping such pollution to a minimum.

The 7 states in the Colorado Basin joined with EPA and the Department of Interior in December 1973 to agree on a new salinity control policy. The combination of a basically arid climate, geology of the region, and water-consuming human activities have created a serious salinity problem in the basin. Salinity is, in fact, the most serious basin-wide water quality problem in the Colorado River. The most significant natural contribution resulted from weathering, decomposition, and erosion of rock formations and soils in the basin. Among man's activities, irrigation is the primary contributor to Colorado River salinity. Other actions, such as grazing, water impoundment in reservoirs, the resultant evaporation, and the "exporting" of the river's waters also increase the salinity. The lower states together with Mexico have been bearing the brunt of salinity in the form of lower crop yields and additional costs for public drinking water supplies.

There have been some successes in reducing salinity through improvements in on-farm irrigation practices. Another effort included the continued implementation of NPDES permit policy in the control of the salinity in urban and industrial discharges. A revised implementation plan identifies a greater role for Section 208 areawide water quality management programs, cites opportunities to improve on-farm irrigation practices, and calls for the development of State salinity strategies by the individual basin States. Salinity problems in the Colorado River are particularly complicated. Involved are natural climatic and geologic processes, a variety of land and water use activities, complex State and interstate water allocation systems, and international concerns.

Among the conclusions to be drawn from considering these case histories are the value of joint effort through an association of all interested groups. Farmers, townspeople, those with interest in good drinking water supplies, and representatives of business and industry, should join together to control nonpoint source pollution in their local area. Many activities can be carried out by individual voluntary efforts without the need for large amounts of funding. Many planning activities have been carried out under Section 208 of the Act. Future activities should be built upon the foundations that have already been erected under Section 208. The official policy statement of NAM on "Watershed Improvement" is attached to this testimony.

The experience of the Ohio River Valley Water Sanitation Commission (ORSANCO) is also instructive. Program goals in the Ohio Valley were attained with little resort to the use of legal proceedings. This was expressed in a letter dated February 28, 1958, from William Foster, Senior General Counsel, U.S. Steel Corporation to Henry F. Hebley, research consultant to Pittsburgh Consolidation Coal Company. Mr. Foster stated: "The power of the Commission is clear and unambiguous. To date the Commission has not had to use its power to accomplish its objectives, and in many instances each individual state carries out through the machinery within the state, pollution-abatement programs favored by the Commission. This is a practical working arrangement since in many states the representatives of each state on the Commission are also members of the pollution control machinery of the particular state . . . The fact that these voluntary methods of accomplishing results have been used by the Commission since 1948 does not eliminate the possibility that the Commission may in the future elect to use the legal powers vested in it by the compact. . . ." Dr. Edward J. Cleary, long time executive director and chief engineer of ORSANCO, commented in 1967 that "It would be fair to say that thus far the conscien-

tiousness of the states in meeting obligations imposed by the compact, coupled with application of persuasive measures by the Commission in lieu of litigation, has minimized the need for enforcement proceedings in advancing program objectives." (*The ORSANCO Story*, p. 215, by permission of Johns Hopkins University Press.) *The ORSANCO Story* also briefly describes the Delaware River Basin Commission. "Among other things, the Delaware commission is empowered to: (a) adopt and keep current a comprehensive plan for development of water resoruces and insure that all new projects or facilities having a substantial effect upon waters of the basin are carried out in conformance with this plan; (b) work with and through existing federal, state, and local agencies—or directly when necessary—in planning, constructing, operating, and maintaining dams, reservoirs, and other facilities, as well as conduct other programs, for the purposes of flood-damage reduction; water-quality improvement; municipal, industrial, and agricultural water supply; recreation and fish and wildlife improvement; hydroelectric power generation; soil conservation, forestation, and watershed management; (c) make future allocations of the waters of the basin among the four states and their political subdivisions in accordance with the Supreme Court doctrine of equitable apportionment which takes into account alternative sources, relative needs, and changing uses; and (d) regulate the volume of withdrawals or diversions in areas where water shortages threaten to develop, or in areas where an actual emergency shortage has developed.

"Financing for the Delaware River Basin Commission activities is authorized from two sources: general public funds, and direct-user funds for facilities without anticipation of repayment where the benefits are widespread and in the general public interest. Where the beneficiaries can be specifically identified and the benefits are measureable (as, for example, in the sale of hydroelectric power) use charges can be levied. Accordingly, the commission operations may be financed by a current expense budget to be apportioned among the signatory parties; by appropriations, grants, or loans from federal or state governments; by issuance of revenue bonds; and by charges for products and services."

COST OF WATER

We were also asked to provide some information on the cost of water. The following data comes from several companies that conducted random samples of plants throughout the nation. Thirteen water systems in nine States were surveyed. The survey revealed that the cost of water depends on the source, availability, and on treatment needed to upgrade the quality of the raw water to the level needed for the intended use. In general, cooling water costs less than water for employee consumption or food processing. Indicated raw water supply costs ranged from $0.05/1,000 gals. to $0.90/1,000. The mean cost was $0.36/1,000 gals. However, that is only part of the cost of water because it must be returned to the environment in acceptable condition. The cost of wastewater treatment ranged from nothing in the case of cooling water to $50.00/1,000 gals., with the mean being $3.62. However, the $50.00 figure relates to a special case; for the vast bulk of industrial wastewater treatment, a more general range of costs may be in the neighborhood of $0.75/1,000 gals.

INTEGRATED FACILITIES

As requested, we made a limited survey of companies which led us to the conclusion that at least 30 percent of all manufacturing plants are integrated. The limited survey listed plants from 35 states, and there were as many as 6 classifications in a single plant. One company with more than 200 manufacturing plants has 62 percent integrated, and 13 percent not classified. Only 24 percent are single category plants.

SUMMARY OF POINT SOURCE CONTROL PRINCIPLES

In our October 20, 1983 testimony, we listed 6 principles to guide any program to deal with the non-point source pollution control problem. We were asked to summarize the part of our testimony dealing with point sources in similar fashion. The following are principles derived from that part of our testimony:

1. Since water is such a pervasive element of the whole production system, unwarranted costs imposed on the use of water adversely affect every member of our society.
2. It is the responsibility of the Congress to exercise the utmost wisdom in tailoring the nation's laws so as to achieve national objectives in ways that avoid excessive costs.
3. The Clean Water Act provides a good framework for a sound national water pollution control program that meets such criteria. However, no law is perfect;

there are some imperfections in the Clean Water Act which could be corrected by the Congress in the process of reauthorization.

4. We urgently plead with the Committee to introduce some flexibility into the pretreatment requirements of the Clean Water Act.

5. The pretreatment section should also be amended to give consideration to the problems of integrated facilities with combined wastewater stream flows.

6. The Congress should provide the same incentives for innovative technology to indirect dischargers as it presently provides to direct dischargers.

7. Water quality standards should have some degree of flexibility. Designated uses should not be frozen as of any particular date.

8. Section 301(e) should be amended to make clear that the use of the bubble concept is authorized under the Clean Water Act.

9. BAT limitations should be required only where there is a significant toxics problem.

10. We support the extension of the Clean Water Act for two fiscal years; we question the wisdom of reauthorizing the Act for four or five fiscal years.

CONCLUSION

We thank the Subcommittee for the opportunity to appear again on the vitally important matter of reauthorizing the Clean Water Act.

WATERSHED IMPROVEMENT

Industry believes that natural watersheds are, in most cases, the most feasible units for conservation, development and wise utilization of the nation's renewable natural resources. Industry also believes that the watershed development concept should embrace the whole complex of major renewable natural resource problems. It should include upstream waterflow retardation, flood control, erosion prevention, protection of industrial and municipal water supplies, abatement of pollution, drainage and irrigation where necessary, recreation, forest and range management—all directed toward the best practicable use and care of all lands. To accomplish these objectives, industry recommends:

1. That the community watershed or small drainage area be recognized by all concerned as the natural unit through which renewable natural resources can be most efficiently and most satisfactorily developed.

2. That local authorities and leaders define watershed problems and determine needs by utilizing available basic information and that they obtain additional surveys where needed to define problems and develop adequate plans.

3. That local responsibility for action be assumed by watershed associations, soil conservation districts, or other voluntary local and state groups. Such responsibility would give emphasis to the rights of individuals and groups of individuals to participate in planning, developing, and maintaining their own community watershed programs, and provide a means of relating such local programs to those of interstate or basinwide scope.

4. That after suitable and adequate community watershed planning is done, local authorities should determine and establish the kind of local organization needed to direct the operational and maintenance programs, and make full coordinated use of existing public agencies, industry groups, associations and individuals in a position to contribute to its success.

5. That a federation of community water shed associations on a state or interstate (agreement or compact between two or more states) basis be encouraged to develop and carry out plans on larger stream basins where such unified approach is most feasible.

Industry believes that foregoing principles should become the policy for a fully integrated approach to the conservation, development and utilization of renewable natural resources in the United States; and that with such approach responsibility lies with those who derive the benefits therefrom.

Industry further recommends that, wherever necessary to permit the effectuation of these principles, the various states consider the adoption of suitable legislation recognizing watershed development as state or interstate (by agreement of compact between two or more states) responsibility.

Mr. ROE. Please proceed.

TESTIMONY OF NATIONAL ASSOCIATION OF MANUFACTURERS, HAROLD JENSEN, DIRECTOR OF ENERGY CONSERVATION AND ENVIRONMENTAL CONTROL, WARNER-LAMBERT CO., MORRIS PLAINS, N.J., ACCOMPANIED BY LOUIS GILDE, CAMPBELL SOUP CO., CAMDEN, N.J.; AND DANIEL W. CANNON, DIRECTOR OF ENVIRONMENTAL AFFAIRS, NATIONAL ASSOCIATION OF MANUFACTURERS, WASHINGTON, D.C.

Mr. JENSEN. Thank you, Mr. Chairman.

I will skip over a few of the points in the prepared testimony. We have introduced ourselves as the National Association of Manufacturers, and accompanying me, on my right, is Mr. Daniel W. Cannon, and on my left is Mr. Louis Gilde.

One of the points we were asked to expand upon is that of control of nonpoint sources of pollution. These remarks are made from a business management viewpoint and not from a political science standpoint. There are several classes of nonpoint sources of water pollution, such as construction projects; drainage from streets, road, and parking lots; drainage from tilled land; and drainage from untilled land. Each class will respond to a different program, and there should be a different mix of programs in different watersheds. Frequently, the most effective programs will be operating practices rather than high cost capital projects. Examples of operating practices are construction controls, street sweeping, antilitter campaigns, pet control in cities, sound fertilizing practices, and sound chemical application practices.

EPA can play an important role in technical assistance, but administration of nonpoint source control programs should be at the local, State, or interstate level. Each class of nonpoint sources in each watershed can best determine the most effective incentive for that class of sources. In the case of farming, the Soil Conservation Service and county agents are ideal agencies already in place to provide training in these practices. Some successful case histories should be helpful.

One such example is Lake Quinsigamond of Massachusetts where water quality sampling revealed nonpoint source problems on the lake in the late 1960's and early 1970's. The lake is transected by two major east-west highways. Algae blooms flourished in the summer months and bacterial counts were abnormally high often forcing swimming areas to close.

Winter salting on the highways was reduced, and the State and the local community shared the cost of applying copper sulfate to control the remaining algae at the lake's lower end. The lake quality commission sponsored spring and summer street cleanup days. All of that has helped. Dissolved oxygen levels now meet standards: Suspended solids, ammonia, nitrates, phosphorus, and bacterial counts are all within acceptable levels. Fishing, boating, and swimming are all on the increase.

Another project involved the Black Creek watershed in Allen County, Ind. The project was designed to show whether traditional soil and water conservation programs have a significant beneficial impact on water quality, and whether voluntary programs encouraged by incentive payments produce land use practices effective in improving water quality. The study was a research and demonstra-

tion project funded by a grant from EPA and carried out by the Allen County Soil and Water Conservation District, with assistance from the U.S. Department of Agriculture Soil Conservation Service, Purdue University, and the University of Illinois.

After 5 years of effort, investigators were able to draw some tentative conclusions concerning the impact of agriculture and land use on the Black Creek environment. The project showed that nitrate loading typical of agricultural watersheds was not high enough to threaten drinking water standards if conventional controls on nitrate use were applied, but phosphate concentrations were high enough to threaten the water quality goals for Lake Erie. As expected, significantly greater sediment loadings were produced during high runoff periods. The conventional methods for controlling nitrates include careful scheduling of fertilizer application and reducing the amount of nitrogen in the fertilizer used.

Although phosphate levels were high enough to be of concern, the study indicated that significant reductions of phosphate levels can be achieved through control of sediment. Simulated rainfall tests demonstrated that raindrop impact is of principal importance in the detachment of soil particles, which in turn results in the erosion of high sediment in the stream. Farming techniques which maximize surface residue, thereby providing better soil cover and subsequent protection from the erosive effects of rainfall, were found to be the most important practices in preventing erosion.

Another practice found to prevent sediment from reaching waterways included establishing vegetative borders around fields, constructing terrace systems to shorten slopes, and constructing sediment basins.

The investigators developed a computer model called ANSWERS to simulate sediment particles in transportation. It helps identify areas with small watersheds that have proportionally greater impact on water quality. The model is useful for those who need to identify areas within a basin where control of erosion is most critical to success of the areawide plan. The Black Creek project has provided a data base that gives a better understanding of the facts contributing to nonpoint source pollution from agriculture and the best methods for keeping such pollution to a minimum.

The seven States in the Colorado Basin joined with EPA and the Department of Interior in December 1973 to agree on a new salinity control policy. The combination of a basically arid climate, geology of the region, and water-consuming human activities have created a serious salinity problem in the basin. Salinity is, in fact, the most serious basin-wide water quality problem in the Colorado River. The most significant natural contribution resulted from weathering, decomposition, and erosion of rock formations and soils in the basin. Among man's activities, irrigation is the primary contributor to Colorado River salinity. Other actions, such as grazing, water impoundment in reservoirs, the resultant evaporation, and the exporting of the river's waters also increase the salinity. The lower States together with Mexico have been bearing the brunt of salinity in the form of lower crop yields and additional costs for public drinking water supplies.

There have been some successes in reducing salinity through improvements in on-farm irrigation practices. Another effort included

the continued implementation of NPDES permit policy in the control of the salinity in urban and industrial discharges. A revised implementation plan identifies a greater role for section 208 areawide water quality management programs, cites opportunities to improve on-farm irrigation practices, and calls for the development of State salinity strategies by the individual basin States. Salinity problems in the Colorado River are particularly complicated. Involved are natural climatic and geologic processes, a variety of land and water use activities, complex State and interstate water allocation systems, and international concerns.

Among the conclusions to be drawn from considering these case histories are the value of joint effort through an association of all interested groups. Farmers, townspeople, those with interest in good drinking water supplies, and representatives of business and industry, should join together to control nonpoint source pollution in their local area. Many activities can be carried out by individual voluntary efforts without the need for large amounts of funding. Many planning activities have been carried out under section 208 of the act. Future activities should be built upon the foundations that have already been erected under section 208. The official policy statement of NAM on watershed improvement is attached to this testimony.

The experience of the Ohio River Valley Water Sanitation Commission [Orsanco] is also instructive. Program goals in the Ohio Valley were attained with little resort to the use of legal proceedings. This was expressed in a letter, dated February 28, 1958, from William Foster, senior general counsel, United States Steel Corp., to Henry F. Hebley, research consultant to Pittsburgh Consolidation Coal Co. Mr. Foster stated:

> The power of the commission is clear and unambiguous. To date the commission has not had to use its power to accomplish its objectives, and in many instances each individual State carries out through the machinery within the State, pollution-abatement programs favored by the commission. This is a practical working arrangement since in many States the representatives of each State on the commission are also members of the pollution control machinery of the particular area. The fact that these voluntary methods of accomplishing results have been used by the commission since 1948 does not eliminate the possibility that the commission may in the future elect to use the legal powers vested in it by the compact * * *.

Dr. Edward J. Cleary, longtime executive director and chief engineer of Orsanco, commented in 1967 that—

> It would be fair to say that thus far the conscientiousness of the States in meeting obligations imposed by the compact, coupled with application of persuasive measures by the commission in lieu of litigation, has minimized the need for enforcement proceedings in advancing program objectives. [The Orsanco Story, p. 215, by permission of Johns Hopkins University Press.]

The Orsanco story also briefly describes the Delaware River Basin Commission:

> Among other things, the Delaware Commission is empowered to: (a) adopt and keep current a comprehensive plan for development of water resources and insure that all new projects or facilities having a substantial effect upon waters of the basin are carried out in conformance with this plan; (b) work with and through existing Federal, State, and local agencies—or directly when necessary—in planning, constructing, operating, and maintaining dams, reservoirs, and other facilities, as well as conduct other programs, for the purposes of flood-damage reduction; water-quality improvement; municipal, industrial, and agricultural water supply; recreation and fish and wildlife improvement; hydroelectric power generation; soil conser-

vation, forestation, and watershed management; (c) make future allocations of the waters of the basin among the four States and their political subdivisions in accordance with the Supreme Court doctrine of equitable apportionment which takes into account alternative sources, relative needs, and changing uses; and (d) regulate the volume of withdrawals or diversions in areas where water shortages threaten to develop, or in areas where an actual emergency shortage has developed.

Financing for the Delaware River Basin Commission activities is authorized from two sources: general public funds, and direct-user funds for facilities without anticipation of repayment where the benefits are widespread and in the general public interest. Where the beneficiaries can be specifically identified and the benefits are measurable—as, for example, in the sale of hydroelectric power—use charges can be levied. Accordingly, the commission operations may be financed by a current expense budget to be apportioned among the signatory parties; by appropriations, grants, or loans from Federal or State governments; by issuance of revenue bonds; and by charges for products and services.

We were also asked to provide some information on the cost of water. The data come from several companies that conducted random samples of plants throughout the Nation. Thirteen water systems in nine States were surveyed. The survey revealed that the cost of water depends on the source, availability, and on treatment needed to upgrade the quality of the raw water to the level needed for the intended use. In general, cooling water costs less than water for employee consumption or food processing. Indicated raw water supply costs ranged from 5 cents per 1,000 gallons to 90 cents per 1,000. The mean cost was 36 cents per 1,000 gallons. However, that is only part of the cost of water because it must be returned to the environment in acceptable condition. The cost of wastewater treatment ranged from nothing in the case of cooling water to $50 per 1,000 gallons, with the mean being $3.62. However, the $50 figure relates to a special case; for the vast bulk of industrial wastewater treatment, a more general range of costs may be in the neighborhood of 75 cents per 1,000 gallons.

[The following was received from Mr. Jensen:]

California canneries, suppliers of most of the canned tomatoes and fruits consumed in the U.S., have to count on significant wastewater treatment charges during their operating season.

Expensive Discharges from Cannery Row

by Jerry L. Jones

Municipal charges for treatment of cannery wastewaters can absorb a significant portion of the profits of a typical cannery. Because of this, in municipalities with seasonally operated canneries, the possibility of plant closure is something to be considered in the planning of major new wastewater treatment projects.

Charges by municipalities for the treatment of seasonal cannery wastewaters are determined by a number of factors. In most cases, the important ones appear to be the effluent limitations imposed on the treatment plant, the size of the canning season, biochemical oxygen demand (BOD), and suspended solids (SS) loads relative to the non-canning season loads, the total capacity of the treatment plant, and the treatment processes employed. Estimated charges in selected California cities for treatment of the wastewaters from a typical cannery vary widely in terms of the total annual charges, the portion of the charges attributable to operations and maintenance costs, the portion allocated for capital costs, and the distribution of the annual charges between flow, BOD and SS.

Canneries located in California supply 85 percent of the nation's canned tomatoes and tomato products, 100 percent of the canned peaches, fruit cocktail, olives and apricots, and 30 percent of the canned pears. Tomatoes are by far the largest single crop grown for canning in California with about 6 million tons processed each year.

Although production acreages and canneries for the above-mentioned commodities are located throughout the state, they are concentrated in the Sacramento Valley, the San Joaquin Valley, the San Jose-Gilroy-Hollister-Salinas area, and the Imperial Valley.

A typical fruit or tomato cannery in California may process 75,000 to 100,000 tons per year of commodities. The largest canneries process up to 200,000 tons per year. The coincidence of the fruit and tomato harvests concentrate the operating periods of most fruit and tomato canneries between July and October. Normal processing campaigns for the major commodities overlap one another in the six-month

period of May through October.

The short canning season is not unique to California. Nationwide, about 75 percent of the total tonnage of fruits and vegetables are processed during the peak four months of harvesting activity. The capital investment in plant facilities is underused as a result of the relatively short season, and thus canners have always had difficulty in justifying new capital investments. The need for treatment systems during the last decade to treat waste waters for discharge or to pretreat them before transfer to municipal treatment plants has placed yet another demand on already limited budgets.

The wastewater treatment problem has been particularly troublesome to the canning industry because of the magnitude of the waste load. Compared with other industrial categories, the food processing industry has historically ranked near the top for conventional pollutants in the untreated or partially treated wastewater. When the first comprehensive industrial waste surveys were completed in the late 1960s, the food processing industry ranked fifth in total wastewater volume, third in total BOD loadings, and first in suspended solids (SS) loadings.

Fruit and vegetable processors discharge a much higher proportion of liquid wastes into public wastewater collection systems or to land treatment than do manufacturers as a whole. A nationwide survey conducted in the mid-1970s of 929 fruit and vegetable processing plants revealed that 55 percent of them discharged to municipal treatment plants, 33 percent used on-land treatment, and 12 percent discharged to bodies of water. Within California, which represented 15 percent of the surveyed facilities, 78 percent used municipal treatment plants, 16 percent discharged to land, and 6 percent discharged to bodies of water. Currently, no California fruit and vegetable processors discharge directly to

Fig. 1. Estimated charges for treatment of the wastewater from a typical cannery in San Jose, California.

Fig. 2. Locations of the cities considered in the survey of treatment charges.

bodies of water. Also, most of the newer seasonal canneries (built during the last 10 years), have located in rural areas where on-land wastewater treatment systems can be employed.

The canning industry is not particularly profitable. It has been reported that the entire U.S. canning industry typically has profits before taxes of 4 to 4.5 percent of total sales. Recently SRI International estimated that a typical fruit or tomato cannery in the San Jose area might earn $1 million per year in profits before taxes on $24 million in gross revenue; during poor years profits could be negative. Recent increases in the annual charges for wastewater treatment in the area could increase the wastewater treatment bill for an individual canner by $200,000 (**Fig. 1**). Such an increase in these charges significantly affects the profitability of a cannery and could be a major factor in deciding on relocating the operation or withdrawing from the business.

To determine how widely municipal wastewater treatment charges vary around the state, SRI contacted fifteen cities during early 1981 to survey the annual wastewater treatment charges for a typical cannery. Ten communities or sanitary districts (**Fig. 2**) provided information in a form suitable for comparison. The 10 cities have treatment plants which serve a total of 29 seasonal canneries or approximately one-third of the large seasonal canneries in the state.

Selected data on cannery wastewater volumes and loadings for some of the major commodities processed in California on a seasonal basis, and information obtained from specific canneries in San Jose, were used to specify the characteristics for a typical cannery. This hypothetical facility operates 75 days from July to October and processes an average of 1,000 tons of commodity per operating day.

Table 2
Expected Increases in Treatment Charges for FY '82-'83 Compared to FY '81-'82

City or Agency	Approximate Percent Increase in Rates for Next Fiscal Year
San Jose	45*
Stockton	29
EBMUD	21
Modesto	12
Sacramento	None

*Estimated by SRI to be a 53 percent increase for a typical cannery based on new rates established by the City of San Jose.

The estimated annual charges for a typical cannery discharging to various municipal sewer systems are shown in **Figure 3**. The results are surprising. There are very large differences in the total annual charges, as well as in the relative charges for flow, BOD and SS. There is approximately a sevenfold range in charges from a high of approximately $360,000 to a low of $50,000 [$3/1,000 gal treated to $0.40/1,000 gal treated]. In two instances (Gilroy and Hollister) the cities own and operate treatment systems used only for cannery wastes. As indicated in **Table 1**, these two plants have percolation ponds for disposal of the treatment plant effluent.

Treatment charges may vary from city to city depending on a number of factors:

- Total capacity of the plant.
- Effluent limitations imposed.
- Treatment processes used.
- Size of the seasonal load relative to the non-canning season load.
- Age of the treatment plant.
- Amount of federal and state grant funding received for construction of the facilities.
- Local labor and power costs.
- Availability and cost of land for low-cost treatment systems such as oxidation ponds and percolation ponds.
- Methods for processing and disposing of sludge.

These factors should explain most, but not all, of the absolute cost variation. Six cities charge separately for capital-related costs (bond interest and amortization) and O&M costs (**Fig. 3**). Capital-related charges represent 22 to 87 percent of the total annual charges or an average of slightly more than 50 percent of the total. The actual distributions of annual charges between flow, BOD and SS for the same six cities vary widely between various parameters (**Fig. 4**). The relative contributions of capital-related charges and O&M charges to each parameter are also evident in this figure.

Because of the small size of the sample and the wide variability in the cost distributions, the reader is cautioned not to consider the above average figures as statistically significant. Only two of the six cities (San Jose and Turlock) have cost distributions close to those of the calculated average.

The calculated annual charges shown are for FY 81-82. In most cases new rates became effective in California after July 1, 1982. **Table 2** summarizes the expected increases based primarily on information tabulated by the City of Stockton and provided by the California League of Food Processors. San Jose's rate increase reflects the significant costs of treatment plant modifications that are required to consistently meet very stringent effluent standards (**Fig. 1**). This rate increase is the second largest in two years.

About the Author

Mr. JENSEN. As requested, we made a limited survey of companies which led us to the conclusion that at least 30 percent of all manufacturing plants are integrated. The limited survey listed plants from 35 States, and there were as many as 6 classifications in a single plant. One company with more than 200 manufacturing plants has 62 percent integrated, and 13 percent not classified. Only 24 percent are single category plants.

In our October 30, 1983, testimony, we listed six principles to guide any program to deal with the nonpoint source pollution control problem. We were asked to summarize the part of our testimony dealing with point sources in similar fashion. The following are principles derived from that part of our testimony:

1. Since water is such a pervasive element of the whole production system, unwarranted costs imposed on the use of water adversely affect every member of our society.

2. It is the responsibility of the Congress to exercise the utmost wisdom in tailoring the Nation's laws so as to achieve national objectives in ways that avoid excessive costs.

3. The Clean Water Act provides a good framework for a sound national water pollution control program that meets such criteria. However, no law is perfect; there are some imperfections in the Clean Water Act which could be corrected by the Congress in the process of reauthorization.

4. We urgently plead with the committee to introduce some flexibility into the pretreatment requirement of the Clean Water Act.

5. The pretreatment section should also be amended to give consideration to the problems of integrated facilities with combined wastewater stream flows.

6. The Congress should provide the same incentives for innovative technology to indirect dischargers as it presently provides to direct dischargers.

7. Water quality standards should have some degree of flexibility. Designated uses should not be frozen as of any particular date.

8. Section 301(e) should be amended to make clear that the use of the bubble concept is authorized under the Clean Water Act.

9. BAT limitations should be required only where there is a significant toxics problem.

10. We support the extension of the Clean Water Act for 2 fiscal years; we question the wisdom of reauthorizing the act for 4 or 5 fiscal years.

In conclusion, we thank the subcommittee for the opportunity to appear again on the vitally important matter of reauthorizing the Clean Water Act.

WATERSHED IMPROVEMENT

Industry believes that natural watersheds are, in most cases, the most feasible units for conservation, development, and wise utilization of the Nation's renewable natural resources. Industry also believes that the watershed development concept should embrace the whole complex of major renewable natural resource problems. It should include upstream waterflow retardation, flood control, erosion prevention, protection of industrial and municipal water supplies, abatement of pollution, drainage and irrigation where neces-

20-955 O—84——201

sary, recreation, forest and range management—all directed toward the best practicable use and care of all lands.

To accomplish these objectives, industry recommends:

1. That the community watershed or small drainage area be recognized by all concerned as the natural unit through which renewable natural resources can be most efficiently and most satisfactorily developed.

2. That local authorities and leaders define watershed problems and determine needs by utilizing available basic information and that they obtain additional surveys where needed to define problems and develop adequate plans.

3. That local responsibility for action be assumed by watershed associations, soil conservation districts, or other voluntary local and State groups. Such responsibility would give emphasis to the rights of individuals and groups of individuals to participate in planning, developing, and maintaining their own community watershed programs, and provide a means of relating such local programs to those if interstate or basinwide scope.

4. That after suitable and adequate community watershed planning is done, local authorities should determine and establish the kind of local organization needed to direct the operational and maintenance programs, and make full coordinated use of existing public agencies, industry groups, associations and individuals in a position to contribute to its success.

5. That a federation of community watershed associations on a State or interstate—agreement or compact between two or more States—basis be encouraged to develop and carry out plans on larger stream basins where such unified approach is most feasible.

Industry believes that the foregoing principles should become the policy for a fully integrated approach to the conservation, development and utilization of renewable natural resources in the United States; and that with such approach, responsibility lies with those who derive the benefits therefrom.

Industry further recommends that, wherever necessary to permit the effectuation of these principles, the various States consider the adoption of suitable legislation recognizing watershed development as State or interstate—by agreement of compact between two or more States—responsibility.

We would be glad to answer any questions.

Mr. ROE. Thank you.

Mr. Stangeland.

Mr. STANGELAND. I have the one question I have been asking of all of the witnesses, Mr. Jensen, I think you have excellent testimony here.

Some of your recommendations I have gone through, and particularly your watershed testimony.

Mr. Ruckelshaus expressed concerns about programs for funding nonpoint source control, and how it might act as a disincentive to voluntary action—the theory of people getting in line and not doing anything until the money is there to help them out.

Would you give us the benefit of your perception of that problem, or do you disagree with that?

Mr. JENSEN. Mr. Cannon would be more able to answer that question.

Mr. CANNON. I would like to make some comments on that, since I studied Federal grant-in-aid programs for the construction of municipal sewage treatment plants, since its origin.

It is very interesting to note that at its incipiency, there was a claim that there had been a big surge in construction right after the grant program was instituted. However, an analysis showed that a great part of the plants whose construction had started was due to communities which had already floated bond issues to pay for 100 percent of the cost of their plants.

In other words, they had been going ahead before the grant program was even started. They got thrown in with the statistics and that made it look like there was a big bulge in the statistics.

As the program went on over the years, and I do not have the exact numbers, it started out with 20 percent Federal share, and went to around 30, then to 50 percent, and then around 75 percent.

I think it is only common sense that a community would not go ahead and float its bond issue to pay for its share of building the plant, unless they had some very clear assurances that they were going to get the Federal part of the money.

So, I have seen many observations, by many experts in the field, that the program eventually worked as a brake, rather than as an incentive. It slowed everything down. Everybody waited in line until they got their grant before they went ahead with building their plant.

Of course, there are many other criticisms that were addressed to the program, regarding the layer upon layer of bureaucratic requirements that the EPA laid down upon receiving grants, and it all had to be done in stages, and it was very detailed, and the whole process was very discouraging.

I would agree, very definitely, with Mr. Ruckelshaus, on the basis of the experience we have had so far, in the water field. Thus far, there is every indication that a Federal grant program would not be an incentive, that eventually it would turn out to be a drag, or a brake on the program.

Mr. ROE. Did you wish to say something, Mr. Gilde?

Mr. GILDE. We have had experience in two of our plants that bear a little bit on this issue. Both plants are a significant factor in small communities of about 25,000 population.

In both communities, planned new secondary treatment plants were built under Public Law 660, where they got approximately 60 percent grant funds. Both systems went onstream in the early 1970's. Both city sewage treatment systems had some secondary problems.

The thing that the grant program, I think, did in both cases, was to encourage them not to go ahead and spend some of their own money over a period of time to modify their systems to cope with the problems.

In the one case, the community, since 1974, has spent $1.7 million of Federal funds on various studies, of all different kinds of what should be done, and they have just recently gotten an additional Federal grant of money for designing a Federal facility. These are all studies that have gone on.

I believe if that kind of money had been spent over the past 12 years in making improvements, they would have pretty much overcome the problem.

Because the grant program seems to just drag on forever, there is disincentive to get in there and pitch in and do something yourself.

Mr. STANGELAND. I am pleased that you delineate the various different types of nonpoint source pollution, and recognize that each has to be addressed in a different manner in different parts of the country.

I think the preponderance of witnesses today have more or less said we have to handle this on a State and local basis, that a national overall program of guidelines is not going to work. I think you would all agree demonstration projects, federally funded, might be part of the educational process to show local people good guidelines as to what best management practices might turn out to be to solve the problem of nonpoint source pollution.

Would that be a fair statement?

Mr. JENSEN. That is true. There is an educational process here that I think is a very important role for the Federal Government, of taking knowledge gained from one area, or even discovering new knowledge, and applying it locally.

We think that a lot of the nonpoint sources can be improved with operating practices.

Back to the grants point, we really feel the emphasis should be on operating practices, and secondarily, on capital funding.

After experience, we feel that maybe a needs survey, or a better identification of the problem with respect to construction would then be developed, and then you could design your program for correcting the problem, after the problem has been designed, rather than developing grants, or a giveaway program for people just to hurry up and spend money.

Mr. STANGELAND. Thank you very much.

Mr. ROE. I, too, want to thank our witnesses for coming back, and also thank you for your extraordinary patience you have shown today. I think you have provided us the information we needed to round out the testimony which will be helpful in further pursuance of the bill.

I do not have any particular questions.

Thank you very much for being with us, and we appreciate it.

The subcommittee will now recess until tomorrow morning at 9:30.

[Whereupon, at 5:45 p.m., the subcommittee recessed, to reconvene at 9:30 a.m., Thursday, Nov. 17, 1983.].

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

THURSDAY, NOVEMBER 17, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to notice, at 9:25 a.m., in room 2167, Rayburn House Office Building, Hon. Robert Roe (chairman of the subcommittee) presiding.

Mr. ROE. Ladies and gentlemen, the Committee on Water Resources Development under the Water Resources Clean Water Act will now come to order again.

We are honored this morning to have with us the very distinguished Governors from the State of Virginia and the State of Maryland, longstanding strong supporters of the water resources development efforts of our Nation in their respective States and very long strong supporters of clean water in our Nation.

The chairman would recognize Congressman Roy Dyson, who has also been a champion and a leader in the efforts on the Chesapeake Bay and has been a strong supporter of clean water and water resources development in our Nation.

I am aware that Governor Robb has a very tight schedule, so Roy I think it would be well if we defer immediately to Governor Robb because he has to leave immediately, as you know.

Mr. DYSON. He has 2 minutes, Mr. Chairman.

Mr. ROE. All right. Governor, we want to welcome you. If you can do a 1-minute speech as well as we can, it is going to be fine.

We want to welcome you again back to our committee, knowing of your untiring efforts on behalf of your State and the Nation in our water resources development and clean water. So, without further ado, Governor, we welcome you to go ahead with your initial presentation.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

OPENING STATEMENT OF GOV. CHARLES S. ROBB

Mr. Chairman and members of the Subcommittee, I wish to lend my support to the prompt reauthorization of the Clean Water Act legislation before you and to endorse, in particular, the amendment proposed by Congressman Dyson to address the problems of the Chesapeake and Narragansett Bays.

This is important legislation which recognizes the Chesapeake Bay estuarine system as a unique and valuabl national resource and provides the states with

vital assistance in their ongoing efforts to improve the health of the Bay and its resources.

Over the last several years the states have exhibited a very high degree of cooperation in matters dealing with the Chesapeake Bay, and we intend to see that cooperative spirit continued and strengthened. We are currently working to create a mechanism which will continue the cooperative efforts of the EPA-Chesapeake Bay Management Committee and are in the final stages of preparation for the Chesapeake Bay Conference to be held December 7, 8 and 9 at George Mason University in Fairfax, Virginia.

I am currently in the process of refining a six million dollar set of Chesapeake Bay initiatives which will be a part of the 1984–86 budget that I will be submitting to our General Assembly this January. Those Chesapeake Bay initiatives cover a wide range of necessary Bay management activities and will represent a significant expansion in Virginia's commitment to improving and protecting the health of the Bay.

I am pleased to be here today in support of HR 2817 because it will:

Supplement state programs such as ours; encourage and support continuing and improved coordination among the states and federal agencies, especially EPA; and greatly increase our chances of improving and protecting the health of the Bay.

As I must leave at this point in order to fulfill a long-standing commitment I have asked Senator Joseph V. Gartlan of Fairfax, Virginia to present my complete testimony on the legislation before you. Senator Gartlan is the Virginia Co-chair of the Maryland-Virginia Chesapeake Bay Commission, the organization which oversees Bay matters for the two legislatures. Senator Gartlan is very experienced in Bay matters and is dedicated to the sound, long-range management of that resource.

Senator Gartlan.

Testimony of Gov. Charles S. Robb

Mr. Chairman and members of the Subcommittee, I wish to lend my support to the prompt reauthorization of the Clean Water Act legislation before you and to endorse, in particular, the amendment proposed by Congressman Dyson to address the problems of the Chesapeake and Narragansett Bays.

Though we in Virginia can well appreciate the very similar pollution problems and fishery declines occurring in Narragansett Bay, we are most concerned about Chesapeake Bay. The proposed amendment, specifically Section 117, would provide grants to states which substantially implement the management plan being developed by the Chesapeake Bay Program. These grants would provide an excellent mechanism for supporting coordinated management programs which would address problems studied through the research of the EPA-Chesapeake Bay Program.

The Chesapeake Bay represents more than a regional treasure. It is a significant national resource that cannot be allowed to further deteriorate. The Bay proper is approximately 200 miles long, ranges in width from approximately 4 miles to 30 miles, and encompasses more than 2,200 square miles of water surface. Although it lies totally within the Atlantic Coastal Plain, it draws water from an enormous 64,000 square mile drainage basin, involving six states and the District of Columbia. Thus, it is a massive interstate estuarine system.

As well as being the largest estuary in the continental United States, the Chesapeake is one of the country's most significant and valuable resources. Even after years of intensive use, it provides millions of pounds of seafood, it serves as a major hub for shipping and commerce, it supplies huge natural habitat for wildlife, and it offers a wide variety of recreational opportunities for residents and visitors. The value of the Chesapeake Bay's fishing catch exceeds $100 million annually. Not only is it the largest producer of blue crabs in the world, but it grows more than half of the total U.S. catch of soft-shelled clams and more than a quarter of the nation's annual oyster harvest. Being so productive, the Chesapeake Bay ranks third in the nation in overall fishery catch, exceeded only by the Atlantic and Pacific Oceans.

More the 90 million tons of cargo, with a value of nearly $24 billion, were shipped via the Chesapeake in 1979. Boasting two of the nation's five major Atlantic ports, the Hampton Roads complex and the Port of Baltimore, the Chesapeake Bay is a key commercial waterway. Nearly 50,000 commercial vessel trips are recorded annual from Chesapeake ports.

But it economic contributions are not its sole worth. One of the Chesapeake's most valuable functions is its role as a major wildlife habitat. Migratory birds and waterfowl use the Chesapeake for major feeding grounds and overwintering protection along the Atlantic Flyway. Approximately half a million Canadian geese and

more than 40,000 whistling swans use the Bay as a winter home. It is a nesting area for both the endangered bald eagle and osprey, supporting the largest U.S. population of osprey.

Though the Chesapeake Bay may sound like an environmental and economic paradise, it is not. This year, the Environmental Protection Agency, together with the states of Virginia, Maryland, and Pennsylvania conclude a seven-year study of the Bay. The Chesapeake Bay Program was established in accordance with a 1976 Congressional mandate to assess the health of the bay, determine factors adversely affecting it, and recommend management strategies for controlling pollutants. The results of this study have confirmed that the Bay system is undergoing major ecological changes. Some of the problems identified by EPA and the Chesapeake Bay Program are:

High concentrations of toxic materials are captured in the sediments of certain areas of the estuarine system; levels of nutrients in many areas of the Bay are increasing; the loss of dissolved oxygen in the deeper portions of the Bay is increasing; submerged aquatic vegetation is declining; certain anadromous fish harvests are declining; shellfish harvests are declining.

These are long-term problems which require long-range solutions. These solutions require a cooperative approach, not only among the users and beneficiaries of the Bay's wealth, but among federal, state and local governments as well.

The EPA-Chesapeake Bay Program is one of several management efforts involved with the Chesapeake Bay. Included in this program is a Management Committee composed of representatives from Pennsylvania, Maryland, Virginia, EPA and the public at large, while NOAA and the District of Columbia are in the process of becoming formal members. The accomplishments of the Program include a bay-wide data base, scientific research into key areas, identification of specific environmental problems, development of alternative management solutions, and recommendations for cooperative management.

In addition to the EPA-Chesapeake Bay Program, other efforts to better manage the Bay include:

Maryland-Virginia Chesapeake Bay (Legislative) Commission which has been central to the development and passage of fisheries legislation and functions as a forum for coordinated legislative initiatives on Chesapeake Bay management problems.

Maryland-Virginia Bi-State (Executive) Working Committee which has focused on fisheries management and water quality issues. This Committee has been a forum for cooperative efforts on Chesapeake Bay actions implemented by the executive branch of state government.

A Chesapeake Bay Conference sponsored by Maryland, Pennsylvania, Virginia, the District of Columbia and EPA is scheduled for December 1983. It is to be a bay-wide conference which will place before the public the findings and recommendations of the EPA-Chesapeake Bay Program and other relevant studies and lead to the development of a consensus on the needs and priorities of Bay management.

While Virginia is geographically at the receiving end of the Bay's drainage system, the state takes very seriously its responsibility to minimize its contribution of pollutants. As our population grows over the next decade, we will be faced with increasing pressures on the water quality and resources of the Bay and its tributaries. Managing the Bay will require the careful study of a wide range of management options and a constant and substantial investment of the Commonwealth's resources in their implementation.

Virginia has begun to develop such a coordinated state program for the management of its portion of the Chesapeake Bay. This initiative will serve as a permanent yet evolving guide, directing the state's involvement in all aspects of Bay management. It will gather together all relevant Virginia state management activities within one comprehensive policy framework and provide a mechanism for meeting new problems and opportunities as they arise. While the development of the overall state program is only now in process, its primary goals are to:

Protect and enhance the Chesapeake Bay's water quality and resources; accommodate growth and development in an environmentally sound manner; and cooperate with other states and the federal government in the management of the Chesapeake Bay and its resources.

At a minimum, I expect Virginia's program to begin to address critical problems in the James, Potomac, Elizabeth, York and Rappahannock Rivers and in the small coastal embayments. I intend to designate resources to correct both toxic and nutrient problems from both point and non-point sources. At this time Virginia is considering strategies to control such problems as agricultural run-off, overloading of sewage treatment plants, and contamination of shellfish beds. We are developing

more sophisticated monitoring programs and data management systems, as well as mounting a new effort to manage our fisheries resources.

I believe Virginia's strategy is entirely consistent with the intent of House Bill 2817. An "interstate management plan" is one which appropriately emphasizes the development of a consensus on problems and objectives, but which leaves the definition and design of specific management programs to the individual states. There will be some instances, particularly in the monitoring and data management areas, where a single program defined and managed in some cooperative manner may be the most effective approach. The general strategy, however, must continue to be one which builds upon the responsibilities and capabilities of the individual states of the Chesapeake Bay drainage basin. I say "builds upon" because the states alone cannot bear the burden of protecting and managing the natural resource that is the Chesapeake Bay.

In conclusion, I want to reiterate my strong support for the Clean Water Act and the Amendments of 1983. Since the Chesapeake Bay knows no absolute state boundaries, but rather shares its wealth and its beauty with the nation, the proposed new Section 117 reflects the equity of requiring others, including the federal government, to share in its protection so as to assure its future bounty.

Thank you for the opportunity to comment on this very important issue.

Mr. ROE. Please proceed.

TESTIMONY OF HON. CHARLES ROBB, GOVERNOR, COMMONWEALTH OF VIRGINIA; HON. HARRY HUGHES, GOVERNOR, STATE OF MARYLAND; HON. ROY DYSON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF MARYLAND; HON. BARBARA MIKULSKI, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF MARYLAND; AND, HON. JOE GARTLAN STATE SENATOR, STATE OF VIRGINIA

Governor ROBB. Thank you very much, Mr. Chairman. I am delighted to have an opportunity to appear again before you and the members of your subcommittee. And I appreciate your understanding of an extremely tight schedule. I have a prior commitment in Lexington, Va., that must begin at 11 o'clock this morning. It has been on the books for some 7 or 8 months, and I simply was unable to change it.

But I am very pleased to be here this morning with Governor Hughes and Congressman Dyson to support enthusiastically the reauthorization of the Clean Water Act and specifically to appear in support of Congressman Dyson's amendment to that particular act.

We appreciate very much the opportunity to say a few words, and in just a moment I am going to introduce State Senator Joe Gartlan, who is the chairman of the Maryland-Virginia Chesapeake Bay Commission, who will provide the remarks that I would like to have been able to present in their entirety myself, and then perhaps a few words of his own, given his long and distinguished career in this particular field, among others.

But I just would like to underscore, if I may, personally my own commitment, the commitment of Virginia, to the entire Chesapeake Bay program in all of its facets with which we are dealing. As you know, both States have been working very cooperatively of late, and I give a great deal of the credit for that cooperative spirit to Governor Hughes and the State of Maryland.

We have another ally in the Commonwealth of Pennsylvania and Governor Thornburgh, and with the Environmental Protection Agency, and Mr. Ruckelshaus, as well as the District of Columbia in some of the things that we are doing.

We are proceeding on a number of initiatives that will lead up to a Chesapeake Bay conference. It will be held on December 7, 8, and 9 at George Mason University in Fairfax, Va., cosponsored by three States, the District of Columbia, and the Environmental Protection Agency.

I would simply say at this point, since Senator Gartlan is going to provide the testimony on behalf of the Commonwealth of Virginia, that we stand foursquare behind that commitment. We see real value in the amendment that Congressman Dyson has proposed. I regret that I have been informed just in the last few minutes that there was a meeting last night. It may be that the Environmental Protection Agency is not going to be able to support the amendment. I think it is important, given the enormous resources that have already been provided by the Federal Government and by the States to saving this critically important estuary that the Chesapeake Bay represents for all of us.

Again, the statistics are in the testimony, so I will not reiterate on that point. I guess I will simply thank my colleague and a real leader in the effort to save the Chesapeake Bay, Gov. Harry Hughes, and now introduce Senator Joe Gartland, who is the chairman of the Maryland-Virginia Chesapeake Bay Commission, who has worked long and hard on bay and environmental matters, representing the State in many different capacities, and in fact was supposed to be at the same conference that I am addressing in Lexington, but very kindly gave up that opportunity to come and present the testimony on behalf of the Commonwealth of Virginia.

Mr. Chairman, I would like at this time, if I may, to introduce the chairman of the Maryland-Virginia Chesapeake Bay Commission, State Senator Joe Gartlan.

Mr. ROE. Senator Gartlan.

Thank you very much, Governor, for being with us this morning. We recognize your schedule problem.

We have with us Senator Gartlan, who is chairman of the Commission, Chesapeake Bay Commission; also Barbara Mikulski has joined us from the great State of Maryland.

Now, if you would go ahead. Now, suppose we now get organized and request, Senator, if you will, a little more formality. We do not have usually so many distinguished guests at one time at our hearing.

And suppose the chairman defers to our distinguished colleague and really a champion of this program, Senator—Senator—I just elevated you—Congressman Roy Dyson.

Mr. DYSON. I will take the elevation.

Mr. ROE. I should not say that. On the House side we are not so sure we agree with that. No reflection, though.

Mr. DYSON. Actually, there was a time, as you recall, we were paid more than they were, and I think that was more than justified.

I am encouraged this morning, Mr. Chairman, with the visit of one of my colleagues from Maryland, Congresswoman Barbara Mikulski. She is from, as you know, the Baltimore region of the Chesapeake Bay, a very critical area in this whole cleanup process.

I also want to thank you and the distinguished members of the subcommittee for the careful attention that you have paid during

Clean Water Act hearings to the Chesapeake Bay and the courtesy you have shown in allowing me to appear before you on two previous occasions concerning my Chesapeake Bay amendment.

The bill, which is before the subcommittee concerning the Chesapeake Bay, H.R. 2817, which I introduced earlier this year, is the most important vehicle to make a major effort possible to restore the water quality of the estuary. Without its inclusion in the reauthorization of the Clean Water Act, it will not be possible for the States of Virginia, Pennsylvania, and Maryland to implement an interstate management plan that will seek to remove pollution from the bay's waters.

I am pleased to report to you that the growing consensus to refurbish the bay continues. Last month, I took a group of my House colleagues out on the Chesapeake to acquaint them firsthand with its value and its needs. Since those Members joined me, the number of cosponsors to my legislation has nearly doubled.

Currently, there are 62 cosponsors, representing virtually every part of the country. Eight of them are members of this subcommittee. This level of support in Congress for the Chesapeake Bay clearly shows that it is perceived as a national treasure.

The presence of the Governors of Virginia and Maryland here today symbolizes how my amendment is able to unite different States, and different interests to work together for a common goal. It provides the needed Federal incentive to help agricultural interest save fertilizer that would otherwise flow into the Chesapeake Bay.

It revitalizes an estuary that is home to countless species of aquatic life which thousands of people rely on for their livelihood. To illustrate this, let me share some figures with you.

One of the University of Maryland's top experts on nonpoint source pollution estimates the market value of the fertilizer lost annually through runoff into the bay is as much as $54 million. The annual aquatic biological harvest is worth about $750 million a year to the regional economy.

Adoption of my legislation will enable farmers to more easily control runoff, helping them to save money and significantly improve their soil productivity. At the same time it will set the tone for restoring the bay's water quality, allowing it to become once again a place where aquatic life can live and grow without the threat of disease or extinction from pollution.

My legislation is not only an attempt to restore a body of water to its once pristine condition. It is, just as importantly, designed to protect and preserve a sector of the Nation's economy that has gone previously unprotected by a Federal statute.

My legislation sets a definitive course for the future of the Chesapeake Bay by mandating a call of action among the States in the Chesapeake Bay region. While it does not force the States to implement specific practices, it is an action plan to stop and reverse generations of neglect on the Chesapeake Bay.

In other words, we are not telling the States what to do, but unless we have a Federal commitment to the Chesapeake Bay's cleanup effort, any effort by the States will fall far short of our ultimate goal. The States simply do not have the resources to go this

thing alone. They need our help, Mr. Chairman, they need mine and they need yours.

Three of your colleagues on your subcommittee have seen the problems the bay faces. Those problems will not respond to the band-aid approach.

Just to give you an idea of how serious the bay's problems have become, U.S. News & World Report recently quoted scientists as saying that the bed of one 65-mile stretch of the bay bottom dies each summer as a result of pollution.

People throughout the Nation are watching how we deal with the Chesapeake Bay's problems. The efforts embodied in this legislation could serve as a realistic model for solving pollution problems throughout the country.

Those 62 colleagues of ours in the House are proof that the bay has become more than a local concern. It has become a prototype for cleaning up the Nation's waterways.

I want to thank Governor Robb, Governor Thornburgh, and Governor Hughes for their support of my bill. I regret that Governor Thornburgh could not join us today, but I am certainly delighted that Governors Robb and Hughes have taken time from their schedules to be here. They are with us to indicate that the States in the Chesapeake Bay region are willing to assure Congress of their interest in the bay's restoration process.

They are here to ask for our help and once again to pledge their cooperation.

Mr. Chairman, it is always an honor to appear before you and the subcommittee. I applaud you as an advocate of improving the Nation's water quality and pledge my support for those efforts. I have been repeatedly encouraged by your interest in the Chesapeake Bay and I am delighted that you will be joining me for one of my congressional tours on the bay. I hope that it will deepen your already rich appreciation of it.

I also promise you that you will taste some of the finest seafood in the world, taken right from the waters of Maryland's First Congressional District.

I welcome my friends from the Chesapeake Bay region testifying before the House this morning and assure them of the subcommittee's interest in working with me to begin a new era for the Chesapeake Bay. I again thank you, Mr. Chairman.

Mr. ROE. Thank you very much for your splendid introduction. And the Chair would now defer to our distinguished Representative, another distinguished Representative from Maryland, the Honorable Barbara Mikulski, who, too, has been a great leader for water resources development in our Nation and particular the environment and clean water that is critical to our country. Barbara?

Ms. MIKULSKI. Thank you very much, Mr. Chairman. And I thank you for holding these hearings today on this most important legislation.

I represent the great Port of Baltimore, which through your efforts we hope to make a world-class port. And we—I know the Governor would join me and Congressman Dyson—we would like to thank you for your leadership in expediting dredging legislation through the House of Representatives.

I am here to lend my support to the legislation under consideration. By representing the great Harbor and Port of Baltimore, I represent those areas where there are point specific and point identified areas of pollution on which we are taking steps and in which we need help.

I know that the Governor will be testifying not only about specific areas of pollution, but also those terrible problems with nonpoint pollution.

He will be offering you many concrete suggestions on how we could use both the Federal legislative framework and Federal financial resources to help clean up the Chesapeake Bay. This is not regional legislation, Congressman Roe, because the Chesapeake Bay really belongs to the country. It is a leading estuary and I know that our Governor will amplify that.

I just want to bring to your attention some facts about our Governor, which I know he would be too modest to say about himself. I would hope that you would pay very keen attention to what the Governor says because he has a distinguished career as being a State senator in the Eastern Shore of Maryland where he has intimate and familiar knowledge with the agricultural and bay issues of that area to being the Secretary of Transportation, in which he made wise use of funds provided by this Congress.

And now as Governor I can tell you he has made very thrifty use of the resources that we provided him under the gasoline tax. And I know that whatever we give him to spend and whatever legislative framework we give him to use, he will use it well and in a way that we look forward to in that partnership we talk about between the Federal Government and State government.

All Federal legislation that calls for partnerships is only as good as the Governor that implements them. And this is one good Governor that will implement them. He has demonstrated that not only by the wise use of funds, but also in the leadership that he has taken on the Chesapeake Bay. I am going to let him tell you about the Chesapeake Bay. But I wanted to tell you about him.

This is not some guy from some think tank who is going to come in with some grandiose plan that will bust the Federal budget; this is a Governor who knows that public investment will generate private-sector jobs and wants to work in partnership with us.

So I know that you will be delighted to hear from him.

Mr. ROE. A splendid presentation; I just hope, Barbara, that if you are not going to be doing anything early spring next year, God, I could use a campaign manager like you. [Laughter.]

The Chair now defers to our distinguished ranking minority member of our committee, the Honorable Arlan Stangeland from Minnesota for a formal welcome.

Mr. STANGELAND. I just wanted to welcome our colleagues, Mr. Dyson, Ms. Mikulski, and also Governor Hughes and Senator Gartlan, and, Senator, express my regrets to the Governor for not being able to be here except the last couple of minutes of his discussion.

I had scheduled a meeting that was important to me at 9 and was not aware that there was going to be a time conflict and a problem. But I express my regrets that I was not able to be here. I look forward to hearing his testimony. But, Governor Hughes, all welcome.

With those glowing accolades, you can go home and rest on your laurels now. But we do look forward to your testimony. I am not all that familiar with the Chesapeake Bay, but I have had occasion to go over there and try my hand at hunting some ducks and some geese, and I can well understand and appreciate the value of the bay to the whole area and to the entire United States.

And so we look forward to your testimony today and we look forward to working with Representatives Dyson and Mikulski in doing what we can to help clean up the bay so it continues to be the tremendous resource that it is.

Mr. ROE. I want to thank the gentleman from Minnesota. The Chair would now welcome and recognize Senator Gartlan, who is to round out the testimony of Governor Robb and is also chairman, as I understand it, of the Chesapeake Bay Commission. So, Senator, we also welcome you to our committee to round out that testimony. So if you would go ahead and proceed, we would appreciate it.

Mr. GARTLAN. Thank you, Mr. Chairman, and members of the subcommittee. I will be reading from the statement prepared for Governor Robb and which will be submitted in its original form to the committee. I trust you will tolerate some minor modifications to remove the pronoun, "I," which as a legislator I feel a little uncomfortable with, speaking for the executive branch, and I trust you will understand that.

Mr. ROE. In the spirit of cooperation in this great federalism and State relationship that Barbara and Roy spoke to, we can use—we'll say we.

Mr. GARTLAN. Thank you, sir.

Though we in Virginia can well appreciate the very similar pollution problems and fishery declines which have occurred in Narragansett Bay, which is one of the objects of this legislation, our primary responsibility, and therefore our principal concern is with the Chesapeake Bay.

The proposed amendments, specifically section 117, would provide grants to States, which substantially implement the management plan being developed by the Chesapeake Bay program. These grants would provide an excellent mechanism for supporting coordinated management programs which would address problems studied through the research of the EPA-Chesapeake Bay program.

The Chesapeake Bay represents more than a regional treasure. It is a significant national resource that cannot be allowed to further deteriorate. The bay proper is approximately 200 miles long, ranges in width from approximately 4 miles to 30 miles and encompasses more than 2,200 square miles of water surface.

Although it lies totally within the Atlantic coastal plain, it draws water from an enormous 64,000-square-mile drainage basin involving six States and the District of Columbia. Thus, it is a massive, interstate estuarine system.

As well as being the largest estuary in the continental United States, the Chesapeake is one of the country' most significant and valuable resources. Even after years of intensive use, it provides millions of pounds of seafood, serves as a major hub for shipping and commerce, supplies a huge natural habitat for wildlife, and offers a wide variety of recreational opportunities for residents and visitors.

The value of the Chesapeake Bay's fishing catch exceeds $100 million annually. Not only is it the largest producer of blue crabs in the world, but it grows more than half of the total U.S. catch of soft shell clams and more than a quarter of the Nation's annual oyster harvest.

Being so productive, the Chesapeake Bay ranks third in the Nation in overall fishery catch, exceeded only by the Atlantic and Pacific Oceans.

More than 90 million tons of cargo with a value of nearly $24 billion were shipped via the Chesapeake in 1979. Boasting two of the Nation's five major Atlantic ports, the Hampton Rhodes complex and the Port of Baltimore, the Chesapeake Bay is a commercial—a key commercial waterway on which nearly 50,000 commercial vessel trips are recorded annually.

But its economic contributions are not its sole worth. One of the Chesapeake's most valuable functions is its role as a major wildlife habitat. Migratory birds and waterfoul, when not being hunted by Congressmen, use the Chesapeake for major feeding grounds and overwintering protection along the Atlantic flyway.

Approximately half a million Canadian geese and more than 40,000 whistling swans use the bay as a winter home. It is a nesting area for both the endangered bald eagle and osprey, supporting the largest U.S. population of osprey.

Though the Chesapeake Bay may sound like an environmental and economic paradise it is not. This year the Environmental Protection Agency together with the States of Virginia, Maryland, and Pennsylvania conclude a 7 year study of the bay. The Chesapeake Bay program was established in accordance with a 1976 congressional mandate to assess the health of the bay, determine factors adversely affecting it, and recommend management strategies for controlling pollutants. The results of this study have confirmed that the bay system is undergoing major ecological changes. Some of the problems identified by EPA and the Chesapeake Bay program are high concentrations of toxic materials are captured in the sediments of certain areas of the estuarine system; levels of nutrients in many areas of the bay are increasing; the loss of dissolved oxygen in the deeper portions of the bay is increasing; submerged aquatic vegetation is declining; certain anadromous fish harvests are declining; shellfish are declining.

These are long-term problems which require long-range solutions. The solutions require a cooperative approach, not only among the users and beneficiaries of the bay's wealth, but among Federal, State, and local governments as well.

The EPA Chesapeake Bay program is one of several management efforts involved with the Chesapeake Bay. Included in this program is a management committee composed of representatives from Pennsylvania, Maryland, Virginia, EPA, and the public at large, while NOAA and the District of Columbia are in the process of becoming formal members.

The accomplishments of the program include a baywide data base, scientific research into key areas, identification of specific environmental problems, development of alternative management solutions and recommendations for cooperative management.

While Virginia is geographically at the receiving end of the bay's drainage system, the States take very seriously its responsibility to minimize its contribution of pollutants. As our population grows over the next decade, we will be faced with increasing pressures on the water quality and resources of the bay and its tributaries. Managing the bay will require the careful study of a wide range of management options and a constant and substantial investment of Virginia's resources in their implementation.

Virginia has begun to develop such a coordinated State program for the management of its portion of the Chesapeake Bay. This initiative will serve as a permanent, yet evolving, guide directing the State's involvement in all aspects of bay management. It will gather together all relevant Virginia State management activities within one comprehensive policy framework and provide a mechanism for meeting new problems and opportunities as they arise. While the development of the overall State program is only now in process, its primary goals are to protect and enhance the bay's water quality and resources, accommodate growth and development in an environmentally sound manner, cooperate with other States and the Federal Government in the management of the Chesapeake Bay and its resources.

At a minimum, we expect Virgnia's program to begin to address critical problems in the James, Potomac, Elizabeth, York, and Rappahannock Rivers and in the small coastal embayments. We intend to designate resources to correct both toxic and nutrient problems from both point and nonpoint sources.

At this time Virginia is considering strategies to control such problems as agricultural runoff, overloading of sewage treatment plants, and contamination of shellfish beds. We are developing more sophisticated monitoring programs and data management systems as well as mounting a new effort to manage our fisheries resources.

We believe Virginia's strategy is entirely consistent with the intent of House bill 2817. An interstate management plan is one which appropriately emphasizes the development of a consensus on problems and objectives, but which leaves the definition and design of specific management programs to the individual States.

There will be some instances, particularly in the monitoring and data management areas where a single program defined and managed in some cooperative manner may be the most effective approach. The general strategy, however, must continue to be one which builds upon the responsibilities and capabilities of the individual States of the Chesapeake drainage basin.

We say builds upon because the States alone cannot bear the burden of protecting and managing the natural resource that is the Chesapeake Bay.

In conclusion, we want to reiterate our strong support for the Clean Water Act and the amendments of 1983. Since the Chesapeake Bay knows no absolute State boundary, but rather shares its wealth and its beauty with the Nation, the proposed new section 117 reflects the equity of requiring others, including the Federal Government, to share in its protection so as to assure its future bounty.

Thank you for this opportunity to comment. It is very important.

Mr. ROE. I want to thank you very much, Senator Gartlan, for a comprehensive, concise statement on the Chesapeake Bay matter.

And now I am honored to defer to the distinguished Governor of Maryland, who again has been a leader, not only in his State but throughout this Nation, in water resources development, management, and particularly now in the water quality of our environment.

So, Governor Hughes, I want to welcome you again to the committee, and you can go ahead with your testimony.

Governor HUGHES. Thank you, Mr. Chairman. I do have written testimony that will be submitted, which I am not going to read.

Mr. ROE. Your statement will appear in full in the record.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF GOV. HARRY HUGHES

I am pleased to be here today to discuss with you my views on the Clean Water Act reauthorization, especially as it concerns the Chesapeake Bay. In addition, I will discuss HR 2817 sponsored by Representative Dyson, which would add a new section to the Clean Water Act authorizing the implementation of the EPA Chesapeake Bay Program. I consider this legislation to be the most significant Clean Water Act issue from Maryland's standpoint.

At the outset, I want you to know that Maryland supports a strong Clean Water Act. We have found the framework of the 1972 Act with its 1977 and 1981 modifications to be basically sound and workable. Under the existing Clean Water Act, Maryland, in concert with EPA, has made significant progress toward cleaner water. To illustrate, we have seen significant improvements in the upper Potomac estuary, in portions of the Patapsco River in Baltimore, and we reduced the numbers of acres of shellfish waters that were closed to shellfish harvesting in the early 1970s from around 28,000 acres to 5,000.

I would urge the House Public Works Water Resources Subcommittee to continue to uphold the strength of the current Clean Water Act. Attainment of its objective—the maintenance and protection of the physical, chemical and biological integrity of the Nation's waters—remains paramount. To ensure continued uniform progress toward this objective, national federal minimum standards must be maintained.

Accordingly, I would hope that following the Subcommittee's review of Clean Water Act issues, you will conclude that major changes to the Act are not required and thus reauthorize the Clean Water Act with a modest package of amendments aimed at improving it.

Two proposed changes to the Clean Water Act which I fully endorse and urge the Subcommittee to support, are contained in HR 2817, introduced by Representative Dyson and HR 4037, introduced by Representative Oberstar.

HR 2817 authorizes a new section to the Clean Water Act entitled "Chesapeake and Narragansett Bays." This legislation would add a valuable concept to the Clean Water Act by giving special recognition to these waters of national significance. HR 4037 also authorizes a new section to the Act entitled "Non-point Source Control Implementation Plans." This legislation would direct the states to increase their efforts to address the very significant problem of non-point source pollution. These two measures would facilitate and greatly assist the Chesapeake Bay clean-up effort to be undertaken by the states of Maryland, Virginia, Pennsylvania and the District of Columbia in partnership with the federal government.

Before discussing the specific provisions of this legislation, I will provide you with a few background statistics on the importance of the Chesapeake Bay. Then, I will discuss the critical problems facing the Bay which have been extensively documented by the EPA's Chesapeake Bay Program and what we must do to take action.

The Chesapeake Bay is one of our most cherished and valuable national treasures. It is the largest and most productive estuary in the contiguous United States. The drainage area for the Chesapeake Bay is nearly 64,000 square miles in size, and includes parts of six states and the District of Columbia. Its primary tributaries, the Susquehanna, the Potomac, and the James, are major river systems in their own right.

The Chesapeake Bay region is home to more than eight million people, including the greater metropolitan areas of Baltimore, Washington, Richmond, and Norfolk. The Bay is integral to the history of this region, its economy, its culture, and its lifestyle. We all share the riches of the "Land of Pleasant Living."

Marylanders, along with our neighbors in Virginia, have always considered the Chesapeake Bay a natural resource of great value. The seafood industry, waterborne commerce, and water-oriented industry have dominated Maryland's economy. The Chesapeake is important not only to Maryland and Virginia but to the nation as a whole. The Bay's fishing production is exceeded only by the Atlantic and Pacific Oceans. The average annual oyster catch over the last fifty years has been approximately 27 million pounds per year, more than a quarter of the nation's total yearly oyster catch. The Chesapeake is the largest producer of blue crabs in the world, averaging about 55 million pounds annually. More than half the total U.S. catch of both soft-shelled clams and blue crabs comes from the Chesapeake. The dockside value of they Bay's fishing catch exceeds $100 million per year, including both shellfish and a thriving finfish industry.

The Chesapeake is also a key commercial waterway; two of the five major U.S. North Atlantic ports are located on the Bay. The Hamption Roads Complex, which includes Portsmouth, Norfolk, Hampton and Newsport News, dominates the mouth of the Bay. At the northern end, the Port of Baltimore handles nearly 24 percent of the export commerce leaving the U.S. North Atlantic ports. More than 90 million tons of cargo, with a value of nearly $24 billion, were shipped via the Chesapeake during 1979.

Both Baltimore and Hampton Roads are situated near the coal producing regions of Appalachia, making them essential to promoting the use of U.S. coal abroad. The Hampton Roads Complex already leads the nation in exporting coal and lignite.

Perhaps one of the Chesapeake's most valuable functions is its role as a major wildlife habitat. Migratory birds and waterfowl use the Bay as a major stop along the Atlantic Flyway, finding food and shelter in the numerous coves and marshes. The Chesapeake is also winter home for approximately half a million Canadian geese and more than 40,000 whistling swans. It is a nesting area for the osprey, whose largest U.S. population is found in the Bay region, and the endangered bald eagle.

The Chesapeake's tributaries provide spawning and nursery sites for several important species of saltwater fish, such as the white perch, striped bass and shad. It is estimated that approximately 85 percent of the striped bass along the Atlantic Coast spawn in the Chesapeake Bay waters. During the warmer months, several marine species including bluefish, weakfish, croaker, menhaden and spot enter the Bay to feed on its rich food supply.

The hospitable climate, lush vegetation and natural beauty of the Chesapeake have made it an increasingly popular recreation area. Boating, fishing, swimming, hunting and camping are the major attractions. Both power and sail boating have grown dramatically. More than 120,000 pleasure craft are registered in the State of Maryland alone. The annual sport fish catch in the Chesapeake Bay is estimated to be 28 million pounds.

Given these impressive statistics on the Chesapeake Bay, it is clear why we in Maryland are so anxious to protect our natural treasure, and why we have been closely involved with EPA's Chesapeake Bay Program.

The EPA Chesapeake Bay Study concluded this year. Nearly seven years and $30 million have been spent studying water quality and living resource problems in the Bay. It has been a long and expensive study, but we believe this effort has significantly advanced our understanding of the natural processes in the Bay and the effect of human activities on them.

Before reviewing the specific research findings, I would like to comment on the structure of the EPA Chesapeake Bay Program. Initially, it was structured as a research program with little or no emphasis on management implications. Then, in the early stages of the program, EPA, in consultation with the three primary states in the Chesapeake basin, agreed to share its management responsibility with the three states and, thus, established the State/EPA Management Committee to set program directions and make policy decisions.

Maryland was uniquely represented on the Management Committee by two members—the Director of the Tidewater Administration in the Department of Natural Resources, who is responsible for tidal fisheries, and the Assistant Secretary for Environmental Programs in the Department of Health and Mental Hygiene, who is responsible for water quality. In large part because of the influence of the State members of the Management Committee, the Chesapeake Bay Program became a management-oriented study rather than strictly a research program. In addition, by

their intensive participation during the Chesapeake Bay Study, the states and EPA have a research product that reflects management needs, and have an institutional mechanism already in place which will enable implementation activities to proceed readily. I would recommend that this management orientation concept of the EPA Chesapeake Bay Program is a useful model for future studies of regional ecosystems.

Turning to the EPA research findings, the Chesapeake Bay Program has learned, or confirmed, some very critical facts about the health of the Chesapeake Bay.

The Bay grasses are at their lowest level ever in the Bay. The populations of fresh water spawning fish, including the American shad and striped bass, are at historically low levels, while populations of the ocean spawners such as bluefish and menhaden, are the predominant species. Reproduction of the sensitive shellfish, the American oyster, also seems to be declining.

The upper and mid-Bay and many of the Bay's tributaries are either severely or moderately nutrient enriched compared to what they were historically. Nutrient levels have increased dramatically over the past ten years in these waters, making them much more susceptible to algal blooms, and resulting in low levels of oxygen and light. The nutrients causing enrichment problems are phosphorus and nitrogen, which come from sewage treatment plants, industrial discharges, urban stormwater, and runoff from agricultural land.

The Chesapeake Bay Program has documented a statistical correlation between high nutrient concentrations in various segments of the Bay and declines in reproduction of sensitive finfish and shellfish species, such as striped bass and oysters, as well as declines of submerged aquatic vegetation. Apparently the level of nutrients in the Bay has exceeded the point where they can increase productivity, and instead, are now beginning to inhibit the survival of sensitive species.

Of equal concern is the finding of the Chesapeake Bay Program that the sediments in some portions of the Bay show high concentrations of heavy metals and toxic organic compounds. The highest metal and organic concentrations in sediments occur in the northern Bay, in Baltimore Harbor and the Elizabeth River. In some areas, concentrations of toxic metals and organics in the sediments are high enough to cause mortality in test animals subjected to samples of these sediments; however, insufficient information exists to date as to whether these sediments are posing a current threat to higher living resources in the Bay. Nonetheless, there is a clear correlation between diversity of species living in the sediments and the level of toxic materials present.

The most dramatic finding of the Chesapeake Bay Program is the fact that the circulation patterns of the Bay make it a sink for pollutants, including sediments, nutrients, and toxics. We used to believe that materials carried into the Bay by streams and rivers were eventually flushed out to the ocean. Now we know that the suspended materials tend to settle out and accumulate in the sediments. What goes into the Bay stays there. The entire 64,000 square mile drainage basin is part of the living ecosystem of the Chesapeake Bay. Any activity affecting the land and water in any part of the watershed may ultimately have an effect on the living resources of the Bay.

Thus, the evidence of the Bay Study presents the probability that the evolution of the Bay ecosystem is at a critical point. Data suggest that in all parts of the Bay, the ecosystem is on the "down" side of a hypothetical curve of ecosystem change. That is, productivity has peaked and is now declining.

This past October, the EPA published its final management recommendations on alternative actions to reverse the trends of Chesapeake Bay resource productivity and water quality decline in the Bay. The states are currently reviewing these management alternatives and working with EPA to develop a regional plan of corrective strategies in the coming months.

Currently, the states and EPA are undertaking the necessary steps to ensure a smooth transition of the Chesapeake Bay Program from a federal research program to a federal/state management program. This transitional period was made possible by the Fiscal Year 1983 and Fiscal Year 1984 Congressional appropriations of $900,000 and $4.25 million respectively. The $900,000 appropriation and the $1.25 million of the Fiscal Year 1984 appropriation plus State appropriations, including $725,000 from the State of Maryland, will support future joint federal/state monitoring of the Bay, operation and maintenance of the computer system and water quality models. The massive computer data base on the Bay's water quality and fisheries comprises a comprehensive baseline of information about the current state of the Bay and trends. Future monitoring data will be added to this system. The mathematical water quality and circulation models enable prediction of the effects of

changes in various pollution sources and assessment of the effects of alternative management options.

These valuable tools developed by the Chesapeake Bay Program will allow the states to monitor the pulse of the Bay, to determine whether our actions are improving conditions.

Let me now turn to the implementation strategies we have taken and our plans for future actions. We have already begun a number of efforts in Maryland to address the nutrient enrichment problems in the upper Bay and its tributaries. For example, Maryland has adopted a regulatory strategy to limit phosphorous from sewage treatment plants discharging to the upper portion of the Bay where nutrient enrichment problems are most severe. Specifically, we are requiring phosphorous removal at a level of two miligrams per liter at all publicly-owned sewage treatment plants (POTWs) north of the Patapsco River with a discharge greater than .5 million gallons per day (mgd). This requirement also applies to larger POTWs between the Patapsco River and the Bay Bridge—that is to say which discharge greater than 10 mgd.

In response to the findings and recommendations of the EPA Bay Program, we intend to require phosphorous removal at several additional POTWs which have significant discharges but are either smaller than 10 mgd or located south of the Bay Bridge and are discharging to the Bay.

With respect to non-point source pollution, we have accelerated our efforts to control agricultural runoff. In 1982 Maryland established a $5 million grant program to assist farmers in the installation of best management practices to reduce nutrient runoff from farmland. The program which became operational this past July, provides assistance to farmers—up to $5,000 per farm—in the form of cost-share grants for the implementation of agricultural best management practices. This program has been well accepted by the farm community with close to 300 applications for assistance currently being processed.

This new program by itself, however, will not resolve all of our agricultural pollution problems. We estimate that at least $90 million will be needed over the next ten years so that best management practices can be installed on all Maryland farms. It is important to note that this amount includes the share which would be paid by farmers. While we are confident Maryland farmers will participate in our program and match our public funds, I do wnat to stress that unless considerable cost-share assistance is provided to assist landowners with implementation of best management practices, little progress in addressing agricultural non-point problems will be realized. Some of these best management practices are costly to install and provide no immediate net return to the farmers. For these reasons, we intend to significantly increase our efforts in this area by providing additional resources for technical assistance at the soil conservation district level, cost-share assistance, and research on nutrient control. Undoubtedly, additional federal assistance from both USDA and the EPA are essential to address all of the agricultural pollution in the Bay region.

We also are developing initiatives to address sedimentation and non-point source pollution from residential suburban and urban areas. For the past ten years, Maryland has had sediment and erosion control plans prepared by local developers and approved by local soil conservation districts. Enforcement of plan compliance in the field by local governments has had mixed results. We intend to introduce State legislation which will transfer enforcement authority for erosion and sediment plan compliance from local government to the Department of Natural Resources with provisions for redelegation to local governments based on a demonstration of capability and performance.

In addition, we are considering providing grants to local governments to ensure adequate implementation of a new State program for stormwater management. Retrofitting existing urban areas to reduce sediments, nutrients and toxics into the Bay is also of great concern. Since state-of-the-art best management practice techniques have not been fully developed, we intend to establish demonstration programs for existing State facilities and for local governments in urban areas.

Finally, we also intend to look closely at the role that land use planning and zoning can play in preventing harmful development in sensitive critical Bay areas.

Before leaving the subject of non-point source pollution, let me stress that federal assistance is essential. The contribution of non-point source pollution to the Bay's decline is considerable and extensively documented thanks to the EPA Study. The magnitude of the problem in terms of costs for controlling these pollutants in the three primary states is tremendous. The complexity of the problem stemming from the diverse causes, the diffuse sources and the magnitude of the need, presents a great challenge to us. Perhaps that explains why historically, federal and State ef-

forts in this area have been minimal. The level of all federal expenditures in Maryland for non-point source controls, including actual construction of management facilities in the 1973 to 1983 decade, was $48 million, which is 4.4 percent of the amount of federal funds received in Maryland for construction of municipal sewage treatment works (approximately $1.1 billion). If we are to reverse the decline of the Chesapeake Bay, we cannot allow this trend to persist. As described above, I intend to commit significant State resources towards controlling non-point source pollution. Both HR 2817 and HR 4037 will greatly assist this task in helping us to maximize our efforts, and will assist similar efforts in Virginia and Pennsylvania.

As far as control of toxic pollutants entering the Bay is concerned, we believe that a strong pretreatment program is the keystone of toxic pollution control. I understand there is a desire expressed by some groups for Clean Water Act changes that would allow communities to develop alternative pretreatment programs which would have to demonstrate equivalence with the forthcoming federal standards. I would urge the Committee to reject this argument. In my view, waivers of national categorical standards for pretreatment will likely result in delay and uncertainty thereby impeding EPA's ability to assure an adequate and consistent level of toxics removal.

Maryland intends to enhance our pretreatment efforts so that there will be adequate State oversight and control of industrial pollutants discharged to municipal systems. In addition, we are proposing to increase our enforcement efforts and to establish new programs providing for the biomonitoring of industrial and municipal discharges. Analyzing these effluents to determine their toxicity to Bay aquatic resources will provide us with data needed to improve the quality of State National Pollutant Discharge Elimination System (NPDES) permits.

To conclude this discussion of Maryland's initiatives to address the water quality problems in the Chesapeake Bay, let me bring to your attention our efforts on the Patuxent River, a tributary to the Chesapeake Bay. Maryland has taken an innovative approach to management of water quality by setting targets for nutrient load reductions over a specific time period, and then designing the best mix of strategies to meet them. The Patuxent strategy is the prototype for the way in which Chesapeake Bay Program findings and information can be translated into action strategies for other portions of the Bay.

Initially, we will be examining specific areas of the Bay and its tributaries which are severely stressed or in need of protection for targeting load reductions. Ultimately, this may necessitate changes to our water quality standards to recognize the relationship between living resources in their critical life stages and ambient water quality.

As I previously noted, the states of Maryland, Virginia and Pennsylvania are currently working with EPA reviewing their management recommendations to develop a regional plan for Chesapeake Bay management. This regional effort was launched in October 1982, when Governor Robb and I met to discuss the EPA Bay Program findings and agreed to work cooperatively on a management strategy. Several months later, we journeyed to Harrisburg, Pennsylvania, where we briefed Governor Thornburgh, who pledged his support for the Bay clean-up effort. Then in July 1982, Governor Robb, Lt. Governor Scranton and I met with EPA Administrator Ruckelshaus and five U.S. Senators to discuss the health of the Bay and the need for a federal/interstate management program. Moreover, throughout this process my Administration has been working jointly with the Maryland General Assembly to develop our implementation initiatives for the Bay.

This regional cooperation and intergovernmental support is unprecedented. It reflects the heightened public awareness and concern for the health of the Bay. In developing our Maryland initiatives, we have worked with farmers, watermen, sportfishermen, conservationists, environmentalists, industry, and local government. There is a collective determination to restore the Bay. More noteworthy, however, is the recognition that all of us have helped to create the problem and we must all take responsibility and work together to revitalize the Bay.

On December 7, 8, and 9, 1983 at the George Mason University in Fairfax, Virginia, I will be joining the Governors of Pennsylvania and Virginia, Mayor Marion Barry of the District of Columbia, the Chesapeake Bay Commission (a bi-state commission of the General Assemblies of Maryland and Virginia), and the EPA in sponsoring a summit conference on the Chesapeake Bay. We are all looking toward this Conference as an opportunity to jointly develop a series of interstate actions on the Bay. The decisions made at the Conference will form the major components of the interstate management plan for the Chesapeake Bay called for in HR 2817.

Following this Conference, the states, in conjunction with EPA, will develop grant proposals for the Fiscal Year 1984 $3 million appropriation for cost-sharing assist-

ance. Thus, it is my hope that we can expect the first year of the combined federal-state implementation program to begin in the early months of 1984.

HR 2817 would provide the kind of supplemental financial, programmatic and legal support needed to strengthen this effort. The language in HR 2817 concerning the Chesapeake Bay is to be commended for several reasons. First, it is innovative in recognizing the importance of a management plan to guide action on the water quality problems of the Chesapeake Bay. Second, the bill recognizes that such a management plan must be an interstate plan in order to address effectively the Bay's water quality problems. Third, the proposal for cost-sharing of the implementation of a management plan by the states and the federal government will continue the productive partnership begun through the Chesapeake Bay Program. Fourth, the bill acknowledges the importance of a continuing role for the federal government on the Bay.

I welcome the emphasis of the bill on implementation. The Chesapeake Bay Program has provided us with much information that we can take direct action on now. The $10 million authorization for grants to the states in Section 117(e)(1) will provide the states with an excellent incentive to strengthen our Bay management programs.

In my view, the "interstate management plan" discussed in 117(a) of the proposed new section will be developed by the states. As I noted earlier in my remarks, it will be drawn from the alternative management recommendations contained in EPA's final management report. The one-year time period of formulation of the plan is more than reasonable given that the states are already working with EPA and hope to make some financial commitments for action early in 1984.

I have already described the kinds of activities we would expect to use these funds for in Maryland. We intend to accompany any new program initiatives with a strong program to monitor water quality and living resource changes in the Bay. We need to establish clear benchmarks in order to evaluate our progress toward a cleaner Bay and to make mid-course corrections if necessary.

Let me emphasize that the interstate dimension of a management plan is tremendously important. I consider it critical to future management of the Chesapeake Bay that there be continued communication and cooperation among the states and the federal government in formulation of strategies to manage the Bay. I am committed to Maryland's strong participation in a continuing interstate institutional mechanism to coordinate implementation of interstate management strategies for the Chesapeake Bay.

I am convinced that the best mechanism for continuing interstate/federal coordination on the water quality and fishery problems of the Bay is the continuation of the Management Committee structure. This institutional mechanism has been very effective in coordinating federal and state involvement throughout the Chesapeake Bay Program, and we expect that it would continue to provide the kind of coordination necessary during the implementation phase of the program.

It would be desirable to provide basic staff support to the Management Committee through a continuing EPA Chesapeake Bay Program office. This office should be composed of a small core staff and continue to be located in Annapolis. The responsibilities of the office would be to provide support of the Management Committee and public participation activities, oversee operation of the Baywide computer system, assist in further development of the mathematical water quality model and Baywide federal/state monitoring systems, and conduct additional limited research on water quality and fishery problems in the Bay. The continuing Chesapeake Bay Program office should be funded out of the $3 million appropriation for Section 117(e)(2). Also the be funded out of 117(e)(2) would be the modest research efforts called for in Section 117(c).

The proposal for 55 percent federal cost-sharing of implementation activities is reasonable. The concept of cost-sharing recognizes the joint responsibility of the states and the federal government in managing the Chesapeake Bay.

Allocation of the cost-share assistance within the Bay region is left to the discretion of EPA rather than stipulated in an allotment-type formula. I assume EPA will make these funding determinations in concert with the states. This flexibility is important in that it will allow EPA and the states to target funds where they are most needed. Moreover, as I understand the legislation, EPA would not be precluded from allowing one state to provide the required match for another state's cost-share. Again, this kind of flexibility will enable us to maximize our resources and further illustrates the need for EPA's continued presence to enhance regional cooperation.

I believe that the authorization for $10 million per fiscal year for four years is a reasonable and rather modest amount to assist the states in the Chesapeake Bay watershed to undertake some significant programs.

At this time, I cannot definitively state a precise cost figure in terms of Maryland's financial commitment for Chesapeake Bay clean-up because we are currently reviewing both Maryland's total revenue picture and the cost estimates of our Bay initiatives. However, I am hopeful that next year Maryland will be able to commit roughtly $10-15 million in operating costs and $25-40 million in capital costs toward protection and restoration of the Bay. Not all of this amount is anticipated to go to water quality improvement. Indeed, some of these funds will go towards restoration of aquatic resources and further research activities. Nevertheless, a significant portion will be directed towards point and non-point pollution control activities with particular emphasis upon strengthening our ability to inspect and enforce effectively.

Earlier in my testimony, I stressed the need for increased federal support in the area of non-profit source pollution control. HR 4037 provides an excellent framework and the necessary financial assistance for addressing these problems. In my view, the proposed legislation has several key elements. First, it directs the states within 270 days after enactment to identify areas where non-point source problems are critical to achieving water quality standards. Second, it directs the states to develop in cooperation with local soil conservation districts, a comprehensive four-year implementation plan to control non-point sources of pollution which must be approved by EPA. Third, it authorizes $150 million annually to the states on a 50-50 cost-sharing basis for both technical and financial assistance to implement these plans. Fourth, it provides for EPA to utilize a management conference approach in order to address regional non-point pollution problems. Fifth, it directs EPA to work with other federal agencies whose facilities or activities within the states are contributing significant non-point source pollution and to assist them in taking corrective action.

Regarding allotment of funds authorized under HR 4037, I offer this observation: I believe that the approach of providing assistance to states on a first-come-first-serve basis with a 15 percent limitation per state, will enable EPA and the states to specifically target those areas with critical non-point source pollution problems and will serve as a strong incentive for states such as Maryland, to expeditiously implement control strategies.

Finally, while I understand the concerns of those individuals who favor a mandatory non-point source program with rigid deadlines and tough enforcement measures, I believe that given the highly complex implementation techniques along with the costs associated with launching a major enforcement program, an incentive cooperative approach to implementation, as provided in HR 4037, is the better option. We in Maryland intend to work cooperatively with our landowners providing education, technical and financial cost-sharing assistence. I am not suggesting that we will not take swift enforcement action against landowners who refuse to cooperate, but merely that the bulk of our resources should initially be directed towards providing assistance.

Before concluding my testimony, I would like to sound a note of caution. Congress should not consider the funds authorized under HR 2817 and HR 4037 a substitute for existing Clean Water Act funds available for both the construction of municipal sewage treatment systems (the Construction Grants program), and grants for pollution control program activities. Funding of these Clean Air Act programs must be maintained at their current levels if the states of Maryland, Virginia and Pennsylvania are going to be successful in revising the decline of the Chesapeake Bay.

With respect to the Construction Grants program, Congress should recognize that the Construction Grants program has been the major source of funds to the states in the past for sewage treatment facilities and must be continued. Accordingly, I urge the Subcommittee to take whatever steps are necessary to ensure that there will be a timely reauthorization of this program before October 1, 1985. In addition, it is especially important that federal funding formulas recognize the severe nutrient enrichment problems typical of estuarine systems like the Chesapeake Bay by permitting Construction Grant funds to be spent on advanced waste treatment facilities where necessary. In this regard, Congress should reconsider its policy of requiring EPA headquarters review of the cost-benefit aspects of advanced waste treatment funding and allow this decision to be delegated to the states.

In conclusion, let me assure you that my Administration is committed not only to the protection and restriction of the quality of the Chesapeake Bay, but also to effective implementation of all the provisions of the Clean Water Act. HR 2917 and HR 4037 will enhance our efforts, and I urge that they be included in the reauthorization of the Clean Water Act.

As I stated at the outset, I strongly support HR 2817 in its recognition of the national significance of the Chesapeake and the necessity for continued state/federal

involvement in Bay management. Preservaton of the Bay has engaged the energy, excitement and dedication of all of us in the Bay region. With enactment of this legislation, Congress would commit itself to the protection and preservation of this most precious national resource—the Chesapeake Bay.

Mr. ROE. Please proceed, Governor Hughes.

TESTIMONY OF HON. HARRY HUGHES, GOVERNOR, STATE OF MARYLAND

Governor HUGHES. I will try to hit some of the highlights and try not to be too redundant because you have heard much of what we all feel is important about the bay. First, I want to join in with Congressman Dyson and Congresswoman Mikulski in thanking you in this committee for your efforts over the years in protecting the environment of this country and particularly the clean water area.

I want to thank Barbara Mikulski for that very glowing introduction that she gave me. There is one thing that she obviously said that really did not have to be said and that is that there is nobody that ever thought I was part of some think tank. [Laughter.]

I am flattered that she would think that maybe somebody thought that.

I am here to do two or three things. One is to support the efforts of this committee in continuing a strong Clean Water Act. We think it is essential in Maryland to achieve our goals and the national goals of fishable, swimmable waters, and we feel that national minimum standards should be maintained and adequate enforcement should be maintained. And I know that this committee has a longstanding record of supporting clean water through the Clean Water Act, and we certainly do urge reauthorization of that act next year.

Specifically, I am here to talk about Congressman Dyson's bill and to thank him for his extraordinary efforts on the Chesapeake Bay, our efforts to save the bay, as well as H.R. 4037, which addresses nonpoint sources.

You have heard some of the reasons of why the Chesapeake Bay is such an important national resource, and I must say I probably have some personal bias because of where I come from. I have lived on all sides of the bay. I was born and raised on the Eastern Shore down where you were hunting, I suppose, Congressman, for many, many years and represented that area in the general assembly for 16 years. And then I lived in Baltimore for 10 years. I was up in Barbara Mikulski's area, and I now live in Annapolis which is on the western side. So I have seen it from all sides. I have been all over it. I have been up every single river in Maryland that is a tributary of that bay. So I think I have some understanding of its importance and I certainly have some great feeling of affection for it.

As far as its national interest is concerned, you have heard from Governor Robb's testimony how important it is as a national asset. When you think about it, there are 64,000 miles, 64,000 square miles that make up the Chesapeake Bay watershed. And in that watershed, over 8 million people live. And it includes two major Atlantic ports. This is an astounding fact that you have also just heard, but I think it is worth reemphasizing, that it produces more

marine life than any other body of water in the world, with the exception of the Atlantic and the Pacific Oceans. Now, if that in itself does not say that this estuary is of national interest, then I do not know what else we could say about it.

Eighty five percent—and this is an area where we are trying to impose some restrictions to improve the harvesting of striped bass—85 percent of the striped bass that are going up and down the east coast from Maine, I guess, all the way to Florida, 85 percent of those are spawned in the Chesapeake Bay and its tributaries.

So I could go on and on with a lot of other facts that indicate very strongly that there is a national interest in this wonderful estuary. And what is the significance of the EPA Chesapeake Bay program and this study? We have all been troubled by the findings of that study. And that was a very good study.

And I think the Congress is to be congratulated for providing the funding and authorizing that 7 year, $30 million study. And one of the unique things about the study, it was not just a research project; it was also a management study. So it did not just tell you what is wrong with the bay, it told you also some of the management solutions that you can address in solving the stresses of the bay, the problems of the bay. And those are the kinds of things that all the States are now working on and will get some very concentrated attention at the meeting at George Mason University in December.

One of the things that the study showed that when you first hear about it, it sounds that that is not too bad, that there are excessive nutrients in the bay. You think, well, that is fine. The bay is rich. Well, that is not fine. It has gotten beyond that point. And these nutrients are, without going into a scientific explanation, are promoting the growth of algae, which in turn is reducing oxygen, and we have some areas of the bay that are really totally without oxygen and those areas are increasing in size over what they used to be.

We found that these nutrients come from various sources, from farmland, from point sources, from urban runoff. I just heard this morning that there is one area where when you talk about erosion from farmland—and we have heard some figures from Congressman Dyson about the cost to the farmers of fertilizer that goes into the bay—that in one area they are losing by erosion each year 20 tons of topsoil per acre per year, and that is an astounding figure. And all of these things are contributing to the problems that the bay is suffering from.

The shortage of grasses is a terribly important problem because so much of the marine life of the bay depends upon that. And those ducks and geese, Congressman, like that very much, too. And we found that there is a connection between the excessive nutrients and phosphorous and nitrogen that has caused this problem.

So there is a lot that we have learned and a lot that we are learning about to address it. And one of the important things that we have learned from this study is that the bay is like a sink. What goes in there stays there. I think there was some concept that eventually it washed out to sea. That does not happen. It stays

there; it is like a sink, and that is an important thing to know when you are addressing the problems of the bay.

So we are now at the point where we have learned what the problems are, and I might say that there has been enough studying. There is a whole catalog of studies that have been made of the bay over the last many, many years and none, though, as good as this EPA study. And it is now time to stop the studying and stop the talking and start getting to work in solving the problems of the bay.

And we feel that in doing that, the comprehensive approach is absolutely essential. It is a national problem. It is a State problem. It is a regional problem. It is a local problem.

And so it is going to take the comprehensive approach that has been there already with the Federal Government involvement of EPA with the three States. In the EPA study there was a management committee that was comprised of the three States of Virginia, Pennsylvania, and Maryland, the EPA, and that management committee sort of guided that study over the years, did a good job, and we certainly expect and Congressman Dyson's bill requires that that sort of a structure remain. And we feel that that is essential, that it does remain so we can have this regional, interstate, comprehensive approach to solving the problems of the bay.

And I think that is unprecedented, really, to a certain extent and what Congressman Dyson said I certainly agree with, that that this approach that is being taken here, this comprehensive regional approach can serve as a model for addressing similar problems elsewhere throughout this country.

To show you the cooperation, we did meet with Governor Thornburgh in Pennsylvania. Governor Robb and I did. He has pledged his support for this effort. That is terribly important. The Susquehanna River provides about 50 percent of all the freshwater that goes into that bay. So that is important that Pennsylvania be a part of this effort. And I applaud Governor Thornburgh for that because the bay does not lie within Pennsylvania; it is within Maryland and Virginia. But the three Governors are working together and we have met with Mr. Ruckelshaus, who has indicated his positive thinking about addressing the problems of the bay and has acknowledged that it also is a national asset.

In our efforts in Maryland, we have been working with everybody you can think of, watermen, farmers, business people, industry, environmentalists, in discussing the possible strategies that we will implement in Maryland in doing our part in solving the problems of the bay.

And we have worked very closely with the Maryland General Assembly, extremely close with them, and I can say that I do not know of any effort—and I have been in public office for 27 or 28 years—and I do not know of any effort where there has been the universal support that I have seen for this effort to save the Chesapeake Bay. And I think Roy Dyson and Barbara Mikulski would agree with that. I do not care what part of the State I go to and I do not care what kind of group I am talking with, there is a spontaneous support for this effort and I think a recognition that we are going to have to do some things differently, and we are all going to have to make some sacrifices, and a recognition that we

all benefit from the Chesapeake Bay, regardless of where we might live in the State of Maryland.

And that is something that gives me great optimism, that we are going to solve this problem. We hope the Federal Government is going to be there with us with their technical support and their coordinative efforts and also their financial support.

I might tell you a few things about what we have been doing in Maryland so that you do not think that we are just coming to Washington to get you to solve all our problems. We do not expect that. We do not want that.

We have been imposing restrictions on the amount of phosphorous that can go into the water out of a waste-treatment plant. We have eliminated a lot of the chlorine, I think over 65 or 70 percent of it, if I am correct, which has had a detrimental effect, chlorine has, on the spawning areas of our fish.

And we are continuing those efforts. We will be reducing even more phosphorous going from wastewater treatment plants, not just in the northern part of the bay where we have been doing it, but in other parts also.

We are going to upgrade our inspection and enforcement capabilities. We are going to impose pretreatment efforts on industrial waste, that instead of just letting it go into a wastewater treatment plant, which might foul it up, it is going to have to be treated through a permit process before it goes into a municipal wastewater treatment plant. And then we will be improving our programs for monitoring that effluent so that we know what is going out and what action we might have to take when we find toxicity problems.

In nonpoint sources we were able to get through legislation a year or so ago in the Maryland General Assembly, which set up $5 million to help farmers in doing best-management practices. And this is on a matching fund basis because some of the practices do not cost too much, but some are fairly expensive if you expect the farmer to build a berm or to take some very productive farmland out of cultivation to avoid the erosion and runoff.

And we are getting treat interest from farmers in that. The last time I heard over 300 farmers had made application for matching funds under this program. And part of our program is to inform and educate farmers about this problem, letting them know about some facts like Roy Dyson has mentioned, and what they can do about it, and how it is in their best interest, not only in the interest of preserving the bay, but in their best interest. And I might also add we have been getting some very positive reaction and cooperation from the farming community in Maryland.

We have been doing demonstration projects on retrofitting in urban areas to eliminate and reduce the problem of urban runoff. We have been granting assistance, funds to local governments for storm-water management and adopted some new regulations on storm-water management.

So there are a lot of things that we are doing already in Maryland to help solve that problem of the bay and keeping our waters clean. Now, I cannot give you a figure on what more we are going to do. We are addressing even more initiatives, a lot of which are

improving or expanding what we already have in place. Some are new.

But we feel at this point—and I will know better in about 1 month—that the commitment by Maryland of financial resources to this is probably going to run in the neighborhood of any where from $12 to $15 million a year. And that is just operating. And capital costs would be somewhat more than that, depending on what we finally come up with as a final program.

So I think that shows that we are willing to put our money where our mouth is, that we are willing to make our—take our fair share of the burden, and we should because we benefit, as Virginia does, more than any other area from the bounty of that bay.

So we need Congressman Dyson's bill. We need it for a couple of reasons. We need the assurance that the EPA is going to remain as a part of this effort. We do really think that that is important. They have the lab in Annapolis, and there has been $900,000 last year and $4.2 million for this coming year to keep that lab going and to help share in the cost of the transition from a study over to implementation, but we need this bill that will provide $10 million a year for the next 4 years to be matched by the States.

And one of the important features of the bill is that the matching is flexible so that it does not say how much any one State might have to match. And that is what we need in this three-State area.

For example, I think in fairness we would not expect Pennsylvania to put up as much money as, say, Maryland or maybe Virginia because even though they have an interest, they do not receive the benefit from the bay that we do. They receive benefit, but not to the extent that we do. So this flexibility says that one State, for example, could put up the match for the Federal funds that might go to another State.

We think that kind of flexibility is essential. So we hope that this committee will look favorably upon that bill. We think $10 million a year is rather reasonable and I think it is pretty obvious at this point that the States involved are going to be making a commitment much larger than that, total commitment much larger than that. And the recent word I heard of the EPA position on this bill—I just heard that this morning, that they might be opposing the enactment of this bill, is, I would say, disappointing. And I hope that that position does not continue. I hope it does not prevail because we are hoping for this Federal involvement and we expect it and we are going to move ahead on saving this bay, regardless of what else happens. And we think it is that important. But I also think it is important enough that the Federal Government be involved.

That is basically, Mr. Chairman, all I wanted to stay. I would mention just briefly about the Oberstar bill, H.R. 4037, which addresses the nonpoint sources and requires each State to submit a report within 270 days and than a plan within 270 days, which we think is reasonable. And we feel that is terribly important; $150 million sounds like a lot of money. Nationwide I do not think it is a lot of money for addressing this problem of urban and agricultural runoff. For example, in Maryland, our estimate is that over the next several years it will, in the farm, agricultural runoff, the cost

to correct that is going to be about $90 million. Right now I think our Federal funds that address this area amount to about $1 million a year.

So we also support the enactment of that bill as another effort to promote the Clean Water Act of this country.

So, I thank you, Mr. Chairman, for permitting these few minutes to testify. In essence, we support a strong Clean Water Act. We see a need for swift reauthorization early next year of that act, and we particularly stress, based on everything we have said today, the enactment of Congressman Dyson's bill, H.R. 2817. Thank you very much.

Mr. ROE. I want to thank you very much, Governor and Senator Gartland, for your testimony, and certainly Roy. I think that you have demonstrated in your testimony, not only in your prepared testimony, but in your own presentation you made here this morning an indepth understanding of the order of magnitude of the problems we are faced with. And I think that the investment that the Federal Government has made in the Chesapeake under your leadership, and Governor Robb, and Governor Thornburgh has been obviously well placed like in their order of priorities in the Nation.

And I think one thing, if you had been privy to hear the testimony this past week we have been hearing from witnesses all over this Nation vis-a-vis the point of nonpoint-source runoff and recognizing that some on the order of magnitude of 50 percent of the pollution in our waterways, in our rivers, and our bays are coming from other than point source discharges, that the Chesapeake Bay initiative has really established a foundation.

I think the effort that has been placed into the bay really has created a model for us to be guided by and to see three States come together and form a compact, as you have, and an understanding, it is really a major step forward.

We know that we cannot resolve the matters of nonpoint source pollution and clean up our estuarine areas or our rivers or bays unless we have States and regions working together in commonality of purpose. So I want to compliment you for your testimony and for your leadership, together with Governor Robb, and Governor Thornburgh, Roy Dyson, Barbara Mikulski, and Senator Gartlan for this presentation this morning.

And I think it sets the foundation as what this committee is going to do. The environmentalists throughout this country have said to us we have done a great deal; we have taken many steps since 1972, but in order to cure the pollution problems of this Nation and improve the quality of life of our country, we have got to deal substantively with the non-point-source issue, of course which you are directing your attentic to today.

The gentleman from Minnesota.

Mr. STANGELAND. I can only echo, Mr. Chairman, what you say. I would like to advise both Governor Hughes and Senator Gartlan that while I have hunted on the bay, I have not depleted a resource yet. [Laughter.]

Mr. DYSON. It is pretty good this year, I understand.

Mr. ROE. What he is saying is he is not a very good shot. [Laughter.]

Are there any other—the gentleman from Massachusetts.

Mr. DONNELLY. Thank you, Mr. Chairman. Let me just welcome you Governor and Senator and let me just state for the record on behalf of all the members of the committee what a wonderful job Roy Dyson has done in lobbying this committee. He has had, I think, all of us out on the Chesapeake, and as you point out, Governor, this is an initial step of what has to be done.

We have a similar problem up in Massachusetts with Boston Harbor and I hope that in the eventuality I will do as good a job lobbying this committee for Boston Harbor as Roy Dyson and the Maryland delegation has done for the Chesapeake.

Mr. ROE. As it is written from the good friend from Massachusetts, one will have to stand in line because I have read the Governor's testimony and I am beginning to have some thoughts of my own about the Delaware, don't you know. [Laughter.]

Again, thank you very much. And, Roy, you have done a splendid job in bringing the leadership of your State before us, and we appreciate your outstanding efforts in getting this legislation passed.

Mr. DYSON. Thank you, Mr. Chairman.

Mr. ROE. Thank you very much for being with us this morning.

The committee will recess for 10 minutes to go vote. [Recess.]

Mr. ROE. The Subcommittee on Water Resources will reconvene, and we have with us as our next witness Ms. Rebecca Hanmer, who is the Deputy Assistant Administrator, Office of Water, for the U.S. Environmental Protection Agency, accompanied by Mr. Thomas Eichler, Regional Administrator of EPA's region III, Philadelphia, Pa.

We want to welcome you back to the committee and appreciate your being with us this morning. I know that Ms. Hanmer has done an extraordinary job in her responsibilities in the EPA and will continue to do so, and we always value your judgment, and your wisdom, and the help that you have been to this committee. I think much of the work that you have done has helped us in framing the legislation, and you have the tough job of carrying it out. So now, we want to listen to what your observations are.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF REBECCA HANMER, DEPUTY ASSISTANT ADMINISTRATOR, OFFICE OF WATER, U.S. ENVIRONMENTAL PROTECTION AGENCY BEFORE THE SUBCOMMITTEE ON WATER RESOURCES COMMITTEE CN PUBLIC WORKS AND TRANSPORTATION U.S. HOUSE OF REPRESENTATIVES NOVEMBER 17, 1983

Good afternoon Mr. Chairman and Members of the Subcommittee. I am Rebecca Hanmer, Deputy Assistant Administrator of the Office of Water. I am pleased to be here today to testify on a common goal—the restoration of the Chesapeake Bay to "fishable/swimmable" quality. With me today is Mr. Thomas Eichler, Regional Administrator of EPA's Region III office which has jurisdiction over the majority of the Chesapeake Bay Basin.

As you know, the Chesapeake Bay Program Study was initiated seven years ago as a cooperative research study of the Bay system. The Study was unique in several ways. First, there was an outstanding cooperative spirit of the States, EPA, and other federal agencies in learning more about Bay water quality trends, most notably the impacts of nutrients and toxics, and the decline of submerged aquatic vegetation (SAV). As a result of this major effort, the Agency's overall working relationship with the Bay States has improved, as has the cooperative efforts between intra-

state agencies, for example between State natural resource and pollution control agencies. Second, the Study not only focused on water quality, but a comprehensive effort relating the impact of water quality on living resources. Third, the public was directly involved in the program in a constructive manner, and played a significant role in problem definition and guidance.

Let me emphasize, Mr. chairman that neither the Agency nor the States see the Study being placed "on the shelf". Rather we see the Study, which has culminated in the recently published "Chesapeake Bay: A Framework for Action," as having a major impact on directing the States and EPA in taking measured control actions, targeting priority problems in priority areas. This report defines two major challenges which must be addressed to insure the recovery of the Bay, those being the effects of toxic and nutrient loadings on the Bay.

Thus, the efforts on the Bay have changed emphasis from research to implementation. During the Bay Program's first seven years as a research program the Agency played the leading role with State involvement being insured through the Management Committee. Now the Bay community is poised for action, and it is the States who have primary responsibility for implementation. As various programmatic responsibilities, for example NPDES permit administration, are delegated to the States the Agency is assuming more of an overview function. Therefore, it would be inconsistent with the Agency's statutory mandate to insist that it play the lead role in control action implementation.

In this oversight role, the Agency will continue its efforts to improve the Bay to a Baywide "fishable/swimmable" water quality. Indeed, this is an Agency responsibility under the Clean Water Act. EPA is committed to working with State and local governments to assist them in their efforts to institute control measures on the Bay. However, we think it is also important to recognize that EPA is basically a pollution abatement agency. In comparison, the States have much broader responsibilities, including pollution control, wildlife management, habitat restoration, and land use management. In this respect, the States can efficiently direct their resources toward the common goal of restoring the Bay's water quality.

Let me now define what we see the Agency's role to be on the Bay. In a way, we at the Agency see the Chesapeake Bay Program as a prototype for the future role of EPA's water programs. As various programmatic responsibilities, for example the NPDES permitting program and substantial components of the Construction Grants Program, are delegated to the States, the Agency is assuming more of an overview function. In using the term "overview" we are not limiting the Agency role to that of auditing State accomplishments in a very narrow way. Rather, we see the overview function as a broad, long-range responsibility in which the Agency shifts its emphasis from concerns as to how specific programs are being implemented to a much broader concern as to how we can direct these programs to achieve basin-wide objectives. This role assumes many responsibilities, let me now turn to those responsibilities.

We believe our role includes a coordination function. In the case of the Bay, the Agency will work with the States to coordinate federal and state activities, channeling efforts to priority projects through technical assistance efforts of other federal agencies. The Agency's coordinating responsibilities is provided by the presence of the Chesapeake Bay Liasion Office in Annapolis. The Agency proposes that this Office continue to represent the Chesapeake Bay Management Committee—composed of managers from State agencies, other federal agencies, and members of the public. The Agency further proposes that to assist this management group, an Executive Committee made up of the Governors of the Bay States and EPA's Regional Administrator, Mr. Eichler, be established to provide the high level policy and political commitment necessary to make and carry out tough control decisions. At the national level, the Agency is directing the head of the Office of Water Regulations and Standards to coordinate Headquarters efforts in assisting Region III and the States to the maximum feasible extent in terms of both coordinating federal efforts and providing technical assistance.

Within the context of control decisions, let me now explain what we at EPA expect to accomplish in the two key areas of toxic and nutrient control. In the Toxic area, EPA, in cooperation with localities and States, is making significant progress in controlling point sources through the issuance of second-round Best Available Technology (BAT) permits limiting toxic discharges and through the implementation of industrial pretreatment programs. As I said earlier, each of the Bay States administers the NPDES permitting program. Technical assistance is available to the Bay States in developing ambient and effluent standards through both Region III and the Office of Water Regulations and Standards. In addition, the Agency is also developing a post-BAT toxics control program based to a large extent on effluent

and instream biomonitoring toxicity testing. These methods have now been field tested in several States. The Agency will be implementing these toxic control approaches as a national pilot with the States of Maryland and Virginia. This will be more than a special research study, discharge permits will be developed on the basis of study results.

In the area of nutrient control the Agency is already committed to funding phosphorous removal of sewage treatment wastes on the Upper Chesapeake. In addition, we will be providing cost sharing funding of nonpoint source control in the Bay States this fiscal year based on the Congressional appropriation for Chesapeake Bay. As Mr. Ruckelshaus indicated in his testimony before you the other day, we are also working on developing a Memorandum of Understanding (MOU) with USDA on providing technical assistance to State efforts on controlling agricultural nonpoint sources. Cooperative efforts to address nonpoint source impacts on the Chesapeake Bay are continuing in 1984. This agricultural nonpoint source control cooperative effort will be directed toward priority basins and will include extensive State involvement. We expect that the results will be as successful as the three USDA projects in the Bay tributaries.

In addition to the responsibilities discribed above, we see several other responsibilities specific to the Liasion Office. Prime among those responsibilities is monitoring the Bay to detect trends and evaluate the impact of control actions. In fiscal year 1984 the Agency's monitoring activities will include monitoring the anoxic zone, an area characterized by low dissolved oxygen, reaching from the Bay Bridge to the Rappahannock River. Another related responsibility will be the development of a model of the Bay's mainstem which will enable us to accurately project the impact of control options on the Bay. Other responsibilities include maintaining the Bay Program's data base, the largest data base on any estuary; conducting special studies, particularly regarding the impact of water quality on living resources; and continuing to provide support for public involvement in the decision making process.

As I said inmy opening statement, the Agency shares the Bay community's goal of restoring "fishable/swimmable" water quality Bay wide. In that vein, the Agency views H.R. 2817's recognition of the Bay as an important area of national concern in a favorable light, and as can be seen significant current activity is already occurring to assure the restoration of the Bay's water quality. We believe that the current act is working and therefore do not support enactment of H.R. 2817. The control programs necessary to restore the Bay's water quality and living resources can and are being developed within the context of the Agency's already exising authorities of the Clean Water Act. Indeed, the fact that such concerns can be addressed within the context of the Act speaks to the overall wisdom of the Act's statutory construct. This concludes my prepared testimony. Mr. Eichler and I will be pleasd to respond to any questions. Thank you.

Mr. ROE. Please proceed.

TESTIMONY OF REBECCA HANMER, DEPUTY ASSISTANT ADMINISTRATOR, OFFICE OF WATER, U.S. ENVIRONMENTAL PROTECTION AGENCY, ACCOMPANIED BY THOMAS EICHLER, REGIONAL ADMINISTRATOR, EPA'S REGION III, PHILADELPHIA, PA.; DR. TUDOR DAVIES, AND GREENE JONES, WATER DIVISION DIRECTOR, PHILADELPHIA EPA

Ms. HANMER. Thank you, Mr. Chairman.

Good morning to you and to members of the subcommittee.

As you pointed out, I am Rebecca Hanmer, Deputy Assistant Administrator of EPA's Office of Water. I am pleased to be here to testify today on a common goal we share with Governor Hughes, Governor Robb, and the other speakers who have appeared before you this morning and as well, I trust, with the subcommittee—that is, the restoration of the Chesapeake Bay to fishable-swimmable quality.

With me today, as you pointed out, is Mr. Thomas Eichler, who is the Regional Administrator of EPA's Region III Office. It is this

Office that has jurisdiction over the majority of the Chesapeake Bay Basin.

Also, Mr. Chairman, I would like to ask your permission to bring to the table Dr. Tudor Davies, who is now a member of the Office of Water, but who is the EPA scientist who directed the Chesapeake Bay program.

Mr. ROE. That is a splendid idea. Would Dr. Davies join us at the table? We want to welcome you, Doctor, to our panel this morning.

Ms. HANMER. Also with us is Mr. Greene Jones, who is the Water Division Director from our Philadelphia Office, who has chaired the Chesapeake Bay Management Committee. It was under his direction that the recent Framework for Action was produced.

As you know, the Chesapeake Bay program study was initiated 7 years ago as a cooperative research study of the bay system. The study was unique in several ways. First, there was an outstanding cooperative spirit of the States, EPA, and the other Federal agencies in learning more about bay water quality trends, most notably focusing on the impacts of nutrients and toxics, and the decline of submerged aquatic vegetation.

As a result of this major effort, focused on these three critical areas, the Agency's overall working relationship with the bay States has improved, as have the cooperative efforts between intrastate agencies, for example, between the State natural resource agencies and the pollution control agencies.

Second, the study focused not only on water quality, but was a comprehensive effort relating the impact of water quality on the living resources of the bay.

Third, the public was directly involved in the program in a constructive matter and played a significant role in problem definition and guidance. This is particularly important because it is the public within the bay region that will bear much of the responsibility.

Let me emphasize, Mr. Chairman, that neither the Agency nor the States see the study being placed on the shelf. Rather, we see the study, which has culminated in the recently published "Chesapeake Bay: A Framework for Action"—and I have a copy here—as having a major impact on directing the States and EPA in taking measured control actions targeting priority problems in priority areas. This report defines two major challenges which must be addressed to insure the recovery of the bay—that is, the effects of toxic and nutrient loadings on the bay.

The efforts on the bay have changed emphasis now from research to implementation. During the bay program's first 7 years as a research program, EPA played the leading role with State involvement being insured through the management committee. Now the bay community is poised for action, and it is the States which have primary responsibility for implementation of the study results.

There were two major reasons, as I see it, for this shift of responsibility. One is EPA's proper role in delegated programs under the Clean Water Act. As various programmatic responsibilities, for example, the NPDES water permit administration or construction grants management, are delegated to the States, the Agency is assuming more of an overview function. In this oversight role, the

Agency will continue its efforts to improve the bay to a baywide fishable/swimmable water quality. Indeed, this is a basic EPA responsibility under the Clean Water Act. EPA is committed to working with State and local governments in their efforts to institute control measures on the bay.

The second basic reason for the shift of responsibility is a consideration of the tools that need to be used to protect the bay, which go beyond EPA's mandate. EPA is basically a pollution abatement agency. In comparison, the States have much broader responsibilities, including pollution control, but also including wildlife management, habitat restoration, and land use management. It is a broad variety of these tools which must be brought to bear. The States can efficiently direct their resources toward the common goal of restoring the bay's water quality.

These broad responsibilities need to be used creatively, to address areas such as nonpoint source control, phosphorous control, fertilizer, and pesticide application practices, and water conservation.

Now let me define what we see as EPA's role in the bay. In a way, we see the Chesapeake Bay program as a prototype for the future role of EPA's water programs. As I mentioned, as various programmatic responsibilities are delegated to the States, the Agency assumes more of an overview function. In using the term "overview," we are not limiting the Agency role to that of auditing State responsibilities or accomplishments in a very narrow way. Rather, we see the overview function as a broad, long range responsibility in which the Agency shifts its emphasis from concerns as to how specific programs are being implemented in detail to a much broader concern as to how we can direct these programs under the Clean Water Act to achieve basinwide objectives.

We believe our role includes a coordination function. In the case of the bay, the Agency will work with the States to coordinate Federal and State activities, channeling efforts to priority projects through technical assistance efforts of other Federal agencies. The Agency's coordinating responsibilities are provided by the presence of the Chesapeake Bay Liaison Office in Annapolis. The Agency proposes that this office continue to represent the Chesapeake Bay Management Committee. The Management Committee is composed of managers from State agencies, EPA, other Federal agencies, and members of the public.

The Agency further proposes that to assist this management group, an executive committee made up of the Governors of the bay States and EPA's regional administrator, Mr. Eichler, be established to provide the high-level policy and political commitment necessary to make and carry out tough control decisions. At the national level, the Agency is directing the head of the Office of Water—and this will be coordinated by our Office of Water Regulations and Standards—to coordinate headquarters efforts in assisting region III and the States to the maximum feasible extent in terms of both coordinating Federal efforts and providing technical assistance.

Within the context of control decisions, let me explain what we at EPA expect to accomplish in the two key areas of toxic and nutrient control.

20-955 O—84——203

In the toxics area, EPA in cooperation with localities and the States will make significant progress in the near term through controlling point sources. This will be accomplished through the issuance of second round, best available technology permits, limiting toxic discharges, and through the implementation of industrial pretreatment programs.

As I said earlier, each of the bay States administers the NPDES permitting program. Technical assistance is available from EPA to the bay States in developing ambient and effluent standards through both our region III office and the headquarters Office of Water Regulations and Standards.

In addition, the Agency is also developing a post-BAT toxics control program based to a large extent on effluent and instream biomonitoring toxicity testing. These methods have been field tested in several States. The Agency will be implementing these toxic control approaches as a national pilot in the Chesapeake Bay region with the States of Maryland and Virginia. This will be more than a special research study, as discharge permits will be developed on the basis of these study and biomonitoring results.

In the area of nutrient control, the Agency is already committed to phosphorous removal in sewage treatment wastes on the upper Chesapeake. In addition, we will be providing cost-sharing funding of nonpoint source control in the bay States in fiscal year 1984, based on the congressional appropriation for Chesapeake Bay.

As Mr. Ruckelshaus indicated in his testimony before you the other day, we are also working on developing a memorandum of understanding with the U.S. Department of Agriculture on providing technical assistance to State efforts in controlling agricultural nonpoint sources. Cooperative efforts to address nonpoint source impacts on the Chesapeake Bay are continuing in 1984. This agricultural nonpoint source control cooperative effort will be directed toward priority areas and will include extensive State involvement. We expect that the results will be as successful as the three USDA projects in the bay tributaries promise to be.

In addition to the responsibilities described above, we see several other responsibilities specific to the EPA liaison office in Annapolis. Prime among these responsibilities is monitoring the bay to detect trends and evaluate the impact of control actions. In fiscal year 1984, the Agency's monitoring activities will include monitoring the anoxic zone, an area characterized by low dissolved oxygen reaching from the Bay Bridge to the Rappahannock River. Another related responsibility will be the development of a model of the bay's mainstem which will enable us to accurately project the impact of control options on the bay.

The liaison office in Annapolis will house and maintain the bay program's data base, the largest data base on any estuary; conduct special studies, particularly regarding the impact of water quality on living resources in the bay; and continue to provide support for public involvement in the decisionmaking process.

As I said in my opening remarks, the Agency shares the bay community's goal of restoring fishable/swimmable water quality baywide. In that vein, the Agency views H.R. 4108's recognition of the bay as a very important area of national concern in a favorable light, and as can be seen, significant current activity is already oc-

curring to assure the restoration of the bay's water quality. We believe that the current Clean Water Act is working. The control programs necessary to restore the bay's water quality and living resources can and are being developed within the context of the Agency's already existing authorities under the Clean Water Act. The act's authorities, for example, accommodated the congressional funding add on of $4 million for bay activities in fiscal year 1984. Therefore, EPA does not support enactment of H.R. 4108 as being a necessary change to the Clean Water Act. Indeed, the fact that such concerns can be addressed within the context of the existing law speaks to the overall wisdom and flexibility of the act's statutory construction.

We are committed—and I want to stress this—to assisting the bay States through our program under the existing Clean Water Act to the maximum extent possible within our funding and legal constraints, and we believe that the Chesapeake Bay reports and the management committee structure, which will be ongoing, give us the focus we need to make the most effective use of these resources.

This concludes my prepared testimony. Mr. Eichler, Dr. Davies and I would be pleased to respond to any questions you may have.

Thank you.

Mr. ROE. We want to thank you very much for your comprehensive testimony and thank you and your Agency for the outstanding job that you have done in coordinating EPA's effort and the other staff people to really bring forth the Chesapeake Bay study as a model for the Nation to follow. I think it is an enormous contribution to the future of the water quality needs of our Nation.

The Chair defers to the distinguished gentleman from Minnesota.

Mr. STANGELAND. Well, I just want to commend Ms. Hanmer on an excellent statement, and I look forward to working with EPA as we attempt to move forward and support efforts to revitalize that very important resource.

Thank you, Mr. Chairman.

Mr. ROE. Are there any questions of the witnesses?

The gentleman from Nebraska.

Mr. DAUB. No questions, except that I got in late; I just scanned your testimony, and I particularly want to encourage you, Ms. Hanmer, ~~to work on~~ the toxic and nutrient control areas. They are particularly of interest to those of us in the Midwest, and we appreciate your interest in that.

Thank you.

Mr. ROE. The gentleman from Georgia.

Mr. ROWLAND. No questions, Mr. Chairman.

Mr. ROE. I want to thank you very much for being with us, and we will take your thoughts into deep consideration.

Thank you very much for being with us.

Our next witness this morning is Mr. Philip Cohen, chief hydrologist for the U.S. Geological Survey of the Department of the Interior.

The Chair wants to welcome you, Mr. Cohen, to our hearing. Your agency has high respect, as you know, by this committee and the Congress, and we are anxious to hear your observations and

views, so if you would go ahead and proceed, we would appreciate it.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

Statement of Philip Cohen, Chief Hydrologist.

United States Geological Survey before the Subcommittee on Water Resources.

Committee on Public Works and Transportation, U.S. House of Representatives

November 17, 1983

THE GEOLOGICAL SURVEY'S WATER QUALITY PROGRAM

INTRODUCTION

The U.S. Geological Survey's (USGS) water-resources program is a balance of data collection and dissemination, problem-oriented water-resource appraisals (interpretive studies), and applied and basic research. In this statement, I will describe the water-quality aspects of the program. As background, I will briefly describe the organizational structure and operation of USGS's Water Resources Division (WRD), which has responsibility for the Geological Survey's water functions.

THE WATER RESOURCES PROGRAM

Mission

The U.S. Geological Survey is a non-regulatory agency having the broad mission of describing the Nation's earth resources.

Within USGS, the specific mission of the water-resources program is to provide the hydrologic information and understanding needed for the best use and management of the Nation's water resources. To accomplish this mission, the Survey's Water Resources Division, in cooperation with State, local, and Federal agencies--

- o Collects data on a systematic basis to determine the quantity quality, and use of the Nation's surface and ground water.
- o Conducts interpretive water-resource appraisals to predict the consequences of alternative plans for developing land and water resources.
- o Conducts supportive basic and problem-oriented research in hydraulics, hydrology, and related fields.

- Develops information on water-related natural hazards such as floods, droughts, mudflows, and land subsidence.

- Coordinates water-data acquisition activities of all Federal agencies.

Organization

The Water Resources Division is primarily a field organization. General direction of the Division's program is through four Regional Hydrologists located at Reston, Virginia; Atlanta, Georgia; Lakewood (Denver), Colorado; and Menlo Park, California. The four Regions consist of a total of 43 District Offices which generally are located in State capitals (Figure 1). Each District is headed by a District Chief who is responsible for the planning, programing, and implementation of water-resources investigations within the District.

Research projects support the Division's mission through study of the physical, chemical, and biological processes that affect the movement and quality of water in the hydrologic cycle. Research is conducted at three of the four regional centers and at project offices in other locations as needed.

The Geological Survey conducts its water-quality analyses in two highly instrumented laboratories in Denver and Atlanta. In fiscal year (FY) 1983, the two laboratories analyzed more than 60,000 individual samples of water.

Sources of Funds

The Water Resources Division's programs are funded as follows (Figure 2): (1) the Federal program, which is specifically identified in the annual Geological Survey appropriations; (2) the Federal-State Cooperative Program, in which the Division represents national interests, the cooperating agencies represent State and local interests, and the funding is shared 50/50; with the Federal share coming from direct Congressional appropriations; and (3) the Other Federal Agencies (OFA) Program, which is funded by the agencies that request the work.

The Federal-State Cooperative Program is a unique partnership for water-resources investigations between the USGS and State and local agencies. This program is the foundation of much of the water-resources management and planning activity in the Nation, and it serves as an early-warning system for the detection of emerging water problems. The Cooperative Program is active in all 50 States, Puerto Rico, Virgin Islands, Guam, and the Trust Territories. In FY 1983, there were joint funding agreements with more than 800 State and local agencies, at a total funding of more than $90 million. Because USGS performs most of the work, the program leads to a consistent and comparable national water information base.

ESTIMATED FUNDING FY 1983
WATER RESOURCES DIVISION

Figure 2.-- Sources of funds for the U.S. Geological Survey's Water Resources Division, 1983 FY.

Program Elements

The Water Resources Division basically conducts three types of work: (1) water research, (2) data collection and dissemination, and (3) problem-oriented, interpretative studies. These basic components are virtually inseparable because of their strong interdependence. For example, theories arising from research are the foundation of data collection and interpretative studies: data collection is a major component of all interpretative studies and most research; and analysis of data often leads to the modification of theory.

The Water Resources Division employs over 4,000 people, of which about 2,000 are professional hydrologists, with formal training in engineering, mathematics, chemistry, biology, and other disciplines. The FY 1983 budget for the Division was about $200 million. Of this total, about $20 million supported research, $80 million supported the collection of basic data, and $100 million funded interpretative studies. The specific topic areas of endeavor in the Division change with time according to the water information needs of the Nation. At present, the Water Resources Division has major programs in the analyses of regional aquifer systems, national water-quality networks, coal and oil-shale hydrology, and water-use information. In addition, the Division has new but growing programs in hazardous-waste hydrology, acid rain, and water-resources assessment. Almost all of the topical programs within WRD contain components of research, data collection, and problem-oriented, interpretative studies.

THE USGS WATER QUALITY PROGRAM

USGS collects a significant part of the Nation's water-quality data. In FY 1983, USGS collected water-quality data at more than 9,000 surface-water measurement sites and from over 8,000 ground-water wells.

Within USGS, water quality comprises a major part of the water-resource program. For example, in FY 1983, more than half of the water projects conducted by the Survey contained a water-quality component. Another way of emphasizing the importance of water-quality studies is that, in FY 1983, water quality investigations amounted to nearly $90 million, or 45 percent of the total funding of approximately $200 million for the Survey's water program.

In FY 1983, USGS estimates that it conducted studies at a total cost of about $7 million in response to the information needs of the Clean Water Act (P.L. 95-217). The studies were supported principally by transfer of funds from other Federal agencies and by the Federal-State Cooperative Program and were initiated mainly in response to two sections of the Act--Section 208, Areawide Waste Treatment Management; and Section 404, Permits for Dredged or Fill Material.

The water-quality program of the USGS consists of three major components: (1) collection of basic data to describe the quality of surface and ground water, (2) research to increase knowledge of the processes which create the

natural quality of water and which control the nature and rate of changes, and, (3) applied interpretive studies to determine the causes of specific observed changes in water quality and to predict the nature and rate of future changes that are likely to occur from human activities.

In describing the USGS water-quality program, I will first describe the research component, covering aspects of both surface and ground waters. Next, I will discuss some of the data collection and applied interpretative studies to define surface-water quality, and I will conclude the testimony by describing a new USGS program for obtaining a national perspective on ground-water contamination.

USGS RESEARCH IN WATER QUALITY

The mission of the USGS water research program is to improve understanding of hydrologic processes as a basis for explaining and, possibly, for predicting the response of hydrologic systems to natural and manmade stresses. Towards this end, the research program is divided into six discipline groups: (1) surface-water hydrology (2) ground-water hydrology (3) water chemistry (4) geochemistry (5) ecology, and (6) geomorphology/sediment transport.

The latter four groups focus directly on the chemical and biological aspects of the Nation's water resources. In FY 1983, of a total research budget of about $20 million, nearly 60 percent was expended in these water-quality areas. Of the senior research staff of 187 persons, 60 percent are in these four research groups. The other two research groups--surface-water hydrology and ground-water hydrology--focus largely on the transport of water and its dissolved constituents. Because dissolved constituents are of water-quality concern, an estimated 50 percent of the research in these two groups actually addresses water-quality issues. Thus, about 80 percent of the total USGS effort in water research is aimed at understanding hydrologic processes which affect water quality.

To illustrate the range of water quality research that USGS conducts, I will briefly describe some of our projects concerning acid rain, hazardous substances, and estuarine quality.

Acid Rain

USGS is conducting research to establish an understanding of the geochemical processes by which acid precipitation affects the quality of both surface and ground water. Surface- and ground-water quality are strongly influenced by reactions with soil and bedrock materials. In general, acid waters tend to decompose geologic materials more quickly than near-neutral waters. To quantify the effect of acid rain on soils and geologic materials, USGS is conducting a comparative study of the weathering of rocks under normal and elevated acidity. Small watersheds on single bedrock types have been selected for investigating interactions between atmospheric deposition,

bedrock, and soils. Geochemical mass balance studies of chemical species in these watersheds are being developed by detailed sampling of input waters (acid deposition) and by following the changes in chemical composition as these waters move through the watersheds. In addition to these field studies, we are conducting laboratory investigations into the leaching of rock samples with waters of differing acidity. These studies are showing both the rates at which various elements are released to the solution, and the fate of these elements in surface and ground water. When completed, the watershed and laboratory studies will aid in predicting the impact of acid precipitation on chemical-water quality, on stream and lake ecology, and on terrestrial plants.

Hazardous Wastes

Past USGS research in hazardous waste hydrology has focused on ground-water contamination. The program has included studies on the movement of chemical-munition contaminated ground water near the Rocky Mountain Arsenal in Colorado; the movement and microbiological alteration of industrial organic substances in ground water following injection through industrial wells near Wilmington, North Carolina, and Pensacola, Florida; the isolation and characterization of TNT in ground water in Nevada; the chemical forms of plutonium in ground water from radioactive waste burial grounds at Maxey Flats, Kentucky; and the character of landfill leachates and gas production at a solid waste disposal site in Delaware. In addition, a USGS researcher recently developed a mathematical model for optimizing the management of multiple sources of ground-water pollution.

In FY 83, we began large research studies at three field sites having a documented history of ground-water contamination dating back a few years to several decades. These sites include an oil spill near Bemidji, Minnesota; chemical contamination from a wood treatment plant near Pensacola, Florida; and contamination of ground water by sewage and trace metals on Cape Cod, Massachusetts. These studies involve teams of scientists examining the physical, chemical and biological processes which affect the movement and fate of the contaminants in diverse ground-water environments.

Research on hazardous wastes in surface water have included studies on the effect of oil shale leachate on blue-green algae; the transport and degradation of organic substances in streams; and the sorption of radionuclides associated with oil-field brines by sediments.

Estuarine Quality

The USGS is presently conducting long-term, interdisciplinary studies of the Potomac and San Francisco Bay estuaries. Teams of scientists have been assembled to study the variability of circulation and mixing of the waters; the seasonal and spatial distribution of the physical, chemical, and

biological properties of water which influence biological productivity; the physical and chemical processes which influence the contamination of clams and other organisms with metals and other pollutants; and the role of estuarine sediments as sources or sinks for nutrients such as nitrogen and phosphorus.

DATA AND APPLIED INTERPRETATIVE PROGRAMS IN SURFACE-WATER QUALITY

Nationwide Monitoring Networks

The USGS operates two nationwide networks of water-measurement sites to monitor surface-water quality--the National Hydrologic Benchmark Network and the National Stream Quality Accounting Network (NASQAN). The locations of stations in both networks are shown in Figure 3.

The Benchmark Network is composed of 52 small drainage basins which encompass a wide variety of natural hydrologic environments. These basins are in a nearly natural state, with little human influence and little likelihood of future development. The Benchmark program is designed to answer the question, "What is the hydrology and water quality in small basins which are in a near-natural state, with little or no change in land use?" Study of these basins may help to explain how much of the variation in water quality and quantity occurring in streams across the Nation is natural and how much is caused by human activity. The program was initiated in the mid-1960's and funding for the network in FY 1983 was $660,000.

The NASQAN network with 504 operating stations, provides a basis for continuously assessing the quality of major U.S. rivers with respect to both natural and man-induced factors. Stations are located to measure outflow from 331 accounting units (subregional drainage basins) which, collectively, encompass nearly the entire land surface of the Nation. The NASQAN network was initiated in FY 1973 with 50 stations and was implemented gradually to reach full operating level in FY 1979. In FY 1983, Federal Program funding for the water quality part of the NASQAN network was approximately $4.4 million. Funding for the measurement of streamflow at NASQAN stations comes from a number of sources, including the Federal Program, the Federal-State Cooperative Program, and other Federal agencies.

Data collected in the Benchmark and NASQAN networks include streamflow, concentrations of major inorganic and trace constituents (including toxic metals), bacterial indicators of pollution, and concentrations of a limited number of radiochemical constituents.

A major purpose of both the Benchmark and NASQAN networks is to detect trends in the concentrations of significant constituents of water quality. Especially difficult in analyzing data from these networks has been the problem of separating human induced changes in water quality from the natural variability in quality that results from the changing seasons and differences between wet and dry years. However, USGS scientists have

Figure 3.--Locations of stations in the Benchmark Network and the National Stream Quality Accounting Network.

recently developed and reported upon special statistical techniques for detecting time trends in fixed-station water-quality data, and the techniques have proven successful for analyses of the constituents measured at the Benchmark and NASQAN stations.

Investigation of Acid Precipitation Induced Trends at Benchmark Stations

Because we lack long-term, nationwide data on changes in the quality of precipitation, the next best possibility is to detect changes in the quality of sensitive streams and lakes that can be attributed to historic changes in the acidity of precipitation.

Records from the Benchmark network are particularly appropriate for investigating atmospheric influences on water quality during the last decade because consistent sampling and analytical methods have been applied for a 15-year period at each station, and because the basins have been relatively unaffected by land-use change. Moreover, many of the Benchmark streams have a low capacity to buffer acids and would be expected to be sensitive to small changes in acid inputs.

Industrial emissions of sulfur dioxide are a major source of acidity in precipitation. Once emitted, the sulfur dioxide is converted to dilute sulfuric acid and transported in the atmosphere. Thus, one expected result of increases in acid rain would be increases in the sulfate concentrations of streams. In contrast, alkalinity is a measure of the capability of water to neutralize acid, and is, itself, reduced by the neutralization process. Hence, acid inputs would be expected to decrease alkalinity, especially where the initial concentration is low, as is typical in regions devoid of certain rock types, such as limestone and marble.

Figures 4 and 5 show the results of applying the new statistical techniques to detect trends in sulfate and alkalinity data collected over the past 10-15 years at Benchmark stations. An upward-pointing triangle or arrow indicates an upward trend in concentration, a downward-pointing triangle or arrow signifies a downward trend, and a black dot means no detectable trend. The statistical significance of the trends exceeds 80 percent at all sites noted with a triangle or arrow, and exceeds 99 percent at most sites. The numbers in Figure 4 show the percentage change in sulfur dioxide emissions (compiled by a contractor to the Environmental Protection Agency) between 1965 and 1980. States showing increased levels of emissions are shaded.

The stations in Figure 4 show that sulfate concentrations have tended to increase over the last 10-15 years over a broad area of the continental United States, extending from the Southeast to the mountain States and the Northwest. By contrast, stations in the Northeast have tended to show slight declines in sulfate concentrations. The overall geographical pattern is similar to that shown by trends in sulfur emissions to the atmosphere during the same period.

Figure 4.--Trends in flow adjusted sulfate concentrations at Benchmark stations, 1963-68 through 1981 (see text for explanation).

Figure 5.--Trends in flow adjusted alkalinity concentrations at Benchmark stations, 1963-68 through 1981.

Figure 5 shows that downward trends in alkalinity--suggesting increases in acid precipitation--greatly outnumber upward trends within a broad area from the Southeast to the Northwest. In contrast, alkalinity trends at the Benchmark stations in the Northeast are consistently upward, suggesting a decrease in the acidity of precipitation.

The determined geographical distribution of trends in sulfate and alkalinity are consistent with the reported sulfur dioxide emissions. In concert, the results suggest a decline in the acidity of precipitation in the Northeastern United States and an increase in acidity in most other regions. The results also indicate that the effects of relatively small changes in atmospheric emissions are observable as changes in stream quality--a point that, recently, has been the focus of considerable national debate.

The next step in our acid rain work is to try to quantify the relationship between sulfur emissions and stream chemistry. Knowing the quantitative relationship between the two types of historical data would help to predict what effects any future reductions in emissions might have on the receiving waters in sensitive regions of the country.

Trends at NASQAN Stations

Most NASQAN stations are located on large rivers to measure the quantity and quality of water moving from one major drainage basin to another. NASQAN data thus provide a regional and national picture of water quality in the major rivers of the country. About 55 water-quality constituents are measured for each NASQAN station, and, at present, sufficient lengths of record exist to support the testing of trends for 35 constituents. To briefly illustrate our work, I will describe recent results on trend analyses of chromium, fecal streptococci, and dissolved oxygen.

Figure 6 shows our trend results for chromium. Since 1975, chromium concentrations have undergone an upward trend at 30 stations. Most of these 30 stations are in the eastern half of the country, especially in the Ohio and upper Mississippi River basins, and, specifically, in some of the most heavily industralized areas of the Nation. We are now compiling data on chromium discharges to water for comparison to the observed trends, and possibly for linking these trends to the major industrial uses of chromium.

Figure 7 shows the results of trend analyses on fecal streptococci--a group of bacteria which are indigenous only to the digestive tract of humans and other warmblooded animals. Possible large sources of fecal streptococci to the environment include raw sewage, sewage treatment plant effluents, combined sewer overflows, and livestock feedlots. Significant trends are evident at 51 of the 261 NASQAN stations having a sufficient record length for analyses. All 51 trends are downward. The downtrends are so widespread that we initially thought they might represent a change in the method of analyzing for fecal streptococci. However, investigation of the history of

20-955 O—84——204

Figure 6.--Trends in flow adjusted total chromium concentrations at NASQAN stations, 1975 through 1981.

Figure 7.--Trends in flow adjusted fecal streptococci levels at NASQAN stations, 1974 through 1981.

fecal streptococci analyses by USGS indicates the data are sound and the trends, therefore, are real.

We first thought that the downtrends might reflect increases in the treatment of combined-sewer overflows. However, data from the Environmental Protection Agency's sewer grant "Needs Survey" indicate that significant improvements in the combined sewer overflow problem have yet to occur. In some urban areas, the downtrends possibly may reflect the upgrading of wastewater treatment plants which accelerated in the mid-1970's. At present we are testing this hypothesis with data from the Needs Survey.

Probably the most important factor in the observed downtrends of fecal streptococci has been a cleanup of agricultural runoff, especially feedlot runoff. During the mid- to late 1970's, EPA reduced the minimum size of animal holding operations which are required to meet pollution control regulations. As a result, there was a marked increase in the number of operations which now must control their effluents. Also, during the same period, dramatic changes took place in livestock populations as a result of changing market conditions. Most notable was the widespread reduction in beef cattle. Between 1974-1978, there was a net decrease of more than six million beef cows in the United States.

Trends in dissolved oxygen (DO) at NASQAN stations (Figure 8) show a markedly different pattern from fecal streptococci. Forty-five of 276 stations having sufficient data show a trend for the period 1974 through 1981. Of this total, 24 stations show a downward trend in DO deficit--an indication of decreased pollution--whereas 21 stations show an upward trend in the computed deficit, signifying an increase in oxygen-consuming wastes. As I will explain in the next section, NASQAN stations are located to fulfill specific goals other than determining compliance with water-quality criteria or the effectiveness of pollution-control programs. Thus, NASQAN stations are not ideally located to measure the effectiveness of Clean Water Act expenditures. Nevertheless, the results in Figure 8 suggest that DO has remained fairly constant in the major rivers of the country during the 1970's, at a time when both population and industrial production increased. This finding suggests that the Clean Water Act has had a positive effect on the quality of major rivers.

What Purposes Do The Benchmark and NASQAN Networks Fulfill?

I will end this brief discussion of the USGS Benchmark and NASQAN networks by reviewing the general purposes which the networks fulfill.

The following list includes most of the broad purposes for collecting water-quality data:

- Define near-natural baseline conditions.
- Define existing water-quality conditions.
- Detect trends and, therefore, possible improvements and emerging problems.

Figure 8.--Trends in flow adjusted dissolved-oxygen deficits at NASQAN stations, 1974-1981. Size of triangle corresponds to significance level of the trend test: all stations showing a trend have a significance level of at least 80 percent.

- o Compute the transported loads of constituents of concern.
- o Determine suitability for major uses.
- o Determine compliance with criteria and standards.
- o Determine effectiveness of pollution-control programs.

As previously noted, Benchmark stations are on headwater streams, in natural or near-natural basins; and most NASQAN stations are on major rivers, at the downstream ends of large drainage basins. Therefore, the USGS Federal Water-Quality Networks do not include a complete array of stations covering all stream orders, stream sizes, and homogeneous units of land use. Nevertheless, in combination, the Benchmark and NASQAN networks provide consistent data bases suitable for: (1) defining near-natural baselines, (2) defining existing water-quality conditions at sites which integrate flow in large river basins, (3) detecting trends, and (4) computing transported loads of important constituents such as suspended sediment, nitrogen, phosphorus, carbon, and dissolved solids. By fully or partially fulfilling these purposes, the networks also provide some information on the suitability of water for major uses. However, the design of the networks limits their usefulness for determining compliance with criteria and standards, and for directly ascertaining the effectiveness of pollution-control programs.

Because of its non-regulatory mission, USGS has never specifically designed water-quality networks or programs for meeting these two regulatory purposes. However, the programs which I will now describe are designed to elucidate water-quality processes and, therefore, are highly pertinent for understanding the causes and effects of pollution.

The Federal River Quality Assessment Program

In 1971, the Geological Survey's Advisory Committee on Water Data for Public Use recommended that the USGS develop and apply an approach for conducting intensive, cause-effect-interpretive studies of river-quality problems. The USGS responded by developing an approach which recognized that: (1) each river is physically and biologically unique, with unique water-quality problems and solutions, (2) intensive, applied studies can be conducted to provide a scientific basis for evaluating the effects of alternative water-resource management plans on river quality, and (3) if scientific results are to be used in decisionmaking, they must be effectively communicated to resource managers and to the public.

The first of a series of pilot, federally funded river-quality assessments (RQA's) was started in 1973 in the Willamette River Basin, Oregon. Subsequent RQA's have been completed on the Yampa River Basin in Colorado-Wyoming, the Chattahoochie River Basin in Georgia, the Schuylkill River Basin in Pennsylvania, the Apalachicola River in Florida, and the Potomac Estuary in Maryland and the District of Columbia. Each of these demonstration projects

was selected to address a markedly different hydrologic setting and a different set of problems in order to develop and test methods suitable for many unique situations.

The union of intensive interpretive studies to understand river-quality problems with communication of results to resource managers and the public has yielded gratifying returns.

In the case of the Willamette River, the maintenance of high-dissolved oxygen concentrations during summer low-flow periods was the the critical problem. At the time of the study, the dissolved oxygen concentrations in the river had been greatly improved through a highly successful waste-treatment program under which all point sources directly entering the Willamette received secondary treatment by 1972. However, dissolved oxygen levels in the river were still violating State standards in some locations during the low-flow summer season. The State was therefore faced with further costly upgrading of secondary treatment at municipal waste-water treatment plants, and, possibly, with the need for very expensive advanced waste treatment at some plants.

The Willamette RQA found that: (1) the major source of oxygen-demanding materials entering the river was ammonia from one industry, (2) further improvement of secondary treatment at municipal plants would have virtually no effect on dissolved oxygen levels, (3) flow augmentation would be needed to assure that dissolved oxygen standards would be met in the future, and (4) advanced waste treatment to decrease nitrogen and phosphorus concentrations in the river was not necessary to prevent algae blooms.

In December 1976, a Comptroller General's report to Congress entitled "Better Data Collection and Planning is Needed to Justify Advanced Waste Treatment Construction" stated that the Willamette RQA "may save several millions of dollars in Federal and State construction funding." In 1980, the USGS determined what use the State of Oregon had made of the RQA results. We found that the State had implemented all of the recommendations (Figure 9), and that predicted increases in dissolved oxygen concentrations had been achieved in the Willamette River.

Intensive River-Quality Assessments in the Federal-State Cooperative Program

Shortly before the close of the pilot RQA Program in FY 1981, USGS judged that the analytical approaches and methodologies for conducting RQA's were sufficiently well developed that future RQA's could be conducted in its Federal-State Cooperative Program. Following is a sample of river-quality assessments in progress during FY's 1983-1984:

- "Water-Quality Assessment of the Souris River within North Dakota"--to assess cause-and-effect relations between domestic sewage discharges and river-water quality for a reach of the Souris River just upstream from important marsh habitats which are managed for waterfowl production.

Figure 9.--Technical findings of the Willamette River Quality Assessment.

- "Jordan River Quality Study, Utah"--to study and evaluate the causes and extent of key water-quality problems in a 40 mile reach of the river near Salt Lake City. Key problems being investigated, as identified in cooperation with local officials, are dissolved-oxygen depletion, pathogens, turbidity, and toxic substances.

- "Water Quality Assessment of the White River, Indiana"--to determine the effect of new advanced treatment of municipal wastewater on dissolved oxygen in the White River downstream from Indianapolis.

- "Assessment of Nonpoint Sources of Pollutants for the Conestoga River, Pennsylvania"--to evaluate, over a ten-year period, the effects on water quality of Best Management Practices implemented in agricultural areas. Key pollutants being studied in both the river and adjacent ground waters include nitrate and pesticides.

A NEW PROGRAM FOR OBTAINING A NATIONAL PERSPECTIVE ON GROUND-WATER QUALITY

The Historic Approach

Unlike the NASQAN Program, wherein surface waters can be relatively easily monitored to provide information about regional changes in water quality, a national network for ground-water monitoring would be a costly and ineffective method of evaluating the status of ground-water contamination. Ground-water velocities are usually very small, and pollution of ground water tends to occur in slowly developing pockets around point sources of contamination or in shallow, slowly expanding zones beneath areas of nonpoint pollution.

Because of the nature of the emplacement process, the actual volumes of contaminated ground water tend to remain small for long periods of time in comparison to the total volume of ground water circulating through the earth. Thus, a monitoring strategy in which samples are collected from observation wells chosen for areal coverage would fail to detect most developing contamination problems until a great deal of damage had been done. Moreover, a simple monitoring effort, without prior analysis and interpretation, is virtually guaranteed to fail, if for no other reason than the directions of flow away from a contaminant source must be understood before an efficient monitoring program can be designed.

The alternative strategy to monitoring used by the USGS has been to study areas where point and nonpoint sources of pollution are known to be affecting ground-water quality. USGS has historically taken this approach in virtually all of its work related to ground-water contamination. The approach has yielded highly useful results for specific contaminated sites and, overall, has provided considerable knowledge of the hydrologic and geochemical processes which affect the movement of water and its constituents in different hydrogeologic settings.

However, in the late 1970's, the USGS evaluated the existing state of knowledge on ground-water quality and determined that the basic information was insufficient to deal with the emerging national problem of ground-water contamination. The Survey concluded that additional data, research, and applied studies were needed to better understand the increasingly complex effects of land use and waste disposal on ground-water quality.

The Toxic Waste/Ground Water Contamination Program

In response to the evaluation, the USGS created the Toxic Waste/Ground-Water Contamination Program, which, in FY 1984, is funded at $8.6 million.

The objective of the Toxic Waste/Ground Water Contamination Program is to provide the earth-science information needed by resource managers to mitigate the effects of waste disposal, storage, and spills on ground-water systems, and to improve future waste-disposal practices. To fulfill this purpose, the USGS is:

- Conducting research into the physical, chemical, and biological principles governing ground-water contamination;
- Conducting regional and national appraisals of ground-water quality--with emphasis on trace organic substances and trace metals;
- Assisting Federal and State agencies in the development of guidelines and standards for managing the disposal of hazardous wastes. This assistance will be provided as requested and will consist of advice in the technical aspects of waste management.

I want to describe the regional and national appraisals of ground-water quality (the second element) in some detail because recent USGS studies have identified a pervasive lack of data on the occurrence and distribution of organic substances and trace metals in ground waters. Thus, no definition of a national baseline for organics and trace metals is presently available, nor is there any way to make reasonable estimates of the extent of or trends in ground-water contamination from these substances. Consequently, few answers are available to the questions of "How much or how badly are our ground waters contaminated?" and "Are they getting better or deteriorating?"

Over the past year, USGS put its best ground-water scientists to the task of developing an approach for obtaining national and regional perspectives on ground-water quality, with emphasis on organic substances and trace metals. Rather than the monitoring of a national array of wells at fixed time periods, the developed approach is based on the intensive appraisal of individual areas

that are representative of larger regions in terms of climate, hydrogeology, and human activities. The major aspects of the new approach are:

- Representative areas of investigation will be selected based on climate, physiography, geohydrology, land use, and population. Typically, these areas will range from tens to hundreds of square miles, be of relatively uniform, well-defined hydrogeologic character, and contain one or more subareas where a single land use predominates.

- Design of the sampling network for each study area will be based on the hydrogeologic setting, ground-water flow conditions, and land use. Most samples will be collected from shallow aquifers--the systems most susceptible to surface sources of contamination.

- Interpretations will be made concerning the current state of the shallow aquifer systems underlying the different land uses. In conjunction with ground-water models, interpretations will be made of sources of organic and trace metal contaminants, the surface and subsurface avenues of contaminant migration, and the factors affecting contaminant concentrations.

- Additional, periodic sampling will be planned at intervals ranging from one to a few years, depending on the system, to help establish trends and a long-term data base for interpretation in future decades.

- As studies end, new ones will begin.

Over a period of years, information on ground-water conditions on enough specific study areas will become available to extrapolate the information to the regional level. At some point, yet unknown, the regional level information will be adequate to permit extrapolation to the national level. At this point, USGS will answer the questions of "How badly are our ground waters contaminated?" and "Is the contamination problem getting better or worse?"

COMMUNICATION OF INFORMATION AND FINDINGS

The Geological Survey has several mechanisms for conveying the results of its water-resources programs to elected officials, State and Federal resource management agencies, university and private researchers, and the general public. First, the Survey has its own formal publication program which includes Water Supply Papers, Professional Papers, Circulars, and Hydrologic Atlases. In addition, Survey scientists publish articles in various professional journals. Second, the Federal/State Cooperative Program provides an excellent mechanism for the transfer of study results. Presently, the Survey has over 800 water-resource cooperators at the State, regional, and local level; each of these cooperating agencies is regularly in contact with our State offices concerning ongoing projects. Third, on behalf of the Department of the Interior, the Survey officially coordinates the water-data acquisition efforts of all Federal agencies. Since 1964, under the authority of OMB Circular A-67, the Office of Water Data Coordination of USGS has coordinated this vital Federal activity through two advisory committees--the Interagency Advisory Committee on Water Data (Federal) and the Advisory Committee on Water Data for Public Use (non-Federal). The membership of each committee provides a pipeline for bringing results of programs to all sectors of the field of water resources. Lastly, the Survey frequently has the opportunity to brief Congressional committees on its programs. We welcome all such opportunities and thank you for your attention today.

Mr. ROE. Please proceed.

TESTIMONY OF PHILIP COHEN, CHIEF HYDROLOGIST, U.S. GEOLOGICAL SURVEY, DEPARTMENT OF THE INTERIOR.

Mr. COHEN. Thank you, Mr. Chairman.

I am pleased to have the opportunity to describe this morning some of the highlights of the U.S. Geological Survey's water-quality programs. We have provided a detailed statement of my testimony for the record, and with your concurrence, I would like to briefly summarize that statement.

The USGS has been studying the water resources of the Nation for over 100 years. The Survey has neither regulatory nor development authority; instead, the water-related mission of the bureau is to provide the information and understanding by other agencies to develop, manage, and regulate the Nation's water resources.

The Survey's program in water quality includes data collection, research, and problem-oriented interpretive studies. In fiscal year 1983, water-quality activities accounted for nearly $100 million of the total funding of about $200 million for the Survey's water programs.

In this statement, I will briefly describe some aspects of the USGS's water-quality programs, emphasizing in particular recent findings on acid rain and quality of the major rivers of the Nation.

The USGS has become increasingly involved in the water-quality activities for the past 20 years or so, and in particular during the past decade, we have initiated new or accelerated efforts in acid rain and toxic waste ground-water contamination through research on physical, chemical, and biological processes, interpretive studies, and data collected in two federally funded water-quality monitoring programs, our benchmark program and our so-called Nasquan program, the national stream quality accounting network.

The benchmark network is composed of 52 small drainage basins which encompass a wide variety of natural hydrologic environments throughout the Nation. These basins are in nearly natural state, with little human influence and little likelihood of future development. Thus, this network is designed to answer such questions as: What is the hydrology and water quality in small basins which are in near-natural state, with little or no within-basin changes in land use? What long-term trends can be detected? And what are the causes of such trends?

For example, based on data from the benchmark network, we have found that trends in sulfate and alkalinity in small streams are consistent with trends in sulfur dioxide emissions in the United States for the period 1965 through 1980. Most interestingly, in the Northeast, sulfur emissions have decreased, and the computer trends in stream data are consistent with slightly decreased concentrations of sulfuric acid in precipitation and a resulting slight recovery of stream-buffering capacity. In other words, Mr. Chairman, we have seen slight improvements in the acidity problem in the Northeast of the United States. In contrast, however, sulfur emissions have increased in the Western Central and Southeastern parts of the country, and we note slight increases in the sulfate content of the receiving waters and slight decreases in alkalinity.

In contrast to the benchmark stations, most USGS Nasquan stations are located on large rivers to measure the quantity and quality of water moving from one major drainage basin to another. In this way, we account for measuring approximately 90 percent of the streamflow of the Nation. Nasquan data thus provide a regional and national picture of water-quality of the major rivers of the country. About 55 water-quality constituents are measured at each station. At present, we have data to detect trends in about 35 constituents.

To briefly illustrate our work with Nasquan data, I would like to describe some results involving fecal streptococci and dissolved oxygen.

Fecal streptococci is a group of bacteria which are indigenous only to the digestive tracts of humans and other warmblooded animals. Possible large sources of these bacteria include raw sewage, sewage treatment plant effluents, combined sewer outflows, and livestock feedlots. In a recent analysis, we have found significant trends in fecal streptococci at 51 of 260 stations examined. Most importantly, all 51 trends were downward. Probably the most important factor of the observed downward trends has been a cleanup of agricultural runoff, especially feedlot runoff. During the mid- to late-1970's, EPA reduced the minimum size of animal-holding operations which is required to meet pollution-control regulations. As a result, there was a marked increase in the number of operations which now must control their effluent. Also during the same period, there was a significant decrease in livestock populations, as a result of changing market conditions.

Trends in dissolved oxygen at Nasquan stations show a markedly different pattern from fecal streptococci. In a recent study, 45 of 276 stations having sufficient data showed a trend for the period 1974 through 1981. Approximately 50 percent of these stations showed increasing dissolved oxygen trends, and approximately 50 percent showed decreasing dissolved oxygen trends. These results suggest that dissolved oxygen appears to have remained fairly constant in major areas of the country during the 1970's at a time when both population and industrial production increased. These findings, in turn, suggest that the Clean Water Act has had a positive effect on the quality of the Nation's major rivers.

With regard to ground-water quality, an issue that has been receiving almost explosive attention in the past 5 years or so, in the late 1970's, the Survey developed a toxic waste ground-water contamination program, which is now funded at a level of about $8.6 million. The objective of this program is to provide some of the earth science information needed by resource managers to mitigate the effects of waste disposal, storage, and spills on ground-water systems and to improve future waste-disposal practices.

This year, we began new research studies at three field sites as a result of this program, having documented histories of ground-water contamination dating back a few years to several decades. These include studies of an oilspill near Bemidji, Minn.; chemical contamination from wood-treatment products at Pensacola, Fla.; and contamination of ground-water by sewage and trace metals on Cape Cod, Mass.

In addition to these research efforts, we are studying the processes associated with ground-water contamination on a regional and national scale. The objective of this element of the program is to assess the quality of the Nation's ground water, emphasizing organic contaminants and trace metals. This would be done by intensive studies of individual areas that are representative of larger regions in terms of climate, ground-water hydrology, and human events.

Finally, the third element of our toxic-waste ground-water contamination program involves assistance to State agencies in the development of guidelines for managing hazardous waste disposal. It includes determining the information needs of States for proper siting of hazardous waste disposal facilities; identifying specific states for coordinated studies; and conveying developed information to State officials.

That concludes the summary of my formal statement, Mr. Chairman. I would be glad to respond to questions.

Mr. ROE. We want to thank the gentleman for his testimony. Would you give us a little of your observations of any work you are doing on acid rain? I note you spoke to that in your formal testimony.

Mr. COHEN. The USGS is one of 14 agencies participating in the interagency task force on acid rain. In that context, we have the lead in the development and managment of a national trends network. When the network is completed, which will be at the end of this fiscal year, we will be managing a network of 150-some-odd precipitation stations, primarily for water chemistry.

Additionally, we are doing research on methods and processes associated with the movement of acidified water through the hydrologic cycle. As I alluded to in my testimony, we are now intensively evaluating long-term data—data collected at long-term networks, especially the Nasquan network. That data has recently been published in a number of articles; it has been referred to by the National Academy of Sciences, among other. Again, as I indicated in my testimony, it demonstrates some rather interesting and, we think, some rather important results—namely, that during the past decade or so, there seems to be a slight improvement in the acidification of the Nation's lakes and streams in the Northeastern part of the United States, and this seems to correlate well with decreases in emissions as a result, in part, of activities of the Federal Government, and State, and local governments. So this seems to provide some encouragement to the Nation that we can, in fact, define the problem and begin to manage it.

Mr. ROE. Are there any questions of the gentleman?

The gentleman from Nebraska.

Mr. DAUB. Thank you, Mr. Chairman.

Mr. Cohen, what is the relationship, if it can be briefly described, between USGS and EPA?

Mr. COHEN. We have been working closely as sister agencies with EPA since the EPA was established. We have a host of formal and informal relationships, including the coparticipation in the interagency task force on acid rain. We have major water quality laboratory facilities, as does the EPA and we participate in joint quality-control procedures to assure that both laboratories are using

consistent methodology. We do a great deal of work for the Environmental Protection Agency in support of the Clean Water Act. We have conducted and continue to conduct investigations, for example, in the so-called 208 studies, which involve nonpoint sources of pollution. We have conducted about a dozen or so studies funded by the Environmental Impact Agency and their national urban runoff program.

So we have both formal and informal relations with the Environmental Protection Agency and their national urban runoff program.

So we have both formal and informal relations with the Environmental Protection Agency and their national urban runoff program.

So we have both formal and informal relations with the Environmental Protection Agency in all aspects of scientific hydrology.

Mr. DAUB. To reiterate, if I missed it, which are formal?

Mr. COHEN. By "formal," I am referring to exchange of documents and funding to conduct various projects. They include those that I have just mentioned. Informal relationships involve coordinating committees by which we consider on a quarterly basis, and more frequently, issues of common concern, development of methodology, the state of the science, and so on.

Mr. DAUB. You are familiar with the Comptroller General Reports?

Mr. COHEN. Some of them, sir.

Mr. DAUB. There were some interesting observations, at least, on the summary pages. In April of 1981, the General Accounting Office Report was highly critical of water quality monitoring techniques being used to assess the quality of our rivers and streams.

How would you evaluate current water quality monitoring efforts?

Mr. COHEN. There are a whole host of water quality efforts, Mr. Congressman, including the two networks I mentioned that we operate—the NASQAN and the Benchmark Network. Additionally, we conduct about 1,000 projects per year in cooperation with State and local agencies. Roughly 50 percent of those are addressing water quality. It is debatable as to whether one can define such activities as water quality monitoring, but they contribute to our understanding and knowledge of the chemistry of the Nation's waters and changes therein.

Mr. DAUB. What is your reaction to the summary that—and I quote—"Water quality is far too complex to be monitored by these networks. Small samples, generally taken monthly, cannot account for water quality at individual sites, and cannot accurately represent other locations on the same river. Nationwide reports based on data from networks are not reliable." And it finishes: "Special studies of individual rivers or river segments would yield more scientifically sound and useful information on water quality. The Environmental Protection Agency and the Geological Survey should stop using their networks and shift their resources and attention to a program of well-managed special studies."

Mr. COHEN. We provided much information, as you might imagine, Mr. Daub, to the GAO, from which they based those conclusions. That work was completed, I believe, toward the end of fiscal

year 1980. We took very strong exception to that report for the following reasons. It has been our experience that a mix of network-type monitoring, such as the two that I have described and others that are now ongoing, and intensive river quality assessments of the type advocated by the General Accounting Office are in the best interest of the United States.

As a matter of fact, we pioneered, if I might say, the development and application of the methodology advocated by GAO; namely, intensive river quality assessments. We have conducted such assessments, published the results thereof, and concluded that they are extremely valuable and needed as part of the nation's monitoring efforts.

Mr. DAUB. I am not being critical at all, but rather am asking maybe in a way for your opinion, so the record is more balanced than what many Members of Congress may read; and secondly, I am just trying to figure out if you have an opinion about how we might be doing what we are doing better than we are right now.

Mr. COHEN. Well, short of saying more of the kinds of things we are doing, we think—and again, in response to your earlier question, I understood you were not being critical—we truly think that a mix of fixed-monitoring networks and intensive river quality assessments are, in fact, in the best interest of the Nation.

We have some serious reservations, however, about the level of work ongoing and the level of work required. Clearly, additional work and additional information over and above that which we have described would be useful to this committee and others who need to make decisions. The critical question, however, is the pace at which we go about doing this additional work. As a result of our activities—and again, I know I read quickly—we are seeing some slight and subtle trends, and these slight and subtle trends are the only clues we have as to the effects of major programs that have been in place over the last decade. We think continued, very slow, very deliberate, perhaps modestly expanding efforts of this type throughout the scientific community, both within the Federal Government and in the private sector and at the State and local levels, of the type that is now ongoing, are appropriate. We are rather frustrated that we cannot come before this Committee and tell you that these are the results of the construction activities or water pollution activities that have been ongoing for the past 10 years; here are the scientific data; this is what we have seen.

GAO points out correctly that what we see is rather subtle and is subject to scientific debate and criticism, and this debate is ongoing right now. We are participating in the debate, along with our sister agencies and others, from a theoretical point of view, and we are beginning to contribute bits of data, bits of information in published form—open to all—to begin to critique what we are doing and what the entire water community is doing.

Mr. DAUB. Thank you very much. I appreciate your testimony. I found it interesting and helpful to me. And I would like personally to conclude by asking you about a subject of most special interest to me, and that is, nonpoint source pollution, because of my farm community, and try to develop that a little better in the record. You have a summary of what you have done so far on that issue—

you mentioned it a moment ago—and I would appreciate it, and I am sure the committee would, as well.

Thank you, Mr. Chairman.

[The following was received from Mr. Cohen, U.S. Geological Survey:]

INFORMATION COLLECTED BY THE U.S. GEOLOGICAL SURVEY RELATED TO NONPOINT SOURCES OF POLLUTION

Although USGS is not a regulatory agency and has no direct responsibility for administering or enforcing any Federal regulations designed to control contamination of water resources by nonpoint sources of pollution, WRD collects a large amount of data and information related to the identification and management of nonpoint sources through its various programs including the Federal/State Cooperative Program, agreements with other Federal agencies including the U.S. Environmental Protection Agency (EPA), and the Federal program of water quality monitoring and research.

Programs conducted by USGS often provide the framework for water resources managers to determine the best courses of action to control nonpoint sources of pollution. In the last 10 years, USGS programs which have contributed most to the description and assessment of nonpoint pollution include Federal/State Cooperative Program studies stimulated by the requirements of Section 208 of the Federal Water Pollution Control Act Amendments (PL 92-500), the National Urban Runoff Program (NURP) operated by EPA consisting of 23 studies of which USGS participated in 11, additional urban runoff studies not part of NURP amounting to 13, the Coal Hydrology Program operated by USGS in coal-producing States, numerous studies of acid-mine drainage pollution funded largely through the USGS Federal/State Cooperative Program, the River Quality Assessment Program (RQA) and subsequent Federal/State Cooperative Program studies patterned after the Federal demonstration studies, and the ongoing monitoring of water quality in major rivers and relatively-pristine streams conducted through the National Stream Quality Accounting Network (NASQAN) and the Hydrologic Bench-Mark Program (HBM), both of which are federally funded.

The estimated total expenditures since fiscal year 1972 for studies related to nonpoint sources of pollution, exclusive of the Federal water quality monitoring program (NASQAN) and HBM), are $193M. These expenditures funded studies of acid mine drainage, irrigation return flows, urban runoff, pollution from agricultural wastes of various kinds, and other nonpoint pollution effects. Descriptions of these programs follow.

THE FEDERAL/STATE COOPERATIVE PROGRAM

The Federal-State Cooperative Program is the cornerstone of data collection and water-resources appraisals at the local, State, and regional level. This program is a partnership for water-resources investigations between USGS and State and local agencies. The principal objectives are: (1) to collect, on a systematic basis, data needed for the continuing evaluation of the quantity, quality, and use of the Nation's water resources, and (2) to conduct analytical and interpretive appraisals describing the availability and the physical, chemical, and biological characteristics of surface and ground water.

Under the Federal/State Cooperative Program, WRD provided assistance to many States in formulation of area wide waste treatment management plans as required under Section 208 of PL 92-500.

COAL HYDROLOGY PROGRAM

Projects within this program are designed to provide the water data and hydrologic information needed to evaluate the effects of mining and reclamation on streams and aquifers to aid in the leasing of Federal lands and permitting of coal mining nationwide. One of the accomplishments of this program is the development of prediction basin models to simulate the effects of various mining and land-use changes in the hydrologic system in several States. Since fiscal year 1972, estimated expenditures in 367 coal hydrology studies, including the Federal and Federal/State Cooperative Program, are $112M.

20-955 O—84——205

NATIONAL URBAN RUNOFF PROGRAM

This USGS/EPA coordinated program had the general objective to provide local managers with urban-hydrology data and methods of analysis suitable to support management decisions. More specifically, the objectives were:

1. To establish a consistent and accessible data base for typical urban watersheds in each study area. Data consist of rainfall, runoff, water quality, and other environmental factors.
2. To determine the magnitude and frequency of storm runoff loads of water-quality constituents from typical urban watersheds.
3. To develop methods for estimating storm and annual loads of water-quality constituents for unsampled watersheds in each urban-study area, and to identify pollution sources.
4. To test the effectiveness of storm-water management alternatives such as street sweeping and detention storage.
5. To determine base needs and to evaluate methods of transferring the data to ungaged watersheds in other regions.

As noted earlier, a total of 23 studies were carried out under this program, of which USGS was a key participant in 11. Coordination of other urban hydrology studies is continuing. Estimated expenditures in the Urban Hydrology Program since fiscal year 1972 by USGS are $6.0M. Total expenditures for 276 studies of effects of urban area pollution sources on surface and ground water are estimated to be $57M.

RIVER QUALITY ASSESSMENTS

In 1971, the Geological Survey's Advisory Committee on Water Data for Public Use recommended that the USGS develop and apply an approach for conducting intensive, cause-effect interpretive studies of river-quality problems. The USGS responded by developing an approach which recognized that: (1) each river is physically and biologically unique, with unique water-quality problems and solutions, (2) intensive, applied studies can be conducted to provide a scientific basis for evaluating the effects of alternative water-resource management plans on river quality, and (3) if scientific results are to be used in decisionmaking, they must be effectively communicated to resource managers and to the public.

The first of a series of pilot, federally funded river-quality assessments was started in 1973 in the Willamette River Basin, Oregon. Subsequently, RQA's have been conducted on the Yampa River Basin in Colorado-Wyoming, the Chattahoochie River Basin in Georgia, the Schuylkill River Basin in Pennsylvania, the Apalachicola River in Florida, the Potomac Estuary in Maryland and the District of Columbia, and the Carson-Truckee River Basin in Nevada-California. each of these demonstration projects was selected to address a markedly different hydrologic setting and a different set of problems in order to develop and test methods suitable for many unique situations.

Shortly before the close of the pilot RQA program in fiacal year 1981, USGS judged that the analytical approaches and methodologies for conducting RQA's were sufficiently well developed that future RQA's could be conducted in its Federal/State Cooperative Program. In fiscal year 1982, 33 RQA-type studies were conducted as part of the cooperative program. In fiscal year 1983, seven well developed studies were underway.

NATIONAL WATER-QUALITY NETWORKS

A major contribution of the USGS Federal program to the identification and assessment of nonpoint sources of pollution is the water-quality data acquisition activities carried out in the HBM program and NASQAN.

The hydrologic bench-mark program

The hydrologic Bench-Mark Program grew out of a proposal on 1962 for a national network of hydrologic bench marks, chiefly for the purpose of the study of time trends and to serve as controls for separating natural from artificial changes in other streams. The purposes of the HBM are to provide consistent data on the hydrology, including water quality and related factors in representative undeveloped watersheds nationwide, and to compare and contrast conditions observed with basins more obviously affected by the hand of man.

Beginning in 1963, the program was built to 57 sites by 1970 with few changes since that time. Sites are located in areas where (1) no manmade storage, regulation, or diversion currently exists or is probable for many years, (2) ground water

within the basin is not affected by pumping from wells, (3) conditions are favorable for accurate measurements of streamflow, chemical and physical quality of water, ground-water conditions, and the various characteristics of weather, principally precipitation, and (4) the probability of special natural changes due to such things as major activities of beavers, overgrazing or overbrowsing by game animals, or extensive fires is small.

NASQAN was created to fill a need, recognized widely in the late 1960's and throughout the 1970's for a consitent national data base for examing conditions and trends in river water quality. The network was begun in fiscal year 1973 with 50 stations and implemented gradually to full level in fiscal year 1979 with 518 stations. Since that time, adjustments in the network have been made to meet budget constraints and to eliminate stations which were not in adherence with the program objectives. Currently, there are 502 stations in active operation.

The objection of NASQAN is to obtain information on the quality and quantity of water moving within and from the United States in way that will permit description of areal variability and detection of changes in stream quality and lay the groundwork for future assessments of stream quality. NASQAN stations are located at the downstream ends of hydrologic accounting units which ranged in drainage area from about 3.4 square miles to about 1.4 million square miles. The median drainage area is about 3,500 square miles. Sites are located such that 90 percent or more of the water originating in the accounting unit flows by the station. For the most part, water samples are collected monthly and analyzed for a comprehensive suite of chemical constituents including major ions, the biological nutrients, and trace metals. Until fiscal year 1982, USGS cooperated with EPA in the collection and analysis of water samples at about 153 NASQAN stations for selected pesticide residues. That program was discontinued after fiscal year 1981. Plans are now being formulated to resume sample collection and anslysis for pesticides and a number of other organic compounds within the NASQAN program.

In addition to the ongoing NASQAN and HBM programs, from 1974 through 1981, USGS operated a National Water Quality Surveillance System (NWQSS) for EPA. This network consisted of 130 sites located upstream and downstream of major nonpoint pollution sources such as urban areas and major agricultural areas. The objective of this program was to assess the nature and extent of pollution from these areas. Samples were collected every 2 weeks over the period of the program.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

You mentioned just a moment ago that you felt that one of the things that we ought to do more of is to improve and increase our monitoring systems. All during this week's testimony, we have heard how difficult it is to assign responsibility for pollution, both in terms of nonpoint and point sources. This is particularly true in agriculture. One farmer may put into the water more nutrients and more pollution than another, and it would be very difficult to monitor each farm or each area of agriculture. And it is true also in industry, in many cases. It is difficult to monitor the input that different industries put into the system.

How do you propose, or do you have proposals of how to improve and increase that monitoring system to where assigned responsibility could be allocated, justifiably? Can this be done without looking upon the Federal Government or State agencies to take the burden of financing and implementing various remedial measures? Does the fact that we do not have a good monitoring system whereby we can assign the responsibility to communities, to industry, to farms necessarily mean that we cannot develop one that operates independently of governmental financing?

Mr. COHEN. From a scientific point of view, Mr. Congressman, I would state, as I tried to before, that this is something that we need to do very carefully and very deliberately. It is very, very expensive to establish major networks to measure water quality.

The amounts of data that are being collected are enormous, and over the past several decades, as the data collection efforts have accelerated, we have found many, many players becoming involved, as is the case with the Geological Survey, in the collection and analysis of water quality data. We and virtually all of our colleagues in the scientific community are very frustrated with the problems associated with inconsistent methodologies from time and place, within agencies using different techniques, these techniques changing—simple matters of not recording the type of change and when it occurred. We do subtle-trend analyses. We have difficulties in determining whether we are, in fact, seeing real trends or simply seeing changes in methodology.

So I think the debate that is going on now at the Government level and in the scientific community as to how—which is the response to your question, in essence—is one that is healthy. I think the EPA approach has been to delegate substantial responsibilities for monitoring down to State and local levels. Significant data bases have been developed. Those data bases are just now being examined from a regional and national point of view, and it remains to be seen whether or not we ought to continue in that direction, accelerate those types of activities, or pause for a moment and reflect on what we are looking at.

My answer to your question has not been as sharply focused as I know you would have wished. But the point I want to make is that it is an extremely complex issue, one that has tremendous payoff in both the short and intermediate term. The Congress and others will need to make decisions based upon the results of certain actions that have been taken, and I think it behooves us to be very, very careful in terms of making sure that the information we can provide you from a scientific point of view is, in fact, real and valid and acceptable.

Again, I would urge a very deliberate and careful debate of the type that is going on right now. Incidentally, I understand that Congress is now in the process of considering some legislation which would establish or might establish a mechanism at the Federal level to review this entire issue of monitoring.

Mr. PACKARD. Let me ask a followup question on that. In your judgment, which is the better way for Federal funds to be utilized, on an expanded network of monitoring devices and systems, or funding remedial antipollution techniques? Or should there be a mixture of the two? Where would you get the most for your dollar?

Mr. COHEN. I think you must have a mix there. Monitoring is necessary to define the problems and help define the remedial techniques that will be employed. Thereafter, one must monitor at some reasonable degree of specificity to determine whether, in fact, we are achieving the results that we have attempted to achieve by funding major projects.

A carefully designed monitoring and interpretation program, I think, is vital to both defining the problem and defining the method of attacking the problem.

Mr. PACKARD. What role do you think that the Congress ought to play in developing a monitoring system—should that be something that we mandate, that we regulate, and to what extent should we be involved?

Mr. COHEN. I think clearly, a monitoring system has been, is, and should continue to be in part a Federal responsibility. There is a Federal role to be played. Witness the fact that with regard to agencies such as mine and EPA, our mandate and our funding derives from congressional actions. I welcome the fact that Congress is paying an increasing interest into the issue of monitoring, and as I indicated before, I understand legislation is being introduced that would further define the role of Congress in a monitoring program. And I personally welcome that initiative on the part of the Congress.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. ROE. I want to thank our witness for his input. It seems to me that fundamentally, we are going to determine one of two things. When you speak of monitoring, you are talking of monitoring as we are progressing alone, and not only for short and long range. But if we are going to determine whether the investment of $100 billion is made properly, somebody ought to be doing something about making those determinations on a scientific basis rather than—without being facetious—checking with the fish. I mean, somebody has got to know what is happening out there, and it is not obvious to the naked eye.

Are the results we receive commensurate with the investment we are making. I think that is what you are saying, in part.

Mr. COHEN. Yes, sir.

Mr. PACKARD. Would the chairman yield on that, just for a moment longer?

Mr. ROE. Of course.

Mr. PACKARD. And maybe I can respond in a question. Is there thought being given to the role that industry and agriculture ought to be playing in this monitoring system, or should it simply be a Federal responsibility for monitoring and establishing the regulatory measure of monitoring? Could or should there be also an overlap in terms of requiring industrial and other polluters to self-monitor? I would like a response on that, also. How should the Federal role and the private sector's role in monitoring be balanced?

Mr. COHEN. Certainly, industry has demonstrated the capacity to do water quality monitoring at the same level or better than any other entity in the country. So industry could and should play a major role in water quality monitoring.

I have no views, no personal views, as to what an appropriate balance would be between all of the entities that should be involved in the monitoring programs. But I would agree with the implication of your question, that the requirement for such a program and magnitude of the program is such that all capable entities, both public and private, should be involved. And thus, as I indicated earlier, I welcome congressional concerns about how to put that package together.

Mr. ROE. The gentleman from Georgia.

Mr. ROWLAND. Thank you, Mr. Chairman.

Along that same line, what part do you think the States should play in doing this in relationship to the Federal Government; should funds go from the Federal Government to the States to help them, or should the Federal Government be more involved, actively, itself to the exclusion of the States?

Mr. COHEN. Traditionally, the States have played the dominant role in the collection of water quality data, and they continue to play that role. It would seem to me that that is the thrust of the direction in which the country has been going, and I think most of my colleagues would concur that that is an appropriate thrust. But somehow, the Federal Government has to continue to develop its role of coordinating these activities. In fact, in various programs, the Federal Government helps fund these activities. A very simple and straightforward matter such as insuring consistency in the methods by which data are collected, analyzed, and stored would be a significant contribution that the Federal Government probably is uniquely qualified to make, in view of the fact that there is some usefulness in looking at this from a national scale.

But the States are playing a major role in collecting the data, and in all likelihood will continue to play such a role.

Mr. ROWLAND. Thank you.

Thank you, Mr. Chairman.

Mr. ROE. Thank you very much, Mr. Cohen, for your valuable testimony, and we may have a few other questions, but we will get back to you on it.

Meanwhile, thank you very much for being with us this morning.

Mr. COHEN. Thank you, sir.

Mr. ROE. Our next witness is Mr. Alvin Myers, manager, Governmental Relations Division, Pennsylvania Farmers Association, representing the Pennsylvania Farmers Association Coalition of Soil Conservation Interests in Pennsylvania.

The committee wants to welcome Mr. Myers to our hearing this morning.

Would you introduce Mr. Swartz, who is accompanying you, for the record?

TESTIMONY OF ALVIN MYERS, MANAGER, GOVERNMENTAL RELATIONS DIVISION, PENNSYLVANIA FARMERS ASSOCIATION, ACCOMPANIED BY PAUL SWARTZ, EXECUTIVE SECRETARY, PENNSYLVANIA SOIL CONSERVATION COMMISSION

Mr. MYERS. I will.

I wish to thank the chairman for the opportunity to testify here today. As you indicated, my name is Alvin Myers. I am the manager of the Governmental Relations Division of the Pennsylvania Farmers Association and the Pennsylvania Farmers Association is affiliated nationally with the American Farm Bureau Federation.

I have with me Mr. Paul Swartz, who is executive secretary of the Pennsylvania Soil Conservation Commission.

My testimony today is on behalf of a coalition of conservation, agriculture, legislative, and municipal groups in Pennsylvania, and I believe you have the list of that group submitted to your committee.

Our testimony today will relate to agricultural solutions to the Chesapeake Bay problem, in addition to clean water on a national basis.

Our comments today will illustrate that the two most important nonpoint problems in the agriculture area are soil erosion and nutrient management. A number of successful programs have been

initiated in the last few years that show promise as important implementation tools to reduce losses from erosion and excess nutrients. Studies such as one recently completed in Pennsylvania, titled "An Assessment Agricultural Nonpoint Source Pollution in Selected High Priority Watersheds in Pennsylvania," are important tools to direct implementation strategies and should be continued where needed in other priority watersheds that have not yet been studied. This type of information provides a solid foundation by which to design effective implementation programs.

We will also outline a number of needed initiatives that will require financial support from Federal, State, and local sources if the nonpoint source pollution program is to move in a forward direction. The organizations endorsing this testimony all urge the Congress of the United States to consider these suggestions in the overall strategy to provide a continuing planning and implementation program as part of the Clean Water Act.

We oppose any effort by Congress to mandate specific cultural practices for agriculture, for a number of reasons. The wide range of available alternatives is almost proof in itself that no one cultural practice is applicable to the diversity of American agriculture. Legislation of particular practices locks us into a past or possibly a present state-of-the-art control mechanism and does not provide the opportunity for newer, more effective, or more economic technologies to be applied in the future. Virtually no recommended solution will work under all circumstances because of the variation of rainfall, soil structure, and topography that is characteristic of American agriculture.

Had terracing been mandated in the past as a solution to a farmer's nonpoint-source problems, new technologies would not be developed to their present state. We would have been regulated into a more energy-intensive soil-moving program that would have been more costly, more difficult to implement and extremely burdensome.

In order to make the nonpoint-source program more effective and more responsive to the individual needs of landowners throughout this country, a number of solutions have been discussed and are supported in Pennsylvania.

One, more funding is needed to allow the continued targeting of technical and financial resources that would be above the current baseline program and not to offset losses from regular program funding. This targeting can allow for a concentrated effort by more efficiently using available dollars.

Two, special programs need to be developed to address the nutrient problems which can be on the order of special ACP projects or other experimental projects. And I might add in the current ACP projects, the USDA lists erosion control as top priority, and we believe perhaps an upgrading of priority of water control or water quality may be appropriate to consider.

Three, additional research is needed by land-grant universities to provide improved soil testing, plant tissue testing, and manure testing to allow farmers to apply only the nutrients required for crop growth.

Four, better information and educational programs are needed that will demonstrate to farmers the economic benefits of conserva-

tion measures, especially where excess nutrients are being applied above what is actually needed for plant growth. Substantial savings could result by reducing chemical fertilizer applications and using the nutrient benefits of manure.

Five, demonstration projects are needed to show how conservation tillage systems and other low-cost management practices can reduce soil losses and nutrient losses without large investments by cash-poor farmers. Demonstration projects would provide farmers and ranchers an opportunity to gain firsthand knowledge of the methods of runoff reduction, potential impacts on yields, costs of production, special skills required, likely management problems, and future profitability of the operation.

Where demonstration projects have been used as educational tools in the Corn Belt, conservation tillage has been well accepted, particularly so where hands-on experience with equipment has been provided. We believe that this trend could be continued in other regions and that farmers and ranchers would adopt other good best-management practices, BMP's, if appropriate demonstration programs could be developed.

Six, new innovative methods are needed to utilize manure; a system that would provide a marketing outlet for excess manure, community-type methane-generation systems, and spray irrigation of digested manure can all play an important role in utilizing a waste product as an economic benefit for farmers.

Seven, an important part of any accelerated program for installing best-management practices has to include a monitoring element that will clearly document the progress that is made and show changes in water quality so that ineffective BMP's can be discarded and successful BMP's can be maximized in the most cost-effective way.

The Clean Water Act has been an important tool from the Federal level to provide a focus on all water-quality problems throughout the country. It especially has provided incentives to recognize and address sources of water pollution from diffuse runoff from nonpoint sources.

In summary, we believe our remarks provided some insight into the nonpoint source pollution problems across the country and specifically as this program applies to the State of Pennsylvania. Our comments attempted to describe the problems that we can presently identify. We are providing additional information as an appendix to our testimony that describes current issues and problems as well as programs that have been addressing nonpoint-source pollution in the past and present.

We appreciate the opportunity to present our views on this subject to you today, and we would be happy to answer any questions that you have.

Mr. ROE. We want to thank you very much for your substantive testimony.

Let me ask you just one question. You mentioned in paragraph 3 on your first page, and I quote: "We oppose any effort by Congress to mandate specific cultural practices for agriculture for a number of reasons."

We have had a thread of testimony over the last 2 days that has spoken to that issue—folks from Wisconsin and other areas—ex-

pressing their concern that if we are just going to extract the point source, municipal, industrial plants, and put that as one category, and then throw everything else into the nonpoint source, that we are just mixing the pickles, and we are not going to solve anything in that direction.

So one solution that one person who testified came up with is that if there is any treatment of agriculture, whether it would be added funding to help with specific problems that may exist on a particular farm or a particular ranch, that agriculture ought to be a separate category within the nonpoint source designation.

What do you think about that issue?

Mr. MYERS. I do not think that we would oppose that. Our concern is that if specific BMP's, best management practices, were mandated, we would be locked into that, and we have determined in the past that the state of the art today is not necessarily the state of the art of the future. And we believe that any mandating of specific practices would lock us into practices which we feel would could not——

Mr. ROE. I think your point is substantively taken. I think you are right there. What I am trying to get at is that a disagreement has arisen as to whether or not there should be any added funding, for example, made available to beef up the USDA's efforts. What they have been doing for 35 years, as you testified to, has been successful. When Mr. Ruckelshaus and others testified they said they did not believe there should be any funding allocated for the nonpoint source, that that ought to be funding that emerges and methodology that emerges from States and localities. So that is going to come to a conclusion someplace in our debate.

And having said that, I just want to get back to the point that it seems logical to remove or separate agricultural uses from other issues in the nonpoint-source issue, for example, minetailings, acid mine wastes, and so forth, and so on.

Mr. MYERS. I understand your question, and my answer would be in the affirmative, yes.

Mr. ROE. OK, that is what I wanted to get.

I have no further questions.

Do you have any further thoughts you want to express at all, Mr. Swartz?

Mr. SWARTZ. Only that I feel that our efforts in Pennsylvania closely parallel those in the States of Maryland and Virginia, and that we are especially grateful for the close working relationship that has developed between the farm organizations and the various State agencies, because we think that that type of a collective approach is the only way that we are going to get the best-management practices on the land.

Mr. ROE. You are talking in the regional approach. The fact of the matter is that the work that they are doing in your respective State, and in Maryland and Virginia on the Chesapeake environs, is excellent, and if we can use that as a model, and as the Governors were saying this morning, let's get moving and get something done. That is what we are going to try to do.

So thank you very much for being with us this morning. Your valuable testimony will be reviewed, and I think you made some very good points.

Thank you very much, sir.
Mr. MYERS. Thank you.
[The appendix to Mr. Myers statement follows:]

APPENDIX

ISSUES AND PROBLEMS

Two main sources of water pollution from land activities are from (1) erosion and the accompanying sedimentation and (2) nutrients that either wash off the land or are leached through the soil profile into the ground water that migrates to the streams and rivers. Pollution from pesticides and other toxic materials that result from other land activities such as mining, oil and gas development and urban activities are also associated with water pollution.

We would like to concentrate our remarks on the first two elements, erosion control and nutrient management, which are the most important insofar as agricultural activities. Recent water quality planning activities and research have focused a great deal of attention on agriculture related pollution activities. The study nearly completed by EPA in the Cheaspeake Bay has produced a great deal of scientific evidence that demonstrates the loss of nutrients and sediment from farming operations within the Susquehanna River Basin in Pennsylvania. At the present time, there are a number of programs that contain best management practices (BMPs) that control problems related to both soil erosion and nutrient management. However, certain activities, particularly those involving the loss of nutrients from animal wastes, require special solutions and need practices that relate primarily to the control of nitrogen rather than the traditional practices that are designed primarily to control phosphorus.

During the past two years, a study was conducted in Pennsylvania by the Department of Environmental Resources ("An Assessment of Agricultural Non-Point Source Pollution in Selected High Priority Watersheds in Pennsylvania") that identified specific problems and potential solutions in a number of high priority watersheds previously identified in Pennsylvania's 208 plan. This study, funded by EPA through the 208 planning program, has confirmed that a significant amount of problems do relate to the agricultural activities. This study involved the actual contract with farmers, nearly 3,000 in number, to gather information including farmers' opinions about certain features of their agricultural operations. Two main problem areas were identified:

a. Soil loss

Traditionally, most of the programs from the federal government have related to soil loss. The current delivery mechanism of the individual agencies within the U.S. Department of Agriculture are sound and have the capability of delivering the technical and financial services to the individual landowners. Continued cooperation among federal, state and local conservation agencies is a *must* in order to maximize the available resouces and to implement an effective program. Many of these programs have been given only modest implementation since their creation, for a number of reasons. Financial constraints upon farmers and a lack of federal funding to assist farmers in complying with BMP's for agriculture are in the forefront of factors that have prohibited full implementation of these programs at the local level.

Our study in Pennsylvania has shown that erosion has exceeded acceptable limits on 46 percent of the farms surveyed. It was also determined that a high percentage of the land under cultivation has been utilized for row crops, with the highest losses of soil (more than 10 tons per acre) occurring on farms with the largest acreage of row crops. It was also found that the program jacks the right cooperators—those with the worst soil and water problems. Further, many of those cooperators have not implemented their plans to protect their soil and water resources. A great deal of the land under cultivation is still tilled by conventional methods; however, our study confirmed that soil losses are reduced when reduced tillage systems are used.

b. Nutrient management

In the area of nutrient management, the majority of farmers in southeastern Pennsylvania apply manure in excess of the crops' nutrient needs. It was learned that the number and concentration of livestock in this area has increased significantly during recent years, resulting in overpopulated pastures that lack management and maintenance. These high concentrations of livestock have generated more manure than could be effectively used by the farmers on adjacent fields or farms.

For example, in Lebanon County, Pennsylvania, studies showed that 40 percent of the farmers who expressed a need for more manure storage do not have the land required to use the manure they now produce. Traditionally, very few farmers have had adequate storage facilities to allow for the timely application of manure.

Existing governmental programs are geared primarily to erosion control and do not address the type of nutrient management problems that the study in Pennsylvania has uncovered. The type of problems relating to manure management needs to be developed on small critical watershed areas where certain types of cropping programs and livestock concentrations produce a unique management situation.

Each watershed that was studied analyzed its own information and developed specific recommendations for program improvement in their watershed. Some even prioritized subwatersheds for faster treatment and will direct their county resources in the areas of greatest need first. Other conservation districts provided specific recommendations for program acceleration, research needs, educational strategies, and other more innovative solutions that would be tailored to their own problems. We believe these programs can be effective and need to be encouraged.

CURRENT ON-LINE PROGRAMS

A number of initiatives have been developed to specifically address the critical erosion and nutrient management needs through various federal, state and local programs. The latest policy of USDA to target manpower and financial resources to critical erosion areas identified during the Resources Conservation Act (RCA) program has enabled the initiation of a major project in Pennsylvania and Maryland to abate critical erosion. The Mason-Dixon project will provide additional technical and financial resources to accelerate the installation of BMPs throughout the 22 county area.

The Rural Clean Water Program administered by the Agriculture Stabilization Conservation Service, although experimental in nature, has provided an important program effort in Pennsylvania on the Consetoga Headwaters Watershed. Many federal, state and local agencies are working hand in hand to accelerate conservation practice installation on an area that has critical nitrate problems in groundwater. An additional element of comprehensive monitoring will attempt to show the most effective practices and track the accomplishments to demonstrate the change in water quality over time.

An effort is underway to coordinate activities among federal, state and local agencies anticipating new funding for implementation of strategies from the Chesapeake Bay Program. There is an expressed need for involvement by researchers, technicians and policy makers alike to determine the most effective strategy for use of any available funding.

There are several initiatives underway by Conservation District organizations to increases state and local funding for conservation related programs. During this past budget year in Pennsylvania, a dramatic increase from $250,000 to $750,000 was accomplished through the efforts of the 66 conservation districts in Pennsylvania. These new monies will allow conservation districts to supplement the technical assistance available from federal and state sources so programs for direct assistance to farmers and other landowners can be accelerated. We are aware that other states throughout the country and expecially in the Northeast have recently expanded their programs providing assistance to their conservation districts for increased program support as well.

Mr. ROE. Our next witness this morning is Mr. Jim Humphrey, from the Humphrey Chemical Co., representing the Synthetic Organic Chemical Manufacturers Association.

We want to welcome you, Mr. Humphrey, to our committee.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF THE SYNTHETIC ORGANIC CHEMICAL MANUFACTURERS ASSOCIATION

The Synthetic Organic Chemcial Manufacturers Association ("SOCMA") is a nonprofit association of producers or organic chemcials. A membership list is attached. Many of SOCMA's 100 members are small chemical companies.

The regulatory approach to pretreatment of industrial wastewater by users of publicity owned treatment works ("POTW's") is an issue of great importance to SOCMA's members. A large number of its members operate one or more plants

which are tied to a POTW. In many cases, these plants are located in areas in which there is no reasonable alternative to the use of a POTW's services.

SOMCA'S CONCERNS WITH THE PRESENT PRETREATMENT STRATEGY

1. The president national pretreatment program is unworkable and has not measurably advanced statutory goals

SOCMA believes that the present pretreatment strategy, founded as it is on national categorical pretreatment standards, has not led toward measurable advancement of the goals of the Clean Water Act. While EPA has made progress in developing national categorical pretreatment standards, many standards, including those for the organic chemical and plastic and synthetic materials industry, have not been completed. And substantial issues remain due to the diverse and complex nature of industrial users of POTWs, to the difficult technical questions relating to the treatability of particular wastewaters by POTWs and by alternative pretreatment technologies, to the difficulty resolving important questions of POTW sludge use and disposal, and to the economic impact of those regulations, particularly on smaller companies. Further, the present provisions of the general pretreatment regulations for application of the categorical standards to particular POTWs and industrial users are excessively complicated to the point that they are, in SOCMA's view, unlikely to be a workable tool for providing needed flexibility in the national standards.

2. Many POTW's have developed effective local pretreatment programs

Perhaps the most important point, in SOCMA's view, is that many municipalities already have developed effective local pretreatment programs. SOCMA believes that such programs have substantially implemented the objectives of the Clean Water Act in that they protect POTW operations, ensure compliance with POTW NPDES permit limitations, ensure safe sludge disposal, and allow cost-effective treatment of both industrial and municipal waste.

As succintly stated by the Oversight Review Subcommittee of this Committee in its 1980 report on implementation of the Act:

"In contrast to the problems that EPA has encountered in its efforts to move forward with a National pretreatment program, many communities have moved forware with their own, experiencing far less difficulty in meeting the essential thrust of the 1972 pretreatment language." Subcommittee on Oversight and Review of the Committee on Public Works and Transportation, House of Representative, 96th Cong., 2d Sess., Implementation of the Federal Water Pollution Control Act, at 40, 44 (Comm. Print 1980).

3. The Wilmington, Delaware POTW offers a good example of an effective local pretreatment program

SOCMA hosted a tour of the Wilmington, Delaware, POTW on November 18, 1982, which was attended by four staff members of this Committee, Messrs. Errol Tyler, Willen Van den Broek, John Doyle and Craig De Remer. The Wilmington is POTW is a large urgan system discharging 700 gallons a day and having over 300 industrial dischasrgers. Wilmkington is a prime example of localities where, in the absence of Federal pretreatment standards, an environmentally sound POTW program has been developed.

ALTERNATIVE LOCAL PRETREATMENT SYSTEMS AS AN OPTION TO NATIONAL STANDARDS

1. The Clean Water Act should be amended to allow alternative local pretreatment systems in lieu of national categorical standards

SOCMA believes that the Clean Water Act should be amended to provide an option to the application of the national standards to industrial users of individual POTWs. SOCMA further believes that constructive legislation can be developed around the concept of "alternative local pretreatment systems" presented by the Association of Metropolitan Sewerage Agencies and others in hearings before the subcommittee in 1982. SOCMA believes that a program for alternative local pretreatment systems would provide needed flexibility with respect to pretreatment controls and should be included in the bill reported by the Committee.

2. Basic principles upon which a revised pretreatment program should be founded

A program for alternative local pretreatment systems should be founded on the following basic principles:

First, alternative local pretreatment systems should be considered the preferred option for implementing the Clean Water Act with respect to industrial users of POTWs. The Congress, in amending the statute, and EPA and the

states, in implementing such new provisions, should encourage POTWs to develop alternative local pretreatment systems. Unnecessary statutory and regulatory impediments to the development and adoption of local systems should avoided.

Second, an alternative local pretreatment system should ensure that industrial wastes do not preclude POTW compliance with NPDES permit effluent limitations implementing secondary treatment requirements pursuant to Section 301(b)(1)(B) or implementing state water quality standards pursuant to Section 301(b)(1)(C).

Third, an alternative local pretreatment system should ensure that industrial wastes do not preclude the sludge use or disposal system option chosen by the POTW consistent with applicable regulatory requirements, including guidelines under Section 405.

Fourth, the POTW and the permitting agency should be accorded flexibility in the type and mix of pretreatment requirements for industrial users of the POTW so long as the two foregoing basic requirements are met.

Fifth, an opportunity for public participation in the development of an alternative local pretreatment system should be accorded and, in particular, industrial users of the POTW should be encouraged to participate.

ELEMENTS OF A PROGRAM FOR ESTABLISHING ALTERNATIVE LOCAL PRETREATMENT SYSTEMS

SOCMA believes that the elements of a workable and acceptable pretreatment program can be derived from the foregoing principles.

1. A program for alternative local pretreatment systems should be implemented through POTW NPDES permit modifications

Modification of POTW NPDES permits is an appropriate procedural approach for implementation of a program for alternative local pretreatment systems since NPDES permits are the prime mechanism implementing the Clean Water Act. While specific provisions would have to be added to the NPDES regulations regarding alternative local pretreatment programs, they should not include unnecessary substantive, procedural, or paperwork requirements which would inhibit POTW applications.

2. Applications for permit modifications to implement alternative local pretreatment systems

The POTW should be required to submit the following as part of its application for modifications of its NPDES permit to authorize an alternative local pretreatment program.

Identification of pollutants which are or are expected to be covered by categorical pretreatment standards and which, on the basis of findings from an adequate monitoring program, are present in POTW effluent or sludge in sufficiently significant concentrations or quantities to merit consideration for regulation in the POTW permit and/or the alternative local pretreatment program.

Identification of and information on industrial users covered by proposed or promulgated national categorical pretreatment standards.

Identification of and information on other industrial and non-industrial sources of significant quantities of pollutants which may be subject to regulation under the alternative local pretreatment system.

A plan for the regulation of industrial users and for the reduction of pollutant loadings from non-industrial sources.

A plan for monitoring and enforcement of requirements for industrial users.

A description of legal authority for implementation and enforcement of the alternative local pretreatment system.

A description of the resources required to implement and enforce such a plan.

3. Approval of permit modifications to establish alternative local pretreatment systems

In acting upon a POTW application for a permit modification to adopt an alternative local pretreatment system, the permitting agency should update the POTW's permit by revising the effluent limitations in the permit to reflect the current requirements for secondary treatment and state water quality standards. The basis for the permit (and for the pretreatment system) should be the water quality standards in effect at the time the permit is issued. Compliance schedules, as necessary and appropriate, should be included to achieve such requirements.

The NPDES permitting authority should be required to approve the POTW's application unless it finds that—

(1) The plan for regulation of industrial users and non-industrial sources is inadequate to—

(a) ensure that industrial wastes do not preclude POTW compliance with NPDES permit effluent limitations implementing current secondary treatment requirements or implementing existing state water quality standards or

(b) ensure that industrial wastes do not preclude the sludge use or disposal system option chosen by the POTW consistent with applicable regulatory; requirements; or

(2) The plan for monitoring and enforcement of requirements for industrial users is inadequate to ensure compliance with such requirements; or

(3) The POTW lacks the legal authority or resources to implement and enforce the alternative local pretreatment system.

4. Pretreatment compliance deadlines

Reasonable deadlines should be established for compliance with requirements of alternative local pretreatment systems or with categorical pretreatment standards for industrial users of POTWs which have not adopted alternative pretreatment systems. Consistent with the requirements of existing law, industrial users should be allowed up to three years to comply with either local requirements or national standards after the time at which it is determined that such requirements are applicable. In addition, a mechanism should be provided for the application of pretreatment standards to plants subject to different regulations promulgated at different times.

5. Pretreatment program review and revision

The alternative local pretreatment system should be reviewed and revised as necessary—

(1) in connection with renewal of the POTW's NPDES permit or

(2) if it is determined that a POTW is not in compliance with its NPDES permit or sludge use or disposal requirements and industrial wastes may be a significant cause of such non-compliance.

In addition to implementing the foregoing elements of a new program, EPA should review and revise its NPDES and general pretreatment regulations to ensure that unnecessary detail, procedures, and paperwork do not discourage POTWs from developing alternative local pretreatment systems. Further, EPA should assist POTWs in developing alternative systems by evaluating and publishing information on existing POTW pretreatment programs.

CONCERNS THAT ALTERNATIVE LOCAL PRETREATMENT SYSTEMS WOULD IMPOSE AN EXCESSIVE RESOURCE BURDEN ON EPA ARE GROUNDLESS

SOCMA understands that concern has been expressed that review of alternative local pretreatment systems would impose an excessive administrative burden upon EPA. SOCMA does not believe that the potential administrative burden is sufficient to justify a Congressional decision not to authorize cost-and environmentally-effective alternative local pretreatment systems. Essentially the same demonstrations with respect to effluent and sludge quality as would be necessary for such alternative local pretreatment systems are required in conjunction with the existing removal credits program. Reviewing alternative local pretreatment systems would not impose much, if any, additional administrative burden on EPA than the Agency would experience in any event under its existing regulations. Indeed, such reviews might prove less burdensome than EPA's responsibilities under the current pretreatment regime, which include review of local POTW programs which must incorporate and apply numerous categorical standards rather than simply limitations for those pollutants that threaten to cause interference, water quality or sludge-contamination problems.

CONCLUSION

SOCMA respectfully urges that legislation being developed by the subcommittee include provisions authorizing alternative local pretreatment programs. SOCMA would be pleased to work with the Committee in developing legislation authorizing alternative local pretreatment programs.

Mr. ROE. Please proceed.

TESTIMONY OF JAMES R. HUMPHREY, VICE PRESIDENT, HUMPHREY CHEMICAL CO., NORTH HAVEN, CONN., ON BEHALF OF SYNTHETIC ORGANIC CHEMICAL MANUFACTURERS ASSOCIATION, ACCOMPANIED BY THOMAS GOLDBERG, MANAGER OF ENVIRONMENTAL AFFAIRS, SOCMA, AND DOUGLAS KLIEVER, COUNSEL, SOCMA

Mr. HUMPHREY. Good morning, Mr. Chairman, and other members of the Water Resources Subcommittee. I am James R. Humphrey, vice president of the Humphrey Chemical Co.

Thank you for the opportunity to share with you the views of our company and also of the Synthetic Organic Chemical Manufacturers Association, otherwise known as SOCMA, a trade association representing about 100 chemical companies, many of which, like us, are quite small.

With me today are Thomas Goldberg, SOCMA's manager of environmental affairs, and Doug Kliever, SOCMA's counsel. Incidentally, I want to note that SOCMA has submitted a written statement for the record.

Mr. ROE. Yes; the statement will appear in full in the record, if you want to summarize, and I think you should strike at the key points that you want to make.

Mr. HUMPHREY. I wanted to briefly outline for you some of the characteristics of our company, because I think it bears well on the issues of pretreatment.

Mr. ROE. Before you do that, could you do me a favor and give us just a little bit of background on what we mean by "synthetic organic chemicals"? I think we ought to get that into the record at this point.

Mr. HUMPHREY. OK. Synthetic organic chemicals as such are chemicals that are manufactured from other materials and find their way—they are used as intermediates, perhaps, in the manufacture of other chemicals. We are an organic chemical manufacturer.

Mr. ROE. What kind of chemicals are you speaking to?

Mr. HUMPHREY. Well, why don't I go on with my statement. I think I answer that question in there.

Mr. KLIEVER. Mr. Chairman, the term "synthetic organic chemicals" really covers the universe of manufactured organic chemicals.

Mr. ROE. OK. Do you want to pull your microphones closer so we can hear.

I want to get into the record, so that we are identifying the scope and the area that you are speaking to.

Mr. HUMPHREY. I understand.

Humphrey Chemical is located in North Haven, Conn., about one-half mile from the Quinnipiac River. We manufacture and sell fine organic chemicals worldwide. These are intermediates for other chemical companies usually larger than us.

Our products can be divided roughly into four groups. This gets a little technical, but for a good purpose.

Mr. ROE. That is all right. I think it is helpful.

Mr. HUMPHREY. One, alkenyl succinic anhydrides. These materials are useful as intermediates for the production of rust inhibitors, epoxy hardeners, modified food starch, synthetic paper size, detergents, and leather treatment chemicals; two, alkanes of very high purity, used as standards by the oil industry; Three, alkyl bromides, and four, alkyl mercaptans used in photographic chemicals and silver polish formulations.

We produce about 100 different compounds, have $5 million gross sales annually, and employ 38 people. So we are small.

At present, we are a direct discharger to the river. This activity is regulated under the NPDES program. As part of the requirements of our newly issued permit, last year, we are being directed by the Connecticut water compliance to hook up to the local POTW in North Haven. We are proceeding with this, and the necessary pretreatment steps, at a cost of about $300,000, a substantial sum to us that represents a sizable proportion of our annual profits. This will be accomplished in approximately 10 months, at which time we will become an indirect discharger, and pretreatment legislation and regulations will become very important to us.

The volume of our plant discharge is about 5,000—not million, but 5,000—gallons per day at a maximum. The costs mentioned earlier are for the neutralization system for our acid stream, and an equalization system for our wastewater flow. I might also add that it includes the complete sewer lines around the entire facility, with laterals, et cetera.

We have also recently done a complete analysis of our effluent for priority pollutants and came out very well, generally, on all of these as measured against the proposed categorical standards. One compound came up slightly above the proposed 50 parts per billion standard. This gives us a little background and allows me to raise a number of issues I would like to comment on with respect to the proposed organic chemical pretreatment regulations and the need for legislation to provide for local alternatives.

One, we question whether reliable test results can be achieved at levels as low as 20 to 50 parts per billion in attempting to set and enforce a standard. Detectability, coupled with the high cost of monitoring and compliance, is of concern to us, especially when the pollutant is not a local problem.

Two, as I stated, we are a small company and cannot afford to employ a large staff to evaluate technologies, to solve what is not a problem in our local POTW. What I am saying is that it would concern us greatly if we had to spend, perhaps, an additional $500,000, searching for, installing, and operating technologies to reduce the concentration of a pollutant to a limit the necessity of which has not been demonstrated. This scenario might be played out if categorical standards become a reality, without needed legislative flexibility.

Three, we are willing to spend our money on the installation of a system designed to solve problems we know we have, that is, a system to neutralize our acidic effluent and equalize our flow prior to entering the POTW. Local and State authorities are confident that this system will meet the needs of the POTW and the requirements of the Clean Water Act.

In conclusion, we agree with SOCMA and others that a more economical and environmentally sound approach for Humphrey Chemical and others like us would be through compliance with locally developed standards. Since many of these local pretreatment programs are now in place or nearing completion, we do not believe that authorizing alternative local pretreatment systems will be as resource intensive, or introduce significant delays in implementation, as was suggested 2 days ago before this Subcommittee by the EPA Administrator William Ruckelshaus.

We think this approach will do the job of achieving the goals of the Clean Water Act in a more efficient manner.

Finally, SOCMA would like to make one brief point based upon Administrator Ruckelshaus' testimony. We agree with Mr. Ruckelshaus that Congress should insure that FDF variance provisions be part of pretreatment regulations to insure that a mechanism is available to refine national technology-derived regulations as applied to individual plants. However, that mechanism is not a substitute for authorizing local pretreatment programs. We would like to submit a supplemental statement addressing the role of FDF variances.

Again, I would like to thank you for the opportunity to express our views.

Mr. ROE. We thank you for your testimony. I think it is important that you do roundout some observations on an industrywide basis of the FDF issue. I think that is a terribly important one, and that is going to be a key issue here.

20-955 O—84——206

Let me ask you this question, because we ran into this once before. Let us take your company. When your company was directed, if you like or you discussed with the local people and you said, "You have got to do certain things as far as your permits are concerned," and now you express that you are going to expend some $300,000 or whatever in that direction, to put in and refine your pretreatment equipment, basically, right?

Mr. HUMPHREY. Right.

Mr. ROE. And you spoke to the issue of a 5,000 gallon per day effluent, which is really your waste at that point—is that point—is that a fair commentary to make?

Mr. HUMPHREY. Yes.

Mr. ROE. You dispose of that in some other manner.

Mr. HUMPHREY. Yes.

Mr. ROE. Now, having said that, your concern is, at least as I understood it, that you have to go out to your folks in your operation, in your company, and you have to find out what kind of technical equipment should we install, because none of it is the same, in the main, in any plant. There may be some stereotype or some proprietary equipment in certain areas, but there is nothing that would necessarily handle a whole system if you had a large divergence of products that you are manufacturing, or producing. In other words, they are not something you can just take off the shelf, necessarily, to solve that problem.

Mr. HUMPHREY. That is right.

Mr. ROE. Because you have multiple wastes involved and multiple product categories involved.

Mr. HUMPHREY. Right.

Mr. ROE. I am leading to a point. Now, therefore, the agency, through the permit process, says to you, "This is what we observe in your category of waste. Now, we want you to correct that and achieve these particular goals"—so many parts per million, reduce it, and soforth. And therefore, then, you have to go on the marketplace and see if you can find either a consulting engineer or a manufacturing engineer who is going to say to you, "Well, we think this will do the job."

Now, the question I am leading to. EPA does not say to you what type of equipment. They are simply interested in the results, regardless of the cost, or whatever the case may be—and I am not saying that unkindly to EPA——

Mr. HUMPHREY. Right.

Mr. ROE. Isn't that the process that is followed, basically?

Mr. HUMPHREY. Yes; we have seen very little, as far as published information about various types of systems, that will solve some of these problems.

Mr. ROE. So that, for smaller concerns, which are the heart of the manufacturing process in this Nation, we are coming back and saying there is not any resource, for want of a better word, where you can go to and see the latest technology available in this whole field.

Mr. HUMPHREY. That is correct.

Mr. ROE. The reason I ask that is we had a case in one of my big cities where one of our smaller firms—which is a fine firm, it had 120 employees, and they were excellent—they had an air pollution

problem. And they went out and they checked with the State, and they checked with the Federal people and the whole bit, went through the drill, took 9 months of intensives, sincerity of purpose and action, and designed a system out that cost them $900,000 to correct it. And they were willing to go ahead and spend the $900,000. And then they took the bundle of plans down to the State and said, "OK, here is what we are going to do. This is what the manufacturer's observations are as far as removal of colloidal suspensions. This is what the equipment is going to cost. Give us a permit for the equipment."

And the agency came back and said, "Hey, we are not approving the equipment. We want to know what your ambient results are going to be so you can put any equipment that is going to achieve that goal in."

The company had no guarantee. There was no timeframe in putting the equipment in, to remove the material, so they literally stopped, they concluded the operation. It was not worth that kind of an investment to them.

So basically, what I am trying to get into this record, what you are fundamentally saying is that where small manufacturers are involved, you are given a set of criteria to meet, and you are on your own, then, to be able to provide the methodology and the equipment and whatever the expenditure may be to do that; is that a correct assumption?

Mr. HUMPHREY. That is correct, and add to that that, given the opportunity to participate in a local alternate approach other than having to achieve XYZ categorical standards, would help small chemical companies, particularly small chemical companies.

Mr. ROE. Well, if the gentleman would yield on that, part of the concern, obviously, of the committee in the overall process is that the sincerity of purpose in the efforts from the Humphrey Company may be fine, but is it a point of trust, perhaps?

Suppose, for example, some of the local communities do not really establish anything that is of substance.

Mr. HUMPHREY. I think we in SOCMA would take the position with respect to that kind of thing that if the governing authority, whoever it might be, did not feel that the POTW could handle adequately the problem of its users, then there probably would be a situation where they would have to go to categorical standards. But at least the option, we believe, should be there.

Mr. ROE. And I would think that if you met the requirements of the permit, and you submitted the—or, should EPA have the responsibility, either at regional level or Federal level, to approve that equipment, and with some kind of guarantee that when it is approved and you have made the investment, that you are not going to have to come back 6 months later and do something else. That is your concern, isn't it, basically?

Mr. HUMPHREY. Yes, sir.

Mr. ROE. I just wanted to get that on the record.

I have no further questions—Mr. Goldberg.

Mr. GOLDBERG. Mr. Chairman, I would just like to add for the record that, with respect to the Synthetic Organic Chemical Manufacturers Assoc., one easy way of understanding our members is they synthetically produce what Mother Nature produces across-

the-board, and we can have approximately 5,000 products represented throughout our membership.

Mr. ROE. Let me ask you this. In your formal membership, is it nationwide?

Mr. GOLDBERG. It is predominantly in the Northeastern United States, but we have members with plants throughout the country.

Mr. ROE. What would you say for the record, if you know, or could you provide for the record, not only what your membership would be, but I think it would be helpful to us to know what would the membership be in your organization—how many companies, I am speaking of—what the average or total employment would be, and what would that be throughout the Nation.

You see, there is an economic base you are speaking to, which is a very important base, and you are providing intermediate chemical processes to other manufacturers, is what it amounts to; am I correct in interpreting that?

Mr. GOLDBERG. Yes.

[The following was received for the record:]

SYNTHETIC ORGANIC CHEMICAL MANUFACTURERS ASSOCIATION, INC.,
Washington, D.C., December 27, 1983.

HON. ROBERT A. ROE,
Chairman, Subcommittee on Water Resources, Committee on Public Works and Transportation, U.S. House of Representatives, Washington, D.C.

DEAR MR. CHAIRMAN: Enclosed, in accordance with the request made during SOCMA's November 17, appearance is a supplemental statement on EPA's proposal to amend the Clean Water Act to allow the issuance of "fundamentally different factors" (FDF) VARIANCES NOTWITHSTANDING THE DECISION IN *National Association of Metal Finishers* v. *EPA*

As emphasized in SOCMA's supplemental statement, FDF variances and the alternative local pretreatment programs as proposed by SOCMA and others address two distinctly different types of problems and both are needed. We note with interest that Administrator Ruckelshaus, in supporting the FDF variance amendment, emphasized that the availability of the FDF variance procedure resulted in cost savings to EPA in developing national regulations because consideration of the unique circumstances of individual industrial facilities could be considered in the variance process. SOCMA believes that, for similar reasons, there might be administrative economies from the adoption of a statutory program for alternative pretreatment programs.

Also included herein is a characterization of SOCMA's membership as it relates to the national economy and, in particular, innovation in the chemical industry.

SOCMA is a non-profit trade association representing over 100 organic chemical companies with annual organic chemical sales under $30,000,000. The members of SOCMA produce more than 5,000 distinct synthetic organic products which are primarily intermediates and finished chemicals for industrial use. A list of the member companies was attached to SOCMA's testimony of November 17.

Many of the products produced by SOCMA's members are speciality intermediate organic chemicals that have application as dyes, pigments, medicinals, flavors and perfume materials, plastics and resin materials, rubber-processing chemicals, surface-active agents, pesticides and related products, and as miscellaneous end use chemicals. These materials find diverse applications in such commonly known products as soap, denim jeans, aspirin, cosmetics, perfumes, and motoroil, as well as, lessor known products for use by the petroleum industry as standards to ensure the consistency of oil products, and solvents used in the electronics industry to quaranty the cleanliness of computer chips. These products play a vital role in the nation's economy and have been found as far afield as main street and outer space.

Many of the more exotic materials, that find applications in America's emerging high technology industries, are the product of innovations developed by small chemical manufacturers which specialize in low volume production. Studies conducted for EPA of the Premanufacture Notifications (PMNs) submitted by firms with less than $100 million in sales (the smallest sales category studied) indicate that sixty-two percent of small business PMNs are for production volumes less than 10,000 kg per year. Thirty-one percent of small business PMNs are for production

volumes of less than 1,000 kg per year. The costs of submitting a PMN are very high in relation to the expected revenues of a low-volume chemical in the initial stages of commercialization. Similarly, it must be assumed that the impacts of other regulatory programs, such as Pretreatment, have the same or greater inhibiting effect on the introduction of new low volume speciality chemicals. Additionally, as the table below illustrates, the value of chemical products produced in the synthetic organic chemicals industry tend to be low in relation to the volume of production thus limiting the degree to which there is flexibility in assuming additional costs.[1]

Organic chemicals	1981 production (pounds)	1981 sales value
Grand total	217,339,092 lbs.	$52,000,000
Cyclic intermediates	45,323,048 lbs.	7,436,562
Dyes	229,670 lbs.	772,737
Organic pigments	75,795 lbs.	415,320
Medicinal chemicals:		
Cyclic	180,260 lbs.	1,144,400
Acyclic	64,442 lbs.	54,292
Flavor and perfume materials:		
Cyclic	93,136 lbs.	157,708
Acyclic	71,427 lbs.	93,887
Plastics and resin materials:		
Cyclic	11,729,680 lbs.	6,836,908
Acyclic	28,871,340 lbs.	10,225,361
Rubber-processing chemicals:		
Cyclic	246,268 lbs.	270,934
Acyclic	33,360 lbs.	27,419
Elastomers (synthetic rubber):		
Cyclic	2,487,145 lbs.	848,554
Acyclic	2,362,312 lbs.	1,656,542
Plasticizers:		
Cyclic	1,458,323 lbs.	662,474
Acyclic	407,216 lbs.	271,159
Surface-active agents:		
Cyclic	1,229,201 lbs.	366,860
Acyclic	3,849,007 lbs.	1,109,659
Pesticides and related products:		
Cyclic	1,012,429 lbs.	3,503,886
Acyclic	417,646 lbs.	1,148,496
Miscellaneous End-Use Chemicals and Chemicals Products:		
Cyclic	3,887,814 lbs.	701,512
Acyclic	18,270,464 lbs.	3,273,682
Miscellaneous cyclic and acyclic Chemicals:		
Cyclic	2,380,733 lbs.	989,586
Acyclic	92,658,296 lbs.	10,754,816

The synthetic organic chemical manufacturing industry has a far greater impact on the national economy than its size would indicate. This is due to the fact that the low volume speciality chemicals produced by this industry find specialized applications throughout American industry for which there are often no substitutes. As the proceeding two examples illustrate the industry is extremely vulnerable to production cost increases. SOCMA's comments to the Environmental Protection Agency on its proposed standards for the organic chemicals, plastics and synthetic fibers category (copy attached), focus on this point as well, and illustrate the regulatory problems confronting the industry under the Clean Water Act. SOCMA believes that Congress must re-assert its intent to mitigate small business economic impacts resulting from the regulation of the discharge of industrial effluents into surface waters or publically owned treatment works. SOCMA believes that by providing a statutory option to local authorities to develop and implement local pretreatment programs it will substantially reduce the cost of compliance for small businesses while providing equivalent protection of the environment and public health.

[1] Synthetic Organic Chemicals/United States Production and Sales, 1981, pp. 4-6 (United States International Trade Commission, Publication 1292).

SOCMA is hopeful these additional comments concerning FDF variances and a characterization of the Synthetic Organic Chemical Manufacturing Industry will be helpful to you in your deliberations on this important matter.

Sincerely,

RONALD A. LANG,
Executive Director.

SYNTHETIC ORGANIC CHEMICAL MANUFACTURERS ASSOCIATION, INC.,
Washington D.C., January 6, 1984.

Hon. ROBERT A. ROE,
Chairman, Subcommittee on Water Resources, Committee on Public Works and Transportation, U.S. House of Representatives, Washington, D.C.

DEAR MR. CHAIRMAN: On December 27, 1983 SOCMA sent to you a letter containing responses to questions you raised at the November 17, 1983 hearings on the Clean Water Act. I wish to bring to your attention an unfortunate error in that letter contained in the fourth paragraph of the first page. The first sentence of that paragraph reads:

SOCMA is a non-profit trade association representing over 100 organic chemical companies with annual organic chemical sales under $30,000,000.

This sentence should be amended to read as follows:

SOCMA is a non-profit trade association representing over 100 small, medium and large organic chemical companies. *Sixty percent of SOCMA's members have annual organic chemical sales below $50,000,000; fifty percent of SOCMA's members have annual organic chemical sales below $30,000,000.*

SOCMA apologized for any inconvenience created by this error and is hopeful that this clarification will be helpful to you in your deliberations on this important issue.

Sincerely,

RONALD A. LANG,
Executive Director.

Mr. ROE. And therefore, you are an integral part of each—they may be small companies, but by the same token, you are a vital part. It is like part of the organs of the body; you are a vital part to the functioning of the entire chemical industry. Is that a fair comment?

Mr. GOLDBERG. I would even go to emphasize that. Mr. Humphrey produces several products for which he is the sole producer internationally.

Mr. ROE. OK. Therefore, what I think we have to get across, and what I am trying to get in this record, is because we have 1 or 2 or 10 or 50 or 1,000 small companies, and when we talk about their economic ability to achieve the goals that Federal is attempting to say, that you cannot just use their size to judge their import to the whole economic complex of the Nation, is what I am trying to get at.

Mr. GOLDBERG. We would emphasize that point.

Mr. ROE. Because some people come back and say—and this is cruel, I suppose, and nonresponsive—but some people have come back and said, "Well, if 10 percent of the people in that industry lose out because they cannot meet the goals, then the goals are higher than the needs of those 10 companies, and therefore, they will just have to fall by the wayside."

But I think it is important to come back and say in the category of your industry that it is a vital catalyst if you like to the whole chemical industry of the Nation. Is that a reasonable point to make?

Mr. HUMPHREY. It certainly is, and I would add to that that the niche for the small chemical company is the manufacture of some

needed chemical or chemicals that the larger fellow simply does not want to—because of economic reasons or whatever—does not want to do himself. And the larger chemical companies very much depend on the little guys to produce these needed substances, even though the volume might be quite small.

Mr. ROE. Sure. That is the point I wanted to make. OK. I have no further questions. I think your testimony is succinct and to the point, and we certainly will give every attention to it.

We thank you for being with us this morning.

Mr. HUMPHREY. Thank you, Mr. Chairman.

[Subsequent to the hearing, the following supplemental statement from SOCMA was received for the record:]

SUPPLEMENTAL STATEMENT OF THE SYNTHETIC ORGANIC CHEMICAL MANUFACTURERS ASSOCIATION

EPA Administrator William Ruckelshaus, in testimony before the Water Resources Subcommittee on November 15, 1983, proposed that Section 301(1) of the Clean Water Act be amended to confirm EPA's authority to grant "fundamentally different factor" ("FDF") variances from effluent limitations guidelines and national categorical pretreatment standards for priority pollutants. EPA's proposal was necessitated by the decision in *National Ass'n of Metal Finishers* v. *EPA*, 19 E.R.C. 1785 (2d Cir. 1983), invalidating EPA's regulation providing for FDF variances from pretreatment standards for priority pollutants.

SOCMA believes that the Court's decision was in error and supports EPA's recommendation that the Congress ensure that FDF variances are avialable.

FDF VARIANCES ARE NOT A SUBSTITUTE FOR ALTERNATIVE LOCAL PRETREATMENT PROGRAMS

SOCMA believes it very important that it be clearly understood that FDF variances are not a substitute for the alternative programs advocated by SOCMA and others in testimony before the subcommittee. The function of the FDF variance mechanism is entirely different from the function of alternative local pretreatment systems. As discussed further below, the FDF variance process allows a technology-derived national categorical pretreatment standard to be determined in light of the special circumstances of a particular industrial user of a POTW which affect the cost or non-water quality environmental impact of that industrial user's compliance with the national standard. In contrast, Congressional authorization of alternative local pretreatment programs would allow local POTWs to develop pretreatment requirements tailored to the operational and environmental needs of that POTW. Those requirements would then be applied in lieu of the national pretreatment standards as promulgated by EPA or as they might be modified through the FDF variance process.

Both types of provisions are necessary to ensure that pretreatment requirements adopted under the Clean Water Act are environmentally and cost effective.

FDF VARIANCE PROVIDE ESSENTIAL FLEXIBILITY IN THE DETERMINATION OF TECHNOLOGY-DERIVED STANDARDS AND LIMITATIONS

FDF variances are not expressly provided for in the Clean Water Act. Rather FDF variances were determined by the Supreme Court in *E.I. DuPont De Nemours & Co.* v. *Train*, 430 U.S. 112 (1977), to be a necessary adjunct to the nationally uniform effluent limitations guidelines promulgated by EPA for broad categories of industry. As stated by the Court, the Act authorizes EPA to promulgate national regulations "so long as some allowance is made for variations in individual plants. . . ." 430 U.S. at 128.

While the Supreme Court was dealing with national effluent limitations guidelines implementing the 1977 BPT requirement, its view that the national regulations must be tempered with a "safety valve" is equally applicable to effluent limitations guidelines implementing BAT and pretreatment standards. Administrator Ruckelshaus in his testimony succinctly stated why the "FDF varinance procedure is an essential adjunct to the national rulemaking process":

In going through the extraordinarily complex process of a national rulemaking, the FDF determination procedure permitted EPA to focus its data gathering and

analysis on the more typical facilities and defer to subsequent proceedings those plants with unique features. . . .

The FDF determination procedure is not a waiver procedure. . . . Rather it is a procedure through which a facility receives an individualized determination of its technology-based effluent requirements. . . .

The need for administrative flexibility in applying national regulations to individual facilities is well illustrated by EPA's March 1983 proposed regulations for the Organic Chemicals and Plastic and Synthetic Fibers Category. 48 *Fed. Reg.* 11827 (March 21, 1983). By EPA's estimates, the proposed pretreatment standards and BAT effluent limitations guidelines would cover up to 2,100 individual industrial facilities in an industry in which 25,000 commercial products are made by a wide variety of processes. Even if EPA were to narrow the scope of the regulations upon promulgation, there would be a need to refine the requirements as applied to plants with unique features which EPA could not adequately consider in a practical rulemaking process.

The decision of the Court of Appeals for the Third Circuit, however, would eliminate that flexibility. The court viewed the 1977 Amendments to the Act as precluding any variance provision for priority pollutants. 10 E.R.C. at 1799–1801. SOCMA believes that the court misconstrued the Congress' intent and that the Congress should confirm the necessity, as determined by the Supreme Court in *DuPont*, for the inclusion of a variance provision as part of nationally applicable regulations.

At the same time, the Congress should endorse Administrator Ruckelshaus' policy statement that, while the FDF variance provision does not constitute a "loophole" in the application of national regulations, it is an essential mechanism for "consideration of individual petitions claiming unique factors." In the past, EPA has been most reluctant to consider petitions for FDF variances. Indeed, EPA has approved only four variance requests.

One of the reasons for EPA's general resistance to variance requests has been the possible administrative burden of considering such requests. However, as Administrator Ruckelshaus made clear in his testimony, the existance of a FDF variance procdure allows "major cost savings and reductions in time necessary for guideline development." It would be most unfortunate if EPA, having concluded the variance procedure reduces the administrative and cost burden of regulation development, were then to cite the administrative and cost burden of processing variances as a reason for a restrictive variance policy.

SOCMA believes that Administrator Ruckelshaus' statement to the subcommittee reflects a balanced view of the role of FDF variances and a change in EPA's prior restrictive policy. The Congress should endorse that policy change.

Mr. E. H. Forsht
Effluent Guidelines Division (WH-552)
U.S. Environmental Protection Agency
401 M Street, S.W.
Washington, DC 20460

Attention: EGD Docket Clerk, Organic Chemicals, Plastics and Synthetic Fibers Industry (WH-552)

Dear Mr. Forsht:

Enclosed are an unbound original and two bound copies of the comments of the Synthetic Organic Chemical Manufacturers Association, Inc. ("SOCMA") on EPA's proposed regulations establishing effluent limitations guidelines and pretreatment standards for the organic chemicals, plastics and synthetic fibers industry (48 Fed. Reg. 11827 (March 21, 1983)).

SOCMA has a long-standing concern with the pretreatment program, and its comments focus primarily on those proposed standards. Many of SOCMA's members are small firms; more than half of its member companies have annual sales of less than $50 million. In addition, most of SOCMA's members, whether large or small companies, operate small plants. SOCMA is particularly concerned about these regulations as applied to small firms and small plants in the organic chemicals and plastics and synthetic fibers industries.

After careful examination and analysis of EPA's technical and economic support documents, SOCMA has concluded, for reasons which are set forth in detail in the enclosed comments, that the Agency's basis for the proposed pretreatment standards, and for the proposed effluent limitations guidelines, is totally inadequate. This is especially true insofar as the proposals apply to small plants. The proposed regulations must therefore be reconsidered, reevaluated and revised.

In reconsidering its proposal, EPA should thoroughly examine the following matters and possible alternatives which are of special concern to small plants:

- A more precise and realistic identification of industry segments and pollutants which pose a significant national pretreatment problem and exclusion of those which do not.

- Consideration of flow, land availability, and other pertinent factors as a basis for alternative standards or exclusions.

- Alternative standards based upon consideration of the cost-effectiveness of different pretreatment technologies.

- Alternative standards or exclusions based upon a sound assessment of the economic impact of different levels of pretreatment.

- Application of the pretreatment standards only to plants which produce priority pollutants regulated by the pretreatment standards as a product or commercial by-product or which use such regulated priority pollutants as raw materials.

- Deferral of regulations for industry segments for which a sound technical and economic record, with adequate opportunity to comment, cannot be established within EPA's schedule for these regulations.

The scope and content of final pretreatment regulations and standards must reflect a thorough analysis, founded on adequate and meaningful data, of their achievability and economic impact with respect to small plants. It is SOCMA's belief, as more fully set forth in the enclosed comments, that EPA's proposed regulations fall far short of fulfilling this requirement.

SOCMA appreciates the opportunity to participate in this rulemaking proceeding. Please do not hesitate to contact me or Tom Goldberg, Manager, Environmental Affairs, in our Washington Office if you have any questions regarding SOCMA's comments on the proposed regulations.

Sincerely,

Ronald A. Lang

COMMENTS OF THE
SYNTHETIC ORGANIC CHEMICAL MANUFACTURERS ASSOCIATION
ON PROPOSED REGULATIONS:

EFFLUENT LIMITATIONS GUIDELINES,
PRETREATMENT STANDARDS, AND NEW SOURCE PERFORMANCE STANDARDS
FOR THE ORGANIC CHEMICALS AND
PLASTICS AND SYNTHETIC FIBERS CATEGORY
(48 FED. REG. 11827 (MARCH 21, 1983))

INTRODUCTION

The Synthetic Organic Chemical Manufacturers Association (SOCMA) is a nonprofit trade association of 100 manufacturers of organic chemicals and allied products. A current list of SOCMA's members is Attachment A.

SOCMA has had a long interest and involvement in implementation of the Clean Water Act. A primary focus of SOCMA has been on the requirements of the Act for pretreatment of industrial waste discharged to publicly owned treatment works (POTWs). In testimony before the House Public Works Committee on the then pending Federal Water Pollution Control Act Amendments of 1972 (P.L. 92-500), SOCMA urged the Congress to ensure that the pretreatment provisions would provide effective protection for POTWs and the nation's waters while avoiding redundant treatment requirements for industrial users of POTWs. Those objectives were adopted by the Congress and should be a primary reference point for evaluation of administrative proposals relating to pretreatment of industrial waste. A Legislative History of the Federal Water Pollution Control Act Amendments, at 800 (1974) (cited as "Leg. Hist. FWPCA").

EPA's development and implementation of a pretreatment strategy under the Act has been fraught with difficulty. In recognition of the difficulties encountered by the Agency, SOCMA submitted to the Agency on November 20, 1981, a proposal for a comprehensive administrative and legislative reevaluation of the pretreatment program. SOCMA's presentation is Attachment B.

These comments are in furtherance of SOCMA's policy of providing constructive input to the Agency to help achieve the goal of an environmentally and economically sound pretreatment program. The report of Peat, Marwick, Mitchell & Co. entitled "Comments on the Small Establishment and Small Business Aspects of EPA's Cost and Economic Impact Analysis and Regulatory Flexibility Analysis Decision" (cited as "PMM Report") is submitted as part of SOCMA's comments.

SOCMA'S INTEREST

SOCMA's members are affected by the full range of regulations proposed by the Agency. However, as noted above, SOCMA has a long-standing concern with the pretreatment program, and its comments focus primarily on those proposed standards.

SOCMA is particularly concerned about the regulations as applied to small organic chemical and plastic and synthetic fiber plants. Most of SOCMA's members, whether large or small companies, operate small plants. Many of SOCMA's members are

small companies; approximately 55 member companies have annual sales of less than $50 million.

Small plants in the organic chemicals, plastics and synthetic fibers industries[1/] tend for a number of reasons to be indirect rather than direct dischargers. They are typically located in urban areas where land for onsite wastewater treatment systems designed for direct discharge is generally either not available or very expensive. In addition, such areas as a rule have POTWs which will accept and treat industrial wastewater. Joint treatment of domestic and industrial wastes is cost-effective. The user charges and other direct and indirect costs associated with discharging wastewater to a POTW are generally less than the cost (amortized capital plus operation and maintenance) of an onsite treatment system designed for direct discharge, particularly for small plants which cannot take advantage of economies of scale in treatment technologies.

As a result of the foregoing factors, a high proportion of small plants in the organic chemicals, plastics and synthetic fibers industries are indirect dischargers. Small

---

1/ In its economic analysis, EPA uses the term "establishment" to mean manufacturing operations at a particular location and "plant" to mean a portion of an "establishment" which employs a single process. PMM Report, at 6. The industry refers to a "plant" as meaning manufacturing operations at a particular location. In these comments, SOCMA uses "plant" in its usual industrial meaning. The Peat Marwick Report uses EPA's term "establishment."

20-955 O—84——207

plants, as a discrete subclass of production facilities within the industry, are thus more likely to be subject to the proposed pretreatment standards than large plants.

Such plants more often than not conduct batch operations rather than continuous production processes. EPA has aptly described the type of facility to which SOCMA's primary concern runs:

> Most of the small plants are batch process plants that make only low-volume chemicals. Such a plant may produce a total of 1,000 different products with 70 to 100 of these being produced on any given operating day. Manufacturing plants that produce large quantities of specific chemicals often incorporate fewer unit processes than smaller plants that generate a large number of products. A representative high-volume plant may produce a total of 45 high-volume products with an additional 300 lower-volume products.2/

It is imperative that EPA give specific and careful consideration to application of the proposed regulations to small plants. The special characteristics of a small plant must be considered regardless of whether the plant is owned by a small, medium or large company. Each such small plant is a technically and economically distinct unit and must be considered by EPA as such.

2/ Development Document for Proposed Effluent Limitations Guidelines and New Source Performance Standards for the Organic Chemicals and Plastics and Synthetic Fibers Industry: Volume II (BAT), at III-12 (hereinafter "BAT Dev. Doc.").

SUMMARY OF SOCMA'S POSITION

Pretreatment Issues

SOCMA believes that EPA must reconsider the proposed pretreatment standards for the organic chemicals, plastics and synthetic fibers industries and revise its proposed regulations to ensure that they are supported by adequate data and are consistent with the Congress' intent:

1. EPA's review of these proposed regulations should be part of a comprehensive evaluation of its pretreatment programs.

* EPA must recognize that categorical pretreatment standards are only one of two elements of the pretreatment strategy authorized by the Clean Water Act. The second element of that strategy is the development of local POTW pretreatment programs. The Congress clearly intended that the categorical pretreatment standards be used only to remedy identified significant national pretreatment problems. EPA has not limited the proposed regulations to identified, significant national problems -- for example, EPA has included 9 pollutants in the pretreatment standards on the basis of the absence of data from POTWs.

* EPA must revise its general pretreatment standards, particularly the removal credits regulation and the combined waste stream formula, to ensure that the categorical standards are equitable, effective and

enforceable. However, the removal credit regulations must not be viewed as a justification for promulgating categorical pretreatment standards which do not address a significant national problem or for which there is an inadequate technical or economic basis.

2. EPA radically expanded the scope of its regulatory program from a limited number of identified major product/process segments of the industries to hundreds of unidentified plants, most of them small, manufacturing a wide range of small-volume chemicals.

* For more than a decade, EPA's data gathering and regulatory programs focused on a limited number of product/processes used in the organic chemicals, plastics and synthetic fibers industries. By EPA's estimates, approximately 550 plants were included within the scope of that program.

* In 1982 EPA decided to abandon the product/process approach to development of regulations for subcategories within the industries, but retained its focus on the product/processes which it had studied. Then, at some unidentified time in the several weeks before the March 21 proposal, EPA decided to extend the regulations to any plant engaged in chemical synthesis. By EPA's estimates, up to 1,500 additional plants were included in the proposed regulations as a result of this change in direction. EPA is unable to identify many of these additional plants.

- Many of these additional plants are small plants and users of POTWs. EPA's data base, by its own decisions in establishing priorities, is limited almost entirely to large plants, mostly direct dischargers, manufacturing high-volume products.3/

- SOCMA agrees with EPA that the product/process approach was unworkable. However, abandonment of that approach did not justify the subsequent decision to expand the regulations far beyond a scope that can be supported by EPA's data base.

3. By radically expanding the scope of the regulations to encompass hundreds of small plants not previously included in the regulatory program, EPA has placed an unreasonable burden on operators of small plants desiring, in good faith, to evaluate and comment on the proposal.

- EPA has an obligation to compile and evaluate data for proposed regulations which reasonably supports the proposal and to provide that information to the potentially regulated community in a manner that will allow informed response to the proposal. In this instance, EPA provided to operators of small plants virtually no information which is useful to them in commenting on the proposed pretreatment standards.

3/ EPA's one effort to develop, for subsequent regulations, information on small plants producing low-volume chemicals was terminated after a limited priority pollutant screening study.

• As a result, operators of small plants desiring to comment would have to develop, within a period of a few months, information which EPA has not sought in the course of a decade long, multi-million dollar regulatory program. Such information includes quantitative information on the 81 priority pollutants for the "not-plastics only" subcategory and the 102 priority pollutants for the "plastics only" subcategory which EPA considers candidates for pretreatment standards, identification and evaluation of technologies to reduce discharges of such substances, and evaluation of the cost and business impact of the proposed regulations.

• For many, if not most, small plant operators, EPA's "eleventh hour" change in direction effectively precludes any meaningful opportunity to comment on the proposed regulations.

4. <u>EPA's data do not support EPA's estimate of priority pollutant discharges from organic chemical, plastic, or synthetic fiber plants using POTWs.</u>

• EPA's estimate of the quantity of toxic pollutants (174 million pounds per year) discharged by users of POTWs was extrapolated from a data base which does not include the plants which would be subject to the pretreatment standards.

- Available information indicates that EPA's estimates are exaggerated.

- EPA's estimates of the pollutant reduction benefits of the pretreatment regulations must be totally reworked.

5. <u>EPA should revise its pollutant selection process to include only pollutants which represent a significant national pretreatment problem</u>.

- The data base (screening studies, verification study, and five-plant study) from which EPA identified 108 priority pollutants as candidates for regulation is biased in that the screening studies may have identified pollutants as present when in fact they were not and the verification and five-plant studies intentionally were directed at plants where significant levels of priority pollutants were expected to be present.

- EPA has not substantiated that effluents from organic chemical or plastic or synthetic fiber plants contribute to a national problem of sludge use or of interference with POTW operations.

- EPA's use of a "BAT comparison" to define the "pass through" of priority pollutants is not an appropriate approach to a determination of whether a priority pollutant is compatible with POTW treatment. Such a test is particularly unacceptable when, as for these regulations, the BAT technology is biological treatment and the

resulting regulations have no reasonable relationship to environmental protection.

* SOCMA urges EPA to consider the alternative approach proposed by CMA to determine whether priority pollutants occur significantly in industrial wastewater and in POTW influents and whether these pollutants are adequately treated. In making this evaluation, SOCMA recommends that EPA separately analyze available data for small plants and for indirect dischargers. Further, EPA should use all available information in making its determinations, including data generated by POTWs in developing local POTW programs.

6. EPA must identify and evaluate available pretreatment technologies.

* EPA admits that it has not evaluated any pretreatment technologies and instead has used the BAT data base to establish the pretreatment standards. Nineteen of the 21 plants in EPA's data base employ biological treatment.

* Biological treatment redundant with POTW treatment is a wholly unacceptable pretreatment technology model and basis for the pretreatment standards.

* In evaluating pretreatment technologies, EPA must consider the circumstances of small plants, including the fact that many small users of POTWs are located in urban areas with limited land for treatment facilities.

7. <u>EPA's analysis of the economic impacts of the proposed pretreatment standards upon small plants lacks any credible basis and must be reworked.</u>

- EPA's estimates of compliance costs are founded on tenuous and speculative extrapolations from very limited data using unverified models.
- The Agency's closure analysis uses an inappropriate across-the-board closure criterion and employs an ill-conceived methodology which predetermines the result of few predicted closures of small plants.
- The compliance cost and closure analyses are founded on data which are derived almost solely from large plants and do not reflect variations in small plant operations.
- Each of these analyses also employs averaging techniques which mask disproportionate impacts on small plants.
- Contrary to EPA's extrapolation-based conclusions, what small plant data the Agency does have shows that both compliance costs and closure impacts are likely to be disproportionately higher for small plants.
- In addition, compliance cost estimates submitted to SOCMA and CMA by member companies confirm that small plants are likely to experience substantially higher economic impacts than large plants.

* The Agency must conduct a new economic analysis which evaluates and meaningfully considers the probable disproportionate impacts the proposed pretreatment standards will have upon small plants within the organic chemicals, plastics and synthetic fibers industries.

8. EPA has failed to comply with the clear requirements of the Regulatory Flexibility Act. The Agency's determination that it was not obligated to prepare a regulatory flexibility analysis of the proposed effluent limitations guidelines and pretreatment standards was patently erroneous.

* EPA arbitrarily rejected the Small Business Administration size guidelines for small entities in violation of the Act and its own regulatory flexibility guidelines.

* The Agency failed to provide any reasonable explanation for its choice of an alternative small entity definition of fewer than 50 employees.

* EPA's determination that the proposed regulations would not impose significant or differential impacts on small entities was based on erroneous cost estimates and a seriously flawed closure analysis with respect to small plants.

* Contrary to EPA's conclusion, the Agency's own data demonstrate that small plants may bear substantial and disproportionate economic impacts as a result of the proposed pretreatment standards.

- Compliance cost estimates submitted to SOCMA and CMA by member companies confirm that small plants are likely to be disproportionately affected by the proposed standards.

- EPA must therefore prepare a regulatory flexibility analysis which considers significant alternatives to the proposed regulations which would minimize the economic impact on small entities. To fulfill this statutory obligation, EPA must acquire new data regarding small plants and analyze the relative impacts of significant alternative approaches to the proposed pretreatment regulations with respect to such facilities.

9. <u>EPA's regulatory impact analysis of the proposed pretreatment standards does not meet the requirements of Executive Order 12291</u>.

- The RIA fails to describe or analyze <u>any</u> alternative regulatory approaches.

- The RIA analyses of net benefits and cost effectiveness fail to support issuance of the proposed pretreatment standards.

- EPA cannot take final action on the proposed regulations until it has analyzed alternatives which would reduce small plant impacts and explained why such alternatives could not be adopted. In addition, EPA must carry out a completely new assessment, based upon actual data

relating to small plants, of the relative benefits and cost-effectiveness of the proposed pretreatment standards as applied to such facilities.

SOCMA's Recommendations for Reconsideration and Revision of the Proposed Pretreatment Standards

The persistent flaw in the proposed pretreatment regulations, particularly as applied to small plants, is that pretreatment was a secondary, at best, consideration to the BAT effluent limitations guidelines in EPA's regulatory development process, and large numbers of small plants were brought within the scope of the regulations at the last minute with virtually no consideration. The result is that EPA's data base is wholly inadequate to support the proposed pretreatment regulations, and the proposed regulations are simply arbitrary, particularly as applied to small plants.

SOCMA understands that EPA plans to augment its data base prior to promulgation of final regulations. No doubt there is need for improvement in the data base, most especially for small plants. SOCMA, however, strongly urges EPA to consider two important questions as it compiles and reviews that augmented data base:

- In view of the fact that EPA has spent a decade and many millions of dollars in developing a data base intentionally focused on large plants, is it now practical in a short period of time to identify, evaluate, and

resolve the many issues presented by the expansion of its regulatory program to hundreds of small plants for which EPA presently has little or no data?

* If EPA does decide to include small plants within the scope of the regulations, how will it collect and present its augmented data base in such a manner that operators of small plants, for the first time, have an adequate opportunity to comment on the proposals?

As it proceeds, EPA must recognize that it has special obligations and responsibilities to ensure that it has an adequate basis for regulations affecting small plants. All possible alternatives must be explored. Among those which clearly should be explored are:

* A more precise and realistic identification of industry segments and pollutants which pose a significant national pretreatment problem and exclusion of those which do not.

* Consideration of flow, land availability, and other pertinent factors as a basis for alternative standards or exclusions.

* Alternative standards based upon consideration of the cost-effectiveness of different pretreatment technologies.

* Alternative standards or exclusions based upon a sound assessment of the economic impact of different levels of pretreatment.

* Application of the pretreatment standards only to plants which produce priority pollutants regulated by the pretreatment standards as a product or commercial by-product or which use such regulated priority pollutants as raw materials.

* Deferral of regulations for industry segments for which a sound technical and economic record, with adequate opportunity to comment, cannot be established within EPA's schedule for these regulations.

General, BPT, and BAT Issues

For reasons indicated above, SOCMA's comments are focused on the pretreatment standards. However, SOCMA believes that there are serious problems which apply to the proposed regulations generally and to the proposed BPT and BAT regulations more specifically. SOCMA fully concurs with the comments of the Chemical Manufacturers Association (CMA) on these matters. SOCMA considers the following points to be particularly important:

1. Generally Applicable Points

* EPA's failure to clearly and consistently define "process wastewater" has resulted in major uncertanties as to EPA's development of the proposal and its application to particular plants.

• While SOCMA concurs in EPA's use of concentration-based limitations, provisions should be made to allow adjustments in the limitations as applied to plants with higher pollutant concentrations due to implementation of water conservation measures.

2. Analytical and Monitoring

• EPA has yet to promulgate analytical methods as required by Section 304(h) for many of the priority pollutants included in the proposal.

• Pollutant concentration measurements in the parts per billion ranges of the proposed BAT and pretreatment regulations are subject to substantial analytical uncertainty.[4/] EPA has failed to give adequate consideration to this problem of analytical variability in two contexts:

- Notwithstanding analytical variability, EPA has taken measurements in its data base at face value and developed the proposed regulations on the assumption that these measurements accurately reflect pollutant levels in plant influents and effluents. EPA should revise upward

---

4/ For example, available round robin testing studies have shown that measurements of a priority pollutant sample with a true concentration value of 50 ppb are subject to a variability factor of 1.48 at a confidence limit of 99 percent. That is, 99 of 100 measurements of the sample would fall within the range of 34 ppb to 74 ppb.

its proposed regulations for each pollutant by an appropriate variability factor (as determined from available data) in order to correct for the range of analytical uncertainty inherent in the underlying data base.

- Because of the inherent uncertainty of measurements at such low concentrations, the measured value of monitoring samples will in many instances indicate noncompliance with a pretreatment standard or NPDES permit effluent limitation when in reality the true value of the pollutant concentration is at or below the level of the standard or limitation. The inevitable occurrence of such "apparent" noncompliances due solely to inherent analytical variability will erroneously expose direct and indirect dischargers to enforcement actions and sanctions under federal or state law and, for indirect dischargers, to potential liability for violations of municipal codes or POTW contracts. In addition, dischargers may incur large costs in continually testing samples in order to demonstrate that "apparent" violations of the standards were in fact due solely to analytical variability. And POTWs will incur unnecessary administrative costs in investigating and evaluating such "apparent" violations. EPA should formally recognize a range of presumed compliance above the level of the proposed standards to take account of the inherent analytical uncertainty of

compliance measurements at such low concentrations. Only measured values above the upper limit of this range should be considered to represent noncompliance with the relevant standards.

- EPA's proposed pretreatment standards and BAT effluent limitations guidelines provide for a four-day average. If EPA intends that to mean a running average of any four consecutive samples, the probability of violations is increased significantly.

- The criterion (no measurement exceeding 10 ppb over a 12-month period) for exclusions from routine monitoring is unnecessarily stringent given analytical variability.

3. BPT

A primary concern of SOCMA with respect to BPT parallels that with respect to the pretreatment standards: EPA's decision to expand the coverage of the regulations was made without a concurrent augmentation of the BPT data base to ensure that it included data representative of small plants. In the absence of data on small plants, EPA assumed, without analysis, that the proposed BPT effluent limitations guidelines were equally achievable regardless of plant size. EPA then extrapolated presumed costs for small plants from a data base which did not include a representative selection of small plants. PMM Report, at 11, 13. Indeed, the formula used by

EPA to extrapolate costs inherently masks the variability or range of costs which could be incurred at small plants. PMM Report, at 14.

SOCMA agrees with CMA that approaches exist for the establishment of BPT effluent limitations guidelines which are more reasonable than the method used by EPA and that broad subcategories are a practical necessity. At the same time, SOCMA emphasizes that EPA's correct decision to abandon its historic product/process approach does not justify expansion of the regulations to cover segments of the industry for which EPA has a nonexistent or inadequate data base.

Other important points regarding the BPT proposal include:

* EPA should not have arbitrarily limited the BPT data base to plants achieving at least a 95 percent BOD_5 removal or a 50 mg/l BOD_5 treated effluent.

* EPA should ensure that the BPT data base does not include plants with NPDES permits and treatment facilities based upon site-specific water quality considerations.

* EPA should review and revise its variability analysis.

* EPA has not given sufficient consideration to the effect of temperature on biological treatment processes.

* The regulations as applied to individual plants must result in NPDES effluent limitations which directly relate to the raw waste load at that plant.

* Even apart from the absence of a representative data base on small plants, EPA's cost-estimation and economic-analysis methodologies are marred by basic factual and theoretical errors.

* EPA has not considered whether the costs in relation to effluent reductions which would result from the proposed BPT regulations can be justified when compared to the costs in relation to effluent reductions from compliance with BPT requirements in existing NPDES permits.

4. BAT

As in the case of the pretreatment and BPT regulations, EPA's decision to expand the scope of the BAT regulations subsequent to its abandonment of the product/process approach has resulted in regulations which overreach EPA's BAT data base. In addition, SOCMA has identified the following issues which EPA should address:

* The data base from which EPA identified 108 priority pollutants as candidates for regulation is biased toward large plants and plants expected to discharge significant levels of priority pollutants. It is not representative of small plants or indirect dischargers.

* Use of the nominal detection level of 10 ppb is an inappropriate indicator of "significance".

* Only metals used in chemical processes should be candidates for national regulation, and the BAT levels for

such metals should be based upon treatment facilities at plants which do use that metal and not upon treatment facilities at plants where the presence of the metal is incidental.

- The only data quantitatively useful in deriving BAT effluent limitations guidelines are GC/MS data from the verification study and the Five-Plant Study. The result is that the data base for the guidelines consists of only 21 plants and that data base is inadequate for nationally applicable regulations.

- The data base is particularly inadequate for small plants since, by design, the 21 plants include only large plants mainly manufacturing high-volume products.

- There are major shortcomings in EPA's variability analysis.

- The use of "generalized plant configurations" is beset with methodological and data deficiencies. As discussed in connection with the pretreatment standards, EPA's approach results in particularly biased and unreliable cost estimates for small plants.

- The BAT closure analysis, which is the same as the pretreatment standard analysis, is seriously flawed and biased against small plants for the reasons discussed in connection with the pretreatment standards.

- EPA has not considered the cumulative impact of the revised BPT effluent limitations guidelines plus the BAT effluent limitations guidelines.

- The cost-effectiveness analysis is not based on either sound cost data or meaningful benefit information.
- EPA has not met its responsibility for identifying and evaluating technologies capable of achieving the proposed BAT levels. And these proposed levels are markedly lower than the BAT levels established by EPA for other industries.

I.

THE CATEGORICAL PRETREATMENT STANDARDS ARE ONLY ONE ELEMENT OF AN EFFECTIVE NATIONAL PRETREATMENT STRATEGY

In its November 1981 recommendations to EPA, SOCMA urged a comprehensive reevaluation of EPA's pretreatment approach which included both legislative and administrative initiatives. However, SOCMA emphasized that, while amendments to the pretreatment provisions of the Clean Water Act were highly desirable, EPA had sufficient discretion under the Act to make significant improvements in its pretreatment program.

SOCMA continues to believe that the Agency should thoroughly assess the improvements in the pretreatment program which it can make administratively. Further, the present proposal for pretreatment standards for the organic chemicals and plastics and synthetic fibers industries should be viewed in the context of such an evaluation.

The two basic elements of the pretreatment program contemplated by the Clean Water Act are national categorical pretreatment standards under Section 307(b) and local pretreatment programs developed pursuant to POTW permits under Section 402(b)(8). Each has its role in the legislative scheme.

The Congress' intent was that the "pretreatment standards established under this section [307(b)] would be national in scope and addressed to the most significant pretreatment problems." Pretreatment problems which are not national in scope were to be addressed by standards adopted by POTWs, and Congress "expected that each manager of a treatment works would provide for such standards." Establishment of categorical pretreatment standards to address POTW problems which are not significant or national in scope would be contrary to the Congressional statement that "[i]t is not intended that private pre-treatment facilities be required as a substitute for adequate municipal waste treatment works." Leg. Hist. FWPCA, at 800.

EPA's evaluation of its pretreatment program and of these regulations should explicitly recognize Congress' intent. More specifically, EPA's pretreatment program should be based on the following:

- Development of national categorical pretreatment standards only for pollutants and for industry segments which represent a significant national pretreatment problem.

- Reconsideration of the provisions of the general pretreatment regulations designed to implement the national categorical pretreatment standards (particularly the combined waste stream formula and the removal credit provisions, with recognition that removal credits were intended by the Congress to be an independent mechanism for the adaptation of national categorical pretreatment standards to the special capabilities of particular POTWs and not an excuse for promulgating categorical pretreatment standards which are not technically and economically sound responses to an identified and significant national problem).

- Recognition of the appropriate and necessary role of local POTWs in addressing problems which are not of national significance by support and implementation of legislation providing for alternative local pretreatment programs or, in the absence of such legislation, use of the NPDES permit pretreatment program requirements to encourage POTWs to address and resolve pretreatment issues of local significance.

SOCMA does not believe that the regulations as proposed adequately reflect these principles. Instead, the proposed pretreatment standards reflect an apparent continuing adherence to a philosophy that national categorical pretreatment standards are the dominant, if not the only, mechanism for

regulating industrial users of POTWs, SOCMA firmly believes that EPA's undue reliance on this one element of the pretreatment program envisioned by the Congress is a major cause of an Agency proposal which --

- Would regulate pollutants on the basis of data and a screening test (the "BAT removal comparison" test) which are inadequate to demonstrate that those pollutants represent a significant national problem.
- Would impose pretreatment standards in the absence of POTW treatment data.
- Would impose pretreatment standards on the industry as a whole without a sufficient data base to identify industry segments which may pose a problem of national significance.
- Would impose pretreatment standards without identification and evaluation of a technology to meet these standards other than biological treatment which would duplicate POTW treatment.
- Would impose pretreatment standards without an adequate data base to evaluate their environmental benefit or economic impact.
- Would rely on the removal credits provision of the general pretreatment regulations to justify and ameliorate the impact of arbitrary categorical pretreatment regulations.

- Fails to recognize the ability and responsibility of EPA, the states, and local POTWs to identify and remedy through local pretreatment programs environmental problems resulting from industrial users of POTWs which are not of national significance or capable of being remedied by categorical pretreatment standards.

II.

EPA HAS RADICALLY EXPANDED
THE SCOPE OF THE REGULATIONS
FAR BEYOND ITS DATA BASE

A. History of Regulations for the Organic Chemicals and Plastics/Synthetic Fibers Industries

Initial efforts to develop regulations for the organic chemicals industry and the plastics and synthetic fibers industry began in 1971. Under a two-phase program, conventional (BOD_5 and TSS) and a limited number of nonconventional pollutant parameters of the organic chemicals manufacturing industry were regulated separately from those of the plastics and synthetic fibers industry.

Phase I regulations for the organic chemicals manufacturing industry were promulgated on April 25, 1974. 39 Fed. Reg. 14676. These regulations applied to 40 specific product/process segments of the industry. Phase II regulations, promulgated on January 5, 1976 (41 Fed. Reg. 902), covered an additional 27 specific product/process segments.

Phase I regulations for the plastics and synthetic fibers industry were promulgated on April 5, 1974. 39 Fed. Reg. 12502. They established regulations for 13 identified plastic/synthetic fibers subcategories. The Phase II regulations, promulgated on January 23, 1975 (40 Fed. Reg. 3730), applied to 8 additional product/processes.

When the Phase II regulations for the organic chemicals manufacturing industry were published, litigation challenging the Phase I regulations was pending. On February 10, 1976 (a month after publication of the Phase II regulations), the court ordered EPA to withdraw, reconsider, and repromulgate both the Phase I and Phase II regulations. Union Carbide Corp. v. Train, 541 F.2d 1171 (4th Cir. 1976). In accordance with this ruling, on April 1, 1976, EPA published a notice revoking all of the Phase I and II regulations except those relating to the manufacture of butadiene. 41 Fed. Reg. 13936.

During the same time period, existing regulations (except those concerning pH limitations) for the plastics and synthetic fibers industry were also being challenged in court. On March 10, 1976, the Phase I plastics and synthetics fibers regulations were remanded to EPA for reconsideration. FMC Corp. v. Train, 539 F.2d 973 (4th Cir. 1976). On August 4, 1976, EPA published a notice revoking all Phase I regulations. 41 Fed. Reg. 32587. Since the Phase II standards were based on similar data, the Agency also revoked those regulations.

In 1976, EPA entered into a Settlement Agreement with environmental groups which was approved in a Consent Decree issued by the U.S. District Court for the District of Columbia. Natural Resources Defense Council v. Train, 8 E.R.C. 2120 (D.D.C. 1976). The Agreement embodied a new regulatory strategy for "toxic" pollutants. By December 31, 1979, EPA was to develop and issue BAT effluent limitation guidelines, pretreatment standards, and new source performance standards for 21 major industries (including the organic chemicals and plastics/synthetic fibers industries) covering 65 priority pollutants or groups of pollutants.[5/]

The Clean Water Act of 1977 (P.L. 95-217) required BAT levels of control for all priority pollutants referred to in Table 1 of Committee Print No. 95-30 of the House Committee on Public Works and Transportation (identical to the list of 65 classes of toxic pollutants listed in the Consent Decree).[6/]

5/ EPA did not meet its original deadlines, and the NRDC filed a motion with the District Court on September 26, 1978, requesting that EPA show cause why it should not be held in contempt of court for failing to comply with the timetable of the Consent Decree. This action led to a modification of the Consent Decree which was approved by the court on March 9, 1979. NRDC v. Costle, 12 E.R.C. 1833 (D.D.C. 1979). In 1981, EPA requested a revised set of deadlines. On May 7, 1982, the court ordered EPA to propose all regulations within six additional months. 17 E.R.C. 2013. EPA then asked that the deadlines for the regulations for the organic chemicals and plastics and synthetic fibers industries be extended. The court filed an order on October 26, 1982, requiring EPA to propose the regulations on these industries by February 1983 and promulgate the final regulation by March 1984.

6/ Recognizing that some of the listed substances represented classes of compounds, EPA refined the list by specifically

(Footnote continued on next page)

The pretreatment provisions of the 1972 legislation were not altered, but the Congress did add a provision to require a credit against the categorical pretreatment standards applicable to an industrial user for removal of priority pollutants by a particular POTW.

B. EPA's Data Gathering Program

After the entry of the Consent Decree, EPA began to collect the technical and economic information necessary to establish effluent regulations for priority pollutants. EPA largely relied on its authority under Section 308 of the Clean Water Act to gather information directly from manufacturing facilities.

By its own choice in establishing priorities, EPA's data gathering efforts since 1976 for the organic chemicals and plastics and synthetic fibers industries have focused on specific product/process segments of the industries. In 1976 EPA requested responses to BPT questionnaires from plants utilizing one or more of the product/processes in the organic chemicals or plastics and synthetic fibers industries covered by the earlier Phase I and II regulations. In 1977, EPA sent a BAT

(Footnote continued)

listing some members of the classes and excluding others, producing a list of 129 priority pollutants. EPA has since eliminated three pollutants from the original list: bis(chloromethyl) ether, dichlorodifluoromethane, and trichlorofluoromethane.

questionnaire to plants covered by the Phase I or Phase II regulations or which indicated in the BPT questionnaire that they produced a chemical on the priority pollutant list. Responses from 566 plants were used by EPA. BAT Dev. Doc., at II-17 to II-19 and App. B.

EPA then initiated a "screening" program and a "verification" program to obtain information on priority pollutants. Again EPA established priorities and focused its verification study efforts on the manufacture of chemicals on the priority pollutant list or directly derived from such chemicals, or approximately 1.4 percent of the estimated 25,000 commercial chemicals. BAT Dev. Doc. at II-21 to II-22. To conserve resources, EPA sampled large plants with as many priority product/processes as possible. A total of 37 plants were included in the verification study (the data for 6 of which were discarded as of questionable quality). BAT Dev. Doc., at II-23.

Finally, EPA participated in the selection of five large multi-product plants for a long-term sampling study by CMA's contractor.[7/] The plants were selected on the basis of specific priority pollutants expected to be found and because they had well-designed and well-operated biological treatment systems. BAT Dev. Doc. at II-23 to II-24, V-34.

7/ Engineering-Science, Inc., CMA/EPA Five-Plant Study (April 1982) (cited as "Five-Plant Study").

The foregoing, or first phase, of EPA's plan clearly was to focus the initial regulatory effort on major product/process segments of the industries. A second phase was to have developed information for other, lower-volume product/process segments. EPA did conduct a screening program in 1979 at 40 plants producing a number of speciality chemicals. However, the second phase was abandoned by EPA, and a verification study was never performed. BAT Dev. Doc., at II-23, V-58 to V-60.

C. The March 21 Regulations

The foregoing history of EPA's implementation of the Clean Water Act as applied to the organic chemicals and plastics and synthetic fibers industries is important. It demonstrates that for more than a decade EPA, by its own decisions establishing priorities, focused its regulatory efforts on a limited number of high-volume products generally manufactured at large plants. EPA's plans for a second phase study of small-volume products were aborted after the screening study.

Until the March 21 proposal, EPA had recognized that it is not reasonable to promulgate regulations for small and batch plants manufacturing thousands of different products without having a sound data base for that varied segment of the industry. Indeed, in the initial 1973 Phase I effluent regulations for the organic chemicals industry, EPA rejected the idea

of proposing a "basket category" regulating en masse the production of chemicals not otherwise included in its product/process subcategories. That proposal did include a "basket subcategory" for the many batch processes used in the manufacture of organic pigments and dyes. 38 Fed. Reg. 34705. However, EPA, recognizing the diversity of the many small producers of dyes and pigments, deleted batch organic dyes and pigments from the 1974 final regulations "due to the limited data base." 39 Fed. Reg. 14677.

The March 21 proposal represents a radical departure from and expansion of the scope of EPA's decade-long regulatory program:

- EPA's regulatory development program focused on specific product/process segments of the industry. The March 21 proposal applies to any facility which synthesizes organic chemicals or plastics or synthetics fibers (and perhaps even some that do not).

- By EPA's estimates, approximately 550 plants used the product/processes studied by EPA. Again by EPA's estimate, the scope of the regulations was expanded on March 21 to include up to 1,500 additional industrial plants.

- EPA's prior program included mostly high-volume chemicals produced at large plants. A large proportion of the plants which would be encompassed by the March 21 proposal are small plants.

• EPA's prior program clearly contemplated regulations identifying the product/process segments to be covered. With the March 21 expansion, EPA is unable to identify many of the regulated plants or the products which they produce. Based upon information from SOCMA's members, EPA has misidentified many plants.

In short, this major expansion of the scope of the regulations from a limited number of product/processes to an entire industry was not accompanied by a corresponding expansion in the data base for the regulations or notice to the potentially regulated community. Rather it seems to have its roots in EPA's decision in 1982 to abandon the product/process subcategory approach to the regulations. For reasons not disclosed, EPA then arbitrarily decided in the several weeks before publication of the March 21 proposal to extend the regulations to the entire organic chemicals, plastics and synthetic materials industries. SOCMA agrees with EPA that the product/process approach was unworkable. However, EPA's decision to abandon that approach does not justify in any way expansion of the regulations to hundreds of small plants and low-volume products for which EPA has virtually no data.

III.

EPA, AS A RESULT OF ITS DECISION TO RADICALLY EXPAND THE SCOPE OF THE REGULATIONS, HAS PLACED AN UNREASONABLE BURDEN ON SMALL PLANTS DESIRING TO EVALUATE THE IMPACT OF THE PROPOSED REGULATIONS AND TO COMMENT TO THE AGENCY THEREON

Recognizing the major importance of the proposed regulations, SOCMA has made every effort to assist those companies, both within and without its membership, who operate small plants in their efforts to evaluate and respond to the proposal. SOCMA sent information on the proposal to a list of 2400 plants. On May 16, 1983, SOCMA held an extensive workshop on the proposed regulations as they apply to small plants. SOCMA has distributed additional materials designed to help and guide small plants in commenting on the proposal.

SOCMA has received many inquiries from small plants in response to its efforts. It has become increasingly apparent that EPA, because of its chosen approach to the proposed regulations, has placed a wholly unreasonable burden on operators of small plants who, in complete good faith, desire to understand the impact of the proposal on their facilities and to provide the Agency with thoughtful, well-documented comments.

The major cause of many companies' inability to develop comments is EPA's decision sometime in the few weeks preceding publication of the proposed regulations to radically expand the scope of its regulatory program from the manufacture

of a discrete number of identified product/process segments of the organic chemicals and plastics and synthetic fibers industries to the manufacture of all organic chemicals and plastics and synthetic fibers. A most unfortunate consequence of EPA's eleventh-hour change in the scope of the regulations is that EPA has provided little meaningful information which the operator of a small plant can use in assessing and commenting on the proposed regulations. EPA has an obligation to make such information available in connection with proposed regulations and in the following more specific instances has completely failed to do so:

- The scope of the regulations should have been clearly defined. In fact, while EPA refers to particular Standard Industrial Classifications (SIC) as providing guidance for the applicability of the regulations, EPA representatives have stated at various times that facilities falling outside those SIC codes may nonetheless be covered by the proposed regulations. EPA's lack of specific definition of the scope of the regulations probably accounts in part for the fact that EPA itself is unsure of either the number or the identity of the plants encompassed by the proposal.

- To assist small plant operators in focusing their assessment, EPA should have identified with precision the pollutants of national significance for which categorical

pretreatment standards are justified and presented a meaningful data base for that conclusion. EPA has proposed regulations for 17 priority pollutants for the "not-plastics only" subcategory and 4 for the "plastics only" subcategory. But 64 additional pollutants for the "not-plastics only" subcategory and 98 for the "plastics only" subcategory have been listed for possible regulation based upon information which EPA may obtain during the rulemaking. And 9 of the 17 pollutants proposed for regulation in the "not-plastics only" subcategory are pollutants for which EPA had no POTW data indicating whether they are or are not compatible with POTW treatment.

* EPA should have had data for representative segments of the entire industry to be regulated indicating which priority pollutants are likely to be present at significant levels. In fact, EPA has little data on small plants, particularly those discharging to POTWs, and its "pollutant pathways model" is of no assistance to a small plant operator seeking to focus its analytic and monitoring work. The limited information which EPA did seek on specialty chemical producers (the second screening study) was not separately evaluated by EPA.

* Since EPA views the pretreatment standards as technology-related, EPA should have identified and provided a sound engineering evaluation of the available

technologies to reduce specific pollutants. As acknowledged by EPA in the Development Document (BAT Dev. Doc., at XI-3 to XI-4), the Agency did not in any way identify and evaluate pretreatment technology. Rather, EPA based its pretreatment standards on direct discharge BAT technology which includes biological treatment which is redundant with POTW treatment.

• EPA has an obligation to evaluate the economic impact of the regulations. The economic analyses as presented by EPA are based upon such complex models with so little actual data and so many hidden assumptions that they are simply inscrutable to the operator of a small plant. Indeed, even the expert consultant retained by SOCMA to assess the economic analysis as applied to small plants has found it most difficult to follow the Agency's reasoning, data sources and conclusions. Further, the record for the economic analyses is virtually devoid of meaningful information on small plants.

EPA's failure to provide an adequate base of reliable and usable information to assist the operator of a small plant has placed major burdens, in SOCMA's view unacceptable burdens, on an operator of a small plant seeking, first, to assess the impact of the proposed regulations on his business and, second, to comment to the Agency:

- EPA has imposed upon the operator of a small plant the time-consuming, expensive, and difficult task (particularly for batch plants) of obtaining representative information on the 81 pollutants for the "not-plastics only" subcategory and the 102 pollutants for the "plastics only" subcategory which EPA proposes to regulate or which it says it may regulate.

- EPA has imposed upon the operator of a small plant the task of identifying and evaluating the effectiveness of pretreatment technologies for the pollutants for which EPA has proposed standards and the several dozen other pollutants which EPA may regulate.

- EPA has imposed upon the operator of a small plant the burden of developing technology concepts and obtaining the information necessary in order to make at least a preliminary estimate of the cost of installing the technology required to achieve the standards or possible standards.

- EPA has imposed upon the operator of a small plant the burden of making an evaluation of economic impact in a manner that is somehow consistent with the complex computer models employed by the Agency.

There are no rational bases for concluding that small plants using POTWs have such information already available. The data-gathering efforts of POTWs and their industrial users in developing local pretreatment programs have been directed to

resolving identified problems. Given EPA's approach to identification of pollutants for regulation and establishment of proposed pretreatment standards, any concordance between studies conducted by POTWs or their users of actual pretreatment problems with EPA's proposal would be pure happenstance.

EPA has spent nearly a decade and several millions of dollars to develop information, albeit still incomplete, for the major product/processes which were included in its regulatory program prior to the radical expansion of that program in the March 21 proposal. Yet EPA, having provided the small plant operator with virtually no information which is useful in assessing the regulations, expects the small plant operator to duplicate that process within the confines of a few months. SOCMA submits that the burden which EPA, by virtue of <u>its decision</u> to dramatically enlarge the scope of these regulations, has placed upon the operator of a small plant is totally unreasonable and has the effect of excluding the small plant operator from the public participation process which the statute mandates.

IV.

EPA'S DATA DO NOT SUPPORT EPA'S ESTIMATE OF PRIORITY POLLUTANT DISCHARGES FROM ORGANIC CHEMICALS, PLASTICS, AND SYNTHETIC FIBERS PLANTS USING POTWS

PA's major enlargement of the scope of the regulations was not accompanied by any analysis establishing that the effluents from several hundreds of small plants now encompassed by the proposed regulations represent a significant national pretreatment problem. EPA's only effort to identify a pretreatment problem is its estimate that indirect dischargers account for discharges of 174 million pounds of priority pollutants and that the proposed regulations would result in a 90 percent reduction of such discharges to 9 million pounds. 48 Fed. Reg. at 11841, 11843.

In SOCMA's view, these figures must be discounted as arbitrary, unsupported and exaggerated. While the methods by which EPA compiled its estimates are shrouded in mystery, one point is clear: EPA's estimates were not based on data from the plants which would be regulated by the proposed pretreatment standards.

A draft EPA report[8/] concedes that the estimates were not derived from current discharge levels of plants covered by the proposed pretreatment standards. Rather the estimates were

---

8/ James J. Spatarella, Project Officer, EPA Office of Water Regulations and Standards, "Summary of Priority Pollutant Loadings for the Organic Chemicals, Plastics and Synthetics Industry" (February 18, 1983).

modeled from data on a limited number of product/processes and arbitrarily extrapolated to the entire industry.[9/]

Consequently, it is clear that EPA attempted to use data from a limited number of large, high-volume direct discharging plants to characterize hundreds of small indirect dischargers. EPA made no effort to assess discharges of the plants which would actually be covered by the regulations.

That information which is available suggests that EPA's arbitrary estimates also are exaggerated. As best SOCMA can determine, EPA's estimates were based upon an assumed priority pollutant concentration in wastewater of 75 mg/l.

The only information presented by EPA separately on indirect discharges is data on three "not plastics only" plants. BAT Dev. Doc., Table V-22, at V-66. Of the 17 priority pollutants included in the proposed pretreatment standards for the "not plastics only" subcategory, only three (2-nitrophenol, chromium, and mercury) were detected in the wastewater of these indirect dischargers:

9/ EPA's data base, modeling effort, and extrapolations are discussed more extensively in CMA's comments.

Priority Pollutant	Number of Plants	Median Concentration
2-Nitrophenol	1	42 ppb
Chromium	3	240 ppb
Mercury	1	80 ppb

Such data are simply inconsistent with the apparent basis for EPA's gross estimate of priority pollutant discharges.

Similarly, a member company[10/] evaluated total priority pollutant concentrations in the effluents of its 14 indirect discharge plants. The average raw wastewater concentrations were approximately 4 to 5 mg/l (or less by 15 times that arbitrarily assumed by EPA).

It is incumbent upon EPA to accurately depict the effect of its regulations. Thus, EPA should --

- Use all available reliable information, including the substantial data base compiled by individual POTWs in developing local pretreatment programs.
- Identify the benefits of the regulations in terms of reductions in discharges of the specific priority pollutants which would be regulated by the pretreatment standards.
- Ensure that the base from which the reduction benefits are computed does not include those quantities of priority pollutants removed by industrial pretreatment and POTW treatment.

10/ E. I. Du Pont de Nemours & Co.

* Clearly define and explain the methodology by which the benefits are calculated.

V.

EPA SHOULD REVISE ITS POLLUTANT SELECTION PROCESS TO INCLUDE ONLY POLLUTANTS WHICH PRESENT A NATIONALLY SIGNIFICANT PRETREATMENT PROBLEM

Utilizing data from the screening phase, the verification phase, and the Five-Plant Study, EPA engaged in a 7-step process to select the priority pollutants to be subject to pretreatment regulations (BAT Dev. Doc., Section VI):

(1) EPA excluded 18 pesticides.

(2) EPA included the remaining 108 priority pollutants as candidates for regulation on the ground that each was detected in influents to treatment systems of at least 42 percent of the plants sampled for that pollutant during the screening, verification, and Five-Plant Study.

(3) For the "not-plastics only" subcategory, a decision on whether to regulate 64 pollutants was deferred because of inadequate data to establish BAT levels. For the "plastics only" subcategory, a decision was deferred on 98 pollutants.

(4) BAT effluent limitations guidelines were proposed for the remaining 44 pollutants in the "not-plastics only" subcategory and 10 pollutants in the "plastics only" category.

(5) EPA conducted a "pass through" analysis in which it compared the removal at industrial plants deemed to have BAT to average removals derived from the 50-plant POTW study.[11/] For the "not-plastics only" subcategory, EPA concluded from this "BAT removal comparison" that 27 pollutants should be excluded on the ground that POTW removal was equal to or greater than BAT removal. A total of 6 pollutants were excluded on this basis for the "plastics only" subcategory.

(6) EPA proposed pretreatment standards for 8 pollutants in the "not-plastics only" subcategory and 4 pollutants in the "plastics only" category on the ground that BAT removals exceed POTW removals by at least 5 percent.

(7) The remaining 9 pollutants in the "not-plastics only" subcategory were included in the proposed pretreatment standards because POTW sampling data were not available from the 50-plant POTW study.

The objective of EPA's pollutant selection procedure for pretreatment standards should be to identify pollutants which pose a significant national pretreatment problem. See Part I above. EPA's procedure wholly misses that mark.

SOCMA agrees with EPA that presence in industrial wastewater should be a factor in identifying pollutants for

---

11/ Burns and Roe Industrial Service Corp., "Fate of Priority Pollutants in Publicly Owned Treatment Works" (September 1982).

regulation. However, EPA's conclusion that 108 priority pollutants occur in industrial effluent with sufficient frequency to constitute a "national" problem is bottomed on a flawed and biased data base:

* There is a serious question as to whether the screening study data are sufficiently reliable to be used as the basis for identifying pollutants for regulation, particularly since EPA's contractors were instructed to identify a pollutant as present if there was any doubt as to its absence. BAT Dev. Doc., App. E, at E-14.

* By design, the verification study and the Five-Plant Study focused on plants expected to have significant levels of priority pollutants. The plants included in those studies are not representative of the industries as a whole.

* The data are mainly from large direct dischargers and are not representative of small plants or indirect dischargers.

* EPA appears not to have separately assessed data from the second screening phase or on indirect dischargers. The information presented on indirect dischargers indicates that there are far fewer "significant" pollutants than the candidates identified by EPA. BAT Dev. Doc., Tables V-22 and V-23.

EPA's implicit definition of "pass through" is not consistent with its own practice or with Congress' intent to focus the categorical pretreatment standards on incompatible pollutants presenting a significant national problem. In its 1978 pretreatment strategy issued following the 1977 amendments to the Act, EPA correctly stated that a determination of "compatibility" should focus on POTWs: adverse impact upon the operation of the POTW, the ability of the POTW to remove a pollutant, and effect on POTW use or disposal of treatment system sludges. 43 Fed. Reg. 27761 (June 28, 1978).[12/]

In evaluating the degree to which effluents from the organic chemicals and plastics and synthetic fibers industries are compatible with POTW treatment, it is important to note --

- EPA has concluded that discharges from these industries do not cause a national problem of sludge use or disposal and that any "local problem should be addressed through the local pretreatment program." 48 Fed. Reg. 11842.

- EPA's assertions as to interference with POTW treatment processes (48 Fed. Reg. 11842) are generalized, undocumented, and not related to any specific pollutants.

Thus, there is no genuine issue of interference or sludge use, and the focus of EPA's analysis should be on

---

12/ SOCMA notes that it does not agree with a number of other positions taken by EPA in the 1978 strategy statement.

"compatibility" in the sense of capability of the POTW system to reduce levels of a pollutant and limit "pass through." The BAT removal comparison is neither the only nor the appropriate approach to determining such capability. The BAT removal comparison is a wholly inappropriate test when the technology upon which BAT is based is biological treatment.

The arbitrariness of EPA's use of the BAT comparison in defining "pass through" can be demonstrated. Congress' objective in requiring that EPA consider the "pass through" of pollutants clearly was environmental protection. Comparison of the pretreatment standards resulting from EPA's approach with EPA's water quality criteria for protection of fresh water aquatic life firmly establishes that EPA's concept of "pass through" bears no reasonable relationship to Congress' intent. As shown in the table on the following page, EPA's methodology results in standards for industrial wastewater prior to POTW treatment which are significantly lower than EPA's criteria for the receiving waters. This serves as an important indication that the proposed standards should be reevaluated.

EPA'S PROPOSED PRETREATMENT STANDARDS COMPARED TO EPA'S WATER QUALITY CRITERIA

"Not-Plastics Only" Subcategory

Pollutants	Pretreatment Standard Daily Maximum (ppb)	Water Quality Criteria Freshwater Aquatic Life Toxicity (ppb)
2,4,6-Trichlorophenol	175	970**
2-Chlorophenol	75	4,380*
2,4-Dichlorophenol	200	365**

* Criterion based on acute toxicity.
** Criterion based on chronic toxicity.
*** Concentration not to be exceeded at any time.

SOCMA strongly urges EPA to abandon the BAT removal comparison as used in developing its proposed pretreatment standards and to consider alternative approaches such as that proposed by CMA. Under CMA's alternative, pollutants would be included in the pretreatment program only if they occur significantly in industrial raw wastewater, occur significantly in POTW influents, and are not adequately treated by POTWs.

In addition, SOCMA recommends in connection with reconsideration of the proposed regulations that:

- The data base for indirect dischargers should be separately analyzed, and, if available, data after any pretreatment step should be used.
- The Agency should separately analyze data available for small plants as defined by sales, flow, or other available information.
- EPA should use all available information in determining whether a pollutant causes a significant national pretreatment problem. For example, EPA has, but has not made use of, an extensive data base generated by individual POTWs in developing their local programs.

Above all, the determination to establish pretreatment regulations for a particular pollutant should be made on the basis of reliable data indicating a problem of national significance. EPA should not flaunt the Congress' intent, as it has done for 9 pollutants for the "not-plastics only"

subcategory, by proposing regulations on the basis of an absence of information on POTW treatment. Nor should EPA utilize any approach in which the inevitably low concentrations in POTW influent (e.g., 20 ppb) are matched with an effluent at the nominal detection level (10 ppb for many pollutants) to demonstrate "inefficient" treatment (50 percent) or any other mechanistic approach which does not reliably evaluate POTW performance.

EPA has recognized that the statutory phrase "incompatibility" does not require a comparison to industrial BAT. In implementing the program required by Paragraph 4(c) of the Consent Decree (page 29 above) to identify incompatible pollutants, other than priority pollutants, as candidates for pretreatment regulations, EPA has not used any form of a BAT comparison. Rather EPA made a qualitative judgment as to whether a particular pollutant would be reasonably amenable to treatment in a POTW.

While SOCMA does not endorse the specific approach used in the Paragraph 4(c) program, the Paragraph 4(c) program does indicate EPA's recognition that there are alternative approaches to determining compatibility and that such screening approaches meet the statutory requirements for pretreatment standards focused on pollutants which cause POTW problems of national significance.

20-955 O—84——210

The BAT removal comparison does not accomplish that result. The comparison indicates only that an industrial biological treatment system conforming to EPA's criteria for BAT technology may be more effective in treating some pollutants than the average of selected POTWs meeting secondary treatment requirements. That is not a "pretreatment problem" of national significance for which the Congress contemplated a remedy of categorical pretreatment standards.

VI.

EPA HAS NOT ESTABLISHED A TECHNICAL BASIS FOR THE PROPOSED PRETREATMENT STANDARDS, PARTICULARLY AS APPLIED TO SMALL PLANTS

A. Inadequacies of the BAT Data Base

The proposed pretreatment standards are derived directly from the proposed BAT effluent limitations guidelines. As discussed in more detail by CMA and its engineering consultant, EPA's data base is inadequate to support the BAT effluent limitations guidelines. That data base is particularly inadequate as applied to small plants which discharge to POTWS:

- The BAT data base consists of only 21 plants out of, by EPA's estimates, up to 2,100 plants covered by the proposal.

- The plants included in the data base were selected on the basis that they produce priority pollutants or produce large volume chemicals. "[T]housands of industrial

product/processes are left unaddressed" by the BAT data base. 48 Fed. Reg. 11835.

* While EPA initiated a second phase of its regulatory program for these industries directed at specialty chemicals with a screening study of 40 plants, that second phase was terminated before even a verification study was conducted.

* The proposed pretreatment regulations for organic priority pollutants are based on data from a limited number of plants. As shown by the table on the following page, the proposed pretreatment standards for 10 of 17 pollutants covered in the "not plastics only" subcategory are based on data from one plant. Each of the pretreatment standards for the "plastics only" subcategory is based on data from just one plant.

BAT DATA BASE AS APPLIED TO PRETREATMENT STANDARDS

* There are serious errors in EPA's variability analysis (which would be particularly important when applied to batch plants with constantly varying product mixes and without the large volume of mixed wastes occurring at larger plants).

* Inadequate allowance is made for analytical variability.

B. The Absence of a Pretreatment Data Base

The most serious flaw in the proposed pretreatment standards is the total lack of an assessment by EPA of the technological basis for those proposed standards. As stated by EPA, "[t]he Agency's performance data for in-plant controls (such as steam stripping, solvent extraction and chemical (sic) (precipitation) that remove specific toxic pollutants prior to end-of-pipe treatment is not sufficient for development of pretreatment standards." BAT Dev. Doc. at XI-3. Therefore, not having adequate information to establish pretreatment standards based upon technologies appropriate for plants discharging to POTWs, EPA based the pretreatment standards on the BAT data base.

Nineteen of the 21 plants included in the BAT data base utilize biological treatment. Thus, the pretreatment standards are based upon biological treatment. Biological treatment is a wholly inappropriate technology for pretreatment. Redundancy with POTW treatment is inherent and, for that

reason, use of biological treatment as a basis for pretreatment standards is contrary to the Congress' intent to avoid duplication of POTWs.

It is not a sufficient answer for EPA to state that industrial users of POTWs will install a technology other than the biological treatment upon which it based the standards. 48 Fed. Reg. at 11842. EPA's obligation is to identify and assess an appropriate technology for pretreatment and to relate its standards to that technology. This EPA simply has not done.

C. Absence of a Small Plant Data Base

Nor has EPA considered in any meaningful way the circumstances of a small plant since its data base consists almost entirely of large plants. Evaluation of the application of pretreatment technology to a small plant is extremely important. For example, many such plants are batch chemical plants with a variability in effluent characteristics over time which may significantly impact the effectiveness of alternative technologies. Further, many small plants are located in urban areas where land constraints are severe. There is no doubt that many such plants simply would not have the space available to install the biological treatment upon which EPA based its pretreatment standards. It is also highly likely that many urban plants would not have the room to install alternative technologies which might approach the effluent levels proposed by EPA. For such plants, the choices would be a drastic change in the products produced or relocation.

EPA gave only the most tentative and incomplete consideration to size in its technical analysis. As a threshold matter, EPA decided that "size is best defined as the sum of process line production rates present at industrial plants[.] [P]roduction rates are those reported in the 308 questionnaire." EPA then concluded that "this definition fails to embody fundamental characteristics such as continuous or batch manufacturing processes" and gave up size as a technical basis for subcategorization because "there is no adequate method to define facility size." Dev. Doc., at IV-17 to IV-18 (emphasis added).

EPA's direction -- identification of fundamental characteristics of small plants -- was correct. However, the failure to identify such characteristics was inevitable since EPA used information from the 1976 and/or 1977 questionnaires, and those questionnaires were limited almost entirely to large plants with high-volume processes. See Part II above. Further, as discussed below, had EPA made an appropriate analysis of its economic data base, it would have concluded that size clearly is a relevant factor.

VII.

EPA'S COMPLIANCE COST ESTIMATES AND ECONOMIC IMPACT ANALYSES OF THE PROPOSED PRETREATMENT STANDARDS AS APPLIED TO SMALL PLANTS LACK ANY CREDIBLE BASIS

An examination of EPA's economic analysis of the proposed regulations leads irresistibly to the conclusion that the Agency's analysis of the economic impacts of the proposed pretreatment standards on small plants is simply not credible. EPA has failed to consider in any meaningful way the probable disproportionate economic impact of the proposed pretreatment standards upon small plants.

A. Lack of Economic Impact Information Regarding Small Plants

The data base underlying EPA's economic impact analysis of the proposed regulations, including the proposed pretreatment standards, consists almost exclusively of information relating to large plants that are direct dischargers and have high volume product processes. PMM Report, at 7-8. As discussed in Part II above, the limited nature of this data base is simply a reflection of the fact that, up until a few weeks before issuance of its proposal, the scope of the regulatory program was limited to large, high-volume product/process segments of the industries. As a result of the Agency's last minute determination to dramatically expand the scope of its proposal, the underlying data base is not coextensive with the universe of facilities covered by the proposed pretreatment standards. See Part II above.

SOCMA's economic consultant, Peat Marwick, has examined EPA's economic data base with respect to small plants.[13/] Peat Marwick found, as a result of cross checking EPA's data against information furnished by individual companies, that even the sparse information obtained by the Agency is riddled with errors and inaccuracies. In addition to these general deficiencies, EPA's data base lacks crucial information, such as actual wastewater flow, for small plants. PMM Report, at 8,

---

13/ For purposes of analyzing the available data, Peat Marwick considered small plants ("establishments" in EPA's analysis and Peat Marwick's Report) as being those that met any one of the following criteria:

- average wastewater flow of no more than 25,000 gallons per day; or
- less than 100 permanent employees; or
- production-related sales of less than $30 million per year.

While SOCMA believes that these criteria are reasonable reference points for data analysis, it is not suggesting that they should be used to define a small plant. It is incumbent upon EPA to develop a reasonable small plant definition after collecting and analyzing additional data regarding the relationship between plant size and the cost of complying with the proposed regulations.

SOCMA is not concerned that a substantial portion of production facilities in these industries would be classified as small plants under the analytic criteria used by Peat Marwick. See Exhibit 2 from PMM Report, reprinted at p. 60 below. Nor should EPA be surprised by such a result, given its last-minute expansion of the scope of the proposed regulations. As discussed in Part II above, it is quite probable that the bulk of these production facilities now covered, beyond the 566 generally large plants originally identified for coverage, are smaller plants.

EXHIBIT 2

PROFILE OF ESTABLISHMENTS BY EMPLOYMENT AND BY SALES

10. Without such information, EPA has no basis upon which to conduct a credible analysis of the economic impacts of the proposed pretreatment standards upon small plants.

B. Deficient Pretreatment Compliance Cost Estimates for Small Plants

The essential first step in EPA's economic impact analysis of the proposed pretreatment standards is an estimation of the compliance costs. Unfortunately, the Agency's compliance cost estimates for small plants were derived using an inappropriate methodology and do not adequately reflect probable variations for small versus large plants.

EPA's methodology for estimating compliance costs associated with the pretreatment portions of the proposed regulations is essentially the same as that used for determining BAT compliance costs. The Agency developed treatment cost curves for 55 "generalized plant configurations" (GPCs) based upon the BAT data base which, as discussed in Part VI above, consists mainly of information relating to large plants. To estimate costs for plants which were not covered by a GPC, EPA employed equations based on rough assumed relationships between sales, cost and flow.

Less than 10 percent of the indirect dischargers (a large proportion of which are small plants) identified by EPA could be matched with a GPC. For those indirect dischargers

that could be matched, the accuracy of the resulting compliance cost estimates is nonetheless suspect because the GPCs themselves were developed from large plant data.

Compliance cost estimates for the more than 90 percent of indirect dischargers who were not covered by the GPCs, were based on the cost-flow-sales equations. EPA did not specify how these equations were derived. Peat Marwick, therefore, was unable to review these equations and comment upon their general validity as a cost estimation methodology. However, because these relationships were apparently also developed from EPA's predominantly large plant data base, they, like the GPCs, do not appear to constitute an appropriate method for determining small plant compliance costs.

Furthermore, Peat Marwick has determined that the equations mask significant variations in flow-to-sales ratios at small plants through the use of averaging techniques. These averaging techniques dampen the variations that would be expected in compliance costs for such facilities. PMM Report, at 19.

Peat Marwick has concluded that "it appears that <u>EPA does not have sufficient data to document the pretreatment practices of the industry and has prepared a cost and impact analysis which does not accurately represent the impact of the regulation.</u>" PMM Report, at 19 (emphasis added).

C. Inappropriate Closure Analysis For Small Plants

The second component of EPA's economic impact analysis is determining the number of plants which are potential closure candidates as a result of the proposed regulations. EPA's closure analysis for small plants is beset by two fundamental deficiencies. First, the Agency's choice of a single across-the-board cost-to-sales ratio as the central closure criterion was wholly inappropriate. Second, EPA's methodology for determining closure candidates predetermines the outcome of the closure analysis for plants whose compliance cost estimates were originally extrapolated from sales.

EPA considers a plant a candidate for closure as a result of the proposed pretreatment standards only if its estimated compliance costs with respect to those standards exceed 4 percent of its annual sales. This across-the-board closure criterion of a 4 percent cost-to-sales ratio fails to acknowledge the variation in profit-to-revenue ratios between large and small plants. PMM Report, at 22. Peat Marwick has determined that the closure criterion should be adjusted to encompass more closely the range of cost-to-sales ratios reflecting the current range of profit-to-revenue ratios in the various segments of the organic chemicals, plastics and synthetic fibers industries and at small plants within those industry segments. PMM Report, at 22.

An equally serious deficiency is that the Agency's analytic methodology, which focuses on the cost-to-sales ratio for each plant, predetermines the outcome of the closure analysis for the great majority of indirect dischargers. This is the case for those plants whose compliance cost estimates were originally derived from their sales because EPA did not obtain flow data. Peat Marwick has determined that this circular relationship within the methodology results in the closure analysis for these facilities being artifically limited to a cost-to-sales ratio of approximately 2 percent. PMM Report, at 22. See Exhibit 9 from PMM Report, reprinted at p. 65 below. Since flow data were not obtained by EPA for 90 percent of the indirect dischargers, EPA's closure analysis for the pretreatment standards is essentially meaningless.

D. Actual Data Suggest Contrary Conclusion

Peat Marwick has determined from an analysis of the flow data which EPA did obtain that a significantly greater number of small plants would experience cost-to-sales ratios of over 4 percent (and thus would become closure candidates under EPA's closure criterion) than estimated by EPA. PMM Report, at 22. See Exhibit 8 from PMM Report, reprinted at p. 66 below. In addition, Peat Marwick concluded that a more realistic analysis of plants for which flow data were not obtained would have shown additional facilities to be closure candidates under EPA's criterion. PMM Report, at 22.

FOR ESTABLISHMENTS WITH EPA FLOW DATA

PEAT MARWICK COMPUTER RUN
REFERENCE II-3 PAGE/6

Furthermore, Peat Marwick has analyzed current capital cost estimates for compliance with the proposed standards as furnished by a number of SOCMA member companies and by member companies in CMA. Peat Marwick's analysis of these current company estimates of compliance costs strongly indicates that plants with less than $30-50 million in annual sales "will incur significantly higher and significantly different impacts" from the proposed pretreatment standards than larger plants. PMM Report at 25. See Exhibit 10 from PMM Report, reprinted at p. 68 below.

Peat Marwick stated flatly that EPA's conclusion that the regulations would not impose differential impacts on small plants "is not correct from our analysis of actual company cost estimates and our analysis of EPA's 'better' data." PMM Report at 25. Peat Marwick noted that on the contrary, "[i]t appears from our analysis that significantly different impacts within the industry begin to occur below $50 million in sales." Id. Peat Marwick stressed that the actual breaking point, in terms of plant size, with respect to the onset of differential impacts could not be determined without more data and further analysis.

20-955 O—84——211

EXHIBIT 10

A COMPARISON OF CAPITAL COST TO SALES RATIOS VERSUS SALES FOR INDIVIDUAL ESTABLISHMENTS[1]

[1] Capital costs for each regulation estimated by affected companies for individual establishments (1979 $'s). Sales estimates are from EPA's economic data base (1979 $'s).

In sum, Peat Marwick's analysis documents that EPA has failed to give meaningful consideration to the probable disproportionate economic impacts imposed upon small establishments indicated by its own data and method of analysis. EPA should reanalyze the pretreatment cost estimating methodology in light of actual data from small plants. The Agency must also adjust its closure criteria to reflect the actual experience of small plants within the industry, as well as revise its methodology to eliminate predetermination of the result of the closure analysis for such facilities.

Until EPA conducts a new economic analysis in accordance with these recommendations, it cannot determine, much less meaningfully evaluate or consider, the impact its proposed pretreatment standards will have upon the many small plants within the industry now encompassed by EPA's regulatory program.

VIII.

EPA HAS FAILED TO COMPLY WITH THE REQUIREMENTS OF THE REGULATORY FLEXIBILITY ACT

The Regulatory Flexibility Act requires all federal agencies to prepare and make available for public comment an "initial regulatory flexibility analysis" when publishing a proposed regulation that will have a significant economic impact on a substantial number of "small entities." 5 U.S.C. §§ 603(a), 605(b). The Act mandates that the initial regulatory flexibility analysis, among other things, examine how

the proposal will affect small entities and describe significant alternatives that would minimize its economic impact on such entities. Id. § 603(b) and (c). The Act specifies that the analysis "shall discuss significant alternatives such as --

> (1) the establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities;
>
> . . . .
>
> (4) an exemption from coverage of the rule, or any part thereof, for such small entities."

5 U.S.C. § 603(c).

The Act defines the term "small entity" to have the same meaning as the term "small business concern" under section 3 of the Small Business Act, 15 U.S.C. § 632, unless an agency establishes an alternative definition of the term "after consultation with the Office of Advocacy of the Small Business Administration and after opportunity for public comment" and publishes the definition in the Federal Register. 5 U.S.C. § 601(3). The Small Business Administration's ("SBA") regulations implementing this statutory definition provide a size limit for small business concerns of 750 employees for some of the SIC code segments of the industries covered by the proposed regulations and 1000 employees for others. 13 C.F.R. Part 121 Schedule A.

EPA's internal guidelines for implementing the Regulatory Flexibility Act reiterate the statutory requirements for consultation with SBA's Office of Advocacy and the provision of an opportunity for public comment if EPA wishes to adopt an alternative definition of small entity in a particular circumstance. "EPA Guidelines for Implementing the Regulatory Flexibility Act," at 5-6 (February 9, 1982) ("EPA Guidelines"). The EPA Guidelines also specify that in selecting an alternative quantitative cutoff point for small entities, EPA may use the following criteria:

- the point at which the adverse economic impacts appear to rise or fall substantially, for example, in the form of higher costs or closures; and
- the point at which the regulation effectively includes a large number of regulated entities without covering a large portion of the pollution problem (e.g. 50 percent of regulated entities but only 10 percent of total discharge of the pollutant).

The EPA Guidelines require that EPA "explain why it made the cutoff where it did and why this cutoff is preferable to the definition in the Act." Id. at 5. Both this explanation and a description of the criteria used in selecting the alternative size cutoff point must be set forth in the preamble of the proposed regulation. Id. at 6.

The EPA Guidelines also provide criteria for determining whether a regulation will have a "significant economic impact" on a "substantial number" of small entities. In general, a substantial number of small entities is more than 20 percent of such entities. According to the EPA Guidelines, there is a significant impact on small entities whenever one of the following criteria is satisfied:

- annual compliance costs will increase the total costs of production for small entities for the relevant process or product by more than 5 percent;
- compliance costs as a percent of sales for small entities are at least 10 percent higher than compliance costs as a percent of sales for large entities; or
- the requirements of the regulation are likely to result in closures of small entities.

Id. at 7.

EPA asserted in the preamble to the proposed regulations that it had conducted a "small business analysis" which showed that there will not be a significant impact on any segment of the industry, large or small. 48 Fed. Reg. at 11846. The Agency asserted further that "[n]o significant differential impacts were estimated for small businesses," which EPA defines, in the context of this rulemaking, as companies with less than 50 employees. Id. On the basis of these determinations, EPA concluded that it was not required to prepare a regulatory flexibility analysis of the proposed regulations.14/

14/ The preamble inadvertently stated that a "Regulatory Impact Analysis" rather than a regulatory flexibility analysis was not required for these reasons.

EPA's determination that it was not required to prepare an initial regulatory flexibility analysis was patently erroneous. The Agency must rectify this failure to carry out its duties under the Regulatory Flexibility Act by preparing such an analysis and considering its findings in revising the proposed effluent limitations guidelines and pretreatment standards with respect to small plants.

A. Incorrect and Arbitrary Small Business Definition

As noted above, the SBA regulations implementing the statutory definition of "small business concern" provide a 750 or 1,000-employee size limit for such concerns in the SIC code categories covered by the proposed rules in this proceeding. 13 C.F.R. Part 121 Schedule A. EPA nonetheless adopted a small business definition of firms having less than 50 employees in the context of this rulemaking. On the basis of this definition, the Agency then determined that there would be no significant impact on small entities and that a regulatory flexibility analysis was therefore unnecessary.

EPA was required by its own regulatory flexibility guidelines and by the Act itself to justify the cutoff point in its alternative definition of small entities. In its Economic Impact Analysis, EPA stated that, under the SBA definitions, approximately half the firms in its data base would be classified as small businesses. Economic Impact Analysis at 2-14, 2C-11. EPA went on to assert, without any basis or foundation,

that a small business cutoff which results in 20 percent of the firms in the industry falling into that class is "more appropriate." Id. at 2C-11. The Agency then simply set the size limit at fewer than 50 employees to achieve that result. Id.

The Agency attempted to suggest that the choice of this size limit was based upon consideration of potentially "significant barriers to entry due to factors such as limited capital access." Id. at 2-14. However, the Economic Impact Analysis provides no indication that capital availability was assessed on other than an industry-wide basis. See id. at 2-13, 2-14, 2C-8.

In addition, EPA failed to consult with SBA's Office of Advocacy with respect to its adoption of this alternative definition of small businesses. This failure further illustrates the Agency's total disregard for the requirements of the Regulatory Flexibility Act and its own guidelines.

In short, EPA presented no meaningful explanation for its rejection of the SBA small business size guidelines for small entities within the organic chemicals, plastics and synthetic fibers industries. The Agency's adoption of a size cutoff of 50 employees was wholly arbitrary. EPA, therefore, must reconsider the impacts of the proposed regulations on small entities using the SBA definition or an alternative size cutoff which has been thoroughly explained and justified in accordance with the requirements of the Act and the EPA Guidelines.

B. Erroneous Cost Estimates and Flawed Closure Analysis

EPA's determination that small entities would not experience significant or differential impacts as a result of the proposed pretreatment standards was based on the conclusion in its economic analysis that small plants (i.e., those at firms with fewer than 50 employees) would not constitute a significant or disproportionate number of the closure candidates. Economic Impact Analysis, at 5-13 to 5-14. As described more fully in Part VII above, Peat Marwick has determined that the Agency's closure analysis uses a seriously flawed methodology and data base. The closure analysis for more than 90 percent of the plants which EPA estimates to be covered by the proposed pretreatment standards is based upon compliance cost estimates extrapolated from sales information. Peat Marwick has concluded that these extrapolated cost estimates are the product of unexplained and unverified equations which employ averaging techniques that dampen cost variations likely experienced by small plants. Peat Marwick also determined that actual company estimates of compliance costs strongly indicate that small plants will suffer disproportionate closure impacts. See Part VII.D. above.

In sum, EPA's conclusion that preparation of a regulatory flexibility analysis of the proposed pretreatment standards was unnecessary because the standards would not impose significant or differential impacts on small entities lacks any

reasonable basis in the record materials. Indeed, Peat Marwick stated flatly that EPA's conclusion as to the absence of differential impacts on small plants "is not correct." PMM Report, at 25. EPA, therefore, must reconsider the need for a regulatory flexibility analysis of the proposed pretreatment standards in light of revised compliance cost estimates and closure assessments for small plants.

C. Available Data Indicate Disproportionate Small Plant Impacts

After careful examination and analysis of EPA's own "better" data, Peat Marwick has determined that, contrary to EPA's conclusion, there appears to be a direct relationship between the ratio of pretreatment compliance costs to sales and plant size as shown by sales. PMM Report, at 22 and Exhibit 8 (reprinted at p. 66 above). In other words, EPA's own data regarding small plants belies the Agency's finding of no significant or differential impact and instead demonstrates that such facilities may bear substantial and disproportionate economic impacts resulting from the proposed pretreatment standards. In addition, an analysis of actual company estimates of compliance costs led Peat Marwick to conclude that small plants with less than $30-50 million in annual sales "will incur signficantly higher and significantly different impacts than larger establishments." PMM Report, at 25. See also Exhibit 10 to the PMM Report (reprinted at p. 68 above). It thus seems clear

that EPA's reconsideration of the need for a regulatory flexibility analysis should lead to the determination that preparation of such an analyis is required in conjunction with the proposed pretreatment standards.

D. Lack of Analysis of Significant Regulatory Alternatives for Small Entities

The Regulatory Flexibility Act requires EPA to consider as part of its initial regulatory flexibility analysis, significant alternatives to the proposed rules that would accomplish the same end while minimizing the economic impact on small entities. 5 U.S.C. § 603(c). Particular alternatives specified in the Act are (1) the establishment of different compliance requirements that take into account the resources available to small entities and (2) an exemption from coverage of all or parts of the proposed rules. EPA's own regulatory flexibility guidelines reiterate this requirement. EPA Guidelines, at 11.

In order to consider such alternatives, as it is required to do under the Act, EPA must undertake an analysis of alternative regulatory approaches with respect to small firms and small plants in the organic chemical industry as discrete classes. See Small Refiner Lead Phase-Down Task Force v. Environmental Protection Agency, 705 F.2d 506, 537-539 (D.C. Cir. 1983). As noted in Part II above, EPA's data base is largely limited to large plants and firms and cannot now

support such an analysis. Therefore, EPA is statutorily obligated to acquire new data regarding small entities within the industry in order to analyze the impacts of the proposed pretreatment regulations and significant alternative regulatory approaches, such as exemptions or differential compliance requirements, with respect to small firms, and to small plants of large firms. Failure to fulfill this obligation would render any final regulation applying pretreatment standards to such firms and facilities vulnerable to legal challenge. See Small Refiner Lead Phase-Down Task Force, supra, at 539.

As noted above, Peat Marwick's analysis of actual company estimates of compliance costs indicates that small plants with less than $30-50 million in annual sales will suffer substantial and disproportionate impacts under the proposed pretreatment regulations. In fulfilling its statutory obligation to analyze alternative regulatory approaches to the proposed standards, EPA should therefore give specific consideration to possible exemptions or differential compliance requirements for firms and plants with annual sales of less than $30-50 million.

IX.

EPA's REGULATORY IMPACT ANALYSIS FAILS TO FULFILL THE REQUIREMENTS OF EXECUTIVE ORDER NO. 12291 WITH RESPECT TO THE PROPOSED PRETREATMENT STANDARDS

Executive Order No. 12291 requires EPA to prepare a preliminary "regulatory impact analysis" of proposed major regulations such as the proposed rules in this proceeding. 46 Fed. Reg. 13193 (Feb. 17, 1981). The Executive Order specifies that a preliminary regulatory impact analysis is to contain, among other things, a description of "alternative approaches that could substantially achieve the same regulatory goal at lower cost" together with an explanation of why such alternatives could not be adopted. The regulatory impact analysis must also include descriptions of the potential costs, benefits and net benefits of the proposed regulations, as well as an identification of those likely to bear the costs and those likely to receive the benefits.

The preliminary regulatory impact analysis prepared by EPA falls far short of meeting these requirements. The Agency, therefore, should prepare a revised preliminary regulatory impact analysis which meets the specifications of Executive Order 12291, especially with respect to small plant impacts, and revise the proposed regulations accordingly.

A. Failure to Describe Alternative Regulatory Approaches Which Reduce Small Plant Impacts

Notwithstanding the clear requirements of Executive Order 12291, EPA's Regulatory Impact Analysis[15/] ("RIA") of the proposed regulations does not include a description or analysis of alternative approaches to the proposed pretreatment standards. In particular, neither the Regulatory Impact Analysis itself nor any of its associated supporting documents[16/] even

---

15/ Regulatory Impact Analysis of the Effluent Guidelines Regulation for the Organic Chemicals, Plastics and Synthetic Fibers Industry (February 10, 1983).

16/ The documents supporting the RIA are the following:

- Cost Effectiveness Analysis of Effluent Standards and Limitations for the Organic Chemical Industry (January 1983);
- Assessment of Projected Water Quality Benefits from the Implementation of Regulations Defining the Best Available Technology Economically Achievable for the Organic Chemicals, Plastics, and Synthetics Industry (February 10, 1983);
- Economic Benefits of the Proposed Effluent Limitations Guidelines for the Organic Chemicals, Plastics, and Synthetic Fibers Industry as contained in the Executive Summary (January 24, 1983);
- Economic Assessment of the Benefits of the Proposed Effluent Limitation Guidelines for Organics and Plastics Manufacturers (January 1983); and
- Estimated Human Health Benefits from Chemical Plant Effluent Control in Two Regions (January 25, 1983).

consider possible exclusions from the standards, based on flow, sales levels, or other criteria, which would significantly reduce impacts on small plants and small firms. Nor is there any examination of alternative levels for pretreatment standards or of standards for a lesser number of priority pollutants as determined by a refined pollutant selection process. See Part V above.

SOCMA strongly recommends that EPA revise and expand the RIA to include an analysis of these and perhaps other regulatory alternatives for small plants. This analysis should present a comparison of the impact on small plants of such alternatives versus those of the proposed pretreatment standards. Such an analysis is clearly required by Executive Order 12291 in conjunction with the promulgation of regulations establishing pretreatment standards for this industry. The current RIA completely overlooks this basic obligation. EPA simply cannot take final action on the proposed regulations until an analysis of alternatives which would reduce small plant impacts has been completed.

B. Inadequacy of Costs and Benefits, Cost-Effectiveness and Net Benefits Analysis

The RIA and its supporting documents purport to examine the costs and benefits, cost-effectiveness and net benefits of the proposed regulations, including the proposed pretreatment standards.[17/] In reality, these materials clearly

---

17/ RIA at 7.

indicate that, with respect to its pretreatment proposal, the Agency's benefits analysis consists solely of model projections based upon hypothetical factors relating to flow rates and receiving water dilution ratios.[18/] What actual data the Agency does have contradicts the RIA's conclusion that the proposed pretreatment standards would result in the elimination of a significant number of water quality violations.[19/] Nor does the RIA examine the cost-effectiveness of the proposed standards with respect to small plants.

In addition, Peat Marwick has concluded that by determining a single average removal cost per pound of toxic pollutants for the entire industry, EPA's cost-effectiveness analysis masks potentially wide variations in removal costs between small and large plants. PMM Report, at 27. Peat Marwick found that EPA's own "better" data regarding small plants and company cost estimates submitted by SOCMA and CMA members both indicate that compliance costs will be significantly higher at small plants. PMM Report, at 25; see also

---

18/ Id.; Assessment of Projected Water Quality Benefits From Implementation of the Regulations Defining Best Available Technology Economically Achievable For the Organic Chemicals, Plastics, and Synthetics Industry at 4-1 to 4-8; (February 10, 1983); Cost Effectiveness Analysis of Effluent Standards and Limitations for the Organic Chemicals Industry Chap. 3 (January 1983).

19/ See JRB Associates, Assessment of the Impacts of Industrial Discharges on Publicly Owned Treatment Works at 3-6 (November 20, 1981) (concluding that categorical pretreatment standards will not significantly alleviate water quality criteria exceedances).

Part VII above. Noting that the average cost-effectiveness ratio for the organic chemicals and plastics and synthetic fibers industries is one of the highest for any industrial category, Peat Marwick recommended that EPA complete a more detailed analysis to determine removal costs at small plants. PMM Report, at 27. Peat Marwick also concluded that EPA should identify alternative pollutant reduction strategies for such facilities which might be more cost-effective. PMM Report, at 27.

SOCMA believes that these deficiencies in the RIA necessitate a completely new assessment of benefits and cost-effectiveness based upon actual data rather than hypothetical information generated by unverified models. In conducting such an assessment, EPA should separately analyze the relative benefits and cost-effectiveness of the proposed standards as applied to small plants. The completion and consideration of such an analysis is a clear prerequisite under Executive Order 12291 to any final action on the proposed regulations.

CONCLUSION

For the foregoing reasons, SOCMA believes that EPA's basis for the proposed pretreatment standards, and for the proposed effluent limitations guidelines, is totally inadequate, especially as applied to small plants within the organic chemicals, plastics and synthetic fibers industries. The proposed

20-955 O—84——212

regulations must therefore be reconsidered, reevaluated and revised. The scope and content of final pretreatment regulations and standards must reflect a thorough analysis, founded on adequate and meaningful data, of their achievability and economic impact with respect to small plants.

ted States Environmental
rotection Agency
556
hington, D.C. 20460

r Mr. Barrett:

The Synthetic Organic Chemical Manufacturers :ociation (SOCMA) is a nonprofit trade association currently isisting of 100 members producing a wide variety of organic :micals. Many of its members are small companies, often :ated in urban areas, which discharge their effluents into blicly owned treatment works (POTWs). SOCMA, therefore, is ncerned with the direction of EPA's national pretreatment rategy. Based upon the extensive experience which SOCMA's mbers have had with local pretreatment program development in ny areas of the country, SOCMA believes that it can contrite toward the development of an effective pretreatment proam which achieves the goals of the Clean Water Act and which based on an appropriate balance of Federal, state and local sponsibility.

Failure of EPA'S Pretreatment Strategy

For the past nine years, EPA has pursued a pretreatent strategy keyed to national categorical pretreatment standrds. The Agency has accomplished little. The national prereatment program is in a state of confusion both with respect o the categorical pretreatment standards themselves and those ortions of the general pretreatment standards intended to mplement the categorical standards. The general pretreatment egulations are excessively complicated to the point that they ire unworkable. The Agency has been unable to develop more :han a handful of categorical standards due to the diverse and :omplex nature of industrial users of POTWs, to the variations in the type, design and capability of POTWs, to the difficult technical issues relating to the treatability of particular wastewaters by POTWs and by alternative pretreatment technologies, and to the difficulty in resolving important questions of POTW sludge use and disposal.

In SOCMA's view, the Agency's present pretreatment strategy has been a failure. It has not led toward measureable advancement of the goals of the Clean Water Act. Its continuing confusion has created uncertainty for the states, for POTWs, and for industrial users of POTWs.

Need for Review of Basic Assumptions
Underlying the Pretreatment Strategy

SOCMA strongly urges that EPA consider, against the backdrop of nearly a decade of experience, whether its national pretreatment strategy is workable, whether it is needed, and what the alternatives are for achieving the goals of the Clean Water Act. SOCMA believes that such a review will lead to the conclusion that the present national pretreatment strategy is not workable and that it is not needed. Equally important, the experience of SOCMA's members in dealing with state and POTW authorities in the vacuum created by the failure of EPA's national pretreatment strategy suggests that alternatives are available to achieve the goals of the Clean Water Act.

Development of Local Pretreatment Programs

Notwithstanding the confusion and lack of progress at the Federal level, many municipalities have developed effective local pretreatment programs. SOCMA believes that many of these local programs have substantially implemented the objectives of the Clean Water Act (CWA) in that they protect POTW operations, ensure compliance with POTW NPDES permit limitations, ensure safe sludge disposal, and allow cost effective treatment of both industrial and municipal waste.

Examples of model programs exist in Buffalo, Chattanooga, St. Louis, Grand Rapids, Chicago and Los Angeles. In large measure, these pretreatment programs have been established by local officials with the oversight of state officials. But it is also important to note that most of these programs have been developed in cooperation with industry through local advisory committees (including industrial users, commercial users, and public participation).

Many other POTWs are in the process of upgrading their pretreatment programs. For these local programs in the developmental stage, the uncertainty as to pretreatment issues at the federal level has been a hindrance, and sometimes even a

detriment to, program development. POTWs are reluctant to complete their own program for fear of having to repeat the process to incorporate substantially different Federal requirements.

Lessons of Past Experience

As succinctly stated by the Oversight and Review Subcommittee of the House Public Works and Transportation Committee, a decade of experience with pretreatment under the Clean Water Act strongly suggests the need for a fundamental change in direction:

> "After eight years of trying, EPA has been almost totally unsuccessful in implementing this requirement [to establish pretreatment standards] of the law."
>
> "In contrast to the problems that EPA has encountered in its efforts to move forward with a National pretreatment program, many communities have moved forward with their own, experiencing far less difficulty in meeting the essential thrust of the 1972 pretreatment language." Subcommittee on Oversight and Review of the Committee on Public Works and Transportation, House of Representatives, 96th Cong., 2d Sess., Implementation of the Federal Water Pollution Control Act, at 40, 44 (Comm. Print 1980).

SOCMA's Recommendation

The most practical solution to the present chaos in pretreatment policies is to allow local pretreatment program development with limited federal involvement. Ultimately, both administrative and legislative changes will be required.

Administrative Steps

SOCMA believes that EPA can now begin to implement the following steps which will hasten progress toward an effective and sensible pretreatment program:

- Specific acknowledgment of the Clean Water Act's policy of encouraging cost-effective joint treatment of domestic and industrial waste.

- Careful and thorough evaluation of pretreatment programs which have been developed by POTWs largely independently from the national pretreatment program.

- Complete reconsideration of all provisions of the general pretreatment regulations designed to implement the national categorical standards (under a timetable which allows reproposal and promulgation in sufficient time to implement categorical pretreatment standards should EPA or the Congress determine that such standards should be one element of a national pretreatment policy).

- Review and revision of the remaining provisions of the general pretreatment standards (such as recordkeeping and reporting requirements) to ensure that unnecessary detail, procedures, and paperwork do not discourage POTWs from developing pretreatment programs.

- Revision of the Agency's present policy on sludge use or disposal to conform to Section 405(e) of the Act by leaving to local POTWs the choice among the alternatives available as long as implementation of the option chosen is consistent with the Agency's Section 405(d) guidelines, RCRA, and other applicable standards.

- Use of the NPDES permit program to encourage POTWs to address and resolve pretreatment issues including implementation of the basic participation of the general pretreatment standards (40 C.F.R. § 403.5(a) and (b)).

- Adoption of a policy applicable to EPA-issued NPDES permits and recommended to NPDES states for early and substantial involvement of user and other public groups in the development of local pretreatment programs.

- Adoption of an enforcement policy under Section 309, Section 309(f), which places upon the POTW initial and substantial responsibility for initiating appropriate measures to remedy violations of its permit which may be related to the receipt of industrial wastewaters.

The foregoing steps can be taken without commitment of major Agency resources and, indeed, may reduce resource needs as compared to the Agency's present pretreatment policy. In addition to the steps outlined above, SCCMA believes that the goals of the Clean Water Act could be furthered by the development, within the limits of the Agency's resource constraints, of the following:

- A compilation of information on the elements of an effective and practical local pretreatment program.

- Development of information, prepared after notice and public comment, regarding alternative pretreatment technologies as related to POTW treatment and sludge disposal considerations.

Legislative Action

SCCMA firmly believes that the foregoing steps can be taken within the confines of the Agency's present obligations

and will ensure significant progress toward shared environmental goals while the larger statutory issues are being resolved. In the longer term, SOCMA believes that the following steps are necessary to achievement of a rational and effective pretreatment policy:

- Total elimination, by amendment to the Clean Water Act, of the categorical pretreatment program. The bases for pretreatment requirements would be prevention of POTW interferences causing the POTW to violate its permit, limiting pass through to the extent necessary to prevent violation of water quality standards as reflected in the POTW's permit, and ensuring a quality of sludge consistent with the use or disposal option chosen by the POTW.

- Adoption of revised requirements for the development, implementation, and enforcement of pretreatment programs which place primary authority with and responsibility in POTWs with the NPDES agency (whether EPA or state) having authority to correct POTW failures to meet that responsibility but not to second-guess reasonable efforts by the POTW.

SOCMA believes that these recommended changes in approach are supported by historical lack of progress in achieving environmental goals under the existing national pretreatment strategy. Our recommendations will lead to practical and workable pretreatment programs which further the goal of environmental protection without enormous waste of valuable national resources (money, energy, time, and paper).

Because of its importance, SOCMA recommends that the resolution of pretreatment strategy issues be expedited within EPA. We believe that it is in the best interests of all involved in pretreatment to have a direction adequately defined as soon as possible. To that end, SOCMA would like to assist the Agency in revising and making more effective its pretreatment policy.

We thank you for the opportunity to comment on this important topic.

Sincerely,

Bruce C. Grefrath

Washington, DC 20460

Attention: EGD Docket Clerk, Organic Chemicals, Plastics and Synthetic Fibers Industry (WH-552)

Dear Mr. Forsht:

Enclosed are an unbound original and two bound copies of the comments of the Synthetic Organic Chemical Manufacturers Association, Inc. ("SOCMA") on EPA's proposed regulations establishing effluent limitations guidelines and pretreatment standards for the organic chemicals, plastics and synthetic fibers industry (48 Fed. Reg. 11827 (March 21, 1983)).

SOCMA has a long-standing concern with the pretreatment program, and its comments focus primarily on those proposed standards. Many of SOCMA's members are small firms; more than half of its member companies have annual sales of less than $50 million. In addition, most of SOCMA's members, whether large or small companies, operate small plants. SOCMA is particularly concerned about these regulations as applied to small firms and small plants in the organic chemicals and plastics and synthetic fibers industries.

After careful examination and analysis of EPA's technical and economic support documents, SOCMA has concluded, for reasons which are set forth in detail in the enclosed comments, that the Agency's basis for the proposed pretreatment standards, and for the proposed effluent limitations guidelines, is totally inadequate. This is especially true insofar as the proposals apply to small plants. The proposed regulations must therefore be reconsidered, reevaluated and revised.

In reconsidering its proposal, EPA should thoroughly examine the following matters and possible alternatives which are of special concern to small plants:

- A more precise and realistic identification of industry segments and pollutants which pose a significant national pretreatment problem and exclusion of those which do not.

- Consideration of flow, land availability, and other pertinent factors as a basis for alternative standards or exclusions.

- Alternative standards based upon consideration of the cost-effectiveness of different pretreatment technologies.

- Alternative standards or exclusions based upon a sound assessment of the economic impact of different levels of pretreatment.

- Application of the pretreatment standards only to plants which produce priority pollutants regulated by the pretreatment standards as a product or commercial by-product or which use such regulated priority pollutants as raw materials.

- Deferral of regulations for industry segments for which a sound technical and economic record, with adequate opportunity to comment, cannot be established within EPA's schedule for these regulations.

The scope and content of final pretreatment regulations and standards must reflect a thorough analysis, founded on adequate and meaningful data, of their achievability and economic impact with respect to small plants. It is SOCMA's belief, as more fully set forth in the enclosed comments, that EPA's proposed regulations fall far short of fulfilling this requirement.

SOCMA appreciates the opportunity to participate in this rulemaking proceeding. Please do not hesitate to contact me or Tom Goldberg, Manager, Environmental Affairs, in our Washington Office if you have any questions regarding SOCMA's comments on the proposed regulations.

Sincerely,

Ronald A. Lang

Ronald A. Lang
Executive Director

Enclosures

Mr. ROE. Our next witnesses are the representatives of the National Society of Professional Engineers. We have with us Mr. Kermit L. Prime, chairman, NSPE's Legislative and Government Affairs Committee; Mr. Louis L. Guy, chairman of NSPE's Legislative Education Fund; Mr. Robert J. Haefeli, past president, New Jersey Society of Professional Engineers and Land Surveyors, and Mr. David McDowell, of Buchart-Horn, Incorporated, Lewisburg, Pa.

We want to welcome this distinguished group of professional engineers to our committee. We have had the privilege of commiserating with you and your organization before on many occasions, and we consider your testimony to be extremely valuable to this committee.

The full text of your prepared statements will appear in the record at this point.

[Statements referred to follows]

TESTIMONY OF THE NATIONAL SOCIETY OF PROFESSIONAL ENGINEERS ON THE FEDERAL WATER POLLUTION CONTROL ACT BEFORE THE SUBCOMMITTEE ON WATER RESOURCES, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, U.S. HOUSE OF REPRESENTATIVES, NOVEMBER 17, 1983

Mr. Chairman, we appreciate having this opportunity to appear today to provide additional testimony on the Federal Water Pollution Control Act. We are pleased to respond to your request to bring in a panel of specialists to elaborate on some of the points we raised in our October 19 statement before this subcommittee. My name is Kermit L. Prime, P.E., and I am chairman of the Legislative and Government Affairs Committee of the National Society of Professional Engineers and a principal engineer with the Boyle Engineering Corporation in Orlando, Florida. I am accompanied by Louis L. Guy, P.E., chairman of the NSPE Legislative Education Fund and a partner in the firm of Guy and Davis in Burke, Virginia; Robert J. Haefeli, P.E., with the firm of Havens and Emerson, Inc., in Saddle Brook, New Jersey and immediate past president of the New Jersey Society of Professional Engineers and Land Surveyors, Inc., and David McDowell, P.E., with the firm of Buckhart-Horn, Inc., in Lewisburg, Pennsylvania. The National Society of Professional Engineers represents 80,000 individuals in private practice, government, industry, construction, and education, with state societies in every state of the Union.

The topics you asked us to address, today, financing sewage treatment facilities, pretreatment, ocean outfall, and nonpoint source pollution, represent some of the more controversial issues surrounding the Federal Water Pollution Control Act. The engineering profession is deeply involved in the nation's efforts to maintain and improve water quality, and we are happy to provide the subcommittee with an engineering perspective on these matters. We will discuss each of these subjects individually. I will address the financing issues, Dave McDowell will discuss his specialty, pretreatment, Bob Haefeli will address ocean discharge, and Louis Guy will discuss nonpoint source pollution.

FINANCING

Mr. Chairman, when we testified on October 19, there was considerable confusion regarding our position on the construction grants program and our suggestions for alternative financing arrangements. Today we will provide a more detailed, point-by-point discussion of the concepts we are suggesting for the subcommittee's consideration.

First, our members recognize that, despite the progress that has been made in cleaning up our nation's waters since 1972, much remains to be done. The construction grants program has played a major role in bringing about that progress. However, we believe the time has come for Congress to give serious consideration to alternative financial arrangements to support state and local governments for the construction of publicly owned treatment works (POTWs). We strongly believe that options are available which will result in a more efficient and effective use of federal and community dollars. Such options, which I will discuss in a moment, will provide for the construction of more facilities more quickly with a smaller drain on the Federal treasury. Further, they will allow the nation to clean up its water at a

faster rate than would continued reliance on the grants program, assuming comparable levels of funding.

Second, we stress the need to find solutions that are affordable on the community level. In particular, we are extremely sensitive to the need to hold down the user charges paid by individual households. Again, if we are to achieve our ultimate goal—cleaner water—Federal programs must result in the construction of overall pollution abatement systems which are affordable for the communities which operate and build them, and the ratepayers who pay for them.

With these points in mind, we now would like to turn to the construction grants program. We do not believe that the program, as currently structured, is the most effective way to get POTWs built. Furthermore, we do not believe that an increase in the grants program funding is the most effective way to get POTWs built. We take this position for two reasons. First, and most importantly, the very existence of the grants program actually discourages many communities from proceeding with construction, even when they could do so by utilizing local financial resources. Discussions with our consulting firms around the nation have revealed that a great many communities, even those whose chances of ever receiving grant assistance are minimal, are reluctant to go forward as long as there is a prospect for receiving grants in the future. Of course, from the perspective of a local official struggling to balance a community's budget, this would be a logical position. It is difficult to justify undertaking these financial burdents, even if the locality does have the resources, when a grant program exists. Proposals to rapidly expand funding levels exacerbate this problem. Doubling the size of the appropriation would still be inadequate to fund a great many eligible projects for years to come. Such an action clearly would encourage local leaders to delay the pursuit or even consideration of other financing alternatives in hopes of obtaining grant assistance. This is true with the Federal grant covering 55 percent of project cost, and will be compounded if the Federal share is increased to its former level of 75 percent.

Second, we have found that the procedural requirements of the grants program have seriously delayed POTW construction. In fact, many of our consulting firms attempt to avoid projects funded through the construction grants program, simply because of the red tape involved.

Therefore, we propose that the grants program be phased out. Only those projects which are already under construction, or are on the fundable portion of the states' fiscal 1984 priority lists, should receive grant assistance. Basically, we are advocating no new starts under the grants program after fiscal 1984. The subsequent years' grant funding should be allocated to completing those "phase segmented" projects which were started in fiscal year 1984 or before. We understand from sources within the EPA that completing these projects alone could easily total $9 billion to $12 billion.

Our basic purpose is to seek an end to the costs of delaying projects by offering false hopes of future grant funding. While we prefer the 1984 cutoff point, we realize that others may argue for a different place to draw the line. Whatever that point may be, we believe it is imperative that communities across the nation know, in no uncertain terms, who will and who will not receive grants. Only then will those localities which have avoided commiting their own resources have an incentive to do so. We recommend that the EPA formally notify recipients, with the understanding that all those communities which are not so notified will not be eligible to receive grants. Of course, a certain period of time should be allowed for individual communities who feel that they were mistakenly left off the fundable list to appeal, but the general rule should be that those localities not notified cannot expect grant assistance.

We believe that this action alone will result in faster progress toward our clean water goals. As we stated earlier, ther are many communities which do have the resources to finance their own POTWs and related systems, and will proceed with the work once they believe that federal grant assistance will not be forthcoming.

But what about the communities which cannot finance construction out of local resources? We believe there are alternatives to the grants program, alternatives which are more cost efficient. We have not come here today with a detailed proposal as to how such alternatives should be structured. Rather, we have focused on concepts which we hope will be helpful to the subcommittee and the EPA in exploring alternatives. Our basic thesis is that a loan program can be utilized to replace the grants program, and that such a loan program can be implemented without placing unreasonable burdens on ratepayers. To demonstrate this, we have conducted a simplified analysis of the relationship of monthly capital charges to certain assumptions regarding interest rates and grant assistance, attached hereto as Exhibit A.

However, before discussing this analysis directly, I would like to raise a few general points regarding the manner in which the current program works.

We contend that a low interest loan program can be just as economical as the current grants program for many communities. This is so because the grant currently covers only 75 percent of eligible project costs, and in fiscal 1985 will cover only 55 percent. In fact, many states already have lowered the EPA-funded share of project costs to 55 percent. The remaining 25 percent or 45 percent of the project costs is commonly referred to as the "local share" and must be financed by the community through loans, bonds, or other sources. Very few, if any, communities have the cash on hand to pay the local share of a significant project. The interest rates paid by the community to finance the local share of project costs are now approximately 10 to 12 percent, and can vary significantly over time. We suggest that it is possible for the Federal Government to structure a low-interest loan program to cover 100 percent of project costs which would not place unreasonable burdens on the community or ratepayers in comparison to the current grants programs. In essence, we are saying that ratepayers in many communities might be better off if the entire project is funded through a federal low-interest loan than if it is funded in part by a grant and in part by financing at market interest rates.

In order to discuss our calculations, I refer you to Exhibit A, which is a graphic comparison of how grant and loans impact on local ratepayers. On the vertical axis is a scale of monthly charges covering capital costs. Two scales are contained on the horizontal axis, one showing the annual interest rates on loans and the other measuring the percentage of project costs covered by grants. As we stated earlier, the calculations are based on a project with a cost of $10 million built for 2,000 customers (6,000 population). The solid lines running from the lower left-hand corner to the upper-right-hand corner were plotted based on the estimated monthly charges for loans covering *total* project costs at interest rates varying from zero to 15 percent. The higher lines assumes financing for 20 years, while the lower line assumes financing over 40 years. The broken line running from the upper-left-hand corner to the lower-right-hand corner depicts the impacts of grants covering various portions of project costs, with the assumption that the local share is financed over 20 years at a 12 percent rate of interest.

Mr. Chairman, our analysis indicates that with an interest rate somewhere between zero and six percent, the loan program can be comparable to the grants program as far as the ratepayer is concerned. Of course, these results could change based on the interest rates charged in the municipal market, and partial lines have been drawn to depict the slopes for the grant lines at seven and 18 percent. However, our basic point stands: from the community's and the ratepayer's perspectives, a loan program may be a viable alternative.

Furthermore, these findings apply for larger projects serving larger communities. The basic relationships depicted in Exhibit A should still apply. Nevertheless, we realize that our biggest cities and our smallest communities probably have unique problems which will require special attention.

Having made these basic points, it is important to note what we are not saying.

First, we are not suggesting what types of construction should and should not be covered by the loans. Current law restricts the grant eligibility of sewer collector systems after fiscal year 1984, for example, but Congress may wish to make collector systems eligible for the loan program. As our West Virginia Society so ably note on October 20 in testimony before this subcommittee, the omission of collectors from grant eligibility raises the local share of total project costs for communities which lack collector lines in the first place. Congress may choose to make collector lines eligible for low-interest loans, but we would suggest such eligibility be limited to small communities with no collector systems and that federal assistance be given to meet only the needs of the current population, not growth.

Second, we are not suggesting which agency should administer the loan program. Currently both the Environmental Protection Agency and the Farmers Home Administration have programs for the construction of POTWs, and the FmHA loan program generally has seemed to work well. However, we are not prepared at this point to suggest where the program should be lodged. We do urge that maximum discretion be given to the states in the actual operation of the program. We endorse the general concept of state "infrastructure banks," and we suggest that consideration be given to providing the states with seed money to set up revolving loan funds specifically for wastewater treatment projects as a viable alternative.

Third, we are not suggesting any set interest rate. Rather, we would note that the rates must be low enough in comparison to market rates to make the utilization of loans attractive to communities which require some kind of federal assistance. Con-

gress may even wish to leave the setting of actal interest rates to the discretion of the states or the administering agency.

Fourth, we would note that direct loans may not even be necessary. Congress could choose to simply revise Section 213 of the current statute, which relates to loan guarantees for POTW construction when conventional municipal financing is not feasible. The Federal Government could achieve comparable results by guaranteeing bonds and loans made by the private sector and subsidizing the interest rates. This concept would have the potential result of "leveraging" the federal funding significantly; thereby financing many times the projects fundable with grants in any given year. We recognize, however, that there also is a risk involved this approach, in that it may result in the Federal Government committing itself to interest subsidy payment over many years and accepting contingent liability if a community defaults.

Finally, we are not recommending that the same approach be utilized for all communities. As we mentioned earlier, very large cities and very small communities have special problems. For example, we are all familiar with cases of one large metropolitan area absorbing almost all of a state's grant allotment under the current program. In these instances, Congress may wish to provide special assistance on a case-by-case or a line item appropriation basis. Likewise, a special program may be needed for the very smallest localities. Again, we are not necessarily advocating these steps; we simply suggest that Congress may wish to explore such options.

In order to avoid the confusion that was evident during our last appearance before the subcommittee, we wish to emphasize that we are talking about phasing out the grants program and replacing it with low-interest loans (or loan guarantees). We have provided some general concepts regarding how such a program might work, and we hope our analysis will be useful to the subcommittee. We are not saying this is the only answer. Rather, we are trying to demonstrate that good alternatives clearly are available. We understand that the EPA is initiating an analysis of options for the future of the construction grants program or alternatives to that program, and we plan to submit our views to the agency. Further, we would be happy to work with this subcommittee to continue developing alternatives.

To recap, we believe false hopes regarding future grant availability have resulted in many communities delaying construction even when they could finance such construction with local funding. A firm decision to phase out the grants program may eliminate this rationale for delay in many communities. For those communities which do not receive grants and need assistance, a loan program is an attractive alternative, provided it is not encumbered with the same governmental controls and red tape that have characterized the grants program.

In addition to affordability, we believe a loan program has other advantages. First, a sum of money given out as loans can finance more projects than the same amount given as grants. particularly if the loan program is set up through a revolving fund, or through many revolving funds administered at the state level, so that the money can be utilized again as loans are repaid. Even if the interest rate charged is not adequate to keep up with inflation, there will still be a source of money available in the future to help finance additional projects. Also, a loan program, especially if administered on the state level, should reduce some of the procedural requirements currently associated with the grants program which introduce delay. Finally, because the communities are paying for these improvements with their own funds, they would more realistically analyze their needs. To further emphasize these points, we note that the State of New Jersey has stopped issuing eight percent state grant participation in the non-federal share and has implemented a "no-interest," 20-year loan for that share effective in October of this year.

PRIVATIZATION

We also would like to comment briefly on another potential alternative for funding wastewater treatment—the use of private capital in public/private partnerships, now commonly referred to as "privatization." Our definition of privatization is simply that—the use of private capital. We do not expand this definition to include the issue of the pros and cons of separate versus combined design/construction and/or separate versus combined construction/operation. The tax code currently provides incentives for private sector companies to finance the construction of new wastewater treatment facilities by using nonpublic funds and to own and operate such facilities while leasing them back to the communities. However, proposed legislation under the jurisdiction of the Ways and Means Committee would close off this option by eliminating the tax benefits to the companies and the public/private partnerships. While we realize that this particular issue falls outside of the Public

Works Committee's jurisdiction, we would like to point out that current tax benefits have been responsible for some communities moving forward with their plans for upgrading wastewater treatment and for resource recovery facilities. We stress that we are talking about new construction, not paper transactions transferring the ownership of existing assets. The provisions in question help achieve the goal of pollution abatement and community improvement, rather than just a better balance sheet. We urge all those members of Congress who are concerned about clean water to defend those provisions of the tax code as they apply to new construction of water and sewage treatment and resource recovery facilities.

PRETREATMENT

While we did not address the pretreatment issue in our October 19 statement, we were asked to discuss it today, especially as it relates to local options for pretreatment programs and ocean discharge. We have no official position on changes in the statute, since EPA has only recently reached the point of having most of the pretreatment standards in place, and it is too early to judge the program's effectiveness. However, many of our members who are engaged in the mangement of large treatment facilities report that it is extremely difficult to police the hundreds of industries that discharge into their POTWs, and it is often more cost effective for the plant to improve its treatment capabilities than to attempt such regulation. Some of them believe that in such cases, the POTW should have the option of choosing the most efficient manner for using its resources, rather than be automatically required to enforce pretreatment for individual categories of pollutants. Because of the infinite variation of biological and chemcial actions in the sewage treatment process, regulations must allow flexibility for adjustment to a specific situation. Appropriate investigative and assessment requirements are already imposed on the POTW due to the necessity to meet the NPDES discharge requirements and the concentrations permitted for the economic disposal of sludge on agricultural lands or other methods of disposal. The effluent limitations or technology-based standards can and should be adequate treatment combined with necessary pretreatment to provide an effluent quality consistent with the use of the receiving stream while simultaneously not causing sludge disposal problems. Many of our members who specialize in this type of work believe that the proper place for this decision is at the local level, with the state and Federal Government monitoring compliance with the POTW permit requirements related to both NPDES and sludge disposal. They support a proposed amendment which would allow a local option for determining the level of pretreatment, as long as the discharge from the POTW meets EPA standards.

OCEAN DISCHARGE WAIVERS

As you will recall, Mr. Chairman, when we last testified, Congressman Packard specifically requested our views on how to address the ocean discharge issue in a manner which would allow greater flixibility regarding waivers. To further develop our statement, we consulted with our members in some of the nation's major POTWs in coastal areas, including the County Sanitation Districts of Los Angeles. The following comments are based on these consultations.

We endorse ocean waivers for those committees that discharge into the deep open ocean and can demonstrate that a less than secondary effluent will not result in any adverse impact on the marine environment or threaten the public health or safety. By and large the language of the 1977 Clean Water Act Amendments provides the opportunity for coastal communities to make such a demonstration.

On the subject of waivers for discharge into estuarine waters, we must frankly admit to a difference of opinion between our members who are involved in the management of coastal POTWs. Some argue that EPA has granted very few waivers into estuarine areas, and that the 1977 language is adequate to guard against abuse of the waivers. Others maintain that the 1977 amendments allowed many communities to apply for waivers even though the waiver concept was not intended for them, which oftentimes delayed the construction of secondary treatment facilities. These latter individuals urge that in regard to waivers, the statute be amended to require a minimum level of primary treatment and to require appropriate dilution (or mixing) in the receiving water. As a Society, we will not take a formal position on this specific question at this time.

Regarding the definition of primary treatment, we wish to point out that the requirement for chlorination (chemcial treatment) to control pathogens is unnecessary, expensive, and potentially damaging to the environment. We are specifically referring to those situations where proper design of deep ocean outfall pipes has insured that good initial mixing, coupled with the natural bio-toxic effect of sea water

on coliforms as well as density stratification has enabled many coastal communities to meet bacteriological standards in the ocean without chemical disinfection.

We further feel that proposed language regarding a pretreatment program for ocean discharges is unduly restrictive. The current 201(h) language coupled with the pretreatment program language contained in other sections of the current statute is adequate to control discharges of toxic pollutants into the marine environment. We recommend against the proposed changes.

Finally, we note that some proposed amendments to this and other provisions of the current statute have been offered to correct what is perceived as poor implementation of the law. However, if the present language of the statute is acceptable, then we would suggest that the statute not be amended and other actions be taken to improve implementation.

NONPOINT SOURCE POLLUTION

There is a growing realization that we connot solve our water problems just by focusing on point source pollution. We could totally eliminate pollution from point sources, and still have major problems resulting from urban and rural runoff. In fact, many states have documented that fact that for them, nonpoint source pollution is the greater problem.

The sources and solutions for nonpoint source pollution vary widely. For example, the rural runoff problem is often a nutrient problem, and is quite different from the urban problem, where the focus is often on toxics. Furthermore, the topography, soil type, land use, amount of rainfall, and other factors vary widely throughout the nation. These also are factors which affect the solutions to the nonpoint source pollution problem. So, the best solutions to the problem also will vary widely throughout the nation.

The technology for correcting these runoff problems exists, by and large. Implementing the corrective measures is an institutional problem which has not been adequately addressed. The issue is broader than the EPA and corrective measures will require revisions to statutes beyond the Federal Water Pollution Control Act. For example, the Department of Agriculture must be brought into the efforts to solve the nonpoint problem. The various agencies of the USDA already have addressed some aspects of this issue, and the involvement of the agricultural community is essential if this issue is to be effectively addressed.

Furthermore, given the localized nature of the solutions to nonpoint source polution, an effective federal/state/local partnership must be forged. We believe Congressman Oberstar's bill, H.R. 4037, is a step in the right direction.

CONCLUSIONS

Mr. Chairman, we appreciate having the opportunity to appear before the subcommittee today to provide some suggestions for expediting achievement of our national clean water goals, especially relating to financing facility construction. We will be happy to answer any questions you may have.

EXHIBIT A

RELATIONSHIP OF MONTHLY CAPITAL CHARGES TO CERTAIN ASSUMPTIONS REGARDING INTEREST RATES & GRANT ASSISTANCE

Mr. ROE. Please proceed.

TESTIMONY OF KERMIT L. PRIME, CHAIRMAN, NATIONAL SOCIETY OF PROFESSIONAL ENGINEERS' LEGISLATIVE AND GOVERNMENT AFFAIRS COMMITTEE; LOUIS L. GUY, CHAIRMAN, NSPE'S LEGISLATIVE EDUCATION FUND; ROBERT J. HAEFELI, PAST PRESIDENT, NEW JERSEY SOCIETY OF PROFESSIONAL ENGINEERS AND LAND SURVEYORS, INC.; DAVID McDOWELL, BUCHART-HORN, INC., LEWISBURG, PA., AND BILL FOGARTY, STAFF, LEGISLATIVE AND GOVERNMENT AFFAIRS DEPARTMENT

Mr. PRIME. Thank you, Mr. Chairman.

In light of the late hour, I may choose to summarize the financial portion, which is the part that I was going to give in adjunct to the past testimony, and ask that the others read theirs. Theirs are relatively brief.

We are here, if you will recall, at your specific request, to come back with a panel that could speak to each of these issues.

Before we get into the presentation, I would also like to introduce Mr. Bill Fogarty, with the staff of the NSPE legislative and Government affairs department.

Mr. ROE. Mr. Fogarty, welcome.

Mr. PRIME. You have already made the introductions. I am Kermit Prime. I was here last time. My area of expertise, if you will, is the financing issue. The thing that we failed to make clear, I believe, last time—and I will accept responsibility for that—was that the National Society of Professional Engineers is recommending an end to the grant program. We would like to then——

Mr. ROE. I remember that issue well.

Mr. PRIME. We would like to see the Federal Government move to another type of program. We are not advocating discontinuance of Federal support of some type. There are two things in this testimony that we feel are viable alternatives, and then there are many subalternatives that we feel may be viable within those two primary families of alternatives. The two I am referring to would be a greater dependence on a loan program, where the interest rates could be subsidized to the point that the rates paid by the users of the systems would be comparable to the rates under a grant program.

To illustrate that point, we prepared figure A, or exhibit A, which is attached to the back of our testimony. I understand that engineers relate to graphs better than certain other professions. I would like to take you through that graph very briefly and then talk to the second possible alternative.

Again, the purpose of the graph is to illustrate the relative impact of different assumptions regarding interest rates and grant assistance on the ratepayer. It relates only to the capital portion of the rate. It does not include a consideration of O&M. The particular numbers here assume a project cost of $10 million and a system that would serve 2,000 customers. Now, those are households, and would probably relate to more like 6,000 people in a community. The solid lines represent 100 percent financing, the solid lines going from the lower left to the upper right portion of the graph.

The top line is for a 20-year financing program. The bottom solid line is for a 40-year financing program. The line is a function of interest rate as it relates to monthly impacts. For example, if you have, let us say, a 5-percent interest rate, it would relate to about a $25 per month capital cost per household.

If you understand that, then we will move and look at the dashed lines on the graph. These lines relate to a share of grant assistance as it relates to the monthly fees. The dashed line goes from the lower right to the upper left portion of the graph. Obviously, as your grant participation goes down toward zero, the cost to the users increases. And there are two, very small dashed lines, because the long line relates to 12 percent, which we feel is a good assumption in today's financial market. It could be higher or lower. And the lower line is 7 percent; the higher of the two lines is 18 percent.

Now, let me make my point. If you assume that you are getting 75 percent grants, look at the little box on the bottom right-hand side of the document. If you follow that line up, you see that is 75 percent. You go up to the dashed line and then move over, and you see that would relate to about a $13 to $14 per month per customer rate for the capital component. But interestingly, you can stop where it crosses the bottom solid line and come down and see that that would be equal to about a 1.5-percent loan for 40 years for the entire cost of the project, not the local share. Conversely, if you use the 55-percent assumption, you can go up to where it intersects the dashed line, move left, and you will see that that intersects both of the 100-percent loan lines. Let us take the first one, which is the 40-year line, and come down, and you will see that that would be equal to about a 5¼-percent, 100-percent loan for the entire cost of the project. Or, you can move further to the left, and then come down, and it is equal to about a 2-percent loan for the entire cost of the project for 20 years.

Mr. Chairman, the purpose of the graph is to support the statement that the loan program can have the same financial impact on the community as a grant program. It has the other benefits that we spoke to when we were before you last month.

Are there any questions about that?

Mr. ROE. Not from me, there isn't.

Mr. PRIME. All right. The second issue is privatization. We do feel that there are some activities in other committees within the House that would prevent privatization from being a viable alternative.

Mr. ROE. Like right now.

Mr. PRIME. Yes, sir. And we would just want to point out to you that that activity could make a potentially viable alternative as a source of funding no longer viable. If you are aware of that, we are sure and confident that you will take the actions necessary that you deem appropriate. It has potential. I have some personal experience with that concept, and believe that it is a potentially viable alternative.

Mr. ROE. Let's just speak to that for a minute. We know there are a number of groups and organizations and companies now that are providing operating expertise, if you like, to different municipalities and cities and regions, whatever, on a private contract

basis. We come back and say that as we build—and some of them are quite sophisticated—plants, that the plant is not going to just work mechanically; somebody has got to know how to operate it, is what it amounts to, to achieve the goals that we are trying to achieve. I recall going back into the sixties, when there was a great deal of development taking place in suburban areas, and they had the so-called famous package plants. None of the two are alike, as I recall it, and none, or very few, of the municipalities involved that were hit with that growth-type of situation had the expertise, nor could they hire the expertise, to even run them. And I do recall in my own community, going back to the early sixties, that we had a proliferation, if you like, of those particular types of plants. The governing body was adroit at the time and forced that to be consolidated, because we could not have all different types of plants all over the town, each one a different type of processing and so forth and so on.

So one of the things that we are facing, I think, on a national basis—and therefore, a State-to-State basis—is putting together a cadre of qualified people on a national basis to be able to operate the plants and to be able to achieve the goals. And therefore, that has generated new business opportunities, if you like, where companies have entered into the point of view as experts, but we will come in and operate the plant for you on an O&M basis, whatever the case may be, and size of the plant location and so forth, and they are contracting out that kind of service. And that gave rise to the point of view, well, if we can do that, why don't we have private enterprise enter into this on a longer term basis, because on the overall basis, we feel that we could cost-effectively do this less expensively and more effectively and more efficiently than so-called publicly owned systems. Isn't that basically what the root of this is about?

Mr. PRIME. That is a part of it, and all of the issues that you spoke to are very accurate. All of those problems have occurred, and the private sector has mobilized to help with the operations problem. But the term, privatization, really carries the concept one step further——

Mr. ROE. Similar to industrial revenue bonds?

Mr. PRIME. Similar, but the private sector gets the benefits of the depreciation and the tax writeoffs and so forth. As part of that, they must then own the facilities for some period of time; that can be negotiated. Typically, they want long-term ownership to get the maximum tax benefits. Well, those tax writeoffs can be brought back through the agreements that are discussed between the public/private sector in the form, or having the effect, if you will, of a grant, in terms of the effect on the ratepayers. So that is why we bring it up today, is the impact that those tax benefits have for the private sector so that the ratepayers can enjoy an effective grant through another mechanism.

Mr. ROE. And a stabilized use rate. I think in effect, what we are saying, those people who have said that we should eliminate that situation or to eliminate that opportunity that exists now, they are only looking at it from a point of view of exposure to the Treasury, rather than the other end of it, as to what the return is on that investment.

Mr. PRIME. That is correct.

Mr. ROE. OK. I understand the issue. I do not know whether anybody else does, but go ahead.

Mr. PRIME. Mr. Chairman, you brought up a point that Bob Haefeli on our panel would like to speak to for a moment.

Mr. HAEFELI. Relative to operator training, Mr. Chairman, it is my opinion that the present level of training through the EPA program for wastewater treatment operators is relatively modest, and it is worked out with the State colleges and assistance of the Water Pollution Control Federation. I would like to suggest that that program could be expanded to meet the needs of a privatization concern.

Mr. PRIME. And before we leave the point and I turn it over to the other members of the panel, I would like to emphasize, Mr. Chairman, that we are talking here about privatization in the context of new construction, and not as a departure from the conventional owner/engineer relationships. We want to make that point very clear. But we are saying we would advocate seeing that concept explored further and not close the door through tax law changes that may not be in the best interest of the public as a whole.

With that, if there are no questions about our position on financing, I would turn the presentation over to Dave McDowell, who is a professional engineer and here to speak to you on the pretreatment issue.

Mr. ROE. Mr. McDowell.

Mr. MCDOWELL. Mr. Chairman, while we did not address the pretreatment issue in our October 19 statement, we were asked to discuss it today, especially as it relates to local options for pretreatment programs and ocean discharge. We have no official position on changes in the statute, since EPA has only recently reached the point of having most of the pretreatment standards in place, and it is too early to judge the program's effectiveness. However, many of our members who are engaged in the management of large treatment facilities report that it is extremely difficult to police the hundreds of industries that discharge into their POTW's, and it is often more cost-effective for the plant to improve its treatment capabilities than to attempt such regulation. Some of them believe that in such cases, the POTW should have the option of choosing the most efficient manner for using its resources, rather than be automatically required to enforce pretreatment for individual categories of pollutants. Because of the infinite variation of biological and chemical actions in the sewage treatment process, regulations must allow flexibility for adjustment to a specific situation. Appropriate investigative and assessment requirements are already imposed on the POTW due to the necessity to meet the NPDES discharge requirements and the concentrations permitted for the economic disposal of sludge on agricultural lands or other methods of disposal. The effluent limitations on technology-based standards can and should be adequate treatment combined with necessary pretreatment to provide an effluent quality consistent with the use of the receiving stream, while simultaneously not causing sludge disposal problems.

Many of our members who specialize in this type of work believe that the proper place for this decision is at the local level, with the State and Federal Government monitoring compliance with the POTW permit requirements related to both NPDES and sludge disposal. They support a proposed amendment which would allow a local option for determining the level of pretreatment, as long as the discharge from the POTW meets EPA standards.

Mr. ROE. I think you are making a very important point. The first point you made—and it was a good one—I am just thinking about our own area in New Jersey. If you have literally thousands of industries involved, going into a regional sewer system, where is the mechanism going to be established to police those? And I do not mean "policing"—and I know you did not mean that either, in the sense—but monitoring them—if they are not monitored substantively, then how is anybody going to know how that is operating, whether it is polluting or not?

Mr. MCDOWELL. Well, the basic idea is to protect the streams. And the streams are being protected if the POTW discharge meets the permit requirements—we hope. And in order to meet the POTW requirements, the POTW has to monitor what comes into their plant. And of course, in monitoring what comes into their plant, one of the first things that happens is if anything happens to the biological system, or if their sludge concentration gets to the point where they can, for example, no longer put it on growing poplar trees, or whatever their particular area of disposal is, as soon as they run into that kind of trouble, they have got to go back out to the system and monitor at manholes successively out through the system and try to find out where this came from. That is difficult and it is hard to do. But the fact still remains that most POTW's in operation right now do that at the present time. And they have limits already on their regulations as to what industry can discharge.

It is interesting to note that when the electroplating standards came out, EPA requirements were quite high, and in the course of trying to do a pretreatment program, you would get into a fight with industry all the time, because they wanted to use the EPA limits. They just came out with new limits for the metal manufacturers. On two of the projects with which I am familiar, our metal requirements were within—met the new standards in all except the case of lead, where we were off by seven hundred parts per million. And that was purely because we had to control the operation within the sewage treatment plant, and we had to be able to put the sludge someplace when we got through with the operation.

Mr. ROE. We will have a recess for a few minutes. We have to go and vote. We are on the second call, so if you would excuse us for a few minutes, we will be right back.

[Short recess.]

Mr. ROE. Now, we were discussing with Mr. McDowell.

Mr. MCDOWELL. I had just responded to one of your questions, and if there are any other questions, I would be happy to try to respond to them.

Mr. ROE. No, I do not think I have any at the moment.

Now, who is next?

Mr. McDowell. I would like to call on Robert Haefeli to continue our discussion.

Mr. Roe. OK.

Mr. Haefeli. Thank you.

On October 19, in the previous testimony of our National Society of Professional Engineers, it was brought out by Congressman Packard that he would like to have views on how to address the ocean discharge issue in a way which would allow greater flexibility regarding the waiver system.

To further develop that previous statement, we consulted members in some of our major POTW's in coastal areas, including the county sanitation districts of Los Angeles. The following comments are based on these consultations.

We endorse ocean waivers for those communities that discharge into the deep ocean waters and can demonstrate that a less-than-secondary effluent will not result in any adverse impact on the marine environment or threaten the public health or safety. By and large, the language of the 1977 Clean Water Act Amendments provides the opportunity for coastal communities to make such a demonstration.

On the subject of waivers for discharge into estuarine waters, we must frankly admit to a difference of opinion between our members who are involved in the management of coastal POTWs. Some argue that EPA has granted very few waivers into estuarine areas, and that the 1977 language is adequate to guard against abuse of the waivers. Others maintain that the 1977 amendments allowed many communities to apply for waivers, even though the waiver concept was not intended for them which oftentimes delayed the construction of secondary treatment facilities. These latter individuals urge that in regard to waivers, the statute be amended to require a minimum level of primary treatment and to require appropriate dilution—or mixing—in the receiving water. As a Society, we will not take a formal position on this specific question at this time.

Regarding the definition of primary treatment, we wish to point out that the requirement for chlorination, that is, chemical treatment, to control pathogens, is unnecessary, expensive, and potentially damaging to the environment. We are specifically referring to those situations where proper design of deep ocean outfall pipes has insured that good initial mixing, coupled with the natural biotoxic effect of seawater on coliforms as well as density stratification has enabled many coastal communities to meet bacteriological standards in the ocean without chemical disinfection.

To digress for a moment, the Delaware River Basin Commission of New Jersey, New York, Pennsylvania, and Delaware, is now in the process of going out for public hearing on a proposal that would waive the requirements for chlorination of POTWs during the winter months—that is, from November through March. Those hearings are coming up this next month.

To continue, we further feel that proposed language regarding a pretreatment program for ocean discharges is unduly restrictive. The current section 201(h) language, coupled with the pretreatment program language contained in other sections of the current stat-

ute is adequate to control discharges of toxic pollutants into the marine environment. We recommend against the proposed change.

Finally, we note that some proposed amendments to this and other provisions of the current statute have been offered to correct what is perceived as poor implementation of the law. However, if the present language of the statute is acceptable, then we would suggest that the statute not be amended, and other actions be taken to improve implementation.

That concludes the formal statement on this subject.

Mr. PRIME. And now, we would like to introduce Mr. Lou Guy—do you want to save the questions?

Mr. ROE. Oh, yes. We are thinking. Go ahead.

Mr. PRIME. Let me introduce Lou Guy, to talk to you on the nonpoint source pollution problem.

Mr. GUY. Thank you, Kermit.

Mr. Chairman, in the engineering community, there is a growing realization that we cannot solve our water problems just by focusing on point source pollution. As you are aware, we could totally eliminate pollution from point sources and still have major water quality problems resulting from urban runoff and from rural runoff. In fact, a number of States are now documenting the fact that, for them, nonpoint source pollution is the greater problem remaining. But it is a different problem. The sources and solutions for nonpoint source pollution vary, very widely. For example, the rural runoff problem is very often a nutrient problem, and is quite different from the urban problem, where the focus is frequently on toxics.

Furthermore, from the engineering viewpoint, the topography, soil type, land use, amount of rainfall, and other factors vary widely throughout the Nation. All of these are factors which affect the solutions to the nonpoint source pollution problem, so the best solutions are going to vary, very widely.

The technology for correcting these runoff problems exists by and large, but implementing the corrective measures is an institutional problem as well as an engineering problem, and we think that the institutional factors are going to need a lot of work. The issue is considerably broader than the EPA, and the corrective measures are going to require revisions to statutes beyond the Federal Water Pollution Control Act.

At the Federal level, the Department of Agriculture must be brought into the efforts to solve the nonpoint problem, and the State ggriculature departments also need to play a role. The various agencies of USDA have already addressed some aspects of this issue and the involvement of the agricultural community is essential if we are going to address the issue effectively.

Furthermore, given the localized nature of the solutions to nonpoint source pollution, an effective Federal, State and local partnership must be forged. For this reason, we believe that Congressman Oberstar's bill, H.R. 4037, is a step in the right direction, building on the information that has been developed.

Several of us were here this morning and heard the testimony concerning Congressman Dyson's amendments and the Chesapeake Bay, presented as a prototype program that would help establish how nonpoint pollution problems could be solved. NSPE has no po-

sition on Congressman Dyson's amendments, but I think this is an example of the Federal, State, local partnership that we believe needs to be demonstrated. It could be a very healthy step in the direction of showing what can be done at correct nonpoint source problems, building on the data that has been developed for the bay area.

This completes our testimony, Mr. Chairman. NSPE is very appreciative of the opportunity to return for this additional input and to give you some additional suggestions for expediting achievement of our national clean water goals, especially concerning the financing, which we think is a major issue.

We on the panel would be very happy to answer any questions you might have.

Mr. ROE. Well, we want to thank you for your help and your rereview of the issues that we spoke of the last time, and we concur with you, Mr. Guy, that in fact, in the majority of the testimony received on nonpoint source, to throw everything into the problem of nonpoint source—I am thinking both municipal and industrial—is a gross mistake in the first place, because there is not any panacea to solve that issue unless it is broken down into respective categories.

One of the things that came out of testimony yesterday which is a germ of an idea was that those items and those elements that had not been included in point source, that could be identified, after a process, to be point source discharges in the other category—acid mine waste, we spoke of, and mine-tailings, maybe concentrated feedlots—could be treated, once they are identified in the process, as point source discharges. Part of the thought process that is emerging here is maybe in that kind of a basis, we ought to be taking a step to get into that nonpoint source area by saying if we have located and we have documented through the 208 process and the management process that we do have isolated elements that are in there that could be treated as point source, whether we have a loan program or a grant program, should they not be included in that area, because we can identify them. I think we are at a point now of identifying the issue. So that has been helpful to us, and we appreciate your looking into that.

The gentleman from Minnesota.

Mr. STANGELAND. I have no questions, Mr. Chairman. I just think that their testimony is excellent, and it again just adds to the record and gives us a well-rounded foundation which, after extensive days of hearings, I think will enable us to move ahead and accomplish some things.

Mr. ROE. Are there further questions?

[No response.]

Mr. ROE. The one thing that sticks the toughest, Mr. McDowell, in what to do, is the pretreatment and the relationship of combined sewers, and what we do with the sludge coming out of the sewer plants. That does not have a simple solution. It just is not a simple solution. And I appreciate, when you do speak of the issue that, before 1972, pollution control was not something that was not being carried out—maybe not to the degree that it has been since 1972, or the public recognition of it—but having said that, you cannot put the world through the eye of a needle, either, and I

think that is what you are leading to, that there are productive and different regions through the country, wherever they are, that they ought to be given a chance to work and not try to replace the whole structure. I think basically, that is what you were saying.

Mr. McDowell. That is correct.

Mr. Roe. The gentleman from Pennsylvania.

Mr. Clinger. Thank you, Mr. Chairman, I have just one question. I am sorry I was not here to hear all of the testimony, but I will certainly read the testimony of the association with great care, because over the years, I think your association has provided us with extremely valuable input as we have tried to shape the laws.

The only question I have is this. Would you generally agree with the estimates that we have had from other witnesses as to the scope of the nonpoint source pollution problem? It has been suggested that it is now, given the history you have had of taking care of point source pollution, significantly the largest problem that we really face down the road. Would you agree with that assessment?

Mr. Guy. Yes, sir. I think the order of magnitude of the problems originally may have been about the same, but we have made so much progress on point sources, and we have made so little progress on nonpoint sources. It obviously varies tremendously from river basin to river basin—but speaking on a national basis, nonpoint sources probably are the largest problem facing us.

Mr. Clinger. And you indicate that you feel we do have the technology to address the problem.

Mr. Guy. Yes, sir. We think the technology is available to address it, but it is not going to be one technology applied to all of the problems. It is such a wide range of problems that there are going to be different technologies, and much of the solution is not going to be technical. It is going to be institutional and educational. A lot of it is going to be educational.

Mr. Clinger. Better farming practices, better mining practices, et cetera.

Mr. Guy. Yes, sir—making the public aware, for example, that too much generosity in spreading fertilizer on lawns pays a price downstream. So it is going to be a more complicated solution because it is going to involve a lot more people. It is a lot more difficult to deal with institutionally. But we think the solutions are available.

Part of the difficulty is going to be to have enough accurate data to know which solutions to push for which particular river basins. That is where I think the 7-year study of the Chesapeake Bay gives us a demonstration opportunity that is large enough and diverse enough to move forward in implementing a wide variety of solutions for the different problems that are within the Bay region.

Mr. Prime. Mr. Clinger, I think Mr. Haefeli would like to add to that.

Mr. Clinger. Please, Mr. Haefeli.

Mr. Haefeli. Thank you, sir.

I had the pleasant experience of being involved in a section 208 water quality management study in central New Jersey, our largest river basin, the Raretan River. It is only 800 square miles—a far cry from the Chesapeake Bay—however, we found that at least half of the water quality deterioration could be directly attributed

to nonpoint source pollution, namely, runoff from the land, whether it be farmland or rural or urban land or what, forests or not. And we developed a number of strategies for addressing these various causes of nonpoint source pollution.

One of the things I would like to suggest from a personal point is that Mr. Oberstar's bill on H.R. 4037 will go a long way to promote the control of nonpoint source pollution. However, I would like to see a specific mention of an educational method of addressing the problem. I personally feel that a great deal of the nonpoint source pollution is from the land management practices, from land use developers for residential properties, commercial, industrial, from the farms themselves, and a great deal of it is a natural background, over which we will have very little control, such as forests, decayed vegetation, and so on.

But I have talked to some of the people in Jersey's soil conservation service, in both the USDA, Department of Agriculture, and the State soil conservation commission, and some of them say, "Hey, we are doing good now. We can show the farmers what to do, and they are not using excess fertilizers and pesticides and herbicides. Don't bother. Get after the developers of the residential and commercial properties." Well, I sort of contest that, and I have found excessive use of these manufactured items in all segments of our society, and I think it is a matter of education, of teaching people what to use, how much to use. Don't overdo it, and save yourselves some bucks; don't buy a couple of extra bags of fertilizer. It won't do you any good. It will just ruin the pond down below.

I would like to see a portion of the funding on Mr. Oberstar's bill go directly toward an educational system throughout the country, directed to the farmers of one segment, through the granges and the cooperatives, with the help of the Agricultural Extensive Service and the Soil Conservation Service agencies—perhaps even to the schools, elementary, secondary and high schools—some training on what soil erosion and sedimentation problems can do.

Also, we have the residents. I did a study for a lake which was bounded by residences all around the shoreline, and it was highly contaminated with nutrients. This caused tremendous peagreen water in July and August. A lot of that problem was because of the excess use of their fertilizers on their lawns and gardens. We had a meeting of these people, several hundred residents, and they did not realize that they were wasting money, buying this material that was not needed.

So there is, I think, dire need for an educational program. It does not have to wait for studies. We have enough general knowledge of the available techniques. I think if people would just learn how to better use their backyards and their frontyards and their farms, that would do quite a bit to reduce the contamination.

Thank you.

Mr. CLINGER. Well, I think you make an excellent point, in the two things that you have pointed out to me, and that is the need for an educational component in addressing this problem, which is so different from the point source problem. Point source control is really more of a technically-oriented problem. This really is a question of getting the informed cooperation of large segments of the population. The second thing I think you stressed is the need for

flexibility, that we cannot lock this into very rigid statutory controls because the water basins vary, the nonpoint source problem varies from basin to basin, and that we should provide the flexibility.

I thank you all for your very excellent testimony.

Mr. ROE. I thank all of you for your time and for the excellent preparatory work that you did. We greatly appreciate it.

Mr. PRIME. Thank you, Mr. Chairman.

Mr. ROE. Our next witness for today is Mr. Andrew A. Holtan, chairman of the Governmental Affairs Committee, National Environmental Training Association.

We want to welcome you back, Mr. Holtan to our committee. I recall that we were discussing with you the last time the training programs that are taking place, both in educating our operators and basically educating people in the issue we are speaking to, and you were going to look into that further. Have you got some additional thoughts you want to express to us at this point?

[The following was received for the record:]

STATEMENT PREPARED AND SUBMITTED ON BEHALF OF THE NATIONAL ENVIRONMENTAL TRAINING ASSOCIATION

INTRODUCTION

Thank you for the second opportunity to provide testimony before the U.S. House Committee on Public Works and Transportation. As before this testimony is presented on behalf of the National Environmental Training Association (NETA). My name is Andrew A. Holtan and I am Chairperson of the NETA Governmental Affairs Committee.

BACKGROUND

At the conclusion of my previous testimony you requested that I research two general questions regarding the state-of-the-art of training in the U.S. Specifically you requested an update on what is currently being done in training and conversely what is not being done. Intuitively this poses the question of what should be done and how.

These very same questions have been posed by the NETA membership as a challenge to the 1980 decision by EPA stating that the Federal role and responsibility in training was complete. Our membership refused to accept this position and began to make their concerns known to their Congressional Legislators.

It is NETA's view that a small investment in training can protect the integrity of billions of dollars of construction financing and ensure that plants are operating at maximum efficiency thereby achieving the National goal of improved water quality.

NATIONAL PLAN

Ultimately we believe that the responsibility for actually conducting such training and implementing ongoing mechanisms for financing does lie at the state and local levels. However, we believe that there remains a key interim federal role to do four things:

(1) Access existing capabilities of various state institutions to provide training.
(2) Develop models of successful training programs.
(3) Develop models of mechanisms to achieve financial self sufficiency.
(4) Provide technical assistance to the states in utilizing these models.

To be effective however all of this must be done within the context of a well though out and orderly plan of action. Therefore NETA proposed federal support for a state-of-the-art survey as the basis for the development of a National Tranining Plan.

Such a plan would evaluate the training needs and training resources and provide for a concerted and coordinated effort to develop the capabilities of the states to conduct an ongoing comprehensive and effective training program which is programmatically and fiscally self sufficient. The concept of a National Training Plan is outlined in Appendix I.

CONGRESSIONAL ADD-ON BUDGET

For the past three years through the combined efforts of the NETA grassroots membership and Congressional committees such as this, the Congress has shown its sensitivity to the critical role played by training and provided a budget add-on training.

In the first two years the Congressional add-on training funds were awarded to the 109 (b) training centers, to the state water quality regulatory agencies and to organizations outside the state structure for the general purpose of providing training and achieving state self sufficiency in training.

During the second year of funding, concerns developed that perhaps not all of the training funds were being spent as effectively as possible on training. Therefore in the third year the Congress specified that the funds were to be used to evaluate how the last two years of training funds were spent.

NETA SURVEY

As the only national association exclusively dedicated to environmental training NETA was selected by EPA to conduct a national survey entitled the "National Environmental Training and Technical Assistance Survey (NETTA)". A description of this survey is attached as Appendix II.

In conducting the NETTA project NETA has made contacts in all 50 states and worked extensively with numerous state agencies and institutions and national organizations. The membership of NETA which includes key members of the training community in the states places NETA in a unique position to interact effectively both with academic institutions and governmental regulatory agencies.

NETTA PRELIMINARY RESULTS

Although we are still in the process of collecting and analyzing the data we can share some preliminary observations with this committee:

(1) First is the training effort varies significantly from state to state. A few states are exceptional in their effort and effectiveness while others are marginal at best.

(2) In as much as many states tend to emulate the lead of the Federal Agencies the decision by EPA three years ago that the effort in training was complete, has had an impact on the state agencies.

(3) In some states a single individual, who has the responsibility for training cannot be identified.

(4) The primary training expertise in most states is organizationally seperate from the state water pollution control agency.

(5) Unless training funds are properly targeted they may not be going to the proper training organization within a state and may in fact not be spent on providing training or developing the state's training capacity.

(6) Where the funds are properly targeted on-site technical assistance does in fact occur with a resulting improvement in performance and compliance of our water quality treatment facilities.

A more complete analysis will be preformed on all of the data and a report submitted to the EPA in December of this year. It is our hope that this information will be used as a basis for targeting funding for training within states to provide incentives to those doing a good job and to develope the tools to assist others.

CONCLUSION

It is not enough to simply provide training funds to the states in the hopes of improving the training in each state. Many states required technical assistance to organize a comprehensive and effective training program which will maximize the operation and compliance of water quality treatment facilities.

The NETTA project will provide us for the first time with an indepth knowledge of the state-of-the-art of training. This information will be invaluable in the development of a National Plan which provides technical assistance to the states to achieve both programmatic and fiscal self sufficiency in training. A concept paper detailing such an effort is attached as Appendix III.

RECOMMENDATIONS

We respectfully request that this committee in its reauthorization of the Clean Water Act consider:

(1) Stimulating and supporting federal funding of water quality training efforts as previously discussed.

(2) Awarding federal funds for water quality training to organizations and institutions which have a history of successful water quality training and that in those cases where past training results have been less than desired that technical assistance accompany training funds.

(3) Support the development and implementation of a National Training Plan to maximize the value of the available federal training funds with the directed integration of state resources.

Thank you for this opportunity to present the concerns of the NETA membership. We are convinced that with the attention and support of such a prestigious committee we can be successful in our efforts to develop a competent water quality workforce and to maximize the operation and compliance of our water quality treatment facilities.

Mr. ROE. Please proceed.

TESTIMONY OF ANDREW A. HOLTAN, CHAIRMAN, GOVERNMENTAL AFFAIRS COMMITTEE, NATIONAL ENVIRONMENTAL TRAINING ASSOCIATION

Mr. HOLTAN. Yes, sir, I do. And I will present my testimony, which is very brief, almost verbatim from the printed copy that you have received.

Mr. Chairman and members of the committee, I want to thank you for the opportunity to provide testimony before the committee. As before, this testimony is presented on behalf of the National Environmental Training Association, NETA. My name is Andrew A. Holtan, and I am chairperson of the NETA Governmental Affairs Committee.

At the conclusion of my previous testimony, you requested that I research two general questions regarding the state of the art of training in the United States. Specifically, you requested an update on what is currently being done in training, and conversely, what is not being done. And intuitively, this poses the question of what should be done and how.

These very same questions have been posed by the NETA membership as a challenge to the 1980 decision by EPA stating that the Federal role and responsibility in training was complete. Our membership refused to accept this position and began to make their concerns known to their congressional legislators.

It is NETA's view that a small investment in training can protect the integrity of billions of dollars of construction financing and insure that plants are operating at maximum efficiency, thereby achieving the national goal of improved water quality.

Ultimately, we believe that the responsibility for actually conducting such training and implementing ongoing mechanisms for financing does lie at the local and the State levels. However, we believe that there remains a key interim Federal role to do four things. The first is to assess the existing capabilities of various State institutions to provide training; second, to develop models of successful training programs; third, to develop models of mechanisms to achieve financial self-sufficiency, and the fourth, to provide technical assistance to the States in utilizing these models.

To be effective, however, all of this must be done within the context of a well-thought-out and orderly plan of action. Therefore, NETA proposed Federal support for a state of the art survey as the basis for the development of a national training plan. Such a plan would evaluate the training needs and training resources and provide for a concerted and coordinated effort to develop the capabili-

20-955 O—84——214

ties of the States to conduct an ongoing comprehensive and effective training program which is programmatically and fiscally self-sufficient. The concept of a national training plan is outlined in appendix II.

For the past 3 years, through the combined efforts of the NETA grassroots membership and congressional committees such as this, the Congress has shown its sensitivity to the critical role played by training and provided an add-on budget for training.

In the first 2 years, the congressional add-on training funds were awarded to the 109(b) training centers, to the State water quality regulatory agencies and to organizations outside the State structure for the general purpose of providing training and achieving State self-sufficiency in training.

During the second year of funding, concerns developed that perhaps not all of the training funds were being spent as effectively as possible on training. Therefore, in the third year, the Congress specified that the funds were to be used to evaluate how the last 2 years of training funds were spent. As the only national association exclusively dedicated to environmental training, NETA was selected by EPA to conduct a national survey entitled the "National Environmental Training and Technical Assistance survey, NETTA." A description of this survey is attached as appendix II.

In conducting the NETTA project, NETA has made contacts in all 50 States and worked extensively with numerous State agencies and institutions and national organizations. The membership of NETA, which includes key members of the training community in the States places NETA in a unique position to interact effectively both with academic institutions and governmental regulatory agencies.

Although we are still in the process of collecting and analyzing the data, we can share some preliminary observations with the committee.

First, the training effort varies significantly from State to State. A few States are exceptional in their effort and effectiveness, while others are marginal at best.

Second, inasmuch as many States tend to emulate the lead of the Federal agencies, the decision by EPA 3 years ago that the effort in training was complete has had an impact on the State agencies.

Third, in some States, a single individual, who has the responsibility for training cannot be identified.

Fourth, the primary training expertise in most States is organizationally separate from the State water pollution control agency.

Fifth, unless training funds are properly targeted, they may not be going to the proper training organization within a State and may in fact not be spent on providing training or developing the State's training capability.

Sixth, where the funds are properly targeted, onsite technical assistance does, in fact, occur with a resulting improvement in performance and compliance of our water quality treatment facilities.

A more complete analysis will be performed on all of the data and a report submitted to the EPA in December of this year. It is our hope that this information will be used as a basis for targeting funding for training within States to provide incentives to those doing a good job and to develop tools to assist others.

Our conclusion is that it is not enough simply to provide training funds to the States in the hopes of improving the training in each State. Many States require technical assistance to organize a comprehensive and effective training program which will maximize the operation and compliance of water quality treatment facilities.

The NETTA project will provide us for the first time with an in-depth knowledge of the state of the art of training. This information will be invaluable in the development of a national plan which provides technical assistance to the States to achieve both programmatic and fiscal self-sufficiency in training. A concept paper detailing such an effort is attached as appendix III.

We respectfully request that this committee in its reauthorization of the Clean Water Act consider:

One, stimulating and supporting Federal funding of water quality training efforts as previously discussed.

Two, awarding Federal funds for water quality training to organizations and institutions which have a history of successful water quality training and that in those cases where past training results have been less than desired, that technical assistance accompany training funds.

Three, consider supporting the development and implementation of a national training plan to maximize the value of the available Federal training funds with the directed integration of State resources.

I thank you for this opportunity to present the concerns of the NETA membership. We are convinced that with the attention and support of such a prestigious committee, we can be successful in our efforts to develop a competent water quality work force and to maximize the operation and compliance of our water quality treatment facilities.

[Appendix items I, II, and III follow:]

National Environmental Training Association

RECOMMENDATIONS FOR NATIONAL TRAINING PLAN

NETA recommends that the National Training Plan address, at a minimum, the following training needs and concerns:

State plans of action for environmental training - If state self-sufficiency lies at the core of the national training plan, then the first step towards such self-sufficiency must be for states to have their own plans for effective training capabilities — plans that are fiscally and programmatically self-sufficient.

The state technical assistance demonstration project proposed for FY84 funding will not only address this need in the five demonstration states, it will serve as a model for the attainment of self-sufficiency in other states.

Funding mechanism - The entire issue of state self-sufficiency turns on the question of adequate, long-term fiscal support for environmental training. The national plan, therefore, must address the development of funding mechanisms that are adequate to support effective, self-sufficient state training capabilities.

Again, the state technical assistance project proposed for FY84 funding will develop a model for state financial management technical assistance programs and such assistance will actually become a component of state O&M programs in the five demonstration states.

National clearinghouse - No matter how effective state self-sufficiency is or becomes, state training programs cannot interact unless there is a focal point for national coordination. And unless states interact — cooperate and share information, expertise, materials, resources and innovative approaches — there will be duplication of effort and a tremendous waste of resources at the state and local levels. National coordination lies at the very heart of any national goal — and national coordination is as necessary for environmental training as it is for any other aspect of our nation's environmental protection effort.

What national coordination does exist is haphazard, at best. Hundreds of individuals and organizations turn to NETA each year for guidance in locating quality training resources, materials, sources, programs, etc. In fact, since NTOTC's termination, even EPA has been turning to NETA for help: EPA Regional offices call to ask about local sources of training; former employees of NTOTC call to see whether NETA's library contains a certain report; USEPA Personnel Management Division calls to ask if NETA has a directory of training sources — where can EPA employees can be sent for training? In addition to EPA, numerous international organizations turn to NETA for similar information. And throughout the country, state and local government, educational institutions and private firms are continually calling on NETA as the source of information about environmental training.

But NETA's financial resources (primarily dues) are inadequate to support an effective, comprehensive clearinghouse system.

No system exists today which is effectively meeting environmental training needs. The IRIS (Instructional Resources Information System) established at Ohio State University does not meet the needs of trainers for several documented reasons:

- Many trainers still do not know that IRIS exists. Apparently, little effort is being made to reach these trainers — especially the part-time trainer.
- More important, many trainers know about IRIS but do not use it. In a 1980 survey of professional environmental trainers, NETA found that 81% of the trainers surveyed were familiar with IRIS but only 5% use it often. The trainers complained that the system is cumbersome and time-consuming to use and that it is incomplete.
- The trainers surveyed also complained that IRIS is filled with references to materials that are outdated, irrelevant or unobtainable; that contact names and addresses are often incorrect; and that materials are not screened for quality, content or relevancy before they are added to the system.

In addition to problems with IRIS, materials being disseminated through Ohio State University fall short of the mark, as well. Individuals have contacted NETA for training materials that they cannot obtain from from Ohio State University, even though they are supposed to be available. Finally, Battelle's National Trainers Institute (for which many trainers held high hopes) represents perhaps the greatest disappointment of all.

No other organization in this nation is as committed to the cause of environmental training as NETA is; NETA's sole constituency is the environmental trainer. And without this commitment to training — without the awareness of who environmental trainers are and what they need to do their job and do it well — any effort at national coordination is not likely to effectively meet the needs of trainers.

Standards of quality training capabilities - The accomplishments proposed in the national plan must be measured: the national plan, therefore, requires a yardstick by which the effectiveness of statewide training capabilities can be assessed. Quality can't be legislated. But certain minimum standards can and must be established for training materials, facilities, personnel, programs, fiscal resources, etc.

The N.E.T.T.A. project is developing the elements of good training. The national training plan should build on this by developing minimum standards for quality state training capabilities. These minimum standards, then, can become self-assessment "packages" that states can use in designing their own training delivery systems. The self-assessment packages will help states select appropriate approaches from a universe of potential approaches that have been identified as effective.

The standards of quality training capabilities and the self-assessment packages will not only offer states insight into what they should be doing and why, but will provide basic guidance in taking the first steps.

Public awareness of the benefits of training - Trainers have recently become aware that Congress and EPA hold training accountable for its impact on plant performance/compliance. As trainers begin to grapple with this challenge, they recognize that various obstacles must be overcome if an effective campaign is to be waged. Perhaps the greatest obstacle currently facing trainers is the lack of public awareness of the benefits of environmental training — particularly at the local level, but also at the state level. Before a local community becomes supportive of training, an entire foundation of awareness must be carefully laid. The community must learn and understand that:

- its wastewater treatment plant represents a huge public investment — an investment that must be protected and maintained
- annual plant operating costs are probably the largest single item in the community's budget
- trained workers can reduce plant operating costs through better operation and maintenance practices (lower energy costs, lower consumption of chemicals and supplies, longer equipment life, etc.)
- the community must provide adequate financial support to staff, operate and maintain the treatment plant

When a community understands the implications of poor O&M, it will be receptive to the benefits training has to offer.

The national training plan, therefore, should help trainers meet the plant performance/compliance challenge by providing trainers with tools to gain local community and state support. Leaflets, brochures and pamphlets should be developed that trainers can use to educate local governments, mayors, city councils, plant superintendents and other decision-makers in the benefits of training.

NATIONAL EVALUATION OF TRAINING & TECHNICAL ASSISTANCE (N.E.T.T.A.)

A Project to Assess State Training & Technical Assistance Capabilities

National Environmental Training Association

April 1983

II. PLAN OF WORK

A. Project Purpose

The purposes of this project are to evaluate the effectiveness of various approaches to environmental training and to identify the critical, common program elements and essential state resource levels for maintaining effective operator training programs. Inherent in this evaluation is the development of recommendations for improving all aspects of environmental training delivery, including programmatic and resource considerations, and for establishing fiscal support at the state and local levels.

B. Approach

The following approach will be used to achieve the goals of this project:

- First, evaluation criteria will be established and an evaluation will be conducted for each of the evaluation areas (described in Section III).
- Second, appropriate state agency personnel and state training center personnel will be contacted through questionnaires, telephone contacts and personal interviews to collect data and information in each area of evaluation.
- Third, the raw data, information and statistics will be analyzed and baseline data will be established.
- Fourth, the critical, common program elements and essential state resource levels for effective operator training programs will be identified.
- Fifth, all data and information will be evaluated, as further described in Section III.

This approach will be repeated in each of the five areas of evaluation described below. It should be noted that the data to be collected, developed and analyzed is contingent upon the availability of data from the States.

Based on the results of these evaluations, recommendations will be developed for improving state training capabilities and strengthening state self-sufficiency for environmental training.

III. AREAS OF EVALUATION

Water quality operator training is a complex picture. In choosing aspects of the training picture for evaluation, major trends in approaches to training delivery and funding were considered the most important areas of study.

Perhaps no greater challenge faces operator training programs than the transition from Federal fiscal support to state and local support. At the same time, assuring that training programs are comprehensive and effective remains a major concern. The ultimate test of the efficacy of operator training is its impact on plant performance.

With these considerations in mind, then, the following areas have been selected for evaluation:

1. Training activities utilizing FY82 104(g)(1) funds
2. State efforts toward achieving self-sufficient environmental workforce development
3. Training approaches used by a representative sample of states determined to have successful training capabilities
4. 109(b) centers as an institutional capability for state training delivery
5. Operator certification as a mechanism for improving plant performance and compliance

These areas of evaluation are described below in further detail.

A. Evaluation of Training Activities Utilizing FY82 104(g)(1) Funds

To a large extent, success in establishing effective and self-sufficient training capabilities depends upon being able to demonstrate that training saves money and improves a plant's performance or record of compliance with appropriate discharge permits.

Yet, improved plant performance has only recently emerged as the touchstone of environmental training. FY82 104(g)(1) operator training funds represent the first allocation of funds for the specific purpose of providing technical assistance to document the relationship between compliance and training.

The extreme importance of documenting this relationship cannot be overstated. A major objective of this project is, therefore, to evaluate the effectiveness of FY82 funds utilized in:

- states with 109(b) training centers
- states without 109(b) training centers
- national training projects, such as the National Demonstration Water Project CompTrain Project

All states will be surveyed to identify the critical, common program elements and essential state resource levels necessary for maintaining effective operator training programs. Information to be gathered will include:

- the number of facilities assisted
- the types of training delivery (e.g. on-site, classroom, etc.)
- areas of emphasis
- the overall effort directed toward technical assistance to improve plant performance and compliance
- the sources of the technical assistance effort (private sector; state agencies; educational institutions; etc.)

Collection of data will be coordinated with the Association of State and Interstate Water Pollution Control Administrators. In addition, an in-depth, extensive analysis will be conducted in ten states. This analysis will evaluate the use of FY82 104(g)(1) funds and the effectiveness of technical assistance efforts. Based on these and other evaluation parameters, this project will assess state views toward operator training and will determine how the national guidance, concerning training to improve plant performance/compliance, was implemented.

B. Evaluation of State Efforts Toward Self-Sufficient Environmental Workforce Development

State self-sufficiency, as it applies to training programs for pollution control personnel, can take many forms. And the first step, perhaps, in measuring self-sufficiency

is to establish "baseline data" — a clear and uniform definition of the term "self-sufficiency."

With the termination of Federal funding for training, states must be ready to assume a primary role in supporting operator training programs.

For many states, self-sufficiency is a laudable goal, but one that will not be readily realized; the framework to support self-sufficiency simply doesn't exist today. Yet, several states do have effective and comprehensive environmental training capabilities that do not rely directly on Federal funds for support.

A basic step in the journey to self-sufficiency is documenting the efforts of travelers who have gone before. States that are struggling to establish independent training capabilities will benefit greatly from understanding how other states have achieved self-sufficiency — legislative history, problems encountered, resources required, model administrative structures, etc. Since many operations and maintenance problems are attributable to poor fiscal management and inadequate user fee systems, special attention should be given to state or local financial management procedures and guidance, and to model user fee systems that provide adequate ongoing support for operator training.

In this project, states which are now self-sufficient, and states that are moving toward self-sufficiency, will be identified. Their progress toward or achievement of self-sufficiency will be documented, along with levels of state and local funding for operator training.

C. Evaluation of States with Successful Training Capabilities

A portion of FY83 funds is being devoted to identifying what is necessary for successful state training capabilities to meet essential training needs, in terms of both program elements and annual resource costs. Each Region of U.S. EPA may select for

this study one state that has a recognized, effective training program. Regional funding will enable this state to describe its program elements and resource needs.

This project will evaluate this data and develop recommendations concerning the critical, common program elements and essential state resources needed to maintain effective training programs. The Regions and States are not required to partcipate in this special study. Therefore, fewer than 10 states may be involved in this evaluation. Whatever the number of participating States and Regions, essential program elements and annual resource costs will be evaluated.

D. Evaluation of 109(b) Centers as an Institutional State Capability for Training

Twenty states and the District of Columbia are utilizing 109(b) centers as the primary vehicle for environmental training activities and programs, while several states (California, Illinois and Texas) have state training centers built without 109(b) funds. But many states have not taken advantage of funds available under Section 109(b) to provide financial assistance in the construction of a state training center. State training centers represent at least a minimum commitment to training and represent an institutional capability for ongoing training delivery. A few states (i.e. New York, Minnesota) without any type of state training center do have viable, effective training delivery systems (utilizing, for example, state and local agencies as the vehicles for training). However, most states without state training centers — 109(b) or otherwise — do not appear to have effective or comprehensive state training capabilities.

In this project, the overall effectiveness of 109(b) training centers will be evaluated and the advantages of designated state training centers, versus other approaches to training delivery, will be identified. Impediments to the establishment of 109(b) state training centers will be identified and recommendations will be developed for resolving such impediments. This project will also identify states that have little or no operator

training programs and will determine any program deficiencies in states without designated state training centers.

E. Evaluation of Operator Certification as a Mechanism for Improving Plant Performance and Compliance

The effectiveness of certification as a mechanism in improving plant performance and compliance has not been evaluated adequately. In this project, states will be surveyed to define the theoretical role of certification, the actual role of certification, and ways in which implementation of certification concepts and practices might be improved.

IV. TIMETABLE

This project is of 14 months' duration. In general, the five evaluations will take place concurrently and many of the tasks involved in each evaluation are identical.

A rough chronology of the tasks for the implementation of this project is as follows:

Establish criteria and conduct evaluation	3 months
Survey/interview state personnel	4.5 months
Analyze data and establish baseline	2.5 months
Identify critical, common program elements and annual resource costs	1 month
Evaluate all data and information	1 month
Develop recommendations	2 months

V. MANAGEMENT PLAN AND QUALITY CONTROL

The success of this project will depend to some extent upon a strong partnership being forged between all of the groups directly or indirectly involved in environmental workforce development. This partnership encompasses the private sector, state and local government, educational institutions, and others.

While the diversity of the groups in this partnership may seem to challenge the notion of cohesiveness, this very diversity — when well-managed, organized and directed — will actually provide a rich bank of human, material and financial resources for developing support for self-sufficient, comprehensive programs for environmental workforce development.

The key to the successful integration of the ideas to be offered by these partners is centralized project management and quality control.

A. Centralized Management

The National Environmental Training Association (NETA), responsible for implementation of this project, is uniquely capable of effectively and successfully managing this project.

More than any other organization, NETA is very familiar with the diversity of the many organizations involved in environmental workforce development, since NETA's membership presently includes — and historically has encompassed — each of these diverse groups.

NETA's capability to manage this project will be maximized by utilizing the NETA membership as the basis for the pool of human resources from which volunteer state coordinators and project consultants will be selected.

In this project, NETA has overall responsibility for establishing baseline data, collecting and analyzing data, and developing recommendations. Yet, in the true partnership spirit, NETA's efforts in each of these tasks will incorporate the input of those who will ultimately be responsible for any implementation of project recommendations.

The responsibility for effective project management includes certain specific activities:

- selecting all project personnel, state coordinators, and project consultants
- coordinating activities in establishing evaluation criteria, collecting and analyzing data, establishing baseline data, evaluating data and developing recommendations
- coordinating the collection of data with the Association of State and Interstate Water Pollution Control Administrators
- preparing periodic progress and financial reports
- evaluating the project and assuring quality control
- maintaining final authority over decisions of the project consultants and state coordinators

In addition, NETA will be solely responsible for working with the funding agency and for representing the project to the public.

B. Project Consultants

Technical experts will be utilized as project consultants and will provide valuable assistance in establishing baseline data, analyzing information and developing recommendations. While the NETA membership offers an excellent base for the pool of project consultants, outside technical experts will be hired as necessary to provide other specialized skills and knowledge.

C. State Coordinators

State coordinators will be volunteers selected from the NETA membership in each state. The state coordinators will assist in the collection of data from state personnel and will work under the direction of the Assistant Project Manager.

The state coordinators will be individuals who are well-acquainted with the existing state training program and existing resources within the state, and will have the special ability to work with and to integrate the activities of the various state resource groups and individuals.

D. Project Organization

APPENDIX III

National Environmental Training Association

STATE-TO-STATE "BOOTSTRAP" EFFORT
TECHNICAL ASSISTANCE DEMONSTRATION PROJECT

Purpose

This demonstration project has two purposes. First, through this project, five states will actually develop and implement a plan to achieve fiscal and programmatic self-sufficiency for wastewater operator training. Second, the plans developed by these five states will become a formula or a model to be used throughout the nation to help other states develop fiscal and programmatic self-sufficiency for wastewater operator training.

Rationale

There is little dispute that there is a widespread problem of plant non-compliance in this country — non-compliance, that is, with NPDES permits. In a similar way, many states are not "in compliance" with a model of effective, self-sufficient training capabilities.

Of course, unlike the NPDES permit system, this "state model" doesn't exist today — but it is being developed right now. One of the outputs of the N.E.T.T.A. project is to identify the "elements of good training capabilities". These elements are, in fact, a model of what states should be doing, how they might go about it, and what it costs to do it effectively.

The evaluation of FY82 technical assistance projects has begun and it's apparent that some states that were given money simply do not have the interest, commitment or capabilities in wastewater operator training. This has happened because until now there has been no yardstick by which a state's current or potential commitment to training can be measured.

To continue to give money directly to such states, simply telling them to "become self-sufficient", is analogous to giving money directly to plants and simply telling them to "bring themselves into compliance." It won't work. Without guidance, expertise, direction and planning, a plant cannot be brought into compliance — nor can a state.

Approach

This technical assistance project is a state-to-state "helping hand" effort. No state today has achieved fiscal and programmatic self-sufficiency for training, but several states have developed expertise in specific areas. By bringing together the knowledge, skills and experience of a number of individuals and organizations, a pool of expertise from other states will provide the basis of the technical assistance in this project.

This project involves three distinct phases — each of which is vital to the successful implementation of the project:

1. Selection of Demonstration States - the very essence of any demonstration project is to achieve the stated objective, thereby demonstrating the validity of a premise — in this case, fiscal and programmatic self-sufficiency for environmental training. It is apparent, therefore, that selection of participants is a crucial step; the demonstration states selected must provide the demonstration project with the best possible chance for success.

   In this project, the demonstration states will be selected based on their potential for

attainment of fiscal and programmatic self-sufficiency. This potential will be identified through the results of the N.E.T.T.A. project, which is providing — for the first time ever — key information about training capabilities in each state.

2. Developing the State Training Plan - Two important outputs of the N.E.T.T.A. project will be used as a starting point in developing state plans of action. First, the N.E.T.T.A. project provides baseline data on the status of state training capabilities. Second, the N.E.T.T.A. project identifies the elements of good training and fiscal resources required. The state training plan will, in essence, be a blueprint on how to close the "gap" between where a state is today and the attainment of fiscal and programmatic self-sufficiency for training.

   Most important, the state training plan will provide the state O&M program with a financial management technical assistance component. This element does not exist today and until states develop this expertise, assistance cannot be provided to communities in the financial aspects of plant operations and maintenance.

   How can we be assured that the state training plans will succeed? How does this state technical assistance project differ from other attempts toward state self-sufficiency?

   - The FY82 104(g)(1) technical assistance projects, as evaluated in the N.E.T.T.A. project, will demonstrate that technical assistance is, in fact, effective. These persuasive data and statistics will be presented to state decision-makers as part of this project.

   - This project will provide incentives — financial, status, and otherwise — for state participation.

   - The "partners" in training will support the training plan because it will be their plan. Management at the appropriate levels of the state; municipal plant personnel; and educational institutions — all of these individuals and organizations will be brought together to work toward the common goal of fiscal and programmatic self-sufficiency for training.

   The first year of this project will be devoted to building the foundation of support among the "training partners" in each state — from the state capitol to the community college to the wastewater treatment plant. The state training plan will then be developed, also in the first year of the project.

3. Implementing the State Training Plan - The second year of the project will be devoted to helping the five demonstration states implement their individual training plans.

Summary

This project signifies a landmark in the journey toward state self-sufficiency. When this project is completed, self-sufficiency will have been demonstrated to be desirable, beneficial and achievable. Five states will actually have plans of action for effective, self-sufficient training; forty-five states will be asking how the same can be accomplished in their states.

10/83

Mr. ROE. We want to thank you, Mr. Holtan, because I think that your summary and your presentation today really rounds out your testimony and brings into clear focus what the issues are, and I think you have identified it very, very well.

Also, we would be looking for the interpretation that EPA makes of your presentation to them, to see how we can apply this dimension.

Are there any questions of the gentleman?

The gentleman from Minnesota.

Mr. STANGELAND. Just one question. How extensive and to what degree level do you anticipate the training ought to take? Is it a voc tech training, is it a 4-year degree training?

Mr. HOLTAN. I think a State training program ought to be multifaceted. People learn in different ways. Some people learn very well at home study. Others learn very well in a classroom. Some require both of them. No training program can be effective, however, without some sort of hands-on practice of the knowledge and skills you have gained, as well as inplant training.

So that I think that it needs to be an extensive training program, with a number of different avenues for that training to be available to the operators.

Mr. STANGELAND. You do not envision—or do you envision the need for every State to have a training program, or couldn't the training programs be conducted more regionally?

Mr. HOLTAN. I think that each State should have its own training program, to the extent that that State's resources will allow it to. They may then have to take advantage of certain specialized training, specialized courses, on a regional basis, that are either too expensive or too difficult to make available in each and every State, but that every State, in my estimation, should have a training plan and training program underway. Some may be more extensive than others, but every one should have one, I believe.

Mr. STANGELAND. Thank you very much.

Mr. ROE. Are there further questions for the gentleman?

[No response.]

Mr. ROE. Again, thank you very much, Mr. Holtan. We appreciate your efforts.

Now, our last witness for the day is the Council of Energy Resources Tribe, Mr. David Lester. Is Mr. David Lester here we will place his statement in the record at this point.

[Statement referred to follows:]

STATEMENT OF DAVID LESTER, EXECUTIVE DIRECTOR, COUNCIL OF ENERGY RESOURCE TRIBES

SUPPLEMENTAL TESTIMONY

CLEAN WATER ACT

Mr. Chairman and committee members, my name is David Lester. I am the Executive Director of the Council of Energy Resource Tribes (CERT). I am pleased to have this opportunity to provide testimony on the Clean Water Act and clarify issues raised by the Committee during the testimony of Mr. Ross Swimmer on October 18, 1983 on behalf of CERT.

With the Committee's permission, I would first like to address issues raised by the Committee during Mr. Swimmer's testimony after which I would be pleased to address anv additional questions you may have. My comments will focus on the three areas of concern raised during the October 18, 1983 testimony. Those three areas are:

(1) interference with water rights,
(2) tribal-state jurisdictional conflicts, and
(3) tribal administrative/management capability.

The statement prepared by CERT and placed into the hearing record of October 18, 1983, and the recommended changes noted in that statement and clarified herein do not involve or interfere with water rights. The tribes are asking that the Clean Water Act be amended to recognize tribal governments, thus allowing tribes direct participation in the programs authorized under the Act. Recognition of tribal governments would allow the Environmental Protection Agency (EPA) to delegate responsibilities to the tribes for program development and implementation, management, and enforcement; parallel to those opportunities presently afforded the states. The recognition of the tribal governments in the Clean Water Act would not involve water rights nor raise jurisdictional issues of water rights. Section 101 (g) of the Clean Water Act clarifies that:

> It is the policy of Congress that the authority of each State to allocate quantities of water within its jurisdiction shall not be superseded, abrogated or otherwise impaired by this Act. It is the further policy of Congress that nothing in this Act shall be construed to supersede or abrogate rights to quantities of water which have been established by any State, Federal agencies shall co-operate with State and local agencies to develop comprehensive solutions to prevent, reduce and eliminate pollution in concert with programs for managing water resources.

In like manner, from the tribes' perspective, the Clean Water Act should not be viewed as superseding, abrogating or otherwise impairing the authority of respective tribes to allocate quantities of water under their jurisdiction. The Clean Water Act does not relate to water rights.

The area of greatest concern raised during the October 18, 1983 testimony was with respect to potential tribal-state jurisdictional conflict that could result from non-compatible (inconsistent) water quality standards. The concern was also raised that the tribes would be a "third party" involved in the question of state and Federal Government jurisdiction.

The issue of compatibility of water quality standards between tribes and states would be no greater than the issue of standards compatibility between two adjoining states. Any water quality standards developed by the tribes, would, like the states, have to comply with the minimum standards established by the EPA. Water quality standards more stringent than the minimum could be established by either or both tribes and states. The ultimate compatibility of differing water quality standards between adjoining states, adjoining Indian reservations, or state lands adjacent to Indian lands would be resolved in the same manner, that is under the jurisdiction of the EPA in compliance with Federal regulations.

Concerns raised about the potential incompatibility of water quality standards independently developed by tribes and states was viewed from the perspective of impact on waters flowing into the states because of lesser quality waters, thus implied less stringent tribal water quality standards, leaving the reservations. Such concerns are equally valid for the potential of lesser quality water entering the reservations because of more lax state water quality standards compared to tribally established standards. It is anticipated that water quality standards developed by the tribes would be equal or more stringent than the standards of the adjacent states. Higher water quality standards would generally be developed by the tribes because of their desire for good water quality necessary to maintain and preserve important cultural values of fishing and hunting and economic development.

The direct participation of Indian tribes in establishing and administering water quality standards and other regulatory programs under the Clean Water Act would be no more "third party" than any other state to federal government relationship. The position of

the tribes would be parallel to the states. Both would be responsible to the federal government and any conflict or inconsistency would be resolved by the federal government.

The third concern to be addressed relates to the present administrative capability of the tribes to assume the responsibilities of program management and enforcement. The administrative capacity of the tribes, like that of states, varies from entity to entity. Some tribes presently have the capability to assume the administrative responsibilities required under the Clean Water Act. Other tribes would require time to build the needed administrative capacity. Where needed, program capability could be achieved through partial program delegation leading to full program responsibility as the tribe develops the ability to assume the additional duties. Again, like the states, there may be instances where the tribes would not want the program and thus compliance with the provisions of the Clean Water Act would remain with the EPA.

It is concluded that tribal governments of federally recognized Indian tribes should be recognized under the Clean Water Act, thus enabling government-to-government (federal to tribal) delegation of programs under the Act. Such delegation would not result in conflicts that do not already exist and for which mechanisms are already in place to resolve. Without recognition of tribal governments in the Clean Water Act, a void of local government regulatory authority will continue to exist on Indian reservations and program responsibility will remain with the Environmental Protection Agency. The right of the federal government to delegate such program responsibility to the tribes is in line with the intent and initiatives of the President's Indian Policy of January 24, 1983. (Copy Attached).

THE WHITE HOUSE

Office of the Press Secretary

For Immediate Release January 24, 1983

STATEMENT BY THE PRESIDENT

INDIAN POLICY

This Administration believes that responsibilities and resources should be restored to the governments which are closest to the people served. This philosophy applies not only to state and local governments, but also to federally recognized American Indian tribes.

When European colonial powers began to explore and colonize this land, they entered into treaties with sovereign Indian nations. Our new nation continued to make treaties and to deal with Indian tribes on a government-to-government basis. Throughout our history, despite periods of conflict and shifting national policies in Indian affairs, the government-to-government relationship between the United States and Indian tribes has endured. The Constitution, treaties, laws, and court decisions have consistently recognized a unique political relationship between Indian tribes and the United States which this Administration pledges to uphold.

In 1970, President Nixon announced a national policy of self-determination for Indian tribes. At the heart of the new policy was a commitment by the federal government to foster and encourage tribal self-government. That commitment was signed into law in 1975 as the Indian Self-Determination and Education Assistance Act.

The principle of self-government set forth in this Act was a good starting point. However, since 1975, there has been more rhetoric than action. Instead of fostering and encouraging self-government, federal policies have by and large inhibited the political and economic development of the tribes. Excessive regulation and self-perpetuating bureaucracy have stifled local decisionmaking, thwarted Indian control of Indian resources, and promoted dependency rather than self-sufficiency.

This Administration intends to reverse this trend by removing the obstacles to self-government and by creating a more favorable environment for the development of healthy reservation economies. Tribal governments, the federal government, and the private sector will all have a role. This Administration will take a flexible approach which recognizes the diversity among tribes and the right of each tribe to set its own priorities and goals. Change will not happen overnight. Development will be charted by the tribes, not the federal government.

This Administration honors the commitment this nation made in 1970 and 1975 to strengthen tribal governments and lessen federal control over tribal governmental affairs. This Administration is determined to turn these goals into reality. Our policy is to reaffirm dealing with Indian tribes on a government-to-government basis and to pursue the policy of self-government for Indian tribes without threatening termination.

In support of our policy, we shall continue to fulfill the federal trust responsibility for the physical and financial resources we hold in trust for the tribes and their members. The fulfillment of this unique responsibility will be accomplished in accordance with the highest standards.

Tribal Self-Government

Tribal governments, like state and local governments, are more aware of the needs and desires of their citizens than is the federal government and should, therefore, have the primary responsibility for meeting those needs. The only effective way for Indian reservations to develop is through tribal governments which are responsive and accountable to their members.

Early in this nation's dealings with Indian tribes, federal employees began to perform Indian tribal government functions. Despite the Indian Self-Determination Act, major tribal government functions -- enforcing tribal laws, developing and managing tribal resources, providing health and social services, educating children -- are frequently still carried on by federal employees. The federal government must move away from this surrogate role which undermines the concept of self-government.

It is important to the concept of self-government that tribes reduce their dependence on federal funds by providing a greater percentage of the cost of their self-government. Some tribes are already moving in this direction. This Administration pledges to assist tribes in strengthening their governments by removing the federal impediments to tribal self-government and tribal resource development. Necessary federal funds will continue to be available. This Administration affirms the right of tribes to determine the best way to meet the needs of their members and to establish and run programs which best meet those needs.

For those small tribes which have the greatest need to develop core governmental capacities, this Administration has developed, through the Assistant Secretary of the Interior for Indian Affairs, the Small Tribes Initiative. This program will provide financial support necessary to allow these tribes to develop basic tribal administrative and management capabilities.

In keeping with the government-to-government relationship, Indian tribes are defined by law as eligible entities and receive direct funding, if they wish, in five block grant programs administered by the Department of Health and Human Services. These and other blocks to the states consolidated dozens of categorical federal domestic assistance programs to reduce fragmentation and overlap, eliminate excessive federal regulation, and provide for more local control. This Administration now proposes that Indian tribes be eligible for direct funding in the Title XX social services block, the block with the largest appropriation and the greatest flexibility in service delivery.

In addition, we are moving the White House liaison for federally-recognized tribes from the Office of Public Liaison to the Office of Intergovernmental Affairs, which maintains liaison with state and local governments. In the past several administrations, tribes have been placed along with vital interest groups, such as veterans, businessmen and religious leaders. In moving the tribal government contact within the White House Intergovernmental Affairs staff, this Administration is underscoring its commitment to recognizing tribal governments on a government-to-government basis.

Further, we are recommending that the Congress expand the authorized membership of the Advisory Commission on Intergovernmental Relations (42 U.S.C. 4273) to include a representative of Indian tribal governments. In the interim before Congressional action, we are requesting that the Assistant Secretary for Indian Affairs join the Commission as an observer. We also supported and signed into law the Indian Tribal Governmental Tax Status Act which provides tribal governments with essentially the same treatment under federal tax laws as applies to other governments with regard to revenue raising and saving mechanisms.

In addition, this Administration calls upon Congress to replace House Concurrent Resolution 108 of the 83rd Congress, the resolution which established the now discredited policy of terminating the federal-tribal relationship. Congress has implicitly rejected the termination policy by enacting the Indian Self-Determination and Education Assistance Act of 1975. However, because the termination policy declared in H. Con. Res. 108 has not been expressly and formally repudiated by a concurrent resolution of Congress, it continues to create among the Indian people an apprehension that the United States may not in the future honor the unique relationship between the Indian people and the federal government. A lingering threat of termination has no place in this Administration's policy of self-government for Indian tribes, and I ask Congress to again express its support of self-government.

These actions are but the first steps in restoring control to tribal governments. Much more needs to be done. Without sound reservation economies, the concept of self-government has little meaning. In the past, despite good intentions, the federal government has been one of the major obstacles to economic progress. This Administration intends to remove the impediments to economic development and to encourage cooperative efforts among the tribes, the federal government and the private sector in developing reservation economies.

Development of Reservation Economies

The economies of American Indian reservations are extremely depressed with unemployment rates among the highest in the country. Indian leaders have told this Administration that the development of reservation economies is their number one priority. Growing economies provide jobs, promote self-sufficiency, and provide revenue for essential services. Past attempts to stimulate growth have been fragmented and largely ineffective. As a result, involvement of private industry has been limited, with only infrequent success. Developing reservation economies offers a special challenge: devising investment procedures consistent with the trust status; removing legal barriers which restrict the type of contracts tribes can enter into and reducing the numerous and complex regulations which hinder economic growth.

Tribes have had limited opportunities to invest in their own economies because often there has been no established resource base for community investment and development. Many reservations lack a developed physical infrastructure including utilities, transportation and other public services. They also often lack the regulatory, adjudicatory and enforcement mechanisms necessary to interact with the private sector for reservation economic development. Development on the reservation offers potential for tribes and individual entrepreneurs, in manufacturing, agribusiness and modern technology, as well as fishing, livestock, arts and crafts and other traditional livelihoods.

Natural resources such as timber, fishing and energy provide an avenue of development for many tribes. Tribal governments have the responsibility to determine the extent and the methods of developing the tribe's natural resources. The federal government's responsibility should not be used to hinder tribes from taking advantage of economic development opportunities.

With regard to energy resources, both the Indian tribes and the nation stand to gain from the prudent development and management of the vast coal, oil, gas, uranium and other resources found on Indian lands. As already demonstrated by a number of tribes, these resources can become the foundation for economic development on many reservations while lessening our nation's dependence on imported oil. The federal role is to encourage the production of energy resources in ways consistent with Indian values and priorities. To that end, we have strongly supported the use of creative agreements such as joint ventures and other non-lease agreements for the development of Indian mineral resources.

It is the free market which will supply the bulk of the capital investments required to develop tribal energy and other resources. A fundamental prerequisite to economic development is capital formation. The establishment of a financial structure that is a part of the Indian reservation community is essential to the development of Indian capital formation.

Federal support will be made available to tribes to assist them in developing the necessary management capability and in attracting private capital. As a first step in that direction, we provided funds in the FY 1983 budget to provide seed money to tribes to attract private funding for economic development ventures on reservations. As more tribes develop their capital resource base and increase their managerial expertise, they will have an opportunity to realize the maximum return on their investments and will be able to share an increasing portion of the business risk.

It is the policy of this Administration to encourage private involvement, both Indian and non-Indian, in tribal economic development. In some cases, tribes and the private sector have already taken innovative approaches which have overcome the legislative and regulatory impediments to economic progress.

Since tribal governments have the primary responsibility for meeting the basic needs of Indian communities, they must be allowed the chance to succeed. This Administration, therefore, is establishing a Presidential Advisory Commission on Indian Reservation Economies. The Commission, composed of tribal and private sector leaders, is to identify obstacles to economic growth in the public and private sector at all levels; examine and recommend changes in federal law, regulations and procedures to remove such obstacles; identify actions state, local and tribal governments could take to rectify identified problems; and recommend ways for the private sector, both Indian and non-Indian, to participate in the development and growth of reservation economies. It is also to be charged with the responsibility for advising the President on recommended actions required to create a positive environment for the development and growth of reservation economies.

Numerous federal agencies can offer specialized assistance and expertise to the tribes not only in economic development, but also in housing, health, education, job training, and other areas which are an integral part of reservation economies. It is to the advantage of the tribes, and in the interest of the taxpayers, that the federal role be fully reviewed and coordinated. Therefore, this Administration directs the Cabinet Council on Human Resources to act as a mechanism to ensure that federal activities are non-duplicative, cost effective, and consistent with the goal of encouraging self-government with a minimum of federal interference.

Summary

This Administration intends to restore tribal governments to their rightful place among the governments of this nation and to enable tribal governments, along with state and local governments, to resume control over their own affairs.

This Administration has sought suggestions from Indian leaders in forming the policies which we have announced. We intend to continue this dialogue with the tribes as these policies are implemented.

The governmental and economic reforms proposed for the benefit of Indian tribes and their members cannot be achieved in a vacuum.

This nation's economic health -- and that of the tribes -- depends on adopting this Administration's full Economic Recovery Program. This program calls for eliminating excessive federal spending and taxes, removing burdensome regulations, and establishing a sound monetary policy. A full economic recovery will unleash the potential strength of the private sector and ensure a vigorous economic climate for development which will benefit not only Indian people, but all other Americans as well.

Attachment

REAGAN ADMINISTRATION INDIAN POLICY INITIATIVES

- Request that Congress repudiate House Concurrent Resolution 108 of the 83rd Congress which called for termination of the federal-tribal relationship. The Administration wants this lingering threat of termination replaced by a resolution expressing its support of a government-to-government relationship.

- Ask Congress to expand the authorized membership of the Advisory Commission on Intergovernmental Relations to include a representative of Indian tribal governments. In the interim, request that the Assistant Secretary of the Interior for Indian Affairs join the ACIR as an observer.

- Move the White House liaison for federally-recognized tribes from the Office of Public Liaison to the Office of Intergovernmental Affairs.

- Establish a Presidential Advisory Commission on Indian Reservation Economies to identify obstacles to economic growth and recommend changes at all levels; recommend ways to encourage private sector involvement, and advise the President what actions are needed to create a positive environment for the development and growth of reservation economies.

- Support direct funding to Indian tribes under the Title XX social services block grant to states.

- Sought and obtained funds for FY 1983 to implement the Small Tribes Initiative to provide financial support needed to allow small tribes to develop basic tribal administrative and management capabilities.

- Sought and obtained funds for FY 1983 to provide seed money for tribes for economic development ventures on reservations.

- Supported and signed into law the Tribal Governmental Tax Status Act which will provide tribal governments with the same revenue raising and saving mechanisms available to other governments.

- Support the use of creative agreements such as joint ventures and other non-lease agreements for the development of Indian mineral resources.

- Direct the Cabinet Council on Human Resources to act as a review and coordination mechanism to ensure that federal activities are non-duplicative, cost effective and consistent with the goal of encouraging tribal self-government with a minimum of federal interference.

THE WHITE HOUSE

Office of the Press Secretary

For Immediate Release January 14, 1983

FACT SHEET

Indian Policy Statement

SUMMARY

Strong and effective tribal governments are essential in the fight to solve the economic, health, educational, social and other problems of some 735,000 American Indians living on or near reservations. Just as the Federal government deals with States and local governments in meeting the needs of other citizens, so should the Federal government deal with tribal governments in promoting the well-being of American Indians.

The President's Indian Policy Statement emphasizes the Administration's commitment to encourage and strengthen tribal government as called for by President Nixon in 1970 and by Congress in the Indian Self-Determination and Education Assistance Act of 1975. The 1970 policy and 1975 law have not been adequately implemented because the Federal government has inhibited the political and economic development of the tribes. Excessive regulations and self-perpetuating bureaucracy have stifled tribal decisionmaking, thwarted Indian control of reservation resources, and promoted dependency rather than self-sufficiency.

This Administration will reverse this trend by removing obstacles to self-government and by creating a more favorable environment for development of healthy reservation economies. This policy recognizes the diversity of the tribes and the right of each to set its own priorities and goals, and to proceed at its own pace. At the same time, the Federal government will continue to fulfill its traditional responsibility for the physical and financial resources held in trust for the tribes and their members.

Indian tribes are tribal governments because they retain all aspects of their original sovereignty not otherwise given up or taken away by Congress. There are 283 Federally-recognized tribal governments in the United States. In addition, there are 193 Alaska village organizations which are served by the Bureau of Indian Affairs (BIA). According to figures released by the U.S. Census Bureau, there were 1,418,195 American Indians, Eskimos and Aleuts in the United States in 1980.

MAJOR POLICY POINTS

-- The Administration will deal with Indian tribes on a government-to-government basis.

-- Tribal governments will be strengthened through these actions:

* Today's signing of H.R. 5470, the Indian Tribal Governmental Tax Status Act. This legislation provides tribes with essentially the same treatment under Federal tax laws as applies to other governments with regard to revenue raising and saving mechanisms.

* Encouragement for tribes to assume responsibilities for services such as the enforcement of tribal laws, developing and managing tribal resources, providing health and social services, and education.

* Designation of the White House Office of Intergovernmental Affairs as liaison for tribes. By moving this function from the White House Office of Public Liaison, the President recognizes that tribal organizations are governments rather than interest groups such as veterans, businessmen and religious leaders.

* A request that Congress expand the authorized membership of the Advisory Commission on Intergovernmental Relations to include a representative of Indian tribal governments.

* Request that Congress repudiate House Concurrent Resolution 108 of the 83rd Congress which called for termination of the Federal-tribal relationship. The Administration wants this lingering threat of termination withdrawn and replaced by a resolution expressing its support of a government-to-government relationship.

* Support for direct funding to Indian tribes under Title XX social services block grants to States. In keeping with the government-to-government relationship, Indian tribes are defined by law as eligible entities and receive direct funding, if they wish, in five block grant programs administered by the Department of Health and Human Services. These and other blocks to the States consolidated dozens of categorical Federal domestic assistance programs to reduce fragmentation and overlap, eliminate excessive Federal regulation, and provide for more local control. This Administration proposes that Indian tribes be eligible for direct funding in the Title XX social services block, the block with the

20-955 O—84——216

largest appropriation and the greatest flexibility in service delivery. Grants for social services would be made directly to the tribal governments, at the option of the tribe, and would not be channeled through the States.

-- To solve the severe economic conditions on reservations, the President has:

* Established a Presidential Advisory Committee on Indian Reservation Economies. The Commission is to identify obstacles to economic growth in the public and private sector at all levels; examine and recommend changes in Federal laws, regulations and procedures to remove such obstacles; identify actions State, local and tribal governments could take to rectify identified problems; and recommend ways for the private sector, both Indian and non-Indian, to participate in the development and growth of reservation economies. It will advise the President on actions needed to improve reservation economies.

* Pledged to work with the tribes to implement expeditiously recently passed legislation allowing tribes to enter into joint venture contracts for the development of natural resources on reservations. This is a major step which will enable the tribal governments to become more proficient in business management while increasing employment opportunities for tribal members and adding to tribal revenues.

* Requested funds in the FY 1983 budget to provide seed money to tribes to attract private funding for economic development ventures on reservations.

* Initiated legislation which Congress passed to provide $375 million for building new roads on Indian reservations.

-- This Administration sought suggestions from Indian leaders in developing this policy.

THE WHITE HOUSE

Office of the Press Secretary

For Immediate Release January 14, 1983

EXECUTIVE ORDER

- - - - - - -

PRESIDENTIAL COMMISSION ON INDIAN RESERVATION ECONOMIES

By the authority vested in me as President of the United States of America, and in order to establish, in accordance with the provisions of the Federal Advisory Committee Act, as amended (5 U.S.C. App. I), an advisory commission to promote the development of a strong private sector on Federally recognized Indian reservations, it is hereby ordered as follows:

Section 1. Establishment. (a) There is established a Presidential Commission on Indian Reservation Economies.

(b) The Commission shall be composed of no more than nine members, who shall be appointed by the President from among the private sector, reservation tribal governments, economic academicians, and Federal employees.

(c) The President shall designate a non-Indian representative and an Indian representative to serve as cochairmen of the Commission.

Sec. 2. Functions. (a) The Commission shall advise the President on what actions should be taken to develop a stronger private sector on Federally recognized Indian reservations, lessen tribal dependence on Federal monies and programs and reduce the Federal presence in Indian affairs. The underlying principles of this mission are the government-to-government relationship, the established Federal policy of self-determination and the Federal trust responsibility.

(b) The Commission will focus exclusively on the following items, and not on new Federal financial assistance:

(1) Defining the existing Federal legislative, regulatory, and procedural obstacles to the creation of positive economic environments on Indian reservations.

(2) Identifying and recommending changes or other remedial actions necessary to remove these obstacles.

(3) Defining the obstacles at the State, local and tribal government levels which impede both Indian and non-Indian private sector investments on reservations.

(4) Identifying actions which these levels of government could take to rectify the identified problems.

(5) Recommending ways for the private sector, both Indian and non-Indian, to participate in the development and growth of reservation economies, including capital formation.

(c) The Commission should review studies undertaken in the last decade to obtain pertinent recommendations that are directly related to its mission.

(d) The Commission shall, unless sooner extended, submit a final report to the President and to the Secretary of the Interior within six months after appointment of the last Commissioner, or by September 30, 1983, whichever comes earlier.

Sec. 3. Administration. (a) The heads of Executive agencies shall, to the extent permitted by law, provide the Commission with such information as may be necessary for the effective performance of its functions.

(b) Members of the Commission may receive compensation for their work on the Commission. While engaged in the work of the Commission members may be allowed travel expenses, including per diem in lieu of subsistence, as authorized by law for persons serving intermittently in the government service (5 U.S.C. 5701-5707).

(c) The Secretary of the Interior shall, to the extent permitted by law and subject to the availability of funds, provide the Commission with such administrative services, funds, facilities, staff and other support services as may be necessary for the effective performance of its functions.

(d) The Commission will meet approximately 15 times at the call of the chairmen. All meetings of the Commission and all agenda must have prior approval of the chairmen.

(e) In carrying out its responsibilities, the Commission is authorized to:

(1) Conduct hearings, interviews, and reviews at field sites, or wherever deemed necessary to fulfill its duties.

(2) Confer with Indian tribal government officials and members, private sector business officials and managers, and other parties dealing with matters pertaining to the Commission's mission.

Sec. 4. General Provisions. (a) Notwithstanding the provisions of any other Executive order, the responsibilities of the President under the Federal Advisory Committee Act, as amended, except that of reporting annually to the Congress, which are applicable to the advisory commission established by this Order, shall be performed by the Secretary of the Interior, in accordance with the guidelines and procedures established by the Administrator of General Services.

(b) The Commission shall terminate 60 days after it transmits its final report to the President, or on December 31, 1983, whichever comes earlier.

Mr. ROE. The subcommittee will now adjourn subject to the call of the Chair. There may be an item or two that we will have to bring into focus in due course.

I want to thank you and all the staff for a splendid job, and now we will go back and interpret and decide what we are going to do.

The subcommittee stands adjourned.

[Whereupon, at 12:45 p.m., the subcommittee was adjourned.]

ADDITIONS TO THE RECORD

American Planning Association

November 15, 1983

The Honorable Robert A. Roe
Chairman
Water Resources Subcommittee
House Public Works and Transportation Committee
Room 3776 Rayburn House Office Building
Washington, D.C. 20515

Dear Congressman Roe:

APA

I would like to express, on behalf the American Planning Association, our support for two bills currently being considered by your Subcommittee: HR 3282 and HR 4037.

Many of our 21,000 members from every state in the Union, professional planners, practitioners at all levels of government, planning commissioners and elected officials are involved in day-to-day decisions relating to water quality and are dedicated to its improvement and protection.

By extending the Federal Water Pollution Control Act, HR 3282 recognizes and supports the need for continuing planning and implementation to improve the water quality of our rivers, lakes, bays and estuaries. To date, may of our actions have only kept water pollution from getting worse while our population and industrial output continue to grow. Planning and construction of treatment facilities must be a continuing process if we are to make gains in maintaining and improving water quality. HR 3282 would help achieve this objective.

In addition, we are pleased to see addressed in Section 319 of HR 3282, the issue of water quality in multi-state estuaries. We support the provision to establish management conferences with respect to multi-state estuaries. We are particularly pleased that the bill encourages the development of comprehensive master plans for such estuaries and provides funding to assist states, not only in planning, but in implementing the master plans.

Our one suggestion in regard to Section 310 is that provision be made to include affected local governments in the management conference and to encourage the recognition of local master plans in the development of the comprehensive master plan for the estuaries. This not only recognizes the important role that the local government plays in planning but also the fact that many of the actions to implement the estuary master plan will have to be carried out by local as well as state governments.

President
Robert C. Einsweiler, AICP

President-Elect
Bruce W. McClendon, AICP

Executive Director
Israel Stollman, AICP

The American Planning Association also supports HR 4037, an amendment to the Federal Water Pollution Control Act, which addresses the issue of nonpoint pollution. The bill requires states to identify areas receiving water pollution from nonpoint sources and to develop plans to control this ever increasing problem.

Nonpoint pollution is both an urban and rural issue. Runoff from streets, construction sites, parking lots, driveways and lawns contain large concentrations of bacteria, toxics and fertilizers which run untreated into our waterways. Preliminary reports by the Conservation Foundation estimate that the erosion costs up to $3 billion per year because of dredging, waste treatment, flooding and other consequences. We believe that HR 4037 is a major step towards addressing this important issue.

We are particularly supportive of Section 319(a) which calls for the utilization of data previously gathered under the Clean Water Act. Much information has been collected concerning the sources and associated problems of nonpoint source pollution. HR 4037 recognizes the existence of this information and encourages its use.

Also important is Section 319(d) requiring states to work with local agencies and organizations experienced with nonpoint source control. Local and regional involvement would ensure ample public participation and support for actions that will have to be taken to address the nonpoint pollution problem.

The American Planning Association supports both of these bills and hope that they will receive approval by your Subcommittee.

If you have any questions please do not hesitate to contact George T. Marcou, AICP or Nancy P. Schamberg, AICP in our Washington office.

Sincerely yours,

Daniel R. Mandelker

Statement
of the
American Soybean Association
to the
Water Resources Subcommittee
Public Works & Transportation Committee
U.S. House of Representatives

August 2, 1983

The House Public Works Subcommittee on Water Resources will be hearing testimony on amendments to the Federal Water Pollution Control Act (FWPCA) of 1972 during the next three days. The American Soybean Association respectfully submits for the record the following comments on Section 404 of the FWPCA.

The American Soybean Association is a national, volunteer, non-profit, producer-controlled, single commodity association organized to assure the opportunity for a profitable soybean industry. ASA has approximately 24,000 dues-paying members and is supported by over 450,000 soybean producers who voluntarily invest in ASA programs through 24 separate statewide soybean checkoff programs. ASA seeks to maintain soybean profitability through its foreign market development, research, producer and public information, and government relations programs. ASA urges the Committee to amend Section 404 of the Federal Water Pollution Control Act to:

1) Restrict Section 404's jurisdiction to the historical definition of "navigable waterways" as found in Section 10 of the Rivers and Harbors Act of 1899;

2) Adopt a reasonable and realistic definition of "wetlands";

3) Streamline the processing of permit applications for dredge and fill activities; and

4) Authorize the Corps of Engineers to make the final decision on permit issuance.

The scope of Section 404's jurisdiction currently creates great problems and frustration for America's farmers. Originally, the Corps of Engineers was assigned the authority to issue permits for dredge and fill activities and modification of waterways under Section 10 of the Rivers and Harbors Act of 1899. Jurisdiction was based on maintaining navigability of these waterways, and the Corps restricted its concern primarily to those waterways used for interstate commerce.

Soybeans
American Soybean Association
777 CRAIG ROAD, P.O. BOX 27300, ST. LOUIS, MO 63141, TELEX 4312091, PHONE (314) 432-1600

Since that time, legislation and court decisions have expanded the scope of the Corps' review to include consideration of the effects of dredge and fill activities on water quality. In addition, court cases in 1974 and 1975 transformed the definition of "wetlands" to mean "waters of the United States" encompassing marshes, swamps, bogs, inland shallows, etc. These areas were included within Section 404 jurisdiction to be administered by the Corps.

These changes have resulted in high costs and serious planting delays to farmers conducting normal farming operations -- especially for the establishment of drainage systems necessary for crop production. This creates an unfortunate adversarial relationship between farmers and Section 404 administrators. Instead, ASA encourages that government regulations be designed to gain the "goodwill" of farmers, and not to discourage them from compliance. ASA recommends that a clearer definition of "wetlands" be established to avoid continued misunderstanding of the law. One such definition has been proposed by the Corps of Engineers and states:

> "The term 'wetlands' means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs and similar areas."

ASA recommends that the definition of "wetlands" be further limited to those areas of land which are inundated more than 50% of the time during each year, and more than 50% of the time during the normal annual growing season for that region.

ASA urges a reduction in the time and involvement required to process permit applications. We recommend the Committee impose a statutory time limit on federal processing of applications. The current review process is unnecessarily time-consuming and costly for farmers. Soybean farmers and government alike would benefit through a reasonable reduction in paperwork and duplication of efforts.

ASA also urges that the Corps of Engineers be given authority to make the final decision on issuance of permits. Soybean farmers have encountered expeditious results in dealing with Corps Engineers. ASA recommends that EPA be denied authority to overrule Corps decisions. This would end the perpetual "tug of war" between the two agencies over implementation of Section 404.

While ASA supports the national goals of cleaner water and the protection of fish and wildlife, we urge a reduction in government regulations which prohibit the utilization of agricultural land. Such laws have delayed or simply prevented the normal farming practices of American farmers. Very often, neither water quality nor navigability has even been affected.

The American Soybean Association wishes to thank the Committee for this opportunity to present the views of the nation's soybean farmers on this important subject.

Statement of

American Textile Manufacturers Institute

Before the

House Public Works & Transportation

Subcommittee on Water Resources

October 20, 1983

Mr. Chairman, we appreciate the opportunity to submit a statement for the printed record of hearings on the reauthorization of the Clean Water Act.

The American Textile Manufacturers Institute (ATMI) is the central trade association of the American textile industry, representing about 85 percent of the domestic industry for the spinning, weaving, knitting and finishing of wool, cotton, silk and man-made fibers. ATMI provides governmental, economic, international trade, occupational safety and health, statistical, public relations and other services to the industry. This industry represents a major industrial segment of the nation's economy with approximately 850,000 employees which are 47 percent women and 23 percent minorities, both of which are well above the national average for all manufacturing.

At the outset, Mr. Chairman, ATMI fully supports the national goal of water quality which provides for the nation's waters to be fishable and swimmable by 1984. The industry has been in compliance with the Best Practicable Technology regulations established by the Environmental Protection Agency in 1974 and has accepted the recently promulgated 1984 Best Available Technology Requirements (BAT). The industry's compliance with both of these requirements demonstrates its commitment to our nation's clean water objectives. While ATMI is not seeking legislative changes to the Clean Water Act this Congress, there has been considerable discussion of the need for amendments,

particularly in those areas of water quality standards and anti-backsliding and we would like to take this opportunity to comment on them.

With respect to water quality standards a great deal of attention has been directed at preventing the downgrading of waterways and maintaining existing designated uses. The textile industry does not want increased pollution in streams nor does it advocate changing the Act's goals. ATMI does believe, however, that some current water quality standards were improperly established to provide for the protection of fish and wildlife in and on the water, without adequate analysis as to whether these uses were attainable. It has been well-documented that the existing standards were established with inadequate information and insufficient data and to perpetuate the miscalculations of the past by legislative mandate would not aid in reaching the true objectives of the Clean Water Act.

More specifically, Section 6 in H.R. 3282 would require that the state must protect and maintain existing uses which exceed designated uses unless because of essential economic or social development. We are very much aware of the controversy currently surrounding EPA's proposed revisions to current water quality standards (F.R. 49234, October 29, 1982), however, we feel that any legislative changes would totally eliminate the agency's ability to re-evaluate existing standards to incorporate new data as it becomes available. Furthermore, we believe EPA's proposed changes are modest and reflect the agency's attempt to utilize the experience gained since the program began ten years ago.

In 1972, for example, there was limited stream data available, and neither the

states nor EPA had experience in water quality setting. States were forced to rely on EPA guidance - the Red Book criteria - which was the result of only laboratory tests and never subject to peer review. Given EPA's policy of presumptive applicability, and the states' lack of resources to challenge the criteria, they were generally adopted regardless of whether or not they reflected local water quality conditions. More than enough case studies have been submitted to demonstrate where these standards are not reflective of local stream conditions. The question is not who is to blame, but what is the best way to correct these errors. The maturation and implementation of the NPDES program and the states' experiences over the last decade have provided the states with the necessary resources to review and revise their water quality standards in a technically sound fashion.

Another aspect of EPA's water quality proposal under consideration is the fact that it would not allow existing stream users to be altered once they have been met. Further, it prohibits modifying or reclassifying designated uses if they can be attained by implementing technology-based controls or if the revision would result in impairment of downstream uses. Finally states are not required to modify existing criteria, standards, or designated uses. We strongly support these restrictions and reject the contention that the limited flexibility would allow widespread degradation of water quality.

Examples of where we believe changes to designated uses are appropriate include situations where natural background pollutant levels or physical limitations in the water body make the uses unattainable. In other cases, designations need modification to allow for seasonal variance within particular stream segments.

H.R. 3282 would require that whenever a state revises a standard or adopts a new standard, it must adopt numerical criteria for each toxic pollutant which could reasonably be expected to interfere with attainment or maintenance of designated uses.

We do not believe the States or EPA can reasonably be expected to assess the need for numerical criteria for each toxic pollutant until categorical standards have been implemented. The Agency is required by the Consent Decree, paragraph 12, to "identify and address toxic problems left unsolved by the categorical approach." EPA's approach for doing this has already been identified in its September Draft Policy for the Development of Water Quality - Based Permit Limitations for Toxic Pollutants.

In addition, it is neither appropriate nor necessary that Congress require the adoption of numerical criteria for toxics every time a water quality standard is reviewed. This mandate incorrectly implies that the existing water quality standards are correct and based on facts. Numerous case studies have already been submitted to Congress demonstrating that this is untrue. A state should have the authority to make corrections when data becomes available which demonstrates that the standard should be modified, without automatically being required to conduct a toxic analysis. All states have water quality standards prohibiting the discharge of toxic materials in toxic amounts. States have been given the primary responsibility under Sec. 303 and 401 of the CWA for developing water quality standards and limits to meet those standards. It follows that states should maintain the authority to determine when a toxic assessment is needed.

The bill also incorrectly assumes that all toxic problems are caused by direct dischargers. We feel that prior to requiring a specific discharger to adopt toxic limits, it should be demonstrated that the discharge in question is the source of the toxic problems.

In summary, we believe it is necessary that categorical limits be adopted prior to assessing the need for toxics, that all changes to water quality standards do not mandate a toxic assessment, that states should maintain the primary responsibility for determining when a toxic assessment is needed, and prior to requiring a discharger to adopt toxic limits it should be factually demonstrated that the discharge is the source of the problem.

Another proposal to amend the Clean Water Act would freeze all existing and future NPDES conditions without allowing a permit issuer to consider the wisdom of doing so as permits are reissued or renewed. This "permit freeze" provision extends far beyond EPA's present comprehensive anti-backsliding rules and cuts across the structural framework of the Act, and regulations to prohibit any later reconsideration, ever by the permit issuer. ATMI believes Congress should not prevent the careful judgements allowed under the existing administrative rules by adopting a sweeping, inflexible statutory provision.

We thank you very much for the opportunity to express our opinion on amendments to the Clean Water Act and we will be happy to provide the Subcommittee with any further information.

NATIONAL
COAL
ASSOCIATION

CARL E. BAGGE
President
(202) 463-2625

COAL

RECEIVED
1983 SEP 24 AM 11:03
OFFICE OF JAMES J. HOWARD

September 22, 1983

The Honorable
James J. Howard, Chairman
Public Works and Transportation
2245 Rayburn House Office Building
Independence and S. Capitol Street, S.W.
Washington, D.C. 20515

Dear Mr. Chairman:

The National Coal Association retains a significant interest in amendments to the Clean Water Act (Federal Water Pollution Control Act). The amendments to the Act supported by NCA were set forth in testimony before the Subcommittee on Water Resources of the Committee on Public Works and Transportation in July 1982. A copy of that testimony from the Subcommittee printed record is enclosed.

NCA continues to appreciate that it was afforded an opportunity to present these views to the Subcommittee. Rather than restate its position during this years' hearing, NCA has submitted a July 12 letter for inclusion in the Subcommittee's record. The purpose of this letter is to stress NCA's continued advocacy for amendments to the Clean Water Act. Our decision not to request an opportunity to testify again before the Subcommittee was motivated by the recognition that NCA had been afforded an opportunity to testify, that NCA's position had not changed and that the Subcommittee is restricted in the time available for consideration of amendments to the Clean Water Act. The decision was not reached because of a lack of interest.

A secondary purpose of this letter is to transmit the enclosed copy of the July 12 letter for your review. That correspondence expands upon NCA's concern about the application of Water Quality Standards to intermittent streams and the need to provide a 10-year life for NPDES permits.

We look forward to working with you during consideration of amendments to the Clean Water Act.

Very truly yours,

Carl

Carl E. Bagge

COAL

CARL E. BAGGE
President
(202) 463-2647

Honorable Robert A. Roe
Chairman, Subcommittee on Water Resources
Committee on Public Works and Transportation
U.S. House of Representatives
Washington, D.C. 20515

July 12, 1983

Dear Mr. Chairman:

It is requested that this letter be made part of the 1983 hearings on amendments to the Federal Water Pollution Control Act before the Subcommittee on Water Resources House Committee on Public Works and Transportation.

The National Coal Association (NCA) testified before the Subcommittee on Water Resources on July 29, 1982. At that time, Jerry Lombardo, Director of Environmental Affairs, Island Creek Coal Co., outlined the changes to the Clean Water Act recommended by the coal industry. In addition, a detailed statement of NCA's proposals for revising the Clean Water Act was included in the record (Possible Amendments to the Federal Water Pollution Control Act - Hearing before Subcommittee on Water Resources of the Committee on Public Works and Transportation; 97th Congress 2nd Session; 97-73 pages 1648-1682).

NCA, which presents coal producers and sellers and other organizations associated with the American coal industry, continues to support those recommended changes. While that testimony was submitted to a previous session of Congress, it is readily available to this Congress. NCA requests that its previous submission be made part of the legislative record of any bill reported by this Committee during the 98th Congress to amend the Clean Water Act.

In addition, NCA desires to avail itself of this opportunity to supplement that earlier testimony with respect to two issues. These are 1.) Water Quality Standards for Intermittent Streams and 2.) Extension of NPDES permit life to 10 years.

Water Quality Standards Should Not Be Applicable To Intermittent Streams

Point Source discharges from coal mines are required to install the best available technology economically achievable (BAT). The Environmental Protection Agency promulgated BAT for the coal

1130 Seventeenth Street, N.W.
Washington, D.C. 20036-4677
(202) 463-2625

mine point source category on October 13, 1982 (47 Federal Register pages 45382-45399). Those standards are mandated by the statute to represent what is economically and technologically feasible to accomplish.

The standards determine what levels of pollutants are allowed in the effluent from each point source. It is important to note that by definition the pollutants in the effluent have been reduced to the level which is economically and technologically achievable.

Water quality standards apply to the body of water into which the effluent from a point source is discharged. Water quality standards are to consist of the designated uses of the water and the water quality criteria necessary to maintain such uses. In most cases the water quality standards will require pollutants at levels lower than the concentrations in the effluent after application of BAT. This does not constitute a problem where the volume of the receiving waters are sufficient to provide a mixing zone. It is where the discharge from a coal mine constitutes the flow of the stream that a problem arises.

Streams are normally classified as perennial, intermittent, or ephemeral. Ephemeral streams flow only in direct response to precipitation, intermittent streams flow part of the time, and perennial streams flow throughout the year. These are commonly accepted terms and the classification of a particular stream can be determined by reference to the topographic maps prepared by the U.S. Geological Survey.

In adopting water-quality-base standards, states have traditionally applied them to all streams (except ephemeral streams), with little or no field studies to determine whether or not standards are appropriate. Thus, water quality standards have been applied to intermittent streams. Such application does not take into consideration the fact that the streams do not have a continuous flow.

Coal mining operations are often located near the headwaters of streams. At that point, the streams are intermittent in character. In fact, in many cases the discharge from the coal mine operation is the only flow in the stream. Without the coal mining operation there would be no flow.

Application of water-quality standards in those circumstances results in the requirement that the effluent from the point source meet the more stringent water quality standards and not BAT. This imposes an economic burden on the coal mining industry which is not justified and in many cases is not achievable. BAT defines what is economically achievable.

Only in those instances where there is enough stream flow to establish and maintain an aquatic ecosystem or downstream uses require additional protection beyond that provided by BAT limits should water quality standards be applied to the intermittent streams. Congress should amend the Clean Water Act to make it clear that, except in limited instances, states should not apply water-quality-based standards to streams having only intermittent natural flow. States should apply limits beyond technology-based effluent limitations to intermittent streams only on a case by case basis when there is significant environmental benefit from such added control.

The Act Should Be Amended To Provide A 10-Year Term For NPDES Permits

Section 402(b)(1)(B) of the Clean Water Act provides that NPDES permits may be issued for a fixed term not to exceed 5 years. Yet, other federal permits issued by EPA can be issued for the life of the facility (e.g., Clean Air Act and RCRA). Extending the term of NPDES permits to provide greater consistency in permit duration would further improve efficiency under permit procedures.

Many businesses engage in extensive planning, most of which exceeds 10 year periods. Therefore, extending the life of the NPDES permit would provide more flexibility for business planning and would ease administrative burden on industry and the government without diminishing protection of the environment.

The 5 year permit term is not long enough to provide sufficient certainty for business planning. Also, the 5 year permit creates an administrative burden which causes unnecessary expenditures of time and money by unproductive exchanges of correspondence and submission of forms.

In providing permit terms of 10 years or more, EPA would not relinquish its authority to reopen permit proceedings to revise or revoke permits for just cause. Nor would extending the life of the permit diminish the emergency powers granted EPA by the statutes to address situations that pose eminent threats to the environment.

Authorization of permits for 10 or more years would provide a realistic time period for preparation, submittal and approval of the applications.

Respectfully Submitted,

Carl Bagge

Carl E. Bagge

NATIONAL COAL ASSOCIATION

STATEMENT
OF

JERRY L. LOMBARDO
REPRESENTING
THE
NATIONAL COAL ASSOCIATION
ON

AMENDMENTS TO THE
FEDERAL WATER POLLUTION CONTROL ACT
BEFORE THE
SUBCOMMITTEE ON WATER RESOURCES
OF THE
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
U.S. HOUSE OF REPRESENTATIVES

JULY 29, 1982
WASHINGTON, D.C.

Mr. Chairman, I am Jerry Lomardo, Director of Environmental Affairs, Island Creek Coal Company. I am appearing on behalf of the National Coal Association, which represents coal producers and sellers and other organizations associated with the American Coal Industry.

Mr. Chairman, you deserve the highest commendation for holding these oversight hearings on the Federal Water Pollution Control Act. Your leadership in ensuring that our Nation's water resources are protected and properly developed is well-known and fully appreciated in the coal industry.

Mr. Chairman, the coal industry supports the essential elements in the Federal Water Pollution Control Act, and believes they are sound. Yet, over the ten-year life of the Act, experience has been a good teacher. Changes can be made to make the Act more effective, more responsive, while strengthening the national commitment to clean water.

Today, I will very briefly outline the coal industry's changes to the Act, but also ask that our detailed revisions be included in the formal record.

Mr. Chairman, the Federal Water Pollution Control Act establishes the goal to reach "fishable/swimmable" waters by 1983, and to eliminate pollutant discharges by 1985. Also the Act requires phased in technology-based effluent limitations, and supplemental controls, where necessary, to achieve the desired water uses.

To reach these goals, the Act calls for a comprehensive permitting program, which specifically prescribes a careful balance of regulatory authority between the Federal Government and the states.

When the Act was passed, Congress set up the National Commission on Water Quality to examine the Act's effectiveness.

Among other things, the Commission made two significant recommendations which the coal industry also strongly supports. They are:

- The goal of eliminating pollutant discharges should be refined. Mr. Chairman, eliminating effluent discharges is widely-recognized as unrealistic, and economically unsound.
- The regulatory authority of the Federal Government and the states should be refined. The coal industry believes, that too much control has flowed to the Federal Government, which is contrary to the Act's original intent.

To these recommendations the coal industry would add a third: The Environmental Protection Agency's technical and scientific performance in setting water quality standards must be improved.

NCA Recommends That the Following Specific Changes to the Act Be Incorporated

The Zero Discharge Goal; Section 101(a)(1)

The Act presently requires that all pollutants discharged into navigable waters be eliminated. We believe that the Act should be changed to require that pollutants in harmful quantities discharged into navigable waters be eliminated.

Conforming changes should also be made in other sections of the Act where the zero discharge goal is mentioned. The phrase "consistent with the goals of this Act" should be substituted throughout the Act.

The Fishable/Swimmable Goal; Section 101(a)(2)

We believe this section must be amended to clarify the national goal of water quality. It must be clear that the goal to support fish, shellfish and wildlife and to assure that water is suitable for recreational uses is to be achieved only to the extent that it is economically and technically feasible. Also, the schedule for achieving that goal should be reasonable.

Water Quality Criteria and Standards; Section 303 and 304

"Water Quality Criteria" and "Water Quality Standard" should be defined to clarify their meaning. The roles of the Federal Government and states need to be spelled out. "Water Quality Criteria," for purposes of Section 304, should be defined as theoretical pollutant levels developed by EPA as technical guidance for permit writers and standard-setting authorities. "Water Quality Standard" in Section 303, should be defined as an acceptible pollutant level which corresponds to the particular water body involved. The standards should be set by the states and reflect site-specific water characteristics.

Applicability of Water Quality Standards

1. Congress should amend the Clean Water Act to exclude intermittent streams from federal water quality standards.

2. Congress should require EPA to demonstrate clearly -- by a preponderance of evidence -- that the benefits to society exceed the costs before water quality limitations more stringent than the regulations prescribing Best Available Technology (BAT) are imposed.

National Standards of Performance; Definition of "New Source; Section 306

Amend Section 306(a)(2) to provide that a new source is any source where construction has begun after publication of final regulations.

Enforcement of State-Issued NPDES Permits; Section 309

Amend Section 309 to prohibit EPA from bringing actions for permit violations in approved states. EPA retains oversight responsibility because the agency can withdraw NPDES authority for cause.

Duration of National Pollution Discharge Elimination System (NPDES) Permits; Section 402

Amend the Act to allow issuance of an NPDES permit for a minimum of 10 years. This permit should not be reopened except in specified circumstances, such as provided in Section 307 of the Act.

Permits for Dredged or Fill Material; Section 404

The Corps of Engineers should have exclusive authority to grant, to supervise, and to enforce the 404 permit program. Sections 404(c) and affected subsections should be amended accordingly.

The life of the permit should be extended from 5 years to 10 years or more in Section 404(e)(2), and Congress should direct

the Corps of Engineers to process dredge and fill permit applications within 90 days.

General Definitions - "Navigable Waters" and "Waters of the United States"; Section 502

This section should be amended as follows: The term "Navigable Waters" means only those waters that are currently used or are susceptible to use in their natural condition, or by reasonable improvement, to transport interstate or foreign commerce, shoreward to their ordinary high water mark, including all waters which are subject to the ebb and flow of the tide shoreward to their mean high water mark, and including wetlands both contiguous and immediately tributary to navigable waters.

Add a new definition of Section 502 to read: The term "waters of the United States" means (1) navigable waters; (2) tributaries of navigable waters; (3) interstate lakes, rivers and streams; and (4) intrastate lakes, rivers and streams (A) used by interstate travelers for recreation and other purposes or (b) which are a source of fish or shell-fish sold in interstate commerce and (c) territorial seas.

Mr. Chairman, these amendments are needed to eliminate the present confusion about the limits of regulatory authority.

General Definitions - Definitions of "Discharge of Pollutants" and "Point Source" and "Pollution"; Section 502

Amend Section 502(12), (14) and (19) of the Clean Water Act to read as follows:

(A) The term "discharge of a pollutant" and the term "discharge of pollutants" each means (a) any net addition of any pollutant to waters of the United States from any point source; (b) any net addition of any pollutant to waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft.

(B) The term "point source" means any discernible, confined and discrete conveyance including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged. This term does not include surface water diversions; shallow ground water diversions, discharge from dams, ponds, or structures that serve only to control streamflow, storm water runoff or non-point source pollution, or return flows from irrigated agriculture.

(C) The term "harmful quantities" means the discharge of pollutants in such quantities as to violate a water quality standard or to preclude the downstream designated use of the receiving stream.

Administrative Procedure and Judicial Review, Section 509

This section should be amended to provide that any final action of the Administrator not specified in Subsection (B)(1)(a)-(f) shall be reviewable in the United States District Court for the district in which the petitioner resides or transacts business.

NEPA Review for New Sources, Section 511

Amend Section 511(c)(1) of the Clean Water Act to exempt NPDES permitting of new sources from environmental impact statement requirements under the National Environmental Policy Act.

Each of these recommendations is explained in detail in NCA's package of proposed amendments.

Mr. Chairman, on behalf of the National Coal Association, I appreciate the opportunity to testify before you on this critical issue. I will be glad to answer any questions.

OVERVIEW OF NCA CLEAN WATER ACT PROPOSALS

Introduction

The attached issue papers present the recommendations of the NCA Environmental Committee for legislative and regulatory changes to be incorporated into the 1982 revision of the Clean Water Act (CWA). The papers are organized into four categories each of which address a separate title of the Act:

- Recommended changes to the goals of the Act set forth in Title I;
- Recommended changes to the water quality criteria and standards and new source provisions contained in Title III;
- Recommended changes to the NPDES permit and Section 404 permit programs established by Title IV; and
- Recommended changes to a number of the general definitions, administrative and judicial review procedures and provisions governing the relationship of NEPA and the CWA contained in Title V.

The proposals set forth in these papers represent "fine tuning" of the CWA. They do not constitute an attempt to restructure the Act but rather are limited to those areas where the Environmental Committee believes that the need for change is compelling.

Other industries are preparing and will be proposing changes which will be beneficial to the coal industry and may differ from those offered here only in the approach taken to the same underlying problem. These may be adopted by NCA in the course of the legislative debate provided of course that they are in keeping with the general policy guidelines implicit in this presentation and as approved by the Board of Directors. Accordingly, specific amendatory language is generally not provided in these papers, but will be developed after Board approval of the substantive changes desired and in the course of the forthcoming debate and drafting process.

Basic Philosophy

The changes proposed here do not seek to change the basic structure or objectiveness of the Clean Water Act. We believe that the essential elements of the Act are sound. However, experience gained during implementation of the Act during the last ten years demonstrates that some of its provisions are in need of revision. In particular, we believe that changes are needed to clarify Congressional intent, streamline the administrative process and bring the roles of the federal government and the states back into balance. Each of these principles can be accomplished while retaining our nation's commitment to clean water.

3450

Essential Elements

The amendments proposed by the NCA Environmental Committee would:

- Revise the zero discharge goal in Secton 101 of the Act. It has long been recognized that zero discharge is economically and technically infeasible and would contribute little if any benefit to the environment. The fishable/swimmable goal would also be revised to reflect consideration of economic feasibility;

- Restore the role of the states in establishing water quality criteria and standards and clarify EPA's standards and impose water quality based limitations in NPDES discharge permits;

- Incorporate greater certainty in the administrative process by clarifying the definition of new sources and extending the term of NPDES permits from the current five year period to at least ten years and by streamlining the Section 404 permit process;

- Eliminate the considerable confusion which has developed as a result of conflicting judicial and administrative decisions over the definitions of "navigable waters," "waters of the United States," discharge of pollutants" and "point source," and clarify the applicability of rulemaking procedures to EPA publication of "guidance documents;" and

- Exempt the issuance of NPDES permits for new sources from environmental impact statement requirements under NEPA.

SUBJECT: THE ZERO DISCHARGE GOAL CONTAINED IN SECTION 101(a)(1) OF THE ACT

RECOMMENDATION: Section 101(a)(1) should be amended to require that the national goal to eliminate the discharge of pollutants be limited to pollutants in harmful quantities into the navigable waters; conforming changes should also be made to other sections of the Act where the zero discharge goal is mentioned, e.g. Sections 301(b)(2)(A), 301(c), 301(k), 304(b)(3), 306(a)(1) and 307(a)(2)(6). A "consistent with the goals of this Act" phrase should replace any mention of zero discharge in these sections.

BACKGROUND: Section 101(a) of the Clean Water Act provides that "it is the national goal that the discharge of pollutants into the navigable waters be eliminated by 1985." Although there is considerable consensus that Congress' intent was not to enforce a literal interpretation of the "zero discharge" goal, the EPA and the Courts have used the 1985 goal to justify increasingly stringent discharge guidelines which provide little, if any, environmental benefit.

PRINCIPAL PROBLEM AREAS: The ultimate practicability of achieving zero discharge across the board is in serious question. While technologies may exist to eliminate the discharge of pollutants, they often are extremely costly, highly energy intensive and will create sludge disposal problems of an enormous magnitude. In many cases the costs of eliminating the discharge of all pollutants would not be justified by the incremental water quality benefits that would result.

DISCUSSION: On May 29, 1981, EPA published proposed rules for the Coal Mining Point Source Category (46 FR 28873). These rules recommend the various technology levels commonly referred to as BPT, BAT, BCT and NSPS for the coal industry. In its development document, EPA recognized that the application of BPT in the coal industry has already surpassed their initial expectations in pollutant removal and that additional technology is not justified. Thus, EPA proposed to make BAT, BCT and NSPS identical to BPT, with one exception. That exception is in the NSPS proposal for raw coal preparation plants. Here, EPA proposes zero discharge.

3451

DISCUSSION: (Cont'd)

The development document does not offer any compelling reason for no discharge. It concludes that no regulations are necessary for the control of toxic organic compounds since they are virtually absent and metals are already effectively controlled by BPT technology. The BPT effluent limitations are the same for mine drainage as for prep plants and associated areas. Therefore, there is no justification for singling out prep plants for a zero discharge requirement.

The alleged benefits attributable to zero discharge at preparation plants are negligible. The development document states that a typical facility removes 370,000 pounds per day of total suspended solids. Installation of facilities to achieve zero discharge supposedly would remove an additional 150 pounds per day from waters discharged to the environment. This amounts to an insignificant additional 0.037 percent removal. However, even this figure is inflated because these pounds per day will merely be transferred to the environment, in concentrated form, as solid waste rather than a dilute nonpolluting discharge. It makes more sense to discharge this water in compliance with the same effluent limitations applicable to other discharges in the coal mining point source category.

This same rationale which applies to the coal industry would apply to other industries as well. Even with the most sophisticated pollution control equipment, industry is not always capable of continuing its operations without the discharge of some pollutants. We must recognize that the "zero discharge" goal is technologically undesirable, and in many cases infeasible. Even assuming the goal could be met, consideration must be given to the ultimate disposition of pollutants; zero discharges in waters will result in more pollutants being discharged into the air and onto or in the land. Furthermore, compliance frequently is extremely costly, both in terms of capital investment and operation and maintenance costs with little additional benefit to the environment.

The Clean Water Act should be modified, not to change its basic objective of restoring and maintaining the chemical, physical and biological integrity of the nation's waters, but

DISCUSSION: (Cont'd)

to bring its goals into better balance with other important national goals, such as energy conservation, control of inflation, and industry productivity. By amending Section 101(a)(1) to establish as a goal the elimination of pollutants in harmful quantities into navigable waters, the Act will more closely reflect a reasonable balancing of these concerns, while at the same time remaining the driving force in the control of water pollution.

3452

SUBJECT: THE FISHABLE/SWIMMABLE GOAL CONTAINED IN SECTION 101(a)(2) OF THE ACT

RECOMMENDATION: Amend Section 101(a)(2) to make clear that the national goal of water quality that will support fish, shellfish and wildlife and is suitable for recreational uses is to be achieved only to the extent that it is reasonable to do so and that the schedule for achieving that goal should also be reasonable.

BACKGROUND: Section 101(a)(2) of the Act now provides that, wherever attainable, water quality which protects, and permits the propagation of fish, shellfish and wildlife, and is suitable for recreational uses, must be achieved by July 1, 1983.

The language of Section 101(a)(2) appears to allow some flexibility because the "fishable/swimmable" goal is to be met "wherever attainable." Nevertheless, the EPA has turned this language into an inflexible mandate, deeming it "attainable" unless widespread economic disruption can be proven to result.

PRINCIPAL PROBLEM AREAS: EPA uses the fishable/swimmable goal as the basis for developing water quality criteria under Section 304 of the Act. To develop these criteria, EPA uses laboratory studies of the effects certain substances have on the most sensitive of aquatic species. After obtaining lab results, EPA then applies safety factors ranging from 1,000 to 10,000 to develop the water quality criteria. The result can only be very stringent limits on the substance under study. These criteria are then adopted by states and frequently are applied wholesale across the entire spectrum of streams whether such streams are capable of supporting a fishable/swimmable goal in their natural state.

A special hardship occurs when these standards are applied to streams which are of naturally low flow or tend to dry up under drought conditions. Moreover, despite the fact the EPA spends millions of dollars and many years to develop the treatment technology recommendations in the first place, EPA and/or state permit writers tend to supersede the various treatment technology levels recommended by EPA and impose more stringent effluent standards to meet the stringent water quality standards.

DISCUSSION: There is clearly no justification for designating all waters to be fishable or swimmable. Even before the introduction of manmade pollution, there have always existed certain bodies of water that were neither fishable nor swimmable because of their high background levels of natural pollutants or because of their natural limitations in stream flow.

In reconstructing the evolution of the Clean Water Act, one can see a logical extension of the Refuse Act of 1899 and its use of the term "navigable waters" and the carry-over of this same term in the Clean Water Act. Navigable waters in the Refuse Act context were truly large streams capable of supporting interstate commerce or others which were defined as navigable by the Courts. Perhaps, the application of the fishable/swimmable goal for such traditionally large streams is meaningful and readily attainable. However, in view of the recent broad expansion of the term "navigable" by EPA with its definition of the "waters of the United States" to include upper reaches of watersheds, intermittent streams, mud flats, prairie potholes, etc., the application of the fishable/swimmable goal in all such cases is readily seen as ludicrous.

Revising the goal set forth in Section 101(a)(2) would send a message to EPA that it must pay greater attention to whether a fishable/ swimmable standard is actually "attainable." Moreover, clarifying the Section 101(a)(2) goal would eliminate the apparent conflict between that goal and other provisions of the Act which grant states discretion to classify state waters for various uses. States must be allowed to classify for other uses those waters which, because of natural causes or present uses, do not support fishing or swimming.

Finally, in many cases, the benefits to be derived from achieving "fishable/swimmable" water quality are not commensurate with costs. This goal must be balanced against other water uses and other national goals, such a industrial development, productivity and energy conservation.

SUBJECT: THE WATER QUALITY CRITERIA AND STANDARDS PROVISIONS OF SECTION 303 AND 304 OF THE ACT

RECOMMENDATION:

> The terms "water quality criteria" and "water quality standard" should be defined in the Act in order to clarify their meaning and the distinct roles of the federal government and states with respect to them. "Water quality criteria," for purposes of Section 304, should be defined as theoretical pollutant levels developed by EPA as technical guidance for permit writers and standard-setting authorities. "Water quality standard" for purposes of Section 303, should be defined to consist of the uses designated by the states for the particular water body involved and the acceptable pollutant level corresponding to such uses that has been modified to reflect site-specific water characteristics.

BACKGROUND: Section 304 of the CWA requires EPA to publish information or "criteria" on the effects of various pollutants, at various concentrations, on health and welfare including effects on plant and animal life. Section 303 requires states to adopt water quality standards, and gives EPA the authority to determine whether state water quality standards are consistent with the requirements of the Act. Nowhere, however, is EPA authorized to require that states apply EPA's criteria in developing standards.

PRINCIPAL PROBLEM AREAS: In an Advanced Notice of Proposed Rulemaking (43 Fed. Reg. 29588 (July 10, 1978)), EPA announced a policy of "presumptive applicability" for Section304(a)(1) criteria. Although the Agency has recently indicated that it may abandon its presumptive applicability policy, it is not clear that EPA's policy has in fact changed.

DISCUSSION: EPA appears to have taken the position that fishable/swimmable use designations are the norm in developing water quality standards, and that less stringent designations will be allowed only in limited circumstances. Nothing in Section 303 requires the setting of standards for fishable/swimmable uses only. States should retain primary responsibility for developing standards based on multiple water uses.

DISCUSSION: (Cont'd) We believe that EPA's information criteria under Section 304 should not be presumptively applicable. Section 303 should provide for multiple use designations and the adoption of standards designed to ensure that such uses are maintained.

While EPA's information criteria should not be presumptively applicable to the states, it is nonetheless likely that states which have limited resources to devote to independent research will rely heavily on EPA's criteria in developing water quality standards. It is, therefore, critical that the criteria rest on a sound technical foundation. To ensure that the criteria are technically valid, the criteria should be subject to public notice and comment and peer review.

SUBJECT: APPLICABILITY OF WATER QUALITY STANDARDS

RECOMMENDATION:

1. Congress should amend the Clean Water Act to exclude intermittent streams from federal water quality standards.

2. Congress should amend the Act to direct EPA to demonstrate, by a preponderance of evidence, that the benefits to society exceed the costs before it imposes water quality based limitations that are more stringent than applicable BAT.

BACKGROUND: In adopting EPA recommended criteria, states have traditionally applied such criteria, across the board to all streams with little or no site specific field studies to determine whether such criteria are appropriate for such streams.

PRINCIPAL PROBLEM AREAS: This problem is particularly acute for the coal mining industry due to the traditional operation in the upper watersheds of streams which, by their nature, are intermittent in character. During drought or dry conditions, little, if any, flow can be found in these streams. When this occurs, water quality standards applicable to such streams are frequently imposed as effluent limitations.

DISCUSSION: Water quality standards are frequently more stringent than effluent standards developed by EPA under Sections 301 and 306 of the Act. The concept of applying these stringent water quality standards as end-of-pipe limits has never been shown to be reasonable or feasible.

There may be rare occasions where certain streams require additional protection through effluent limitations more stringent than present technology based treatment levels prescribed by EPA. However, such limits should only be applied after performance of a cost/benefit analysis, and they should never be applied to intermittent streams.

SUBJECT: SECTION 306 NATIONAL STANDARDS OF PERFORMANCE: DEFINITION OF "NEW SOURCE"

RECOMMENDATION: Amend Section 306(a)(2) of the Act to provide that a new source is any source the construction of which is commenced after publication of final regulations prescribing a standard of performance under this section applicable to such source.

BACKGROUND: As currently written, the Clean Water Act defines a new source as "any source, the construction of which is commenced after the publication of proposed regulations prescribing a standard of performance." Further, the Act empowers the Administrator to revise from time to time such standards as technology and alternatives change.

PRINCIPAL PROBLEM AREAS: There have frequently been protracted delays between proposal of new source standards and their promulgation in final form. This delay has led to unnecessary costs and confusion. For example, EPA proposed new source performance standards for the coal mining point source category on September 19, 1977 (42 Fed. Reg. 46932). Final regulations were not published until January 12, 1979 (44 Fed. Reg. 2586). Many operators were hesitant to expend large sums of capital when all of the "rules of the game" were not yet finalized. In order to eliminate this problem in future regulations, the effective date of new source standards should be the date of final promulgation, rather than proposal.

SUBJECT: ENFORCEMENT OF STATE-ISSUED NPDES PERMITS

RECOMMENDATION: Amend Section 309 of the Act to prohibit EPA from bringing actions for permit violations in approved states. EPA can retain oversight responsibility because it may withdraw state NPDES authority for cause.

BACKGROUND: Under Section 309, the EPA Administrator has the option of bringing an enforcement action directly against the violator of a state-issued permit or to allow the state to bring an enforcement action within 30 days after EPA notifies the violator and the state.

PRINCIPAL PROBLEM AREAS: Present provisions create potential double jeopardy for dischargers, who face prosecution by both EPA and the state.

SUBJECT: DURATION OF SECTION 402 NATIONAL POLLUTION DISCHARGE ELIMINATION SYSTEM (NPDES) PERMITS

RECOMMENDATION: Amend Section 402(b)(1)(B) to allow the issuance of an NPDES permit for a minimum term of 10 years. This permit should not be reopened except in rare, specified circumstances, such as provided in Section 307 of the Act.

BACKGROUND: Section 402(b)(1)(B) of the Act provides that NPDES permits may be issued for a fixed term not to exceed 5 years. Yet, other federal permits issued by EPA can be issued for the life of the facility (e.g., Clean Air Act and RCRA). Extending the term of NPDES permits to provide greater consistency in permit duration would further improve efficiency under consolidated permit procedures.

Many businesses engage in extensive planning, most of which exceeds 10 year periods. Therefore, extending the life of the NPDES permit would provide more flexibility for business planning and would ease administrative burden on industry and the government without diminishing protection of the environment.

PRINCIPAL PROBLEM AREAS: The 5 year permit term is not long enough to provide sufficient certainty for business planning. Also, the 5 year permit creates an administrative burden which causes unnecessary expenditures of time and money by unproductive exchanges of correspondence and submission of forms.

DISCUSSION: In providing permit terms of 10 years or more, EPA would not relinquish its authority to reopen permits proceedings to revise or revoke permits for just cause. Nor would extending the life of the permit diminish the emergency powers granted EPA by the statutes to address situations that pose eminent threats to the environment. Authorization of permits for 10 or more years would provide a realistic time period for preparation, submittal and approval of the applications.

REFERENCES: Clean Water Act -- Section 402(b)(1)(B).

Consolidated Permits Regulations - 40 CFR - Parts 122, 123 and 124.

SUBJECT: PERMITS FOR DREDGED OR FILL MATERIAL UNDER SECTION 404 OF THE ACT

RECOMMENDATION:

1. The Corps of Engineers should be given the exclusive authority to grant, supervise and enforce the 404 permit program. Sections 404(c) and affected subsections should be amended accordingly.

2. The period of the permit should be extended from 5 years to 10 years or more in Section 404(e)(2).

3. Congress should direct the Corps of Engineers to act and process dredge and fill permit applications within 90 days.

BACKGROUND: The Assistant Secretary of the Army for Civil Works announced on October 16, 1981, that intensive efforts are underway to review the Department of Army's Section 404 permit program under the Clean Water Act. Included among the revisions being considered by the Corps are steps 1) to shorten the permit processing time; 2) to give states more opportunities to issue permits; 3) to eliminate conflicting and overlapping policies; 4) to expand regional and nationwide general permits; and 5) to better define the objectives and jurisdictional extent of the permit program.

The EPA guidelines issued under Section 404(b) (40 CFR Part 230) on September 18, 1977, have never been finalized. Similarly the proposals to amend the existing regulations (33 CFR Parts 320-329) published on September 19, 1980 (45 Fed. Reg. 62732), have not been finalized.

DISCUSSION: EPA and the Corps are given overlapping authority under Section 404. This has led to inefficiency and waste of resources. The Corps should be given exclusive authority over the Section 404 program.

To minimize the workload of the Corps, the period of permit duration should be extended to the life of the project, or at the very least, for a minimum of 10 years.

DISCUSSION: (Cont'd) Industry has been faced with substantial delays and unreasonable economic costs due to the way the Corps is administering the dredge and fill permit program. Despite the clear 30-day review period directives of Section 404(m) and (g) of the Clean Water Act, federal and state fish and wildlife agencies are taking, and Corps regulations allow, an excessive comment period on permit applications. When comments are submitted, the operating conditions recommended are frequently unreasonably restrictive. The Corps, rather than exercising its judgment and refusing to adopt any unreasonable or conflicting recommendations, requires the applicant to resolve any disputes with each and every party involved. Imposing a statutory requirement that the Corps act on permit applications within 90 days should help remedy these problem while still providing adequate time for public and agency comment.

3457

SUBJECT: SECTION 502 GENERAL DEFINITIONS - NAVIGABLE WATERS AND WATERS OF THE UNITED STATES

RECOMMENDATION:

1. Amend Section 502(7) to read:

   The term "navigable waters" means only those waters that are currently used or are susceptible to use in their natural condition, or by reasonable improvement, to transport interstate or foreign commerce, shoreward to their ordinary high water mark, including all waters which are subject to the ebb and flow of the tide shoreward to their mean high water mark, and including wetlands both contiguous and immediately tributary to navigable waters.

2. Add a new definition of Section 502 to read:

   The term "waters of the United States" means (1) navigable waters; (2) tributaries of navigable waters; (3) interstate lakes, rivers and streams; and (4) intrastate lakes, rivers and streams (a) used by interstate travelers for recreation and other purposes or (b) which are a source of fish or shellfish sold in interstate commerce and (c) territorial seas.

BACKGROUND: Section 404 of the Clean Water Act requires permits issued by the Corps of Engineers for disposal of dredged or fill material in the "navigable waters" of the United States. The definition of "navigable waters" in Section 502 is too vague to provide legislative guidance. Both the Corps and EPA have been obliged to define "waters of the United States" in order to provide administrative guidance.

PRINCIPAL PROBLEM AREAS: Considerable confusion surrounds the definition and use of the term "navigable waters" in the Clean Water Act. The term defined as "waters of the United States" has not been defined by Congress and is quite ambiguous. Both EPA and the Corps have developed administrative definitions for "waters of the United States." The CWA defines "navigable waters" as the "waters of the United States" that include territorial seas, coastal and inland water, lakes, rivers including adjacent wetlands. 33 CFR § 323.2 defines "navigable waters of the United States" as "those

PRINCIPAL PROBLEM AREAS: (Cont'd) waters of the United States that are subject to the ebb and flow of the tide shoreward to the mean high water mark and/or are presently used, or have been used in the past, or may be susceptible to use to transport interstate or foreign commerce."

Because the CWA gave a broader definition for U.S. waters, the Corps of Engineers is obligated by law to include wetland considerations in the issuance of 404 permits. This should be corrected by redefining navigable waters for the purpose of 404 permits.

The lack of legislative direction contained in the definition of navigable waters has led to court rulings and agency regulations that are much broader and more cumbersome than Congress intended. As a result, the jurisdiction of the Corps has been extended far beyond waters traditionally considered to be navigable.

The recommended change in the definition of "navigable waters" is necessary to clearly indicate that Section 404 applies only to water courses that are navigable or wetlands that are contiguous with and tributary to these navigable water courses.

In other sections of the Act where "navigable waters" is used where the intent is clearly "waters of the United States" such as in Section 402(a)(4) we suggest that the broader term "waters of the United States" be used instead.

DISCUSSION: While NCA supports the protection of the nation's navigable waters from the adverse impact of dredged or fill material disposal, we believe that a change in the definition of "navigable waters" is essential to produce a permitting program that more closely corresponds to what we believe to have been Congress' original intent. Dredge or fill permits for activities outside these navigable waters and the wetlands immediately adjacent to them should require no federal permit. Finally, we do not believe it was Congressional intent to authorize the Corps under Section 404 to regulate land use activities on wetlands that cannot impact navigation.

3458

SUBJECT: SECTION 502 GENERAL DEFINITIONS - DEFINITIONS OF "DISCHARGE OF POLLUTANTS" AND "POINT SOURCE" AND "POLLUTION"

RECOMMENDATION:

Amend Section 502(12), (14) and (19) of the Clean Water Act to read as follows:

(a) The term "discharge of a pollutant" and the term "discharge of pollutants" each means (a) any net addition of any pollutant to waters of the United States from any point source; (b) any net addition of any pollutant to waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft.

(b) The term "point source" means any discernible, confined and discrete conveyance including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged. This term does not include surface water diversions; shallow ground water diversions, discharge from dams, ponds, or structures that serve only to control streamflow, storm water runoff or non-point source pollution; or return flows from irrigated agriculture.

(c) The term "harmful quantities" means the discharge of pollutants in such quantities as to violate a water quality standard or to preclude the downstream designated use of the receiving stream.

BACKGROUND: The NPDES permit program established by Section 402 of the Clean Water Act applies to the discharge of any pollutant into navigable waters. The definitions in Section 502 imply that the discharges regulated under 402 apply to any addition of any pollutant to waters of the United States from any point source.

PRINCIPAL PROBLEM AREAS: Since the basis of the NPDES program is the development of technology-based effluent limits, it is necessary that the definition of point sources apply to discharges that are amenable to treatment to specific effluent limits using

PRINCIPAL PROBLEM AREAS: (Cont'd) a proven technology. A change in the definition of point source is necessary to reverse court rulings that NPDES permits are required for discharge of storm water runoff or streamflow where no technology exists to achieve specific effluent limits. Furthermore, activities which do not result in the net addition of pollutants to navigable waters should not be considered point sources of pollutants since these activities can be considered as stream flow regulating activities. These activities are best controlled with management practices that are compatible with the water laws and practices of the state.

The change in definition of "pollution" is suggested to reflect the intent that pollution refers to an adverse change in the water resource that can impact its potential use. Thus stream depletion through water use could be considered pollution even though it involves no discharge of pollutants. On the other hand, a change in chemical, physical or biological activities that does not impact existing or potential water use is not pollution.

DISCUSSION: The change in definition of point source is necessary to eliminate the present cumbersome, inefficient program requiring exemptions, such as storm exemptions, to the definition of point source to develop a viable regulatory program. The existing definition implies that discharge permits may be required for storm water flowing through ponds, culverts or diversions. Administrative rulings have attempted to limit the scope of the point source definition but these limitations, such as the exclusion for dams, have been overruled by the courts.

Efforts to control and mitigate the impacts of non-point source pollution can result in a need to obtain NPDES permits. Effluent limits may be difficult or impossible to meet for such sources without exemptions for large storm events. Thus operations that control non-point source pollution under mandated programs such as SMCRA or voluntary programs under Section 208 are, in effect, penalized for these efforts.

30-955 O—84——218

DISCUSSION: (Cont'd)

The changes in definition of pollution and discharge of pollutants are recommended to make the programs authorized under the Clean Water Act more compatible with water management. Water users would not be penalized for withdrawing water from a particular water source if it could be returned to the same source at approximately the same quality. This would not result in degradation of water quality but could avoid expensive storage or overflow provisions required in water recycle operations.

SUBJECT: ADMINISTRATIVE PROCEDURE AND JUDICIAL REVIEW

RECOMMENDATION:

Section 509 of the Act should be amended to provide that any final action of the Administrator not specified in Subsection (b)(1)(A)-(F) shall be reviewable in the United States District Court for the district in which the petitioner resides or transacts business.

BACKGROUND:

In implementing its statutory programs, EPA has followed the practice of issuing guidance materials, instructions, manuals, etc., for the use of EPA and state permit writers. Such materials often have not been made subject to public comment and EPA has avoided judicial review of them by claiming they are not regulations but are only of a policy or guidance nature. Nevertheless, these materials significantly influence EPA's regulatory and enforcement programs and directly effect industry permittees.

PRINCIPAL PROBLEM AREAS:

EPA has followed a practice of issuing instructions, manuals and other similar information or directives to EPA and state permit writers regarding implementation of NPDES program. Such information and directives have not been subject to public comment and often escape judicial review based on the assertion by EPA that they are only policy or guidance. Often the public is unaware of the existence of these documents and the EPA policies set further therein. Yet, these policies and guidance have a major impact on industry.

Examples include the Agency's five-volume treatability manual, which will be used to set case-by-case permit limits; the water quality criteria, which will be used by states in developing water quality standards; and a best management practices manual, which may be used in writing or enforcing permits.

DISCUSSION:

To ensure that EPA action which directly affects dischargers will not escape judicial scrutiny, review should be provided in a United States District Court of all final EPA action taken under the authority of the Act other than that made reviewable in the Courts of Appeals. Such final action would include issuance not only of published rules and regulations, but also guidelines, manuals, guidance documents, instructions, criteria and other such documents in-

DISCUSSION: (Cont'd)

tended by EPA to be applied by its Regional Offices and the states. In addition, EPA should be required to publish notice of the availability of and to take comments on all such documents that have an impact on the public and the regulated community.

SUBJECT: NEPA REVIEW FOR NEW SOURCES

RECOMMENDATION: Amend Section 511(c)(1) of the Clean Water Act to exempt NPDES permitting of new sources from Environmental Impact Statement requirements under the National Environmental Policy Act.

BACKGROUND: A NPDES permit is only required for a point source discharge and governs only "end-of-pipe" requirements. It is inappropriate to require new sources seeking only a NPDES permit to comply with NEPA environmental impact statement requirements. NEPA procedures need to be followed for truly major federal actions significantly impacting the environment. However, the act of issuing a NPDES permit for coal mining operations is not a major federal action significantly impacting the environment and should not be so considered. The process of complying with NEPA requirements is one of the main causes for delay in the permit process for new operations. The requirement for an environmental impact statement delays the issuance of the NPDES permit and causes undue hardship on the operator by tying up capital and manpower.

PRINCIPAL PROBLEM AREAS: Presently, the Clean Water Act subjects certain categories of new point-source dischargers to review under the National Environmental Policy Act of 1969 (NEPA) when the EPA administrator issues an NPDES permit. The requirement to conduct an environmental review and to prepare an Environmental Impact Statement (EIS) for a new project is time-consuming, unduly burdensome, and can cause long delays in permit issuance. Permits for new sources of air emissions and hazardous wastes are exempted from NEPA impact statement requirements. Imposing EIS requirements on new water discharge sources is similarly unnecessary.

DISCUSSION: Congress provided in Section 511 of the CWA that nothing in the National Environmental Policy Act of 1969 (NEPA) should be deemed to authorize the imposition of any effluent limitations other than limitations established under the CWA. It should also be made clear that new sources are not subject to the Environmental Impact Statement (EIS) requirement of Section 102(2)(c) of NEPA. Preparation of an EIS for new sources is a time-consuming and unnecessary process.

DISCUSSION: (Cont'd)

While the requirement that such an EIS be prepared may make sense as applied to federal agencies other than EPA, it is unnecessary to impose the heavy burden of preparing an EIS on EPA since that Agency, in acting under the environmental statutes, performs the "functional equivalent" of an EIS. Moreover, EPA has in the past used its NEPA responsibilities to assert jurisdiction far beyond its authority under the CWA. For example, in its NPDES regulations, EPA has provided that, as a general rule, new sources may not begin construction prior to the issuance of a final EIS and NPDES permit. We do not believe that Congress ever intended the Clean Water Act to regulate construction as opposed to discharges.

IN THE 80'S

Statement of the Chamber of Commerce of the United States

ON: FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS
(H.R. 3282, H.R. 4037)

TO: SUBCOMMITTEE ON WATER RESOURCES OF THE
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

BY: DR. HARVEY ALTER

DATE: NOVEMBER 30, 1982

The Chamber's mission is to advance human progress through an economic, political and social system based on individual freedom, incentive, initiative, opportunity and responsibility.

The Chamber of Commerce of the United States is the largest federation of business and professional organizations in the world, and is the principal spokesman for the American business community. The U.S. Chamber represents more than 204,000 members, of which more than 200,500 are business firms, more than 2,500 are state and local chambers of commerce, and more than 1,200 are trade and professional associations.

More than 85 percent of the Chamber's members are small business firms having fewer than 100 employees. Yet, virtually all of the nation's largest industrial and business concerns are also active members. We are particularly cognizant of the problems of smaller businesses, as well as issues facing the business community at large.

Besides representing a cross section of the American business community in terms of number of employees, the U.S. Chamber represents a wide management spectrum by type of business and location. Each major classification of American business -- manufacturing, retailing, services, construction, wholesaling, and finance -- numbers more than 15,000 members in the U.S. Chamber. Yet no one group constitutes as much as 23 percent of the total Chamber membership. Further, the Chamber has substantial membership in all 50 states.

The Chamber's international reach is substantial as well. It believes that global interdependence provides an opportunity and not a threat. In addition to the 48 American Chambers of Commerce Abroad, an increasing number of Chamber members are engaged in the export and import of both goods and services, and have ongoing investment activities. The Chamber favors strengthened international competitiveness and opposes artificial U.S. and foreign barriers to international business.

STATEMENT
on
FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS
(H.R. 3282, H.R. 4037)
for submission to the
SUBCOMMITTEE ON WATER RESOURCES
of the
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
for the
CHAMBER OF COMMERCE OF THE UNITED STATES
by
Dr. Harvey Alter*
November 30, 1983

The Chamber of Commerce of the United States is pleased to have the opportunity to comment on H.R. 3282 and H.R. 4037, proposed amendments to the Federal Water Pollution Control Act (Clean Water Act).

The Chamber strongly supports the national commitment to the restoration and maintenance of the chemical, physical and biological integrity of the nation's waters. We believe that these are laudable goals that can be achieved through the application of reasonable strategies that will result in demonstrable water quality improvements.

Amendments to the Clean Water Act should be assessed in light of the substantial progress that has been made toward improving surface water quality since passage of the 1972 amendments. Most water bodies are now meeting the Act's fishable/swimmable goals. This progress should continue. In our view, the primary challenges before this Subcommittee are to review the adequacy of the present law to manage current surface water quality problems effectively, and determine the most appropriate ways to continue progress made to date.

The Chamber intends to work with the Water Resources Subcommittee and the Public Works and Transportation Committee to meet these challenges. We will take this opportunity to comment on seven issues that we consider to be of importance to the reauthorization of the Clean Water Act. Our comments are summarized below.

---

*Manager, Resources Policy Department, Chamber of Commerece of the United States.

- Water Quality Standards

  The Chamber opposes Section 6 of H.R. 3282 because the proposal would eliminate states' flexibility under current law and regulations to modify designated water uses, and is unnecessary in light of the Environmental Protection Agency's (EPA) recently promulgated revisions to the water quality standards regulations.

- Pretreatment Authority

  The Chamber recommends amending the Act to allow municipalities, under certain prescribed conditions, the option to develop and manage local pretreatment programs.

- Post-BAT Permit Requirements

  The Chamber opposes Section 7 of H.R. 3282, which would mandate water quality based permit requirements prior to promulgation of best available technology (BAT) effluent limitations guidelines and the full implementation of other statutory provisions.

- BAT/BCT Compliance Deadlines

  The Chamber supports the three year extension of BAT compliance deadlines as outlined in Section 4 of H.R. 3282, and believes that a similar three year extension should be granted for best conventional technology compliance (BCT).

- NPDES Permit Term

  The Chamber recommends that the National Pollutant Discharge Elimination System (NPDES) permit term be extended from five to ten years.

- Federal Common Law

  The Chamber opposes any attempt to expand common law remedies to allow suits against dischargers for damages and pollution abatement by establishing a federal common law provision in the Clean Water Act.

- Nonpoint Source Pollution Control

  The Chamber recognizes the importance of nonpoint source pollution control measures and is in the process of developing a position on this issue. We would like to reserve the opportunity to comment further on the strategy outlined in H.R. 4037 when our policy is finalized in early 1984.

Water Quality Standards

The Chamber is strongly opposed to Section 6 of H.R. 3282 that would require states to "maintain the designated uses of the navigable waters in effect on January 1, 1983." Secton 6 is unnecessary in light of EPA's recent evaluation of changes to existing regulations governing the way states set water quality standards (48 FR 54100, November 8, 1983). We view EPA's revised water quality standards regulations as providing sound guidance to states for determining appropriate water uses in cases where designated stream uses have not been met or are not likely to be met after the imposition of technology-based controls. Under these revised regulations, the Act's minimum technology-based requirements would not be altered, and states would be allowed the necessary flexibility to establish attainable water uses. We support the approach adopted by EPA and believe it to be consistent with the objectives of the Clean Water Act. We urge you to drop Section 6 from H.R. 3282 on this basis, which is explained further below.

The Amendments of 1972 emphasized a technology-based approach to the control of pollutants. This strategy was deemed necessary to meet the Act's goals which are clearly based on an assessment of the quality of the nation's waters. States retained primary responsibility for determining the water quality levels appropriate for the designated uses of the waters in their jurisdiction, as well as for establishing and enforcing limitations to be placed on dischargers.

The technology-based standards set minimum control requirements that all point source dischargers are required to meet. Where these requirements are inadequate to achieve a particular state-designated water use (water quality limited stream segments), the state water quality standards serve as the basis for additional controls necessary to meet those uses. In practice, industry must meet the more stringent of the two standards.

Water quality standards serve a dual purpose: (1) they establish the water quality goals for a specific water body, and (2) they serve as the regulatory basis for the establishment of water quality-based controls beyond the minimum technology requirements required under the Act. Current law reflects Congress' recognition that there are many uses of a water resource and that the Act's goals should not exclude justifiable uses. In determining the feasibility of attaining or maintaining designated water uses, states should continue to analyze the environmental, physical and economic factors that influence the attainment of a given use. In order to do so, states must be allowed flexibility to make reasonable determinations as to whether designated water uses are attainable in those limited, special circumstances where attainment is less feasible.

Based on current law, existing water quality regulations allow needed flexiblity where designated uses cannot be met. Where the designated use is not attainable due to natural background or irretrievable man-induced conditions, states should be able to modify existing uses, and are able to do so under current regulations. This approach, which takes into account both the goals of the Clean Water Act and those special circumstances which may affect the attainment of the goals in certain water bodies, is a realistic and responsible means of achieving clean water goals while balancing other important objectives. Adoption of Section 6 would remove this necessary flexibility.

Many of the original water quality standards were not based on sound and accurate information. The limited stream data available in 1972, the states' lack of expertise in water quality standards setting, and EPA's other priorities, resulted in the development of standards which, in many cases, do not reflect site-specific stream conditions and are difficult to implement on individual stream segments. The need to reevaluate periodically the water quality standards to assure the incorporation of new data that may warrant changes in the standards is important to the integrity of state regulatory programs. Section 6 would hinder states' ability to modify water body classifications when new data become available.

Since passage of the 1972 amendments, the states have been gradually improving their capabilities and are now in a much better position to review and revise standards in a technically sound fashion. The water quality data

base that now drives state water quality assessments has had the benefit of ten years of further development. By restricting states' flexibility to address local conditions, dischargers will be faced with advanced treatment requirements that are costly and dubious as to their potential environmental benefits.

The Chamber believes that Section 6 reflects a response to EPA's proposed revisions to the water quality standards regulations which is no longer appropriate, given the content of the final regulations. Important revisions have been made to the Agency's regulations reflecting more than 1400 comments received by the Agency. Among these changes are: (1) explicit language reaffirming EPA's commitment to the nation's clean water goals and the role of water quality standards as a regulatory tool; (2) clarification of the use of physical, chemical, biological and economic factors in conducting use attainability analyses, particularly the role of cost/benefit analysis; (3) emphasis on the protection of water quality, not uses; (4) improved guidance on state procedures for reviewing and revising water quality standards; and (5) revision of the anti-degradation policy to provide special protection for high quality waters and waters which constitute an outstanding natural resource.

The final water quality standards regulations demonstrate EPA's commitment to the goals and spirit of the Clean Water Act. They incorporate the kind of flexibility state regulators and planners will need to deal with economic growth and development, with concurrent protection of environmental quality. Section 6 of H.R. 3282 should be deleted because it would restrict EPA's and the states' ability to respond to future water quality conditions, and is unnecessary in light of the recently published final regulations.

Pretreatment Authority

As introduced, H.R. 3282 does not address pretreatment. It should be amended to allow publicly owned treatment works (POTWs) to demonstrate their capability to develop and implement local pretreatment programs in lieu of the federal categorical requirements.

Under existing statutory authority, Sections 307(b) and (c) authorize EPA to establish pretreatment standards to control various pollutants found in industrial effluents discharged into POTWs. These pretreatment provisions are

designed to control discharges that might contaminate sewage sludge, interfere with the disposal of sludge and/or the efficient operation of the POTW, cause the POTW to violate the terms of its NPDES permit, or cause water quality problems.

Responding to its congressional mandate, EPA has developed an elaborate and cumbersome pretreatment program involving national technology-based pretreatment standards for dischargers of toxic and non-toxic/non-conventional pollutants. Under this program, standards vary for the same toxic pollutant depending upon the industrial category to which they are applied. EPA has also developed general pretreatment requirements that are applied in conjunction with the categorical standards.

In developing the categorical standards, EPA has attempted unsuccessfully to develop a method of granting credits that reflects the consistent removal by a POTW of various substances in a discharger's effluent. Without these removal credits, industrial dischargers are often required to install expensive treatment technology to meet pretreatment limits even when the receiving POTW is capable of removing a portion of the regulated constituent. Further, the general pretreatment requirements authorize a POTW to require the separate pretreatment of some industrial wastes that could otherwise be treated with domestic wastes. These circumstances have created a complex and duplicative pretreatment program that results in great expense without commensurate environmental benefits.

The Chamber recommends that the Clean Water Act be amended to allow POTWs the opportunity to demonstrate to EPA that they now operate, or will soon be capable of operating, pretreatment programs at least as stringent as the federal categorical program. Such a demonstration would involve an evaluation of the technical, legal and financial capability of the POTW to implement an effective local program. The criteria for granting this local authority should be the same as the criteria applicable to the federal pretreatment program--the control of discharges that might contaminate sewage sludge, interfere with the disposal of the sludge and/or the efficient operation of the POTW, cause the POTW to violate its NPDES permit, or cause water quality problems.

Opponents of a "local option" pretreatment provision contend that EPA's resources would be severely strained if the Agency had to evaluate several hundred applications to "opt out" of the federal pretreatment program. This

argument ignores the fact that EPA now must evaluate the adequacy of plans submitted by approximately 1700 municipalities that are presently required to establish pretreatment programs. It also ignores EPA's lack of success in developing a workable federal program.

The current program is an inefficient use of public resources generally, and industry's resources specifically. Tailoring pretreatment progams to meet the needs of local POTWs will eliminate costly administrative and technical requirements that are not necessary for the protection of water quality, public health or the proper operation of the facility. If the objectives of the Act are to enhance water quality and protect public health, where feasible, locally established programs are a sensible and effective alternative to the current federal system.

The Chamber recognizes that many POTWs, particularly the smaller ones, will not have the capability to develop and manage local programs. To this extent, we encourage continued efforts to develop a workable and effective federal pretreatment program. However, qualified POTWs should have the opportunity to implement local programs that are at least as stringent as EPA's.

Such a targeted approach, in lieu of federal standards, would strengthen the pretreatment program. By targeting the program to local conditions, site-specific water quality problems are likely to be addressed more adequately than under a national program that may or may not be relevant to the protection of water quality in the specified area. However, while we firmly believe that localities should have the option of managing pretreatment programs, EPA should continue its present role of supervising enforcement and providing technical assistance where local programs are established.

In addition, Congress should encourage EPA to resolve problems associated with the removal credit regulations. EPA should promulgate national removal credits applicable to all pollutants subject to federal standards so that redundant treatment will be avoided. It should also develop a workable mechanism for the establishment of POTW-specific removal credits where a POTW can show that its removals are higher than the national credits or those credits otherwise do not apply. We believe that such efforts will enhance the efficiency and effectiveness of the national program.

Finally, many industrial facilities with integrated processes are subject to more than one categorical pretreatment standard. These facilities face increased regulatory uncertainty because their pretreatment requirements change each time EPA promulgates new or revised categorical standards applicable to any one of the processes. This uncertainty makes the planning and design of adequate pretreatment systems difficult and unnecessarily expensive. To facilitate the orderly design and construction of pretreatment systems for integrated facilities, we recommend that three years be allowed for compliance from the time the last standard applicable to the facility is promulgated.

Post-BAT Permit Requirements

Section 7 requires the Administrator to identify waters within each state that, in the Administrator's opinion, are not expected to meet water quality standards due to point source discharges of toxic pollutants. Within one year after publishing the list of such waters, the Administrator is required to propose regulations setting forth an individual control strategy for each noncomplying water body. After promulgation, each strategy must be implemented by modifying discharge permits issued to direct dischargers under Section 402 of the Act.

Section 7 is both unnecessary and inappropriate at this time. While we support reasonable efforts to control toxic water pollution, particularly in those water bodies experiencing special problems, we cannot support a provision that presumptively concludes that these problems should and will be resolved through more stringent regulation of point source dischargers. Section 302(a) provides adequate authority for the management of water quality problems that are not being resolved through the Act's technology requirements, and therefore the proposal contained in Section 7 is not needed.

The Chamber also believes that Section 7 is premature. EPA is only now promulgating BAT effluent limitations guidelines for major segments of American industry. According to the Agency's most recent schedule for guidelines promulgation, final BAT effluent limitations guidelines are not likely before mid-1984 at the earliest. Once the guidelines are promulgated, it will be approximately three years before permit limits are established and technology requirements are designed, installed and operational.

Progress toward improving water quality is possible through the application of BAT requirements and other provisions of current law, such as Sections 208 and 302. These strategies should be allowed to be fully implemented before new control strategies are created. Only after the full implementation of existing statutory requirements will it be possible to determine what additional controls on point sources beyond BAT, if any, are needed to meet water quality standards.

It would be bad public policy to mandate that point sources, already facing significant regulation under the Act, face additional regulation through new requirements when existing provisions have yet to be fully implemented and tested for their adequacy to control localized toxic pollution problems.

Section 7 would also negate implementing authority historically delegated to states under the Act to set water quality standards and issue NPDES permits. This would be the effect, if not the intent, of allowing the EPA Administrator to identify areas that may not meet water quality standards due to toxic discharges, and to establish control strategies in NPDES permits for those water bodies. This provision would fundamentally alter the way in which water quality standards are established and NPDES permits are issued under the Act. States are in a much better position than the federal government to determine the limitations required to achieve designated water quality, based on local needs and conditions.

For these reasons, we urge you to delete Section 7 of H.R. 3282 and encourage EPA to move forward expeditiously with BAT effluent limitations guidelines. We recommend, as an alternative, that EPA seek appropriate means of building on and implementing Section 208 and other existing statutory provisions as additional means of controlling toxics pollution.

BCT/BAT Compliance Deadlines

The Chamber agrees that an extension of the best conventional technology (BCT) and best available technology (BAT) compliance deadlines is needed to allow sufficient time for many industries to comply with applicable effluent limitations.

When the current deadlines in the Act were established, Congress assumed that EPA would be able to issue effluent guidelines in a timely manner. Industry would then have needed approximately three years to obtain

NPDES permits and install treatment systems to achieve compliance. In view of the fact that EPA will not finish promulgating many of the effluent guidelines until mid- or late-1984, we consider the current deadlines to be unrealistic.

The deadline extension for BAT compliance, as proposed in Sections 4(a) and (c) of H.R. 3282, recognizes that EPA may not be able to adhere strictly to the recent court ordered promulgation schedule. Historically, promulgation schedules slip. Unanticipated and legitimate delays in promulgating guidelines have often resulted in significant uncertainty within industry as to what requirements apply, and how and when compliance must be achieved. For large manufacturing facilities subject to more than one guideline, the uncertainty is even greater. Tying compliance deadlines to a specified time following guidelines promulgation makes sense and adds predictability and stability to the regulatory program.

In lieu of the specified 1987 deadline for BCT compliance, we recommend that Section 4(b) be amended to tie compliance to the date of promulgation of the appropriate effluent guideline. Such an amendment would make the BCT compliance requirements consistent with those for BAT, and again, decreased uncertainty.

Eliminating the 1987 BCT compliance deadline is necessary because EPA has yet to finalize its BCT methodology. The proposed methodology for determining BCT requirements was recently withdrawn (48 F.R. 44091, September 27, 1983), and has consequently delayed the development of defensible effluent guidelines.

NPDES Permit Term

One issue not addressed by H.R. 3282 is the term of current NPDES permits. The Act currently specifies that permits issued under the Act shall not exceed five years. Experience has shown that industrial dischargers generally require two to three years to install the treatment technology necessary to meet permit limitations. The length and complexity of the permit process, the short life of the permit term, and the time needed to comply with permit conditions has resulted in industrial dischargers constantly finding themselves in the process of either preparing applications or negotiating permit conditions. Therefore, the Chamber recommends that Section 402(b)(1)(B) of the Clean Water Act be revised to extend the permit life from

five to ten years, with continuing EPA authority to terminate or modify the terms of any permit for violations of permit conditions, misrepresentations, or conditions that warrant a reopening of the permit.

By extending the permit term for most dischargers, the permit holder would be provided greater certainty, which would be an incentive for further investment in pollution controls. Additionally, state and federal agencies with responsibility for issuing discharge permits would have a reduced permitting work load and, consequently, more time to ensure the achievement and maintenance of permit conditions.

Federal Common Law

H.R. 3282 does not now contain a provision addressing federal common law. We believe that this is as it should be. Any attempt to amend the Clean Water Act to allow a federal common law remedy for suits against dischargers for abatement and damages would be ill-advised. The Chamber opposes the establishment of this type of legal remedy on a number of grounds.

To establish a federal common law provision in the Act could result in abatement orders and awards for damages against dischargers that are in full compliance with all applicable Clean Water Act requirements. This would create unlimited liability for the regulated community, make the NPDES permit program meaningless, and subject those regulated under the Act to unknown and technically unjustifiable judicial standards.

The Clean Water Act is comprehensive federal legislation through which extensive permit and effluent limitations regulations have been successfully implemented. Federal water pollution control authority should be provided through acts of Congress, and administered by federal agencies or delegated states, not determined on a case-by-case basis in the federal courts.

Allowing courts to fashion additional requirements under the guise of federal common law would result in an unacceptable degree of uncertainty as to the federal standards of conduct and remedies, as the U.S. Supreme Court held in Milwaukee v. Illinois, 451 U.S. 304 (1981). This decision is grounded in fundamental principles of federalism, as well as sound practical considerations, and should not be overturned. A permittee who is in compliance with Clean Water Act requirements should not be subject to injunctive relief or penalties for a permitted discharge on grounds of federal common law of nuisance.

Nonpoint Source Pollution Control

Another issue before the subcommittee is nonpoint source pollution control, as contained in H.R. 4037.

Nonpoint source pollution control is an issue that is of great concern to our members. In an effort to provide Congress with our members' views on this issue, we are now developing a position on H.R. 4037. We expect to complete this process soon and would appreciate the opportunity to comment on the bill at that time.

Conclusion

The Chamber reaffirms its support for the important goals of the Clean Water Act and believes that existing law can provide the basis for additional water quality improvements in the years ahead. At the same time, we recognize that a number of clean water programs need modification or further development to assure achievement of the Act's goals.

With strong public support and commitment to enhancing the quality of the nation's waters, there is no question that progress toward improving water quality will continue. Experience to date with the Clean Water Act is ample evidence of the nation's commitment and the successes made. In light of this experience, it is important to bear in mind that continued efforts to control sources of water pollution must be technically sound, economically achievable and designed to result in clear environmental benefits.

Federal water pollution control programs should be tailored to the needs of local communities and decision-makers whenever possible, and sufficiently flexible to address future environmental concerns. Continued progress in achieving the Clean Water Act's goals will be significantly enhanced through adherence to these principles.

August 5, 1983

The Honorable Robert A. Roe
Chairman
Subcommittee on Water Resources
House Committee on Public Works
and Transportation
2165 Rayburn Building
Washington, D.C. 20515

Dear Chairman Roe:

Enclosed are three copies of the statement of Mr. Fred J. Gentile, Vice President and Comptroller of The Brooklyn Union Gas Company, for inclusion in the record of the August 2-4 hearings concerning reauthorization of the Clean Water Act.

Mr. Gentile previously submitted testimony to the Subcommittee on August 12, 1981. The enclosed statement revises and updates that testimony to show the increased impact of the Red Hook and Oakwood Beach Water Pollution Control Projects on Brooklyn Union's customers. The revised figures demonstrate that because of these two projects Brooklyn Union will incur in excess of $9.0 million in utility relocation costs. These costs will be borne by Brooklyn Union's customers unless the present federal law is changed to correct the situation. Mr. Gentile recommends that the Committee amend the Clean Water Act to ensure that utility relocation costs caused by the Red Hook and Oakwood Beach projects be reimbursed under the Act in the same proportion as the federal share of any other costs on such projects.

Sincerely,

Dana Contratto

Dana Contratto
Attorney for The
Brooklyn Union Gas Company

The Brooklyn Union Gas Company
195 MONTAGUE STREET
BROOKLYN, NEW YORK 11201

STATEMENT OF

FRED J. GENTILE,

VICE PRESIDENT AND COMPTROLLER

of

THE BROOKLYN UNION GAS COMPANY

before the

WATER RESOURCES SUBCOMMITTEE

of the

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

on the

ALLOWABILITY OF UTILITY RELOCATION COSTS

UNDER THE CLEAN WATER ACT

CONSTRUCTION GRANTS PROGRAM

August 5, 1983

The purpose of this statement is to bring to this Committee's attention an issue of vital importance to gas utility customers nationwide and, in particular, to the customers of the Brooklyn Union Gas Company. The issue is the continued inequitable and unjust treatment of utility relocation expenses by the federal government.

Each year, water and sewer construction projects financed by the federal government under the Clean Water Act make necessary the relocation of gas facilities owned by public utility companies such as Brooklyn Union. Relocation and replacement of gas lines located in city streets is every bit as much a part of a treatment or sewer construction project as is the cost of labor and materials directly employed in Clean Water Act construction work. Like labor or materials expenses, utility relocation expenses would not be incurred but for these Clean Water Act projects. But in contrast with other construction expenses, the federal government does not bear its fair share of the cost of utility relocation. Instead, in most cases, and in the case of those projects that affect the Brooklyn Union Gas Company, the federal government bears none of the utility relocation expense. Thus, despite the fact that such expenses are incurred by virtue of federal programs intended to further federal interests, the cost of utility relocation is borne exclusively by local gas utility customers. This state of affairs is inappropriate and inequitable.

A. The Magnitude Of Utility Relocation Costs Caused By EPA-Assisted Projects: Brooklyn Union

Under the Clean Water Act, EPA is presently funding two water pollution control projects that affect Brooklyn Union's service area. These are the Red Hook and Oakwood Beach Water Pollution Control Projects. As the attached tables demonstrate, these projects will require substantial relocation of utility lines and considerable expense to Brooklyn Union. For example, on the Red Hook Water Pollution Control Project, Brooklyn Union will spend approximately $9.05 relocating its pipes and facilities for every $100.00 in government expenditures on this project. Given the $19.9 million which expectably will be spent on this project over the next three years, Brooklyn Union will be forced to assume the cost of an estimated 1.8 million dollars for work unrelated to providing gas utility service to its customers. Even more significant is the cost to Brooklyn Union over the next five years as a result of the EPA-assisted Oakwood Beach Water Pollution Control Project in Staten Island. That project will cost Brooklyn Union an estimated $7.25 million, based upon estimated project costs of $130.9 million ($5.54 of utility relocation expenses for every $100 spent on the project).

The important point to be gained from these figures is that the utility relocation costs that concern Brooklyn Union are significant. Brooklyn Union will incur in excess of $9.0 million in utility relocation costs over the next few years solely because of these two EPA-assisted projects in its service area. That $9.0 million, as explained in the next section, will be borne by Brooklyn Union's customers unless the present law is changed to correct the situation.

B. Current Law: Passing The Utility Relocation Burden of EPA-Assisted Projects From The Federal Government To Local Gas Utility Customers

Under the Clean Water Act, as administered by the EPA's Office of Water and Waste Management, a construction grant program provides federal funding for the construction of municipal treatment works which are required to meet state and federal water quality standards. Under the program, EPA assumes 75 percent of allowable costs of approved construction projects.

The Office of Management and Budget's Circular, A-87 (January 15, 1981), is intended to establish uniform principles and standards for determining allowable costs under grants and contracts with state and local governments. Subsection C of Attachment A of OMB Circular A-87 sets forth the guideline that allowable costs must "be authorized or not prohibited under State or local laws or regulations." */ The practical effect of this guideline, as interpreted by EPA, has been to allow the federal government to avoid -- through the operation of local property laws -- compensating utilities for relocation expenses incurred as a result of the EPA-assisted construction projects.

The source of the federal government's ability to escape payment for the cost of utility relocation is that under the law of many states, public utilities are required to relocate their facilities to make way for state construction without reimbursement of the costs incurred. The legal theory by which many states, including New York, deny utilities direct

---

*/ EPA has codified its interpretation of this criterion at section 35.940-1(k) of Title 40 of the Code of Federal Regulations, which states that allowable costs include "Removal and relocation or replacement of utilities, for which the grantee is legally obligated to pay."

compensation for their relocation expenses is that because utilities possess only a "privilege" or "franchise" to locate service lines in the public streets, they operate at the sufferance of the state and do not have the "right" to operate in any particular place. Under this peculiar theory, it is frequently held that the state may require the utility to move its facilities without paying any compensation. */ As EPA has administered the Clean Water Act, since the state may avoid paying its share of the cost of utility relocation, the federal government allows the full cost of relocation to fall on the utility and its customers.

This practice, by which the federal government fails to pay its fair share, or, for that matter, any share of the cost of a federally-induced project, must be changed.

C. The Current Policy Regarding Utility Relocation Costs Is Misguided, Inappropriate, And Inequitable To The Local Gas Utility Customers Who Must Pay More Than Their Fair Share Of Federally-Assisted Projects

There are compelling reasons why the government's current policy toward utility relocation expenses should be reversed:

1. As a result of this practice, gas utility customers are forced to pay more than their fair share of Clean Water Act construction. The Clean Water Act programs which finance construction projects requiring relocation of gas utility facilities are conceived and designed to benefit the general welfare: "The objective of this [Act] is to restore and maintain the . . . integrity of the Nation's waters." 33 U.S.C. § 1251(a). No special benefit is conferred upon gas utility customers by these projects. Gas utility customers, however, pay twice for these construction projects -- once in the form of federal taxes, and again in the form of increased utility rates. This inequitable burden should be relieved, and the full cost of construction should be spread equally among all taxpayers.

---

*/ One of the peculiarities of this theory is that if the relocation was necessitated by a project conducted directly by the federal government, just compensation would have to be paid. Thus, it is only by funneling the federal money for these projects through the states that the federal government takes advantage of the quirks in local property law and avoids its obligation to pay compensation.

Similarly, the costs of Clean Water Act projects do not fall on those who reap the benefits of the program. Projects such as those at Red Hook and Oakwood Beach directly benefit all citizens in the Hudson valley and at least arguably the entire northeast United States. To require a select group of individuals -- Brooklyn Union Gas Company customers -- located in a distinct geographic sector -- Brooklyn, Queens and Staten Island -- to pay more than a pro rata share of the project costs clearly places an inequitable and unjust burden on those individuals.

2. The current policy results in discriminatory treatment between gas customers in different states. The present practice of predicating the compensability of utility relocation expenses upon the intricacies of state property laws has created a situation in which some states' utilities are reimbursed from federal funds, while the relocation expense on comparable projects in other states goes uncompensated. The burden of federally-financed construction should not be borne disproportionately by the gas consumers of one state, while similarly situated gas consumers in another are relieved of this burden.

3. The failure to recognize the full cost of public construction leads to economic waste. Public utilities are given no voice in planning federally-financed projects in a manner which might reduce these burdensome costs. The federal government does not intervene to assure that relocation is approached economically and efficiently, as would be the case where federal funds were at stake. And, because the expense of utility relocation is not paid by the state or municipality, local project administrators tend to be less concerned about the manner in which those expenses might be reduced.

4. The Clean Water Act policy of disallowing utility relocation costs disrupts the national energy policy. The full cost of relocation, while initially borne as an out-of-pocket expense by the utility, is ultimately paid for by the consumer in the form of higher gas prices. This increment to the price of gas artificially stimulates demand for alternative sources of energy when gas, in reality, may be the most cost-effective form of energy available. As presently administered, the system extracts an extra charge from gas consumers, and confers an economic boon to fuel oil consumers who may well be in the very same geographical class of alleged "beneficiaries" of the Clean Water Act project.

5. The historical quirk which allows some states to avoid payment of utility relocation expenses, upholds no public policy and has no rational application to utility relocation necessitated by federal projects. As an historical matter,

most utilities, including Brooklyn Union, were invited by the states onto the public way in order that the states might assure their citizenry adequate and efficient utility service. If the utilities -- particularly those asked to operate in metropolitan areas -- had been required to purchase private rights-of-way to lay their lines, the costs would have been prohibitive. The franchise was offered to the utilities as a means of ensuring affordable utility service. Here, anomalously, the federal government is exploiting the nature of the franchise to increase the cost to the consumer of utility services.

Even if it could, in some sense, be said that the utilities, by not procuring private rights-of-way, had entered into the business of providing utility service with the understanding that they would be required to relocate without reimbursement, that "understanding" did not contemplate relocation on the scale now required. The outpouring of federal grant money has induced states and municipalities to undertake enormous projects serving federal policies and meeting federal requirements. Neither the utilities, nor the municipalities or states, who at the time of granting franchises desired to keep the cost of utility services low and the cost of entry into the field relatively small, could have realized the enormity of the yearly relocation expense which federal involvement in public works now causes.

In any event, the immediate question is who should now equitably bear the very real cost of utility relocation -- the natural gas consumer, paying both federal taxes and higher utility rates, or the general public through funds which Congress has set aside to finance these projects.

D. CONCLUSION AND RECOMMENDATION

There is no doubt that Brooklyn Union Gas Company customers are presently shouldering a disproportionate share of the costs of the EPA-assisted Red Hook and Oakwood Beach Water Pollution Control Projects by being asked to pay for the cost of relocating utility facilities in order to accommodate construction on those projects. It is an inequitable situation that can, and should, be changed. I recommend that the Committee consider this issue seriously and that it amend the Clean Water Act to ensure that the utility relocation costs caused by the Red Hook and Oakwood Beach projects are considered allowable and reimbursed under the Act in the same proportion as the federal share of any other water pollution control project cost.

TABLE - I

WP - 152 - RED HOOK WATER POLLUTION CONTROL PROJECT

Borough of Brooklyn

Contract #	Description of Proposed Project	Estimated New York City Cost ($ Millions)	Estimated Impact On Brooklyn Union Gas* ($ Millions)	Anticipated Construction Date
1B1	Interceptor sewer in Columbia Street between Atlantic Avenue & Kane Street.	6.7	.600	1983
1B2	Interceptor sewer in Columbia Street between Kane Street & Degraw Street.	4.5	.400	1986
3A**	Interceptor sewer in Degraw Street between Columbia Street & the Gowanus Canal.	8.7	.800	1985
		19.9	1.8	

*Historical data shows that Brooklyn Union Gas spends approximately $9.16 for utility relocation and maintenance for every $100.00 that New York City spends on sewer construction in Brooklyn.

**This project has several alternative schemes (see attached maps); it is anticipated that the dollar impact to Brooklyn Union Gas will remain the same regardless of which design is used.

The Honorable Robert A. Roe, Chairman
Subcommittee on Water Resources
House Committee on Public Works and
Transportation
2165 Rayburn House Office Building
Washington, D.C. 20515

Dear Chairman Roe:

The Western Regional Council is composed of approximately fifty chief executive officers of companies located in the Intermountain West. Each year, the WRC selects five to seven issues which significantly impact the Intermountain West as a region. One of the issues on which the WRC has been concentrating its efforts during the last year has been revision of the Clean Water Act.

It has come to the attention of the WRC that you have announced hearings on February 23 and 24 at which will be discussed the Environmental Protection Agency's proposed regulations on water quality standards. Since the WRC's comments do not directly address EPA's proposed regulations, the WRC is not requesting to testify. However, the WRC continues to seek revisions to the Clean Water Act provisions dealing with water quality standards. Representatives of the WRC have spoken to your staff director Errol Tyler about this matter a number of times.

Therefore, the WRC would like to submit, as part of the formal record, its proposed revisions to the water quality standards. Your Subcommittee's consideration of the Council's views would be appreciated.

Thank you for your time and consideration.

Sincerely,

David Delcour

THE EFFECT OF WATER QUALITY STANDARDS ON WESTERN WATER

When Congress adopted the Federal Water Pollution Control Act Amendments in 1972, attention in both government and industry was focused on implementation of the NPDES permit program and the development of technology-based effluent limitation guidelines (i.e., BPT and BAT). The permit program is now in place and effluent guidelines have been adopted for most major industries. With these jobs out of the way, significant governmental effort is being directed back toward the Act's original, pre-1972 concern -- the development and protection of ambient water quality standards.

Section 303(c) of the Clean Water Act requires states to establish "water quality standards" for all "navigable waters" within their borders. These "standards" must consist of two things:

(i) designated beneficial uses for the waters; and

(ii) water quality criteria for those uses.

Once adopted, these standards must be submitted to EPA for approval. EPA must grant approval if the standards meet "the requirements" of the Act. If EPA "disapproves" any standard submitted to it, the concerned state must be given a reasonable amount of time to develop a substitute standard which then becomes federally enforceable.

The standards have a direct regulatory impact because of the role they play in the NPDES permit program. Section 301(a) of the Clean Water Act prohibits all discharges of pollutants to "navigable waters" except as authorized by an NPDES permit. In turn, Section 402(a) of the Act requires these permits to "meet" certain minimum requirements. The most prominent of these, as discussed above, is the requirement that discharges reflect minimum levels of treatment technology, i.e., BPT and BAT. However, Section 301(b)(1)(C) of the Act also provides that:

> ...there shall be achieved..
>
> ***
>
> not later than July 1, 1977, any more stringent (effluent) limitation... required to implement any applicable water quality standard established pursuant to this Act...

In other words, dischargers must meet effluent limitations more stringent than BPT and BAT -- the technology-based standards -- if necessary to protect receiving water quality.

Impact on the West: Water quality standards are generally more stringent than technology-based effluent limitation guidelines, i.e. BPT and BAT. In wetter regions of the country, this disparity has little or no practical regulatory effect -- dilution flows generally enable technology-limited discharges to protect receiving water quality. Unfortunately, in perhaps the majority of cases in the arid west, industrial dischargers are asked to install treatment systems that are "better" than what EPA has defined as being "best". At a minimum, this creates confusion and uncertainty, and unreasonably increases the cost of compliance. At worst, it can lead to shutdowns, and prevent industries from locating or expanding their operations in desirable areas.

This breakdown in the regulatory process is the result of several practical problems in the way EPA and the states have implemented the standard-setting process:

i) In the course of preparing their proposals, standard-setting agencies totally ignore economic and technical limitations. Thus, their proposals fail to reflect any sort of meaningful planning.

ii) Due to the absence of any advance correlation between water quality standards and effluent limitations, industries are unable to predict the economic consequences of the agencies' proposals. Even if agencies consider economics in the standard setting process, the standard still would not adequately reflect practical economic concerns.

iii) Furthermore, if meaningful economic information could be presented at standard-setting hearings, EPA limitations on the ability to elect against "fishable, swimmable" waters would render most data irrelevant.

In order to remedy this, industries and the States need to be allowed to consider economic issues to the permitting process without EPA disapproving such permits strictly on the basis of the "zero discharge", "fishable, swimmable" goals of the Act. For a more indepth discussion of the problem the reader is referred to the example in Appendix B.

Recommendations: The solutions to the problems just discussed are very complex. Ideally, the existing standard-setting process should be modified to require a comprehensive, basin-wide water quality assessment, an assessment of the impact

of proposals on dischargers, and a comparison of these impacts with regional planning goals. And, in fact, Sections 208, 303(e) and 304(a) of the Act suggest that such a modification would be consistent with the existing statutory scheme. However, as a practical matter, comprehensive hearings such as this are never held for the issues are too complex. Instead, each of the elements is addressed on a piecemeal basis.

In view of this situation, the most practical solution is probably to amend Section 302.

Section 302(a) of the Clean Water Act grants EPA the power to impose effluent limitations more stringent than those required under Section 301(b)(2) (i.e., BAT, BCT, and toxic pollutant effluent standards), if such limitations are necessary to protect public water supplies, agricultural uses, recreation, wildlife, fish, or shellfish. However, before taking such action, EPA must review the social and economic impact of the more stringent limitations. They cannot be imposed if there is "no reasonable relationship between the economic and social costs and benefits to be obtained. . . ."

A new subsection should be added to Section 302 requiring a similar review for all water quality based effluent limitations, whether imposed by EPA under Section 302 or by a state under Section 301(b)(1)(C). In effect, this would allow dischargers to consider economic issues in permit proceedings, and eliminate the "Catch-22" that prevents any detailed consideration of economic and technical issues until the discharger has worked through a compliance schedule.

The WRC also recommends that the statute be amended to ease EPA's restrictions on the state's ability to decide that "fishable, swimmable" waters are not desirable. In fact, as a matter of administrative policy, EPA is in the process of doing this. However, a statutory clarification would still be desirable for it would reinforce what EPA is now doing and it would prevent future administrations from reversing the policy.

The statute should be amended in two ways to accomplish this:

i) Amend Section 101(a)(2) to provide that the "fishable, swimmable" goal is only desirable if it can be attained in an economically reasonable manner.

ii) Amend Section 303(c) to modify EPA's role in the review and approval of state water quality standards. Provide that EPA may only disapprove of a standard if it is totally unsupported by the record, and will have a substantial adverse effect on interstate water quality.

APPENDIX B

Example of the Effect of
Water Quality Standards on Western Water

As a practical matter the standard setting process has broken down -- at least in the arid west -- because of the great frequency with which industries have been asked to install treatment systems that are "better" than what EPA has defined as being "best." At a minimum, this creates confusion and uncertainty and unreasonably increases the cost of compliance. At worst, it can lead to shut downs and prevent industries from locating or expanding their operations in desirable areas.

This breakdown is the result of several practical problems in the way EPA and the states have implemented the standard-setting process. As a result of these problems, standard-setting agencies in the arid west tend to set ambitious goals that, more often than not, cannot be met through a reasonable level of control.

To better understand the problem, consider the following example. Suppose that State X has decided to establish water quality standards for all "navigable waters" within its borders. The first thing it will probably do is adopt "state-wide" standards, applicable to all waters of the state. This was done by most states in the early and mid-1970's. The current impact of these standards is generally minor.

Next, the state will probably adopt a system for assigning more restrictive, site-specific standards.

For use classifications, the state will create a set of categories which describe beneficial uses of water, and which correspond more or less closely with identifiable criteria. Common examples are "water supply", "agriculture", "recreation", "aquatic life", etc. The state will also create a procedure for assigning these classifications.

For criteria, the state will probably adopt a table of maximum suggested pollutant levels for each standard use category. These criteria will be based on guidelines published by EPA pursuant to Section 304(a) of the Clean Water Act. The state will also sanction the adoption of less restrictive criteria (i.e., it will permit higher in-stream pollutant levels) if the designated uses are "in place", and "existing ambient conditions" support those uses. Having adopted this system, the state will begin the process of assigning standards to specific waters. First, it will probably subdivide the state geographically according to drainage basin. Next, it will assign a schedule for conducting standard-setting proceedings.

Suppose the state has elected to commence with the Y River Basin. It will first take a map of the basin and divide the river and its tributaries into "segments", that is, areas designed to have a single set of standards. These are usually many miles long. Next, employees of the state will inspect each segment and propose classifications based on the uses they see in place, and any others that appear desirable according to local land use plans. Finally, they will propose numeric criteria to go along with the use designations. When this process has been completed for every segment in the basin, the state will propose the standards as an administrative rule.

For the purpose of this example, suppose that you are an industry located on a small tributary to the Y River. Let's assume that the tributary is about five miles long, and you are one of two industries discharging to this stretch of the stream. Upon reviewing the state's proposal you see that this segment (designated as Segment 4 of the Y River Basin) is to be classified as "Cold Water Aquatic Life -- Class I." Under the state's classifications scheme, this means that the stream should be capable of supporting a high quality cold water fishery. Upon reviewing the proposal further, you find that copper is the limiting parameter for this type of fishery. Thus, the state has proposed a numeric limit for copper of 0.005 mg/l. This is the "table number."

Upon completing your review, your first question is, "How will this proposal affect me?" After some reflection, you will probably conclude that you cannot tell. You know that the proposal might affect your ability to discharge copper, but you can't predict the likely extent of the effect. Under the best possible scenario, the proposal won't affect you at all, and your discharges of copper will be limited solely by BPT and BAT. Thus, for instance, if you are a mining company, your discharge will be able to contain 0.30 mg/l of copper as a daily maximum, and 0.15 mg/l as a 30-day average. Under the worst possible scenario, your discharge will only be able to contain 0.005 mg/l of copper -- sixty times more stringent than the daily maximum attainable with BAT.

In order to determine where in between these two extremes your discharge limit might fall, certain assumptions have to be made about available dilution flows, mixing zones, background loading from non-point sources, and allocation of the allowable daily waste load among the two point source dischargers. As a practical matter, these assumptions can only be determined after detailed negotiations with the state permit writer. However, upon calling the state, you discover that the permit writers won't be participating in this hearing -- the state's evidence will be limited to matters directly relating to ambient water

quality, not the effect of the proposed standards on dischargers. Furthermore, because of their busy schedule, the permit writers won't have time before the hearing to discuss the effect of the proposal on your discharge.

Placed in this situation, all you can do is assess the likely impact of alternate scenarios, i.e., what it might cost to meet different effluent limitations that might result from the proposal. Suppose you decide that certain scenarios will require the company to incur substantial additional expense. How do you oppose the proposal? The first thing you will probably do is conduct a review of uses on the stream -- in this case, the status of the aquatic life. You will probably find that the quality of this aquatic life is variable. For instance, a good fishery probably exists upstream of both discharges, but the diversity and population size declines noticeably in the vicinity of the first discharge. The fishery then recovers somewhat as you proceed downstream until you reach the second discharge, where very little aquatic life can be found. As you proceed further downstream to the end of the segment the fishery improves slightly, but it never attains the vigor of the upstream population.

Next, you will probably sample water quality at various points in the segment. It is likely that population levels will correlate inversely with the quality of the fishery -- i.e., copper will be low above both discharges, increase noticeably in the vicinity of the first discharge, decrease somewhat as you proceed downstream, increase significantly in the vicinity of the second discharge, and then recover slightly as you near the end of the segment.

In light of this evidence you will probably argue that the proposed standard should be rejected because it fails to accurately reflect existing conditions, at least for the segment as a whole. However, this argument is almost sure to fail, for the following reasons:

(i) The standard-setters will point out that a high quality fishery does, in fact, exist in some parts of the segment.

(ii) Based on this fact, they conclude that a high quality fishery could exist throughout the entire segment if it weren't for the two industrial discharges. In this regard, they interpret "existing ambient conditions" to refer not to the conditions that actually exist in the stream, but to conditions that would exist in the absence of man-made discharges.

(iii) In light of this situation, they conclude that the higher standard should be considered the "norm". (See 43 Fed. Reg. 29589, July 10, 1978). They suggest that they will adopt "relaxed" standards only if the higher standards are "unattainable" technically, or because they would lead to severe economic dislocation because of plant closures.

When you ask for the source of this latter policy, the standard-setters will almost surely point to EPA's grant regulations, 40 CFR Part 35, and the process by which standards are reviewed by the agency. It is likely that the state water program is funded largely through EPA grants. Since implementation of EPA's "fishable, swimmable" policy has traditionally been a grant requirement, it is unlikely that the state will risk the loss of federal money by refusing to go along. This puts you in a dilemma. You probably can't prove that the standards are "unattainable," because you don't know the precise impact they will have on your discharge permit. Furthermore, even if you could predict these impacts, it is unlikely you could show that the standards were "unattainable" -- it is more likely you would simply think them to be unreasonable. Thus, it is likely that the higher standard will be adopted.

Suppose the higher standard is, in fact, adopted. What happens next in the permit proceeding depends on the precise relationship between your discharge, other discharges, and streamflow conditions. If streamflows are typically high in relation to discharge flows, as they often are in wetter regions of the country, then the standards will have little or no impact. For instance, if the average flow of your discharge is 10 cfs, and the Y River rarely flows less than several hundred cfs, your discharge will be limited by BAT. However, receiving streams in the arid west generally suffer extended low flow periods. Thus, effluent limitations for major industries more often approach water quality standards than BAT guidelines.

What happens when a state proposes these low effluent limitations, which are generally beyond the discharger's existing treatment capacity? Section 301(b)(1)(C) of the Act suggests that if the limitations cannot be met, the source should be shut down. In a classic "Catch-22," economic issues generally cannot be raised during the permit process. The results are rarely so draconian, but they can nonetheless be costly. Generally, permit writers will devise a "compliance schedule" for meeting the water quality based limits. This can have one of two effects. If the discharger elects to go ahead and install the requisite treatment, he will retain his right to discharge, but he will have spent a lot of money in a manner that is unlikely to be cost-effective. If the discharger decides that he can't meet the limits, then the dispute has only been delayed. Upon expiration of the schedule, the discharger must once again attempt to change the underlying standards, using new information he has generated during its term.

As noted above, it is not necessarily unreasonable to make dischargers comply with water quality based effluent limitalimitations. Thus, compliance schedules aren't always objectionable. However, in the arid west, perhaps the majority of major industries are required to investigate the use of technologies that are "better" than "best". This practice is wasteful, and strongly suggests that economic and technical limitations are inadequately addressed in the standard-setting process.

FORT PECK TRIBAL COUNCIL
P.O. Box 1027 Poplar, MT 59255

ASSINIBOINE & SIOUX TRIBES

December 2, 1983

James J. Howard
Committee on Public Works and Transportation
Subcommittee on Water Resources
U. S. House of Representatives
Washington, D. C. 20515

Dear Mr. Howard:

Enclosed with this letter is testimony on possible amendments to the Federal Water Pollution Control Act that I am submitting on behalf of the Fort Peck Assiniboine and Sioux Tribes of Montana.

The Fort Peck Tribes are concerned that provisions of the Clean Water Act do not extend to Indian reservations. As a tribal entity responsible for the management of resources, we are concerned that water quality is virtually unprotected. This situation can be corrected through amendments to the Clean Water Act recognizing Indian Tribes.

We urge this committee to thoroughly review the situation and to extend protection of water quality to all waters in this Nation.

Sincerely,

Norman Hollow
Chairman

FORT PECK ASSINIBOINE AND SIOUX TRIBES

CLEAN WATER ACT TESTIMONY

The Fort Peck Assiniboine and Sioux Tribes of Montana are submitting this testimony to urge the House Committee on Water Resources and Congress to adopt amendments to the Clean Water Act that would recognize Indian Tribal governments and provide full protection for water quality on Indian reservations.

The Fort Peck Reservation, located in northeastern Montana encompasses a land area in excess of two million acres. The Missouri River forms the southern boundary of the reservation. Tributaries arising or crossing the reservation contribute approximately 204,000 acre feet of water annually to the Missouri River. Water is a valuable resource in this semi-arid region of the country. The maintenance or upgrading of the water quality of these tributaries is of great importance to the reservation people.

The cultural heritage of the Assiniboine and Sioux people has always emphasized respect and preservation of the natural environment as a responsibility of the people. The Tribes have always taken for granted that access to a clean environment is a God given right. However, interest in the vast energy and water resources on and around the reservation by energy corporations, developers, state and federal governments have prompted the Tribes to formally evaluate their vulnerability to exploitation by outside interests. Let it be noted that the Tribes are not anti-development. We realize that development of many of these resources is inevitable, if not on the reservation, then on surrounding lands. Development of natural resources in our area evokes the possibility of destruction of our environment and thus degredation of our cultural heritage and uniqueness. Although proverty and unemployment are very real on our reservation, we do

not believe that uncontrolled development of our natural resources offers any long term solutions; thus, the Fort Peck Tribes favor what can be termed orderly development with preservation of our lifestyle as our first priority.

This concern has prompted the Fort Peck Tribes to develop Tribal expertise and programs to research, monitor, and control environmental impacts. Unfortunately little headway has been made for protection of the reservation's water quality. This is because the provisions of the Clean Water Act to not extend to Indian reservations.

In 1972, P.L.92-500, the Federal Water Pollution Control Act, was enacted by Congress in an effort to clean up and maintain the integrity of the nations waters. The Act was amended in 1977 to better meet the needs of states and communities. The Clean Water Act as amended sets standards, deadlines, effluents, and discharges as well as sets forth the responsibilities of states and local governments in reaching national water quality goals.

Funds were made available to states to identify and quantify sources of water pollution. Funds were also provided to states to mitigate problems associated with various point and non-point sources of water pollution such as municipal wastes and agricultural run-off. Towards this end, states developed programs which classified their streams and lakes based on quality and allowable changes in that quality. Unfortunately, these programs did not extend to Indian reservations. The streams and rivers of the Fort Peck Indian reservations are not classified based on their true natural quality. In-stream flow requirements to support fisheries and wildlife have not been determined and baseline quality is still unknown for all but one of our streams.

The Fort Peck Tribes were awarded a 208 Area-Wide Management Planning

grant in 1978. With limited funding various point and non-point sources of pollution and several real and potential water quality problems on the reservation were identified. One major problem identified is lack of necessary baseline data on water quality and the biological characteristics of reservation streams and lakes. Without this information it is impossible to develop an effective reservation wide water quality management plan.

It was not until recently that the Fort Peck Tribes became fully aware of the holes in the state data base which we had intended to utilize in determing stream classifications and in-stream flow requirements. This discovery also leads us to believe that many other reservations are in similar predicaments. The result is that the mandates of the Clean Water Act are not being met on a substantial number of streams, rivers, and lakes nationwide.

It appears as though assistance has been given to Indian Tribes to develop water quality management plans merely for planning sake - there are no means for implementing the plans. By specifically including Indian Tribes as municipalities. Congress has limited the Tribal role in the Clean Water Act. The limited Tribal role has created a regulatory vacuum on Indian lands since states, except for certain Public Law 280 reservations, have no jurisdiction on Indian reservations.

We recognize a concern states may have in reconciling state water quality standards with standards proposed by Indian Tribes. Under Section 303 of the Clean Water Act, state standards require EPA review. Standards consistant with the Act are approved by EPA. If the state standards are not consistent with the Act, the EPA so informs the state which then has time to propose new standards. Through rulemaking, a similar mechanism could effectively resolve any state/tribal water quality standard variations.

In keeping with the direct relationship established between the Fort Peck Tribes and the Federal government in the Act of May 1, 1988 (25 Stat. 113-133, C. 213), we urge Congress to amend the Clean Water Act to provide us with the same recognition, authority and assistance to that given the states.

January 16, 1984

The Honorable Robert A. Roe
Chairman, Subcommittee on Water Resources
U. S. House of Representatives
2243 Rayburn House Office Building
Washington, D. C. 20515

Dear Chairman Roe:

It is respectfully requested that the attached General Motors comments relative to the Clean Water Act be made a part of the record of the hearings recently held by your Subcommittee on Water Resources. The statement explains the nature of the problems faced by integrated industrial pretreatment facilities which were referred to by various witnesses. There is growing recognition of the adverse consequences that befall integrated facilities faced with different standards promulgated at different times. This was quite clear from your comments and dialogue with EPA Administrator William D. Ruckelshaus, following his Clean Water Act testimony before your Subcommittee. The statement will also correct a highly erroneous and misleading statement made by the NRDC witness before this subcommittee in testimony on November 9, 1983.

We stand ready to assist you, your staff, and your Subcommittee in your deliberations over reauthorizing the Clean Water Act.

Sincerely,

William C. Chapman

STATEMENT OF

GENERAL MOTORS CORPORATION

TO THE

SUBCOMMITTEE ON WATER RESOURCES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

U.S. HOUSE OF REPRESENTATIVES

FOR THE RECORD OF THE HEARINGS ON

REAUTHORIZATION OF THE CLEAN WATER ACT

JANUARY 16, 1984

General Motors Statement

In testimony recently presented to the Subcommittee on Water Resources relative to pretreatment requirements, a Natural Resources Defense Council, Inc. (NRDC) witness included a direct and negative reference to General Motors. Specifically, the NRDC witness, Frances Dubrowski, on November 9, 1983, said, "We (NRDC) conclude that General Motors waited until it had exhausted all litigation opportunities, and is now using the variance procedure to try to get EPA to ratify its decision to postpone compliance."

A review of those comments in the context of existing statutory and regulatory realities causes GM deep concern because of the implication created by NRDC that General Motors attempted to circumvent the pretreatment provisions of the Clean Water Act (CWA).

Therefore, General Motors is submitting herewith for the record a complete description of its activities relative to the effect of the pretreatment program on integrated facilities. Also, in order to place events in the proper perspective and gain a complete understanding of the current situation, it is necessary to review the regulatory activity which preceded General Motors filing of Fundamentally Different Factors (FDFs) variance applications for each of 27 plants. Several of these plants are projected to be unable to comply with requirements by June 30, 1984.

While the environmental implications of non-compliance are marginal since all the facilities in question comply with locally established water treatment standards, the other consequences of operating in non-compliance are alarming to us. Financial penalties could be $25,000 per violation per day in criminal

20-955 O—84——221

penalties plus $10,000 per violation per day in civil penalties, as well as imprisonment.

At one plant, an investment of $17,000,000 will be required to bring the plant into compliance, but even that kind of monumental spending will not achieve compliance in time to preclude the unreasonable penalties noted above. Since GM will not knowingly subject its employes to criminal prosecution, some way needs to be found to accommodate the present situation without having to consider closing anv of the plants in question.

General Motors believes it has demonstrated good faith efforts relative to all applicable pretreatment regulations under the Clean Water Act and continues to pursue those objectives. However, the retroactive reinstatement of some of the regulations mandated by the Third Circuit Court in July of 1982 and effected by EPA in September, 1982, had the effect of substantially shortening compliance time available to us. As a result, General Motors and others were presented with a revised regulatory framework with new and unrealistic constraints in the time available to accomplish compliance.

GM's filing in June, 1983, of FDF variance requests for facilities projected to be noncompliant beyond the June 30, 1984, deadline was based upon EPA's advice offered in meetings with Agency representatives and in accordance with then existing regulations. Earlier filing based on the September, 1982, EPA regulations could not be accomplished because required baseline monitoring information was being gathered. In fact, General Motors discussed our predicament openly and forthrightly with EPA, with Congressional representatives, and with NRDC itself as we explored possible alternative remedies. Our concerns focused on the serious impact of the court decision in July, 1982, which

denied us critically needed compliance time and the pretreatment requirements as they affect our integrated facilities.

Regrettably, four months after our filing of variance requests in June, 1983, the Third Circuit Court, in response to NRDC pleadings, in September ruled out FDF variances, creating the situation in which we now find ourselves.

We believe the serious impact of the July, 1982, court decision in consuming expected and necessary lead time is a totally unintended adverse consequence of the statute and its interpretations.

The chronology of events which led industry to this situation is:

1. In March, 1981, the applicability of the Electroplating Pretreatment Standards to integrated facilities was indefinitely suspended by EPA. Because the final rule was so suspended and was subject to modification by either judicial or administrative ruling, owners of integrated facilities had no way of knowing what their compliance obligations would be. Not until such time as the Third Circuit Court order gave these suspended rules -- with possible modifications -- new life would there exist guidelines to which to design and engineer suitable systems. Moreover, as part of its decision, the Court pointed out that their action did not necessarily affect the technical validity of the original suspension, but rather the decision was based on the finding that EPA had failed in 1981 to follow the requirements of the Administrative Procedures Act (APA). The Court further explained in its decision that EPA was not precluded from resuspending the regulations, provided that they did so in accordance with the APA. Although

the Court ruling occurred in July, 1982, EPA delayed until September 28, 1982 in responding to the Court's action. EPA then elected to reinstate the regulations without a subsequent resuspension. Therefore, integrated facilities (including General Motors plants) did not know, and in fact, could not know, of their exact compliance obligations any earlier than September 28, 1982.

Thus, the one-and-one-half-year gap between the promulgated (and subsequently suspended) regulation (January, 1981) and initiation of engineering studies is accounted for solely as the result of the retroactively reinstated regulation. It is beyond reason to expect integrated facilities to begin construction of treatment systems costing millions of dollars without knowing what their final compliance obligations will be.

2. As a direct result of the retroactive reinstatement of the deferred pretreatment regulations, which nullified 18 months of a 36-month compliance schedule, many GM integrated facilities are projected to remain noncompliant with the Electroplating Pretreatment Standards beyond the June 30, 1984 deadline. In response to GM's concerns relative to this situation, EPA suggested in meetings with Agency representatives that relief was available through Fundamentally Different Factors variances. Accordingly, GM filed on June 27, 1983, requests for extensions for time only, under the FDF variances procedure, for each of the noncompliant facilities. It is important to note that the Court action which ruled on the illegality of FDFs occurred on September 30, 1983, a full four months after the June 27 filing date.

In view of the above background facts relevant to the Electroplating Pretreatment Standards, it is clear that GM has been responding to conditions beyond its control which eliminated one-half the compliance time Congress intended. However, since the Court has withdrawn the FDF variance capability from EPA and since GM is not able to make up for the electroplating compliance time removed by government action, it is uncertain how the GM plants mentioned earlier can operate in compliance with the regulations after June 30, 1984. Contrary to allegations, General Motors has pursued options not only available to us under the law, but recommended by administrators of the law as well. Further, most of GM's affected facilities met the Electroplating requirements well in advance of the June 30, 1984 deadline; more will be brought into compliance by June 30, 1984; and necessary efforts are continuing to make the remaining several plants meet the requirements as soon as possible even though they likely will not meet those requirements by June 30, 1984.

Appended hereto as Attachment A is a brief paper which provides more detail and background on these government actions and their impact upon General Motors. Also appended hereto as Attachment B is General Motors testimony on related matters which was presented to the Senate Environmental Pollution Subcommittee on April 14, 1983.

Attachment A

BACKGROUND ATTACHMENT TO

GENERAL MOTORS CORPORATION CLEAN WATER ACT STATEMENT

The CWA requires the establishment of pretreatment standards for pollutants which interfere with, pass through, or otherwise are incompatible with a publicly-owned treatment works (POTW), as well as for those pollutants which prevent sludge use or disposal by such works. EPA has implemented these requirements through the promulgation of General Pretreatment Regulations which establish standards common to all industries, and industry-specific Categorical Pretreatment Standards which establish separate standards for 34 industrial categories, including Electroplating and Metal Finishing. This approach requires an industrial discharger which is subject to multiple category regulation (i.e., integrated facility) to comply sequentially with each categorical standard as it is promulgated.

The Electroplating Standards, one of eleven pretreatment standards affecting GM's integrated facilities, were amended in January, 1981. However, their applicability to and required compliance by integrated facilities (including General Motors) were directly tied to a portion of the General Pretreatment Regulations. These general controlling regulations were suspended indefinitely in March 1981, as a result of action

initiated in part by Vice-President Bush's Task Force on Regulatory Relief.

EPA's action suspending the combined wastestream formula had the effect of lifting any requirement for General Motors integrated facilities to meet the Electroplating Pretreatment Standards. Also, EPA announced that it was studying various alternatives to the suspended formula. Therefore, until EPA finalized its thinking on the formula, as well as the question of how to regulate integrated facilities, GM was unable to define the regulatory requirements it had to meet.

To restate our problem in a different way, until such time as final wastewater discharge requirements were established for integrated facilities, GM could not properly design and construct facilities to meet unknown objectives. Moreover, EPA refinalized the suspension of the combined wastestream formula on February 1, 1982.

On September 28, 1982, EPA implemented the order of the Third Circuit Court of Appeals by reinstating, retroactive to March 30, 1981, the deferred sections of the pretreatment regulations. The immediate effect of this action was to make the Electroplating Pretreatment Standards applicable to all integrated facilities, and, by that time, due to the retroactive nature of the order, to nullify 18 months of a 36 month schedule aimed at a June 30, 1984 compliance deadline.

With compliance time diminished, GM filed an administrative Petition for Stay and Rulemaking on August 10, 1982 requesting EPA to reconsider

and resuspend the section of concern because the remaining 24 months of compliance time was inadequate to design and construct facilities. In passing, it should be noted that the Court decision did not prevent EPA from undertaking a proper rulemaking to continue the suspension of the regulation. On June 3, 1983, EPA denied General Motors petition. On September 1, 1983, GM filed an appeal to this denial.

In the meantime, EPA proposed the Metal Finishing regulations appplicable to the same integrated facilities affected by Electroplating. As proposed, the Metal Finishing rules would have established significantly more stringent levels of control on the industrial discharge. In these proposals EPA maintained that the more stringent second level of control (Metal Finishing) could be achieved by application of the same treatment technology required by the Electroplating. GM's position on this was that in order to meet the proposed Metal Finishing standards, additional treatment would be required.

Concurrent with General Motors activity in the regulatory and judicial areas, similar efforts were undertaken in Congress to effect changes to the CWA during current reauthorization activities. These efforts included numerous conversations with the NRDC representative, discussions with EPA and congressional staff, and GM testimony before the Senate Subcommittee on Environmental Pollution. Our testimony projected an estimated $350 million expenditure for GM to comply sequentially with eleven pretreatment standards (see Attachment B). This testimony also indicated the potential for misspending $200 million

in order to comply sequentially with future standards that would affect the same facilities.

After receiving comments from GM and others relative to the proposed Metal Finishing rules, on July 15, 1983, EPA issued final regulations which elevated approximately two-fold the pollutant limitations. These final standards, which must be met by February 15, 1986, can be attained by available technology and are perceived by many in the industrial community to meet the requirements of the CWA.

In a related matter, on September 30, 1983, the Third Circuit Court of Appeals rendered its decision on the 1981 litigation, in essence upholding the validity of the General Pretreatment Regulations and Electroplating Pretreatment Standards relative to integrated facilities. The Court also ruled in favor of NRDC pleadings that the granting of FDF variances for toxics would be illegal under the CWA.

General Motors integrated facilities which do not already meet the Electroplating and Metal Finishing Pretreatment Standards are now proceeding with requisite engineering and construction activities which will culminate in compliance. Because wastewater treatment technologies for both regulations are similar, treatment facilities installed to meet Electroplating will also provide compliance with Metal Finishing.

STATEMENT OF

GENERAL MOTORS CORPORATION

TO THE

SUBCOMMITTEE ON ENVIRONMENTAL POLLUTION

OF THE

SENATE COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS

ON

COMPLIANCE WITH CATEGORICAL PRETREATMENT STANDARDS BY INTEGRATED FACILITIES

PRESENTED BY

PHILIP E. GERWERT

ENVIRONMENTAL ACTIVITIES STAFF

APRIL 14, 1983

WASHINGTON, D.C.

Good morning, Mr. Chairman and Members of the Subcommittee. I am Philip E. Gerwert, Manager, Water Pollution Control, General Motors Environmental Activities Staff.

We welcome this opportunity to review with you the effect of categorical pretreatment standards on our one hundred forty plus plants -- over 100 of which are classified as integrated facilities.

Before doing that, however, let me state that General Motors recognizes the great improvement in the quality of the nation's waterways which has resulted from implementation of the Clean Water Act, particularly since 1977. We also acknowledge at the outset that the categorical pretreatment standards, while not the ideal solution from General Motors viewpoint, appear likely to achieve the objectives for which they were designed, at least in a large number of plants where only one type of wastewater is discharged. Thus, the Act has been and can continue to be successful in at least these two major aspects.

Our testimony today will address two additional points, where it appears the consequences of the Act are unintended. First, it has been generally acknowledged that compliance with Best Available Technology (BAT) cannot be achieved by the dates currently specified in the Clean Water Act. This situation is addressed by the provisions of Senator Randolph's bill, S. 432, which we fully endorse. The second point centers on the lack of equitable, practical pretreatment standards for

integrated facilities. This issue, while not addressed in S. 432, was included in Senator Randolph's floor remarks on February 3, 1983, when he introduced the bill (Congressional Record, page S. 1011, attached).

General Motors supports S. 432. because it would provide necessary relief from the harsh consequences of the 1984 BAT deadline in a reasonable way. In addition, we commend Senator Randolph for recognizing in his introductory message to S. 432 the compliance problem faced by integrated facilities. The solution he suggests would correct the problem faced by one major segment of the industrial community -- that which utilizes integrated treatment facilities to accomplish the necessary control in a more economical way. The approach suggested by Senator Randolph can be made without any far-reaching substantive changes in the Act, and without sacrificing water quality.

BACKGROUND

By way of background for the specific problem I will address, Section 307(b) of the Clean Water Act directs the Environmental Protection Agency (EPA) to promulgate categorical pretreatment standards in order to regulate the discharge of pollutants from industries into publicly-owned treatment works (POTWs). Specifically, these standards must (a) prevent pollutants from interfering with the operation of such POTWs, (b) ensure that such pollutants do not pass-through the POTW, (c) prevent sludge contamination, and (d) assure continued compliance by the POTW's with their discharge permits.*

---

*Under the National Pollutant Discharge Elimination System

The Act currently incorporates the commitments embodied in the 1976 Consent Decree entered into by the Agency and the Natural Resources Defense Council. These commitments include provisions for the Agency to establish several industrial (source) categories for regulation of wastewater discharges.

Final regulations for 14 of the 34 primary industry categories thus far listed by EPA have been issued. Fourteen more have been proposed and are pending promulgation. Based upon EPA's "Regulatory Agenda" (October 28, 1982, 47 Federal Register 48734-42), regulations for the six remaining categories are scheduled to be proposed during 1983, with promulgation expected approximately nine to twelve months later.

SEPARATE SOURCE VS INTEGRATED PRETREATMENT

Under this regulatory program for the control of pollutants into POTWs, industries must comply with the specific categorical pretreatment standard which reflects actual operations performed at a given facility. For example, a facility performing electroplating operations exclusively is regulated by the electroplating pretreatment standards, while one which manufactures only inorganic chemicals is regulated under the inorganic chemicals pretreatment standards. Each of these types of facilities is required to install separate pretreatment equipment on its wastestream.

Obviously, this approach does not address the problems encountered by large, diverse complexes typical of many in American industry, where multiple sources and various kinds of manufacturing operations on the premises of a single facility cause the discharge of several different types of wastewater. Such installations are subject to as many different standards as there are individual categorical wastestreams within the confines of the plant. An overview of the widespread effect of such multiple categories on GM facilities, for example, are presented in Attachment A.

GM EXPERIENCE

General Motors manufacturing operations are representative of these large, diverse complexes. Of the 140 plus General Motors facilities which discharge process wastewaters into POTWs, 94 will be required to comply with the electroplating pretreatment standards by June 30, 1984, as well as subsequent pretreatment standards yet to be promulgated. From experience, we already know that each unit of control equipment required by such future separate categorical standards will in significant measure duplicate equipment on other different wastestreams. For efficiency purposes, it is clear that one unit of control equipment should be installed on the combined wastestream prior to discharge to the POTWs.

Contrary to what one would expect, there is an additional difficulty we face, namely, that compliance cannot be determined by direct comparison of the pollutant concentration levels in the discharge with the

pollutant limitations established by the various regulations. And here I must get fairly technical to define the crux of our problem.

The comparison just mentioned cannot be made because the actual regulated value for the same specific pollutant varies among the different categorical pretreatment standards. For example, the daily maximum limitation for nickel is 4.1 milligrams per liter for the Electroplating category, whereas it is 3.51 milligrams per liter in the proposed Metal Finishing pretreatment regulations.

In an effort to accommodate these variables at integrated facilities, EPA provided a mechanism for determining compliance with the various categorical pretreatment standards mathematically through the use of a "combined wastestream formula." This formula calculates the flow-weighted average of each pollutant limitation common to several of the categories affecting any given facility.

While the "combined wastestream formula" may be appropriate for some integrated facilities -- that is, those for which all categorical standards have been issued -- it does not resolve the problems faced by all integrated facilities for the following reasons:

1. The first problem is the inability to determine the ultimate pollutant limitations using the combined wastestream formula until the limits have been established for each category at a manufacturer's facility. Thus, only after promulgation of

the last applicable standard can we assess with any degree of certainty the technological feasibility of meeting the combined pollutant limitations because the "combined wastestream formula" relies on published standards for each category. In short, we face a moving target.

2. The second reason is the result of the first. Since the compliance numbers for each new category affect the combined numbers derived from the formula, the likelihood exists of having to alter over and over the design of the combined industrial wastewater control equipment. In some cases, portions of a facility that have been completed in order to comply with the discharge requirements calculated from the combined wastestream formula will be obsoleted or require significant change due to a subsequently issued categorical standard. As a result, a substantial amount of monies for such facilities could be misspent.

A visual presentation of the cost-inefficiency of the sequential, category-by-category compliance approach, compared with the single control approach applied to the total combined wastestream as a distinct category, can be seen in Attachment B.

SOLUTION TO INTEGRATED FACILITIES PROBLEM

In order for our facilities to comply with the current requirements of the categorical preatment standards, General Motors has estimated it will require capital expenditures of about $350 million. We also have estimated that about $200 million of this investment could be avoided if the law provides for the designation of "integrated facilities" as a distinct source category. As previously mentioned, such a remedy for the problem of integrated facilities was noted by Senator Randolph in his remarks accompanying the introduction of S.432. Compliance for this new category would also be required no later than three years following promulgation of the final categorical pretreatment standard affecting a given integrated facility. We heartily agree with this approach.

However, in order to avoid compliance dates which extend too far into the future, it would be appropriate to limit the affected source categories to the primary industries previously referenced.

These remedial actions can be implemented by appropriate amendments to Sections 306 and 307 of the Clean Water Act. Consistent with the above, the compliance date for a facility classified as "integrated" could be extended only to the latest compliance deadline specified in the combination of those primary categories which affect that given facility. Moreover, by designating "integrated facilities" as a separate source category, the technological attainability of the final standards can be assessed properly, and cost-effective, environmentally-sound controls installed.

20-955 O—84——222

CONCLUSION

In summary, General Motors remains committed to controlling the discharges of pollutants to our nation's waters consistent with the goals of the Clean Water Act. In 1947 we completed installation of our first integrated facility at a GM plant. Because of this commitment, all of GM's plants in this country have water pollution control now in place. From 1969 to 1982, to cite a period for which GM has recorded its expenditures, we have spent approximately $879 million for water pollution control.

Future controls, GM believes, must be instituted in the most technologically-feasible and cost-effective manner if this country and its industrial community are not to squander their limited economic and engineering resources. With regard to pretreatment, this can be accomplished with the modifications to the Clean Water Act suggested by Senator Randolph and endorsed here today by General Motors. Again, this can be done without impairing the quality of the receiving water. We urge that the Committee act on our recommendation to clarify the intent of Congress with respect to establishing separate categorical source and non-conflicting effective dates for integrated sources.

Attachment B

ance within 3 years of adoption of such standards.

Arguments have been made for, and last year's administration bill reflected, the concept of national categorical standards for only the major sources of toxic pollutants, with a provision that exemptions would be obtained on certification by a publicly owned treatment works that it has a program adequate to maintain designated uses for receiving waters.

This legislation does not modify the requirement for establishment of national categorical pretreatment standards. It permits local treatment works to establish and implement alternative local pretreatment systems under certain stringent conditions. Such systems would be closely monitored and controlled, and would not be detrimental to current existing designated uses for receiving waters. This approach will serve as a starting point for this year's consideration of the pretreatment issue. I expect further amendments to it to be offered.

Mr. President, I believe this bill to be an important further step in the deliberations of last year. I look forward to working with the Environmental Pollution Subcommittee, chaired by our able colleague, Senator CHAFEE, and the Committee on Environment and Public Works, under the constructive leadership of Chairman STAFFORD, in completing vital action on amendments to the Clean Water Act.●

By Mr. RANDOLPH:

S. 432. A bill to amend the Clean Water Act to extend the 1984 compliance date for certain recently established requirements; to the Committee on Environment and Public Works.

CLEAN WATER COMPLIANCE DATE EXTENSION ACT OF 1983

● Mr. RANDOLPH. Mr. President, today I am introducing the Clean Water Compliance Date Extension Act of 1983. It is my intention that this legislation be considered by the Committee on Environment and Public Works at the same time as the Clean Water Act Amendments of 1983, a measure also intoduced today by my colleague, Senator JOHN CHAFEE.

The measure I introduce is similar to an amendment which I considered offering to the Clean Water Act last year, when the committee was examining possible amendments to that act. I did not offer it at that time because it was apparent that such an amendment, regardless of its merit, would attract a number of other amendments, perhaps not so meritorious.

The Clean Water Act currently mandates that industry achieve effluent limitations based on the best available technology (BAT) for all toxic pollutants no later than July 1, 1984. BAT for nonconventional pollutants must be achieved by 3 years after promulgation but no later than July 1, 1987, and BCT, or the best conventional technology for conventional pollutants, such as biological oxygen-demanding materials, by July 1, 1984. These targets were set in the expectation that the Environmental Protection Agency would promulgate guidelines in a timely fashion for the 26 industrial categories initially to be regulated by the 1977 amendments to the act. The Agency has been unable to conform with this expectation, and is now under court order to promulgate all guidelines by late in 1983.

For most of the 26 industries required to comply with these standards, it will be impossible to meet the July 1984, date for compliance which is mandated by law. Guidelines for most of these industries have not yet been promulgated. Testimony at last year's hearings of the Environmental Pollution Subcommittee demonstrated that 3 years after promulgation would probably be necessary to write permits and design and construct facilities. Such as extension, important to many industries, will be essential to the steel industry, for which guidelines were not promulgated until May 1982. In fact, these guidelines are under litigation and may be revised further. I am not being parochial, Mr. President, when I say that the steel industry, so important to my own State of West Virginia, is equally important to the welfare of the Nation as a whole.

The bill I introduce today would extend these deadlines. Three categories of treatment are addressed in this measure: BAT and BCT deadlines for toxic, nonconventional and conventional pollutants; recently issued BPT (best practicable technology), a minimum requirement for all pollutants—confined to guidelines issued after January 1, 1982, such as those for parts of the steel industry; and permits based on best engineering judgment for pollutants for which guidelines have not been established but which have been granted in lieu or effluent guidelines for BAT, BCT, and BPT since January 1, 1982. These deadlines may be extended to not later than 42 months after the date of enactment of this legislation, or not later than 36 months after the date of promulgation or issuance of the appropriate effluent guidelines or permit, whichever is later.

This extension will give industry a minimum of 3 years after Environmental Protection Agency promulgation of guidelines to comply with requirements, with all industries with previously issued guidelines achieving compliance by 3½ years after the bill is signed into law.

I look forward to working with Environmental Pollution Subcommittee Chairman JOHN CHAFEE and full committee Chairman BOB STAFFORD in the development of this amendment to the Clean Water Act.

Mr. President, the failure of the Environmental Protection Agency to promulgate industrial standards has also had a severe impact on the ability of industry to comply with the pretreatment requirements of the Clean Water Act. Although a provision of the amendment I considered offering last year dealt with this, I have not addressed this issue in the context of the bill which I introduce today. When the Committee on Environment and Public Works considers amendments to the Clean Water Act, however, it may be appropriate to add language which will deal specifically with the problems being encountered by industries in which diverse manufacturing operations require the application of more than one categorical pretreatment standard.

One example of such an industry would be an automotive manufacturing plant, in which waste water from each individual operation is ultimately combined to achieve cost-effective compliance with water quality standards. Such an industry is faced with severe practical problems in complying with the Environmental Protection Agency's categorical pretreatment standards, particulary when they are issued at widely different times. The discharge limits imposed by the combined waste-stream formula will change as subsequent pretreatment standards are promulgated. This means that this industry, as well as others having integrated operations, will be uncertain about the form of future compliance obligations. It will make it impracticable, if not impossible, for such industries to build new treatment plants until all applicable standards are promulgated.

It may be appropriate to incorporate into section 307(b)(3) of the Clean Water Act as designation of an integrated facilities category, to be defined as a facility in which more than one waste stream is subject to categorical standards, issued at different times, entering a publicly owned treatment work. Under the law, compliance with pretreatment standards would be mandatory within 3 years after promulgation of the last categorical standard affecting such a facility.

As I said, Mr. President, I have not included this concept in the legislation which I introduce today. But I believe the committee should give attention to this problem when it considers other amendments to the pretreatment provisions of the Clean Water Act. It is my understanding that Chairman STAFFORD and Subcommittee Chairman CHAFEE are committed to reporting out this legislation by mid-March, and I will support their efforts to do so.●

By Mr. GARN (for himself, Mr. PROXMIRE, Mr. NUNN, Mr. COHEN, Mr. TOWER, Mr. MOYNIHAN, Mr. LAXALT, Mr. THURMOND, Mr. ARMSTRONG, Mr. TRIBLE, Mr. MATTINGLY, Mr. HATCH, Mr. HELMS, Mr. PRESSLER, Mr. ABDNOR, Mr. SYMMS, Mr. EAST, and Mr. WALLOP):

Rayburn House Office Building
Room 2243
Washington, D.C. 20515

Dear Mr. Roe:

My sincere thanks to you for permitting Mr. John Hart, P.E. to present the position of this organization on amendments to the Clean Water Act to your Subcommittee during your recent hearings.

It is true that we inadvertantly failed to provide a copy of our remarks to NSPE prior to the hearing, and as stated in Mr. Weinerts letter to you of October 26th we are a small minority of the national organization. Nevertheless, we do speak for the state of West Virginia and the issues of collector sewer funding and 75% grants are of such magnitude to the success of the water pollution control effort in West Virginia that we had to make this known directly to you.

Confusion, if it exists in this instance must be with those who are trying to focus divergent views into one statement to present for hearing. But in reality it is your comittee that should have the divergent views so you can, sift the wheat from the chaff and produce realistic, workable legislation. This is the meat of what democracy is all about.

We are most pleased to know our views correspond with yours. If we may be of service to you in anyway please let us know.

Sincerely,

GOUTY ASSOCIATES, INC.

Otis D. Gouty, P.E.
President

GOLDEN ANNIVERSARY

"50 YEARS OF SERVICE TO THE STATE OF WEST VIRGINIA"

BILL SHEFFIELD
GOVERNOR

STATE OF ALASKA
OFFICE OF THE GOVERNOR
WASHINGTON, D.C.

October 6, 1983

RECEIVED
OCT - 7 1983
PUBLIC WORKS AND TRANSPORTATION COMMITTEE

The Honorable James J. Howard
Chairman
Committee on Public Works
and Transportation
U.S. House of Representatives
Room 2165
Rayburn House Office Building
Washington, D.C. 20515

Dear Representative Howard:

The State of Alaska has been actively involved in and concerned about Section 404 of the Federal Water Pollution Control Act for a number of years. As your Committee looks at possible amendments to that Act, and Section 404 in particular, we did want to contribute the enclosed statement to the record.

With an estimated 59% of the country's remaining undeveloped wetlands, the State of Alaska continues to have a keen interest in the 404 program. As a measure of that interest, the Sheffield Administration has recently prepared a summary of points which we believe are important to consider in any review of the 404 program. The points address the procedural problems which have arisen in implementing Section 404, while encouraging the relention of its substantive provisions. In particular, we have found the current law allowing State assumption of the program to be cumbersome and counter-productive to the Congressional intent of encouraging such assumption by States.

We hope that you find our "seven points" helpful as the Committee considers action on the 404 program. If you have any questions or desire any further information, I would be happy to oblige.

Sincerely,

John W. Katz

John W. Katz
Director of State/Federal
Relations and Special
Counsel to the Governor

Enclosure

STATE OF ALASKA
SHEFFIELD ADMINISTRATION
RECOMMENDATIONS ON
SECTION 404 OF THE
CLEAN WATER ACT

The seven points below represent the Sheffield Administration's formal outline on possible amendments to Section 404 of the Clean Water Act. The paper responds to the need for the State of Alaska to convey its recommendations to its Congressional delegation in Washington, D.C. It updates the State of Alaska's recommendations presented as testimony before the U.S. Senate Committee on Environment and Public Works on July 8, 1982. The State does not currently seek substantive amendments to Section 404. The State is interested, however, in exploring alternatives which would improve the procedural aspects of the 404 program and make more attractive the possibility of State assumption of the 404 program, including State administration of the 404 program on State lands.

The seven cornerstones of the State of Alaska position are:

1. Retain the substantive provisions of Section 404 as they currently exist. Retain the current regulatory jurisdiction over phase I, II, and III waters of the United States.

2. Streamline the 404 permitting process through all available avenues.

3. Encourage flexibility within individual Corps' districts for resolving agency disputes at the regional level rather than at the national level.

4. Establish reasonable but definite time periods for permit review, while providing for extensions when properly justified. Continue use of preapplication and pre-decision conferences.

5. Consistent with Senator Murkowski's directive to resource agencies, advocate the completion of local, State and federal wetland management plans or guides as a desirable means of expediting 404 permitting through mapping, classifying and managing wetlands according to relative value.

6. Support changes that will make delegation of the 404 program to States more acceptable. Support management or other alternatives which allow for direct State administration of the 404 permit program on State lands. (Alternatives here include assumption of the 404 program by the State on State lands; the use of general and regional 404 permits on State lands; and local administration of general permits in areas with approved local wetlands management plans.)

7. The State of Alaska encourages federal regulators and legislators to consult with the State prior to making major changes in Section 404 or implementing regulations.

Kimberly-Clark

November 10, 1983

Representative Robert A. Roe
Chairman, Water Resources Subcommittee
House of Representatives
2243 Rayburn House Office Building
Washington, DC

Re: Clean Water Act Position Statement of Kimberly-Clark Corporation

Dear Representative Roe:

Kimberly-Clark Corporation appreciates this opportunity to provide input to the Water Resources Subcommittee regarding Clean Water Act issues and amendments.

A major U.S. manufacturer of fiber-based products for personal care, service, institution, and other diverse markets, Kimberly-Clark Corporation has operations throughout the U.S. covering all phases of pulp and paper production, nonwoven fabric manufacturing, and aircraft refurbishing. Twenty-nine Kimberly-Clark facilities in seventeen states are directly or indirectly affected by the Clean Water Act.

Kimberly-Clark comments focus on five specific issues in the Clean Water Act (CWA) renewal and amendments. The five issues are discussed in detail below and are supported by examples of Kimberly-Clark's concerns.

1. Dams/Water Quality

The significant adverse effects of large dams on downstream water quality are now well established. This phenomenon was documented in testimony before the Water Resources Subcommittee by the National Wildlife Federation, which demonstrated that dams can cause major dissolved oxygen and other water quality problems. Kimberly-Clark shares this concern.

As a case in point, Kimberly-Clark cites the Coosa River in Alabama from Logan-Martin Dam to Lay Lake. Logan-Martin Dam is a large peaking power dam constructed in 1964 by Alabama Power Company. It has drastically changed the flow regime of the river during the critical water quality months of May through October.

Kimberly-Clark Corporation 401 North Lake Street Neenah, Wisconsin 54956 (414) 721-2000

In the past, the Coosa River was characterized by a continual, slowly changing flow. Now, its flow changes frequently and is characterized by large fluctuations (Attachment 1). For example, flows below the dam can change from approximately 500 cfs (dam leakage) to 10,000, 20,000 or 30,000 cfs (operation of one, two, or three turbines) in less than an hour.

A concomitant change wrought by the dam is a reduction in lowest recorded one-day flows. Attachment 2 indicates that summer, one-day low flows were reduced by as much as 80 percent, from 1300 to 436 cfs. This type of change can severely affect water quality (Attachment 3) and result in increased stress to aquatic life.

The ability of industries to discharge wastewater to the river downstream from the dam is restricted by the State of Alabama on the basis of low flow and dissolved oxygen concentrations. At our Coosa Pulp & Paper Mill, ten miles downstream from the dam, wastewater must be stored in a 1.6 billion gallon lagoon system, sometimes for as long as a month, until the turbine operation provides adequate flow and the dissolved oxygen levels rise above designated minimum levels. The net result is that the mill incurs significant additional operating problems to compensate for the unregulated adverse impacts of the dam's generating operation.

Other large dams similarly affect aquatic life, recreation, aesthetics, municipal treatment plant and industrial operations. Kimberly-Clark believes that an amendment to the Clean Water Act is necessary to address water quality problems associated with designated categories of large dams.

H.R. 3282, introduced by Chairman James Howard, includes a provision that the Environmental Protection Agency (EPA) study and monitor the water quality effects attributable to dams and recommend control measures. This provision is a step in the right direction, and Kimberly-Clark fully supports its intent. EPA needs additional legislative direction in establishing the minimum water quality standards which must be met by operators of designated categories of large dams.

2. Finalizing BCT Effluent Guidelines

Best Conventional Pollutant Control Technology (BCT) effluent limitation guidelines for the Pulp and Paper Point Source Category have not been promulgated, even though these guidelines have been under development by EPA for over five years and final compliance is required under the present Water Act by July 1, 1984. Attachment 4 provides a brief history of BCT effluent guideline development for the Pulp and Paper Industry.

BCT proposals have been a shifting target for both the Pulp and Paper Industry and state regulatory authorities, making planning to meet anticipated BCT requirements a complex and frustrating exercise. The latest shift is the result of EPA's proposal to use new cost data from Publicly Owned Treatment Works (POTWs), but not industrial Wastewater Treatment Plant (WWTP) costs, in calculating BCT "cost reasonableness" benchmarks. This could potentially change BCT limitations in ten industry subcategories.

Nor does the BCT development history for the Pulp and Paper Industry presage confidence in the stability of BCT effluent guidelines once they are promulgated in "final" form. EPA currently has the option of revising "final" BCT guidelines at any time. In fact, Section 301(d) mandates that BCT effluent limitations be reviewed at least every five years. Considering BCT development to date, "final" BCT guidelines may be subject to frequent revision. Pulp and Paper Industry investments to meet "final" BCT guidelines will likely miss this moving target.

To ensure the stability of final BCT effluent guidelines, Kimberly-Clark recommends that once final BCT standards are published, they be held constant for 10 years. This would remove the "moving target" aspect of BCT standards. The ten-year period of unchanging standards should apply only to BCT.

Control of conventional pollutants at final BCT levels for ten years would provide adequate time for evaluation. Such standards should be more than sufficient to protect against the actual environmental effects of conventional, non-toxic pollutant discharges by most dischargers, and EPA has ample, alternative authority to deal with

specialized water quality problems. A fixed period of time will further ensure that compliance investments can be made with reasonable confidence.

3. Ten Year Permit Life

Kimberly-Clark currently has five major NPDES permits which expired in 1981 or 1982 and that have not yet been renewed due to the current backlog of permit renewals at both the Federal and State level. Extending permit life from five years to ten years would help to relieve permit backlog by reducing paperwork. Existing reopener provisions currently in effect or written into a permit at the state's discretion would ensure that ten year permits do not become outdated.

4. 301(h) Waivers

Kimberly-Clark views 301(h) waivers of secondary treatment as a program which should not be limited to ocean environments, but where justified be extended also to major inland waterways.

Existing 301(h) regulations allow waiver applications from municipalities discharging to estuaries and bays. The use of secondary treatment waivers for discharges to marine environments should be limited to deep ocean discharges. Bays and estuaries often contain unique and sensitive aquatic life, breeding areas, and commercially important fisheries that should not be subject to pollutant discharges. Kimberly-Clark recommends that a CWA amendment prohibit 301(h) waivers for discharges to bays and estuaries.

In contrast, major inland waterways are very effective in assimilating conventional pollutants. Rivers such as the Mississippi can adequately assimilate municipal wastewater that has received only primary treatment without degradation of water quality. Any such waivers would, of course, have to be based on careful assimilative capacity modeling to ensure that they would not have adverse environmental consequences and would then have to be carefully controlled.

301(h) waivers for major inland waterways would have two immediate benefits. Municipalities obtaining waivers would benefit from immediate and future savings of capital and operating expenditures. Municipalities in

need of Federal funds for wastewater construction projects could benefit from the greater availability of funds. Waivers for major inland waterways would also have secondary benefits. For example, reduced municipal sludge disposal requirements would assist with the growing solid waste disposal problem.

Kimberly-Clark supports a CWA amendment that would allow 301(h) waivers for major inland waterways.

5. Reporting Hazardous Waste Mixture

Kimberly-Clark believes that CWA amendments should include a provision requiring reporting any hazardous wastes sent to POTWs in liquid mixtures since they can seriously disrupt treatment plant operations to the detriment of all indirect dischargers. Seventeen Kimberly-Clark facilities discharge all or a portion of their wastewater to POTWs; we are concerned that these POTWs continue to operate effectively.

We believe Kimberly-Clark Corporation's positions are worthy of serious consideration in formulating the Clean Water Act Amendments. Our representatives are prepared to further discuss any of these issues with you or members of your staff. Thank you for your consideration.

Sincerely,

E. E. Dickson

The Honorable Robert A. Roe
Chairman
Subcommittee on Water Resources
Committee on Public Works and
Transportation
B376 Rayburn HOB
Washington, D.C. 20515

Dear Chairman Roe:

In your Subcommittee's deliberations in connection with hearings on July 19 and 20, 1983, I would like to call to your attention two related situations which bear on proposed amendments to the Federal Water Pollution Control Act.

First, there are instances where industrial point sources have, through their own efforts and resources, met and exceeded the state and federal water quality standards for the streams on which they are situated. These systems have, in fact, made their discharges "fishable and swimable." I believe you will agree that these efforts should be recognized; not penalized.

Secondly, when any further technology requires the consumption or destruction of water, a very precious commodity in the arid west, state water rights of downstream users are often breached. I am confident that this is not the intent of the Subcommittee's efforts.

For your interest, I have attached specifics on one case which combines the two considerations. I respectfully request that these facts be included in the record of your Subcommittee's hearings.

Thank you for your consideration of this important matter.

Sincerely,

Ray Kogovsek

Enclosure

Testimony Presented to The

Subcommittee on Water Resources

of the

Public Works and Transportation Committee

of the U.S. House of Representatives

by

William R. T. Crolius
Vice President, Crane Co.
in
Behalf of CF&I Steel Corp.
a Subsidiary of Crane Co.

Conclusions - Recommendations

Chairman James Howard has stated in his introduction to his bill to amend the Federal Water Pollution Control Act, his dedication to the continuing protection of stream quality standards. His goal is expressed as "fishable and swimable" water.

1. In recognition of such objectives, any legislation, in fairness, should recognize those programs and systems in place, which have met or exceeded such standards and which continue to monitor and improve those systems.

2. A further consideration of new legislation should include the consideration of varying climatic conditions, state water rights laws and the crucial requirement not to destroy water in the arid regions of the United States.

Mr. Chairman:

My name is Rich Crolius. I am a Vice President of Crane Company, a leading manufacturer of building products and fluid controls. Our headquarters are in New York City.

Our largest subsidiary, CF&I Steel of Pueblo, Colorado, has asked me to bring to the attention of the committee our environmental success story. At the same time, our success has created a problem, which may not be unique to us, and which bears on these hearings.

CF&I Steel Corporation stands on the south side of the Arkansas River, in the southeast corner of the city of Pueblo. The river originates about 130 miles to the northwest of Pueblo, travels as a mountain stream through Chaffee, Fremont and Pueblo counties to Pueblo Reservoir west of the city. From that point, the Arkansas becomes a meandering plains stream through arid land eastward to the Kansas line.

In some dry seasons, the treated discharges from the city of Pueblo and CF&I represent the entire volume of the river water, which is so important for downstream municipal water supply, agricultural irrigation and minor recreational use.

Water in the Arkansas - as well as all other water in Colorado - belongs to the state. Users must have water rights and state permits, which require both quality and quantity of discharge. Arkansas water, largely from snow melt, is used over and over for a variety of needs. Water is a very precious commodity in an area of very light rainfall.

In the early 1960s, CF&I embarked on a modernization program. An important segment of that effort was - and continues to be - both air and water quality improvement. At that time, there was no Federal EPA nor were specific quality standards available. This program was

aimed at both cleaning up steel plant discharge and, also, maintaining quantity of water to downstream users.

Working with the State of Colorado (and with EPA after 1970), CF&I's water quality program took shape and by 1974, our waste water process facilities were in place. Since then, discharges back into the Arkansas River have met all state and federal standards. We have continued to monitor and improve this quality system.

Within the flow, from our treatment plant to our final river discharge, nine species of fish reside and the settling lagoons have become wildlife sanctuaries for land birds, water fowl, and small mammals.

With the CF&I discharge at present control limits, the river meets all water quality standards established for the several uses assigned by the State and Federal agencies to the Arkansas - these are municipal water supply, fishing, agriculture and recreation. We are proud of that success. Therein lies our problem.

The recent technology-based steel guidelines promulgated by the EPA in 1982 would require substantial revision to our present system. Additional technology will not improve Arkansas River quality. It will destroy, through added rapid evaporation, water which is badly needed downstream.

The best available technology defined by EPA is environmentally undesirable for the Arkansas River. We ask this committee to consider recognizing that in the instance of the Arkansas - and presumably in other steams which are clean, useful and attractive - any further technological requirement will be wasteful of resources, natural as well as material. Indeed, they may be environmentally counter-productive. Provisions should be made in the Act to exempt such situations.

Thank you for the opportunity to bring this unusual, but probably not unique situation to your attention.

THE LONG ISLAND SOUND TASKFORCE

of The Oceanic Society

December 14, 1982

The Honorable James L. Howard
Chairman
Committee on Public Works and
Transportation
2165 Rayburn House
Washington, D.C. 20515

Dear Congressman Howard:

It is my pleasure to submit to your Committee, a statement of support for Section 319 of H.R. 3282 concerning the establishment of management conferences for estuaries in need of scientific and technical assistance together with mutual cooperation from the riparian states.

The enclosed statement directs itself to two aspects: 1) the consideration of Long Island Sound as an estuary under the definition found in the Clean Water Act; and 2) having received recognition as a estuarine system, a statement of need for Long Island Sound. The first section cites existing scientific literature to document the estuarine nature of Long Island Sound. The second portion of the statement attempts to highlight the existing need for management and research on the Sound.

Since we recognize that the Committee has an interest in time as well as content, the statement is not exhaustive in its detail or scope. Should additional documentation be necessary, we will gladly gather further documentation of need from area researchers, governmental officials, and commercial users.

Thank you for this opportunity to add the enclosed statement to your consideration of Section 319 of H.R. 3282.

Respectfully Submitted,

Whitney C. Tilt

Whitney C. Tilt
President

cc: Congressman Stewart B. McKinney

Stamford Marine Center Magee Avenue Stamford, Connecticut 06902 (203) 327-9786

STATEMENT OF SUPPORT FOR SECTION 319 OF H.R. 3282
FOR LONG ISLAND SOUND

Section 319 of H.R. 3282 is important to the Long Island Sound estuary for numerous reasons. The purpose of the following statement is to attempt to qualify some of the reasons and place them in context of the ecology of Long Island Sound and the socio-economic health of the Long Island Sound region.

Before stating specific needs and rationale, it is important to understand the character of the Sound.

Though biologically a single body of water, the Sound is politically, economically, and sociologically fragmented. One important result of this fragmentation is a lack of coodinated planning, monitoring, and response. While estuaries like the Chesapeake have drawn coordinated response in addressing its problems, Long Island Sound has not, nor does the existing political system lend itself to state/local implementation of a coordinated response. A issue deemed important on one end of the Sound may be unknown at the other end even though associated impacts may threaten the entire estuary. One area's economic well-being may rely on a marine activity that another feels is totally unacceptable.

What is needed for Long Island Sound is a central coordinated planning process. The management conference proposed by Section 319 is the beginning of such a process.

This statement addresses the following:

Long Island Sound as an Estuary
Case for Research and Management Need
Additional Research Needs

LONG ISLAND SOUND AS AN ESTUARY

Long Island Sound may be regarded as an estuary under the definition of Section 104(n)(4) of the Federal Water Pollution Control Act. The following is submitted in support of this statement.

Documentation of the Sound's estuarine nature is found in Coastal and Offshore Environmental Inventory, Cape Hatteras to Nantucket Shoals published by the University of Rhode Island in 1973. The report defines the Sound as a "Type B, moderately stratified estuary." Here estuary is defined as "a semi-enclosed coastal body of water which has free connection with the open sea and within which sea water is measurably diluted with fresh water derived from land drainage (Pritchard, 1967)." In addition, a Type B estuary is defined as an estuary where "tidal mixing plays an important role in the circulation. Mixing occurs between the

upper seaward flowing layer and the higher salinity water flowing up the estuary along the bottom, thus increasing the net volume of flow." Other Type B estuaries include Narragansett Bay.

In Coastal Ecological Systems of the United States, Odum et al defines Long Island Sound as a "Medium Salinity Plankton Estuarine System." Examples of such estuaries include the Chesapeake, Narragansett, and Delaware Bays. Odum states "that the precise delimitation of the middle estuary is not possible because of the spatial and temporal variability exhibited by such components." Hence as a result of this delineation problem, the natural geological boundaries of estuaries such as the Chesapeake Bay, Narragansett Bay, and Long Island Sound should be recognized as delineating the boundary of the estuary.

Riley in Oceanography of Long Island Sound (1954) found salinity in the Sound to be the highest in the eastern end, though this area was subject to rapid and extreme freshening during periods of high flow in the Connecticut River while the western end was ordinarily 3-5ppt fresher than eastern end. The range of salinities recorded ranged between 24 and 31 ppt (parts per thousand). The salinity of ocean water is generally greater than 35 ppt.

The National Marine Fisheries Service's Environmental Baselines for Long Island Sound, 1972-73 maps the range of salinities occurring in the Sound on a seasonal basis. NMFS found surface salinity averaging between 20-22 ppt during April with the western end generally exbibiting less saline waters than the eastern end. In September, the overall surface salinities increase with an average of 24-26 ppt found throughout the Sound. Salinities along bottom are higher than those found on the surface especially during the the warm summer months.

The research cited above accounts for a majority of work done to date. Certainly it defines Long Island Sound as an estuary in the same right as the Chesapeake and Narragansett Bays.

CASE FOR RESEARCH AND MANAGEMENT NEED

The need for research and management efforts on Long Island Sound is paramount. The most comprehensive report done to date on Long Island Sound, the Long Island Sound Report conducted by the New England River Basins Commission (1975) identified the need for directed management and research efforts. The report called for the formation of a Long Island Sound Committee to oversee this management and research effort. Other reports have continued to echo this need.

A look at the political morass of the Long Island Sound region soon gives a clear indication of why comprehensive management is lacking on the Sound. Sharing some authority over Long Island Sound are: 2 EPA regions; 2 Army Corps of Engineer Division/Districts; 2 states; the U.S. Fish and Wildlife Service;

National Marine Fisheries Service; Interstate Sanitation Commission; and others. In addition, the two states have very different systems of government: Connecticut relies on a Hartford to individual town system. Some 24 towns are found directly on the Connecticut shoreline. In New York, the system operates from Albany to County seat to individual township. New York has four counties on Long Island Sound with anywhere from 16 to 37 townships/towns depending on how they are counted (please see Attachment A for listing of regional counties and towns). The U.S. Coast Guard is perhaps the only agency that views Long Island Sound as a single body of water. Parochial self interest and cross-Sound/trans-Sound disputes are more the rule than the exception.

Examples of the need for an comprehensive management/research approach are numerous. A few examples follow:

Water Quality of Long Island Sound has improved over the last 10 years, due in large part to the construction of sewage treatment plants funded by the Construction Grants Program of the Federal Water Pollution Control Act. However documentation of this improvement along with the identification of problem areas remains casual, where it is done at all. For example, no comphrehensive Sound-wide surface water quality testing is conducted outside the testing of beaches and shellfish areas for bacteria. In New York, two counties do regular testing, Westchester and Nassau, but the data are not always refined into working reports and these data are not shared on a regular basis with other portions of the Sound. The Interstate Sanitation Commission has regularly seen its budget slashed until the scope of its testing is reduced to the extreme western portion of the Sound. The result is a lack of trend analysis, nor do the monies currently spent effect any real basis for management decisions. The data that are available show some improvement in bacterial levels in western Long Island Sound but the chemical sampling' results do not demonstrate the same improvement. Dissolved oxygen levels are chronically low with a recent Interstate Sanitation Commission report concluding that no available dissolved oxygen capacity exists in western Long Island Sound and the East River during the summer months.

In addition, while advances have been made in wastewater treatment, a great deal of work is still necessary in the management and control of combined sewer overflows and sub-standard treatment (less than 85 per cent removal of suspended solids and biochemical oxygen demand). Long Island Sound water quality is also directly linked to New York City water quality via the East River. A recent New York Department of Environmental Conservation report estimated that in dry weather, the NYC wastewater treatment system discharged approximately 1,584 million gallons per day of treated wastewater, bypassed 316 mgd of sewage, 927,000 pounds of BOD, and 888,000 pounds of suspended solids. A large proportion of that load is discharged into the East River whose net flow is into Long Island Sound.

Dredging and Dredged Material Disposal has pitted Long Island versus Connecticut with Westchester and New York City being sided with Connecticut. While great strides have been made in the management of dredging and dredged material disposal, a management plan reflecting this state of the art does not yet exist for Long Island Sound. As a result of the large number of rivers found along the northern shore of the Sound, some 95% of the dredging load is centered on the north shore. Long Island objects to all open water disposal in Long Island Sound while failing to offer a feasible alternative. Law suits, political maneuvering, and poor use of "science" are part and parcel of the dredging dilemma in Long Island Sound. In addition to the political problems which hamper effective management, there remains an active dredging need that must be aligned with the need for maximum resource protection. Many of the sediments from the Sound's industrial harbors are enriched with organic and inorganic pollutants. Inproper handling and disposal could have significant impacts on the adjacent shellfish and other marine organisms and the industries dependent on them.

Commercial fisheries are of growing importance to the Sound region with oysters, hard clams, and lobster leading the fisheries market. Here again, a general lack of research and Soundwide management has resulted in impacts to the fishery and rivalry between states and opposing ends of the Sound. Currently the Sound's oyster production is excellent with the production forecast strong. The Long Island Sound oyster fetchs 30% more per bushel than its Chesapeake counterpart, yet much of the potential oyster ground in Connecticut remains closed because of chronic water pollution problems or other impacts. The movement of the "red tide" or PSP (Paralytic Shellfish Poisoning) from the north and MSX from the south are potential hazards to the industry. In 1982, the lobster fishery had its best year ever. 1983 saw that catch almost doubled. Yet the fishery had pitted potters against trawlers with a good deal of legislation recently installed. Even with good enforcement of the legislation, much data are needed for future management of the growing lobster fishery, especially if the impacts of the Maine fishery are to be avoided. Finfish are mostly important as a recreational resource. The recent discovery of the parasite *Glugea stephani* in windowpane and winter flounder is one example of the fishery research necessary. Winter flounder is one of the most important finfish species in the Sound, and preliminary findings show that this parasite appears to have a significant effect on flounder populations. Migratory and anadramous species such as the bluefish and stripped bass also have a variety of research needs in Long Island Sound.

Recreational boating is extremely important on the Sound. While exact numbers are not available, the Sound is recognized as the largest boating center in the country with up to 110,000 vessels on Long Island Sound during a sunny summer weekend. The

continual loss of marina services to residential development and non water-dependent uses; the potential loss of 100% federal funding for federally authorized channels (there are 40 in Long Island Sound and the upper East River); and the continuing conflict over the associated impacts of recreational boating (ie., impacts from dumping of heads; impacts from anti-fouling paints; "buffer zones" around marinas, etc.) all represent the need for research and management.

A recent survey conducted by the Connecticut Marine Trades Association found the Connecticut boating industry to be the cause of a minimum of $281 million worth of business activities in the state. A similar study for the New York marine trades is not available but boating is of major importance there also. However as use increases, so does the conflict and the potential impact to the estuaries natural systems.

The above are just a few examples with commercial shipping, cross-Sound ferry service, shoreline erosion, aquaculture expansion, and public access to the Sound a few more examples of the need for coordinated management and research.

ADDITIONAL RESEARCH NEEDS

In the statement above, several research needs were identified. For the most part they lie within the realm of public policy research, rather than research in the traditional sense. Examples of needed research and its applications follow. It should be recognized that this is only a brief "shopping list" and that discusssions with leading researchers in the Long Island Sound region would yield a greater number of research proposals.

Impact of heavy metal contamination of sediments to fisheries and environmental health of estuary. Many of the analyses conducted on selected harbor sediments show extremely elevated levels of numerous heavy metals ranging from zinc and copper to arsenic and cadmium. The impact of these metals along with their ability to move through the food chain is not well understood at this time.

Water dynamics and net flow of East River. As the tidal strait between the massive pollution loadings of New York harbor and Long Island Sound, the water flow dynamics of the East River are still poorly understood. A complete understanding and ability to model pollution loadings via the East River is extremely important for water quality management in the Sound.

Effects of sewage chlorination on the marine environment. Currently all sewage treatment plants in Connecticut chlorinate their sewage year round. The effects of this practice are not evaluated for Long Island Sound, but research conducted on other estuaries suggests that this practice is expensive, has no proven health benefits, and may adversely impact marine ecosystems. New

York chlorinates on a seasonal basis.

Effect of sewage effluent on Long Island Sound. More than 1.1 billion gallons of sewage effluent enters the Sound each day. This does not account for additional volume during storms, or for effluent contained in river waters entering the Sound. The assimulative capacity of the Sound, especially in the western end, is not known but proposals such as the recent 301H waiver proposals make this research extremely important.

Restoration of chronically polluted embayments is a pressing need. Many embayments in New York and Connecticut have suffered long term impact from various forms of pollution. Many of these embayments are located near population centers, but because of their degraded condition offer little to no recreational or commercial benefits. Methods directed at restoring these areas would be an important contribution to the Sound's overall benefits to the region.

208 or "non-point" pollution was a popular buzz word in past years but most efforts to date have centered on freshwater systems with little regard to its impact to the Sound, ultimately the final sink for contaminants found in freshwater watercourses. In addition, I suspect, without being able to substantiate the claim, that while water quality (aquatic and marine) has improved over the last 10 years, little additional improvement has been made recently. In fact, some degradation in specific areas may have occurred in past few years as enforcement has waned due to budget cuts and "environmental zeal" has lessened.

Expansion of aquaculture offers great commercial potential for Long Island Sound. However advances in culture techniques, definition of the legal problems (such as who has right to use of the water column), and expansion of the species cultured, all have research requirements.

The Coastal Energy Impact Program has conducted two years of analysis for the western Connecticut shoreline. To have significant impact on management and policy, this program must be expanded to other areas of the Sound. Data collected on species distribution and densities; benthic community assemblages; and hydrocarbon analyses of the sediments are all vital to a fuller understanding of the Long Island Sound ecosystem.

The above is just the beginning of the discussion on the management and research needs of Long Island Sound. The Sound has been called the "American Mediterranean" and the "Urban Sea". It ranks as one of the most populated estuaries in the United States and that association has left its impact on the physical, chemical, and biological nature of the estuary.

In February 1971, a weekend issue of Newsday announced that Long Island Sound was "dead" and stated, "the sun will rise a trembling red in the suffocated haze...[and] the Sound will lie

still against the petrochemical black beaches." The Sound is no longer "dead", though numerous areas remain chronically polluted. However since that Newsday article little to no progess has been toward the management of the estuary as a single body of water. Section 319 of H.R. 3282 offers the states of Connecticut and New York an opportunity for comprehensive management of Connecticut's only marine resource and one of New York's most potentially valuable marine resources.

Respectfully Submitted,

Note: many of the environmental management and research issues mentioned above have been simplified for the purposes of this statement. Additional background on these issues along with the identification of other issues is available on request.

METRO
Municipality of Metropolitan Seattle
Exchange Bldg. • 821 Second Ave., Seattle, Washington 98104

September 26, 1983

Honorable Robert A. Roe
Water Resources Subcommittee of the
Committee on Public Works and
Transportation
B376 Rayburn House Office Building
Washington, D.C. 20515

Attention: Mr. Errol Tyler

Dear Representative Roe:

I have recently become aware of the testimony given by Dr. Benjamin C. Dysart, III on behalf of the National Wildlife Federation before the Water Resources Subcommittee on August 2, 1983. It is not my intention to comment on the merit of the proposals contained in his presentation. However I have noted several factual errors which I would like to correct and clarify for the subcommittee members and the record.

Water quality conditions in Puget Sound and the impacts on the Sound from municipal wastewater sources, including Metro's four primary plants, are cited frequently in the federation's testimony. This information is often inaccurate or inaccurately presented. On page 7 the metric ton loadings of zinc, copper and lead should be corrected to reflect generally accepted scientific data. Metro's 1983 Toxicant Pretreatment Planning Study (TPPS) C1 report gives the annual loading to the central basin of Puget Sound from municipal effluents as 34 metric tons (MT) of zinc; 2.5 MT of copper and 15 MT of lead. These numbers are many orders of magnitude smaller than those cited by the federation, 3,690 MT zinc, 1,958 MT copper and 3,690 MT lead. We were unable to locate the source cited by Dr. Dysart, "Trovik, 1983". I believe there may have been a typographical error and the individual cited is Solvieg Torvik a reporter for the Seattle Post-Intelligencer newspaper. I have enclosed the two articles by her which I believe Dr. Dysart was referencing.

We question the assertion that "toxic contamination" is a reason for shellfish harvesting closures. Harvesting has been closed due to bacterial contamination and red tide, not high toxicant counts. Health agencies have noted that these areas would be closed with or without treatment plants, much less with or without secondary treatment. Also to the best of our knowledge, no central basin beaches have been closed to swimming because of public health

risks due to municipal discharges. It is also our understanding that the major sources of high concentrations of organics in Commencement Bay are not related to municipal wastewater dischargers but rather to past direct industrial dumping directly into and adjacent to Commencement Bay.

Page 11 states that Metro's Richmond Beach plant's effluent "contains pollutants whose concentrations will exceed EPA's Water Quality Criteria for the protection of marine life." A review of the effluent characteristics data presented in our Richmond Beach waiver application clearly shows that following initial 100:1 dilution, the concentration of toxicants present in the discharge will all be far below the EPA acute and chronic criteria for ambient conditions. On page 13 the federation proposed that POTW effluent meet these criteria after initial mixing and contends that this is not currently the case for four of the EPA tentatively approved plants, including Richmond Beach. Obviously, for the Metro plant, the opposite is true and all criteria are met following dilution.

On Page 16 the federation quotes the Draft TER prepared by Tetratech for EPA on Metro's West Point waiver application. Based on the paragraph cited the federation concludes that there were "significant data gaps" and that EPA projected a balanced indigenous population (BIP) based on inadequate information. The section cited by the federation is one small part of a 378 page evaluation of our application by Tetratech. Any quotations from this document are solely one consultant's opinion.

In the introduction to EPA's September 1981 West Point tentative decision document, EPA explains that the TER prepared by Tetratech was prepared subject to the guidance and review of the EPA task force. On pages 16,17 and 18 (attached) of the same document, EPA explains why they concluded that "the West Point discharge will not interfere with the presense of a BIP beyond the ZID." EPA also concludes that improved solids removal in the West Point discharge and an effective toxics source control program are expected to mitigate any potential long-term discharge-related effects (page 18). Monitoring is also proposed to further examine solids deposition and benthic communities in the deep waters of the central basin in relation to solids loadings of the plant to demonstrate the discharge will not have any long-term effects. I believe that this information demonstrates EPA's decision to have been well informed and that adequate monitoring is proposed to accurately track long-term trends.

As a final comment it should be pointed out that in its definition of estuaries the federation fails to differentiate between semi-enclosed, well-flushed systems such as Puget Sound and enclosed, shallow embayment-type estuaries. Metro believes that the substantial variety of estuarine types is such that a total exclusion of all types of estuarine waters from the waiver process is arbitrary and not correlated in any way with actual quality of the receiving water.

I appreciate your careful consideration of our comments and earnestly request the record be clarified to reflect more accurate information with respect to Puget Sound and the Municipality of Metropolitan Seattle's wastewater treatment facilities. We would be pleased to make a presentation to the subcommittee on these issues at any time. Please contact me at 206-447-6591 if you would like to invite us to speak or if I can provide further clarification of our comments.

Very truly yours,

John B. Lampe
Superintendent of Water Quality

Waiver Application for Seattle, Washington West Point Plant;
"EPA Office of Marine Discharge Evaluation, September 1981"

(c) Biological Impact of Discharge [40 CFR 125.61(c)]

- BIP Beyond The ZID and Absence of Extreme Adverse Impacts Within The ZID [40 CFR 125.61(c)(1)(i) and (ii)]

An applicant must demonstrate that a balanced indigenous population (BIP) of shellfish, fish, and wildlife will exist in all areas beyond the ZID that might be affected by the proposed modified discharge. In addition, conditions within the ZID must not contribute to extreme adverse biological impacts within the ZID or contribute to adverse effects beyond the ZID.

The application included a series of eight studies conducted in the vicinity of the applicant's outfalls to evaluate the effects of primary effluent upon plankton, benthic invertebrates, macroalgae, and fish assemblages of Puget Sound. Based on an assessment of the data available in these studies as well as other studies conducted for the applicant and more general references addressing the impacts of municipal discharges on benthic communities (Pearson and Rosenberg, 1978, Word, 1979), it is concluded that the West Point discharge will not interfere with presence of a BIP beyond the ZID. The following findings are pertinent to this conclusion:

1) Phytoplankton biomass and productior measures of community function, are within the r...e of values expected for highly productive estuarine waters. Comparison of annual production for pre-discharge and post-discharge years shows no major stimulation of algal growth in the central basin following initiation of discharge.

2) Intertidal invertebrates sampled at beaches near West Point and Lincoln Park beach, a site removed from direct discharge impacts, show a similar occurrence of dominant species of bivalve molluscs and a high similarity in the communities of epifaunal (urface-dwelling) organisms. Further comparisons between the infauna (organisms dwelling within the bottom) are precluded by the inadequate sample size; however, the above results indicate the absence of adverse impacts.

3) Macroalgae sampled near West Point and other municipal discharges as well as the Lincoln Park control site show some effects related to the existing discharge such as decreased diversity and changes in growth and reproductive rate of the kelp. Density of the kelp beds indicates these

alterations are not severe. The probable cause is suspended solids loading from the discharge.

4) Demersal, or bottom-dwelling fish, in the vicinity of the West Point outfall show no significant difference in the frequency of occurrence of the 15 most common species when compared with areas distant from the discharge. Species diversity of the community is lower, most likely due to organic enrichment from the discharge; however, the magnitude of this change is not significant in view of the above finding regarding dominant species. Pelagic fish (non-bottom dwelling species) were surveyed in Central Puget Sound during February June, September, and December, 1975, with an additional survey in March 1976. The surveys consisted of acoustic transects, mid-water trawls, and beach seines to provide a quantitative assessment of the temporal and spatial distribution of pelagic fishes. A test for significnat differences in species diversity was not possible for for pelagic fishes, because the pooling of data over large geographic areas obscures site specific differences, although they do identify a general BIP for pelagic fishes in the Central Puget Sound (TER, Part B, Section 6). In addition, patterns of fish egg abundance of dominant fishes (both pelagic and demersal) collected by beach seines at West Point and at the control beach were very similar. Moreover, futher examination of the health of fish communities demonstrates that the incidence of fish tumors and parasites is actually lower in the vicinity of West Point than at Point Pully, the control site.

However, there is evidence of alterations in the benthic community in the vicinity of the discharge. [TER, Part B, Sections 6 and 7]. Benthic invertebrates, because of their relative immobility, are an important indicator of impacts from a point-source discharge. Data from both within and beyond the West Point ZID show changes in the Infaunal Trophic Index (a measure of community function that can be related to pollution), number of individuals, and species abundance when compared to reference sites. Lower sediment organic content in an area extending northwest to southeast across the discharge zone bears out the conclusion of Thom, et al., (1979) that scouring by strong currents and resulting sediment instability is are the likely cause for decreased richness and abundance of organisms in this region. Some effluent suspended solids may settle beyond this zone where an enriched community of filter-feeding invertebrates was found by Thom, et al., (1979).

A lack of replicates and inadequate sample size do not allow firm conclusions with respect to the extent of change or its cause. Although at present major perturbations are not evident, the cumulative impacts of continued discharge of solids at the current level is a matter that will require careful observation over the long-term. Improved solids removal in the West Point discharge and an effective toxics source control program are expected to mitigate these potential long-term discharge-related affects.

The application suggests that deposition in deep water habitats is a likely fate for sewage wastes (Application, Part B, Section 1, Subsection C, and Section 4, Appendix IX), and there is evidence that sewage particulates are accumulating in the deep waters of the central basin adjacent to the West Point outfall. Evidence of far-field biological perturbations are limited. Foraminifera may be used as an indicator of effects on the BIP. Studies by Harmon, et al., (1977) attributes the dominance of at least two species of foraminifera in deep waters near the outfall to the enriching influence of sewage particulates. There is no evidence of substantial adverse effects on foraminifera. However, Harmon cites sediment displacement to deep waters as a "major process immediately off West Point." Incorporation of sewage particulates into sediment systems can alter biological communities substantially through organic enrichment favoring deposit-feeding, pollution-resistant species, or through toxic effects on sensitive species (Pearson and Rosenberg, 1978). The monitoring program will examine solids deposition and benthic communities in the deep waters of the central basin in relation to the solids loading of the modified discharge to determine if the discharge will have any long-term effects.

- Additional Biological Requirements For Saline Estuarine Dischargers [40 CFR 125.61(c)(1)(iii)]

o Benthic Restriction Within ZID [40 CFR 125.61(c)(1)(iii)(A)]

Benthic populations within the ZID of the proposed modified discharge must not differ substantially from the benthic populations which exist immediately beyond the boundary of the ZID.

Data presented in the application indicate that there are no substantial biological changes within the ZID (TER, Part B, Sections 6 and 7). Data on the benthic community including Infaunal Trophic Index, number of individuals, and species abundance indicate biological modifications are not substantial. As discussed above data presented in the application and analyzed in the TER, Part B, Section 6 indicate

Poverty Bay

The muck stops here

The Samoans addressed their sewage disposal problem by building outhouses over the ocean. They were called "tidal flush toilets" because the tide was supposed to carry the effluent out into the vast Pacific and dissipate it harmlessly. But the system had its flaws. Not only did the waters become polluted, but low tides left sewage to bake on the beaches under an equatorial sun, a stunning assault on the senses.

The 2 million people who use Puget Sound as a cesspool also blithely put their trust in the tides. Every day, 230 million gallons of chlorinated sewage effluent is poured into Puget Sound, most of it lacking secondary treatment. In addition, 3,690 metric tons of zinc, 1,958 metric tons of copper, and 6,789 metric tons of lead enter the sound annually.

Dumping into the sound has been tolerated on the theory that it is deep and well flushed. But recent scientific investigations into the movement of tides and currents suggest that the sound may be more prone to pollution buildup than previously thought.

Dr. Herbert C. Curl Jr., an oceanographer with the National Oceanographic and Atmospheric Administration, is overseeing the first study of overall pollution transport in the sound. Obviously, says Curl, much of what is put into the sound and stays dissolved is carried out into the Strait of Juan de Fuca. But already he has found that a good deal more material than most people have assumed is left behind in the bottom sediments.

Curl says most of the pollution ends up in the main southern basin of Puget Sound because of the way the tides move. According to him, the final resting place for a large share of those pollutants is probably Poverty Bay, east of Vashon Island, north of Tacoma's Commencement Bay and about seven miles south of Seattle's Seahurst Park, the proposed site of the Municipality of Metropolitan Seattle's (Metro's) controversial new sewage treatment facility.

As Curl explains it, fresh river water floats on top of the sound and salt water coming from outside the sound stays on the bottom. The salt water moves slowly southward while the fresh water moves northward and out of the sound. The Skagit River flows into the sound from the north and, in spite of some agricultural pollution, is relatively clean and dilutes more contaminated sediments. The main polluter is the Duwamish River, which carries not only much of Seattle's sewage, but also a host of metals and chemicals from the industries at the mouth of the river.

Pollutants are carried by deep currents to their final resting place in Poverty Bay.

From Seattle, Curl says, the pollutants piggyback onto soil or biological particles, hitching a ride into the central basin's main channel. There, by leaps or crawls, days or months, depending on storms, tides and currents, the pollutants travel south down to Poverty Bay and settle into the sediments.

Meanwhile, pollutants near Tacoma and Sinclair Inlet are picked up by currents and take a fast ride north on the west side of Vashon Island, through Colvos Passage. They may circle the island twice (the current always flows north there at all depths) before they come to rest in Poverty Bay, says Curl.

The "worst actor" coming into the sound is lead, according to Curl. Lead comes from cars and industrial sources, and there is more of it at the mouth of the Duwamish than in Tacoma's infamous Commencement Bay. Every time the Duwamish is dredged, lead-loaded sediments are carried off by barge to Four Mile Rock off Magnolia Bluff. There they are dropped off a 300-foot cliff into the main channel which, Curl says, takes them on a leisurely trip south.

Metro is conducting an $8 million study of the effects of its effluents on the sound, but the scope of the study is limited to what Metro defines as its sphere of sewage influence — the areas around its own outfall pipes.

While Curl praises Metro's efforts, he also says that the fragmented approaches being taken to the problem by various agencies pose problems. As he puts it, "Water doesn't know any political boundaries."

How much pollution can Puget Sound bear?

By Solveig Torvik
PI Reporter

PI 5-2-82 B4

Your rusty car is sitting in the driveway leaking oil from the crankcase. You've just put a new chain link fence around your yard, and you've spilled a little weed killer on your sidewalk.

Then it starts to rain.

The oil from your car, mixed with particles of rust, seeps down the driveway, into the street and down the storm sewer. Zinc washes off your fence and into the sewer. The weed killer runs down the sidewalk into the sewer.

If your neighborhood is on a separated storm sewer system, as is the case with half of Metro's customers, the zinc, oil and weed killer will travel directly into Puget Sound untreated.

The zinc at first will fall into the bottom sediments close to shore near Elliott Bay. The oil and weed killer are likely to travel farther, following the currents south.

But the zinc may follow at a much slower pace, as the high tides stir up the bottom and heave the pollutants south.

Eventually — days to years later — they all are likely to arrive in Poverty Bay east of Vashon Island.

There they will come to rest, scientists think, along with many of the pollutants that enter Puget Sound from the area between Tacoma and Seattle's West Point.

****

Off Port Townsend, above what is called the Admiralty Sill, the scientists aboard the gleaming white research ship McArthur are standing by on the fantail while a large "rosette," clasping empty metal sample bottles, is lowered into the water by a hydraulic winch. Electronic sensors connect the contraption to a computer in the chart room.

Scientists are looking into the seemingly clean waters of Puget Sound for traces of your crankcase oil, zinc, and a plethora of other pollutants from industrial sources that have dribbled unnoticed into the sound for decades.

They want to know where this pollution comes from and where it goes. And they want to know how much of it the sound can stand before it is irreparably damaged.

Herbert C. Curl, an oceanographer with the National Oceanographic and Atmospheric Administration, is heading a team of seven scientists that is taking the first overall look at pollution transport in the sound.

"The long term question we're asking is: As population grows and industry increases, what's going to be the effect on these bottom sediments? There's no reason to think more water will flow into the sound (to clean it), but we do know that the pollution load will increase," he says.

Curl's colleague in NOAA, Dr. Donald Malins, has found high incidences of diseased bottomfish near the sound's urban shorelines where toxic chemicals and heavy metals are most prevalent. That's one red flag that something is going wrong in the sound.

The prolonged red tides that have made shellfish from some areas in the sound inedible may be another, says Curl.

A large share of the pollutants dumped into Puget Sound end up in Poverty Bay, according to a National Oceanographic and Atmospheric Administration study

NOAA research on the East Coast has led to suspicions that an increase in trace metals is likely to suppress the growth of a plankton called diatomsone. This allows another plankton called dinoflagallates, which causes red tides, to flourish.

"I think it's a good hypothesis," says Curl, adding that if the theory proves true, the biologic cycle involved means that "red tide leads to still more red tide."

Controversy over how well the sound cleans itself has led to Curl's study. Some people assume that the sound cleans itself regularly by discharging pollutants out into the Pacific through the Strait of Juan de Fuca. Others fear pollution is trapped in the sound.

"Clearly the stuff is going somewhere," says Curl. Otherwise, Puget Sound would look like the muddy Mississippi River.

But southern Puget Sound is "not as well flushed as we thought at one time," he adds.

While some pollution does go out through the strait, Curl says, "We think a lot of it is retained in the sound." How much is part of what he's trying to discover by studying the movement of fresh and salt water currents and the influence of river deposits. He has been at it two years already and expects to spend three more years and a total of $3.5 million before the answers are in.

Curl's study is focusing on what happens between the Admiralty Sill near Port Townsend and the Narrows Sill at the Tacoma Narrows. These two shallow areas strongly influence the passage of water in the sound.

The Admiralty Sill, under the route of the Keystone Ferry, is the only place on the sound where salt water and fresh water mix all the way to the bottom.

Curl says that what happens in between the Admiralty and the Narrows sills will determine how well Puget Sound survives the onslaught of chemical pollution.

He believes pollution discharge should be kept in the north as much as possible because there the circula-

pg. " How much pollution can Puget Sound bear" Cont'd

STAFF PHOTO CARY W. TOLMAN/P-I PHOTO

Herbert C. Curl, a NOAA oceanographer heading the first team to study the movement of pollutants in Puget Sound

tion is better and pollutants are more apt to be diluted by clean rivers. The Skagit, the major cleansing force in the sound, not only dilutes chemical pollutants but also buries them under soil deposits.

The farther south you go, however, the more polluted the bottom is because the curents carry urban pollution in that direction and the influence of the Skagit is not as pronounced. The levels of lead, zinc, copper and cadmium increase, Curl says.

Unlike the Skagit, the Duwamish River desposits a heavy load of pollutants into the sound.

The metals brought into the sound by the Duwamish never decompose and some are apt to travel with the current under certain chemical conditions.

"Potentially the worst actor now coming into the sound is lead," says Curl. "There is a much higher concentration of lead in the mouth of the Duwamish than in Commencement Bay." (Commencement Bay is one of the top ten most polluted places in the nation, according to the Environmental Protection Agency.) The lead at the mouth of the Duwamish, Curl adds, probably comes from Harbor Island industries.

Lead harms the central nervous system of humans and fish. He predicts that an increase in lead levels will cause the fish to behave abnormally and that fish populations may decline.

One problematic source of pollution in the sound is Metro's chlorinated sewage. "You're damned if you do and you're damned if you don't" is the way Curl puts it.

While the treatment "tends to produce pretty clean effluent," he says "you end up with all kinds of bad actors" such as polychlorinated butadiene which is both a carcinogen and a toxin.

He thinks the sewage should be treated with ultraviolet light.

North for sewage

And he's learned enough about the sound's circulation of pollutants to say that all things like expense being equal, Metro's proposed Seahurst outfall should be moved north. "I'd go north to West Point," he says, where there would be maximum dilution.

He also notes wryly that Metro "made its decision before doing their research" on whether the location at Seahurst, which is just north of Poverty Bay, would harm the environment more than some other location.

In the small lab aboard the McArthur, oceanographer Sharon Walker uses a computer to tally the number and size of particles in samples of sound water. The particles — soil or biological forms — are important because the chemical pollutants piggy-back onto them and hitch a ride around the sound.

As the ship works its way south, the particle count registered on her computer rises.

In the chart room above Walker, meanwhile, another computer instantly reads out the temperature and salinity of the water in the sample bottles attached to the rosette. This tells the scientists the changes in the density of the water, how well it mixes vertically, how many layers of water there are and in which direction the layers are moving. All this helps predict which way pollution will travel, says Curl.

The fresh water entering the sound from rivers and runoff stays on the surface and the salt water remains on the bottom. Depending on the tide, the salt water will run in one direction and the fresh water in another.

Curl is tracking the movement of salt and fresh water to discover where pollution-bearing particles will be deposited.

Curl says that up to now, agencies have tried to treat "single point sources" in their fight against pollution. But he argues that the Puget Sound Council of Governments should take a sound-wide view and worry about the total effect of all the pollutants that are loading the sound. As the Poverty Bay example illustrates, pollution often moves from one community to another heedless of jurisdictional boundaries.

Poverty Bay receives "the highest net deposition" of pollutants because of the way the currents work, says Curl.

On the west side of Vashon Island in Colves Passage, the current always travels north at all depths, unlike other places in the sound. But it moves so fast that very little is deposited there, and the water is carried in a circle around the island. Pollutants from Tacoma and Sinclair Inlet are likely to make a couple of trips around the island before coming to rest in Poverty Bay on the island's east side, he says.

Crude less damaging

Oil spills on the sound, the bugaboo of environmentalists, would do less damage if crude oil rather than gasoline or diesel oil number 2 were spilled, he says. This is because crude oil is still in its "natural" state and not toxic.

A surprising finding of a NOAA study on oil spills in the Strait of Juan de Fuca was that the surface water didn't always move out toward the ocean but instead headed back into the sound, he says. A crude oil spill, however, would be "catastrophic" for birds on Protection Island, Curl adds.

And one near Seattle would move in large circles and eventually paint the beaches on both sides of the sound, he says.

Oil company spokesmen have made the argument that oil spills in a contained area such as the sound are easier to mop up than one on the open ocean, but Curl shakes his head.

"I don't know of any major oil spill that has ever been mopped up."

ON

AMENDMENTS TO THE
CLEAN WATER ACT

DECEMBER 16, 1983

Introduction

I wish to thank you, Mr. Chairman, and the members of the committee for this opportunity to present testimony concerning Section 319 of the Water Quality Renewal Act. I am sure we agree that revising and strengthening the Clean Water Act is an economic and environmental priority; and that through compromise and creativity effective regulations will be conceived and implemented. I commend the committee for their tireless efforts in this regard.

Today I submit basic scientific evidence which will confirm Long Island Sound's estuary status and outline the need for further research and pollution abatement measures. Widely recognized as one of our nation's largest boating centers, Long Island Sound is unfortunately a victim of human carelessness and industrial encroachment. However, I am confident that Congress will recognize Long Island Sound's recreational and commercial value and protect the integrity of its waters by including it under Section 319 of the Water Quality Renewal Act.

Connecticut and New Yorks' Urban Estuary

According to the National Oceanic and Atmospheric Administration (NOAA), Long Island Sound is a long, narrow and shallow estuary located between New York and Connecticut. Ocean water flows in and out of the sound through the opening in the eastern end and fresh water, entering the sound along the Connecticut coast, dilutes the seawater. The major contributor of fresh water is the Connecticut River, which accounts for nearly 80% of the fresh water supply.

Section 319 of H.R. 3282, the Water Quality Renewal Act, would require that in instances of interstate sourced estuary pollution, the Environmental Protection Agency (EPA) must convene a management conference to formulate a comprehensive water quality restoration plan. For the purposes of this act, an estuary is defined as it is by the Clean Water Act of 1972: "All or part of a river or stream or other body of water having an unimpaired natural connection with the open sea in which sea water is measurably diluted by fresh water." Clearly, under this definition the Sound is a large estuary; estuarine properties are also found in the many harbors and river mouths of the sound.

Surface water salinity at the eastern end of the sound known as the "Race" is approximately 30 parts salt per 1000 parts water. At Stamford, near the western end, the salinity decreases to about 26 parts per 1000. Since salt water has a higher density than fresh water, the surface water is typically less saline than the water near the bottom. The saline-laden bottom water flows westward and under the fresh water into the sound, while the less saline surface water flows eastward into the open sea. This characteristic is known as estuarine circulation and it occurs during both ebb and flow tides.

Eutrophication

According to the most recent sound-wide data compiled by the National Oceanic and Atmospheric Administration, phosphate concentrations in Long Island Sound doubled between 1950 and 1970, while nitrogen levels also increased. One potentially dangerous effect of an increase in the phosphate and nitrogen levels of an aquatic system is over-enrichment -- eutrophication. This phenomenon could cause a significant reduction in the aquatic life of a system and, if remedial action is not taken, render it completely lifeless. Full-scale eutrophication of Long Island

Sound would be a major tragedy for both Connecticut and New York. It must be avoided at all costs. Let me explain.

An aquatic system free from pollutants remains at a point of homeostatic equilibrium, it is self-adjusting and self-regulating. Each of its components -- primary producers (algae), primary consumers (fish), secondary consumers (fish or birds) and decomposers (bacteria) -- interact and the system achieves a period of long-term stable growth. These interactions (trophic levels) produce waste which is broken down by bacteria. The system is essentially closed because the decomposition process produces substances that are attractive to algae. However, an aquatic system is scientifically known as an open-system because an external source of energy -- sunlight -- is primarily responsible for algae growth through photosynthesis.

Phosphate and nitrogen concentration increases result in a stimulation of algae growth and a subsequent buildup of surface algae. Unable to absorb sunlight to photosynthesize, the bottom layers of algae begin to die off. As this occurs, bacteria begins to decompose the dead algae. However, since decomposition is dependent on oxygen and the overall system is receiving less sunlight and is able to manufacture less oxygen, the aquatic system becomes over-enriched. Bacteria, struggling to decompose

the algae, depletes the system's oxygen supply. Aquatic life begins to die off at a tremendous rate.

Although eutrophication is increasing in Long Island Sound, it is not too late to implement corrective measures and defuse the dangerous situation. Phosphate and nitrogen contaminants entering the Sound from detergents and fertilizer run-off, respectively, must be reduced if we are to avoid full-scale eutrophication. Unfortunately, contaminant studies in Long Island Sound are infrequent and too brief to be conclusive. What is urgently needed is a comprehensive pollution monitoring program. Inclusion of Long Island Sound under Section 319 of the Water Quality Renewal Act would establish such a program.

Trace Metals

A 1972 study conducted by the National Marine Fisheries Service of 13 trace metal concentrations in Long Island Sound (the latest Sound-wide review of trace metals) revealed extremely diverse distributional patterns. Of the 13 metals tested only five had similiar patterns: chromium, copper, lead, zinc and nickel. These five had their highest concentrations in the extreme western end of the sound, while most of the others -- antimony, cadmium,

cobalt, silver, mercury, selenium and scandium -- lacked uniformity in their distributional patterns. Manganese, however, was found to have high concentrations in both the eastern and western end of the sound.

The determination of trace metal concentrations is important because high levels could result in the contamination of marine life. However, adequate information-gathering techniques are not employed in Long Island Sound. Connecticut only tests beaches and shellfish areas, while New York, Nassau and Westchester counties conduct periodic tests of their harbors, but the data compiled is not always distilled into practical reports and shared with interested organizations. Moreover, no sound-wide surface water pollution monitoring is conducted at all.

Long Island Sound is a valuable resource to both Connecticut and New York. Considered by many to be the finest recreational boating area in the United States, the Sound is also a source of livelihood for innumerable fishermen and lobstermen. It must be protected by careful management and scientific review. Occasional trace metal studies do not satisfy this requirement.

Conclusion

On any sunny summer weekend more than 110,000 commercial and recreational vessels dot Long Island Sound. Millions of Americans visit the sound each year; and if its waters are protected, millions more will utilize this urban estuary.

Perhaps the best known example of an interstate estuary in trouble is the Chesapeake Bay. Bordered by Maryland, Pennsylvania, Virginia and the District of Columbia, the bay has long been a subject of jurisdictional controversy. However, these three states and the District, with technical and financial assistance from the U.S. Environmental Protection Agency (EPA), have agreed to put self-interest aside and cooperate in repairing the bay's damaged ecosystem. Long Island Sound's inclusion in the estuaries provision of the Water Quality Renewal Act would ensure similiar EPA assistance for both Connecticut and New York. As is evident by the on-going Chesapeake Bay restoration project, it is possible for jurisdictional conflicts to be resolved for a mutual interest.

I therefore urge the committee to recognize the critical need for an effective pollution monitoring program in Long Island Sound. I think I speak for New Yorkers, citizens of Connecticut, as well as for all Americans, when I state that the integrity of our nation's water resources must be protected. The decisions we make today may not affect us directly, but future generations will either pay the cost of our mistakes, or reap the benefits of our achievements.

HENRY W. MAIER
MAYOR

OFFICE OF THE MAYOR
MILWAUKEE

December 6, 1983

The Honorable Robert A. Roe
Chairman
Water Resources Subcommittee
Public Works and Transportation Committee
U.S. House of Representatives
Room B376, Rayburn House Office Building
Washington, D.C. 20515

Dear Chairman Roe:

I would like to submit the following comments on reauthorization of the Federal Water Pollution Control Act of 1972. These comments should be included as part of the record for the reauthorization created as a result of public hearings recently completed on this matter.

I would also request that if future hearings are scheduled prior to mark-up of amendments to the Federal Water Pollution Control Act that I be allowed to personally elaborate on these comments before your honorable committee.

Please consider the following comments as submitted on behalf of myself, the City of Milwaukee and the United States Conference of Mayors.

1. Non-Point Pollution Control

We are in general agreement with the principles enunciated in H.R. 4037 recently introduced by Representative Oberstar. We agree that non-point pollution represents a significant obstacle to achievement of water quality goals proclaimed in the 1972 law. In the rivers and streams which flow through Milwaukee, we have identified, and are in the process of identifying, the precise stream loadings due to non-point source pollution. Our preliminary studies show that some fifty percent or more of all pollutant loadings are the result of non-point pollution loadings occurring upstream from the jurisdictional boundaries of the City of Milwaukee.

In our opinion, the provisions of H.R. 4037 do not go far enough in requiring that non-point sources of pollution control be addressed at a rate that assures that our significant investment in point source pollution control will realize the water quality benefits that should be attainable given an investment of such magnitude. Milwaukee will invest some $1.7 billion in current dollars over the next decade or so to meet secondary treatment and point source requirements of the law. This investment, which covers treatment

plant expansion and upgrading, rehabilitation and expansion of our interceptor sewer system, including treatment of wet weather overflows from combined storm and sanitary sewers, is proceeding under the auspices of a consent degree entered into in 1977 between Milwaukee and the State of Wisconsin Department of Natural Resources. Milwaukee has, and is willing, to proceed in all good faith to meet the requirements of the Federal Water Pollution Control Act. In turn, we ask that the Congress address our concerns in the area of non-point source control to assure that our efforts do not result in the municipal folly of our time.

In my opinion, the best way to assure that non-point improvements are made commensurate with point source efforts is to require that non-point efforts be carried out on a mandatory basis. While recognizing the technological and institutional improvements necessary to implement non-point source controls are in many ways more complicated--though costing far less dollars--than point source controls, I firmly believe that mandatory efforts will be necessary to protect the massive investment by the public and private sectors in meeting water quality requirements and in achieving the secondary treatment requirements of the law.

2. Construction Grant Funding

We endorse the provisions of H.R. 3282 which would increase the spending authorization for the construction grants program. We are in substantial agreement with those that have previously testified that current authorization levels are sorely inadequate to meet the time deadlines required under the federal law.

We further urge that the Congress review its commitment to local units of government to assure that enforcement practices are tied to realistic levels of funding under the construction grants program. In this regard we would also ask that the Congress review the precipitous drop in the federal share under the construction grants program in light of the commitment made to local government in 1972.

3. Enforcement

We would recommend that the National Pollution Elimination Discharge System established under Section 402 of the 1972 law be modified to allow for inclusion of factors other than those currently considered. Possible factors would include:

- status of Section 208 plans including implementation of best management practices identified under such plans;

- federal, state and local funding commitments and compliance schedules necessary to realistic achievement of water quality goals and protection of public health;

- suspension of mandatory deadlines in those cases where compliance can be demonstrated as impossible to achieve within the deadlines established by the Congress.

In this regard, Mr. Chairman, we would ask that the current proposals to extend the length of a discharge permit from a five to ten year period be rejected in those instances where consistent compliance cannot be achieved within the time allotted under the provisions of a properly issued permit.

In these cases, primarily in major metropolitan areas, we would recommend that permits be predicated upon the progress expected to occur during the life of the permit. Permits issued under this exception should contain enforceable compliance schedules which are to be met during the life of the permit and should be subject to the same legal and procedural safeguards as those currently contained in Section 402.

This recommendation should not be regarded as a turning away from the goals of the Act but rather as a way of insuring that maximum progress is made against those goals even in cases where the magnitude of the task at hand requires a long term sustained effort. The issuance of discharge permits under this proposal could and should be coordinated with the provisions of the separate track funding proposal suggested by the Association of Metropolitan Sewerage Agencies (AMSA). This would integrate the requirements of Titles II, III, and IV in a manner that has been sorely lacking since passage of the original law in 1972.

We believe that permits issued in this manner can be a more effective tool for assuring that maximum progress is made based on the flexible requirements of negotiated compliance schedules which recognize the systemic relationships of sewerage systems in major metropolitan areas. For example, it may make common sense to spend resources and time on the improvement of sewer systems prior to the construction of treatment facilities to assure the maximum return on total investment in the system. We disagree with the fixation that has been placed on the construction of new waste treatment plants without regard to contributions from other point and non-point source discharges which can negate the water quality benefit of treatment plant investment. In this sense we agree with the suggestion of AMSA that comprehensive facilities implementation plans provide the basis for the development of multi-year project schedules.

4. Common Law

We would strongly urge the Committee to resist any and all efforts to overturn the decision of the United States Supreme Court in Illinois v. Milwaukee II. Litigation of this nature only serves to restrain legitimate efforts to attain water quality goals by placing at risk the massive investment necessary to protect our water resources. The Committee has held hearings on this matter and therefore I will simply associate myself with the testimony presented before the Committee on this matter on July 29, 1982 by counsel for Milwaukee, Mr. Richard Cutler, without reiterating the legal, political, technical and economic arguments contained therein.

One additional point can be made on this issue, however, regarding the adequacy of the judiciary to deal with controversies such as those presented in Illinois v. Milwaukee. With the growing body of information on all environ-

mental issues, be they germane to water, air, toxic substances, hazardous wastes, it may prove necessary to establish special environmental courts charged with the responsibility of overseeing controversies generated by the increasing complexity of environmental law. If "safety nets" are necessary for the protection of the rights of individuals and the environment, they should be specifically designed to assure that the kind of legal "overkill" that occurred in Milwaukee II would not be repeated.

5. Pretreatment

We are aware of the difficulties implicit in this issue and of the recent testimony of Administrator Ruckelshaus in which he rejected a more flexible approach than the current system which is based on national categorical standards. Local officials throughout the United States are seriously committed to the basic objectives of pretreatment. We do believe, however, that the imposition of federal categorical standards without regard to the administrative and economic burdens imposed belittles the competency and commitment of those charged with basic responsibilities in this crucial area. Therefore we would ask that a more flexible approach be developed which would recognize those local efforts which have proceeded in good faith in face of a substantial lack of national direction.

In closing, Mr. Chairman, I would emphasize that the Federal Water Pollution Control Act of 1972 is sound and comprehensive legislation. What is suggested above would not, in my opinion, require more than minor modifications to the law as it stands today.

I hope my comments are constructive to your deliberations and would ask that I be allowed the opportunity to elaborate on these concerns if additional hearings are scheduled after the first of the year.

With all best wishes, I remain,

Sincerely,

Henry W. Maier

House Office Building
Washington, DC 20515

Dear Congressman Howard:

The National Environmental Health Association is a professional organization with over 4,000 members representing individuals from government, industry, academia, and the military who are employed in environmental health related positions throughout our country. I am pleased to have the opportunity to submit to you our association's concerns relative to the Clean Water Act. NEHA believes that the Act has been successful in maintaining and improving the nation's waters and protecting the health and welfare. We also believe that much can be done to improve the Act's effectiveness through legislative amendments and revised administrative policies.

Therefore, I ask that you take a moment to review our considerations and recommendations which are listed on the attached position paper and to consider them during forthcoming deliberations.

Kind personal regards,

Phil B. Kirkwood Jr.

NEHA POSITION PAPER ON
THE CLEAN WATER ACT

The National Environmental Health Association (NEHA) is this nation's largest association of environmental health professionals concerned about the quality of our country's environment. We support the continuation of a strong federal Clean Water Act. It is the Association's position that strong water pollution control legislation is essential to the nation's dual protection of the public health and welfare. We view this commitment as inseparable.

While NEHA believes the Act has been successful in maintaining and improving the nation's waters and protecting health and welfare, we recognize that much can be done to improve the Act's effectiveness through legislative amendments and administrative policies enforced by the U.S. Environmental Protection Agency (EPA). It is in this spirit that the following recommendations are made.

I. DECLARATION OF GOALS AND POLICY

Section 101(a) of the Clean Water Act declares the Act's objective "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." To achieve this objective the Act declares two national goals: (1) the elimination of pollutant discharges into navigable waters by 1985, and (2) wherever attainable, "fishable and swimmable" waters by July 1, 1983. Section 101(a)(4) outlines a national policy that Federal financial assistance be provided to construct publicly operated treatment works (POTW).

Recommendations:

1. Delete reference to "1985" in the goal to eliminate pollutant discharges.

2. Change the date "July 1, 1983" to July 1, 1990, as it refers to "fishable and swimmable" waters.

   Rationale: NEHA supports the goals of "zero discharge" and "fishable and swimmable" waters but believes that even under the most optimal circumstances the goals as stated will not be achieved. The pursuit of unachievable goals greatly weakens the Act's credibility, while undermining the case of its most ardent supporters.

3. Delete reference to "financial" in the policy statement as it appears in Section 101(a)(4).

Rationale: Since 1972, more than $37 billion has been spent on the construction of POTWs. EPA now estimates that another $118 billion may be needed to complete the task. Considering the meager gains in water quality that have resulted from such extraordinary expenditures and the need to establish self-sufficiency on the part of municipalities for construction and maintenance of wastwater facilities, NEHA does not see the continual infusion of federal dollars as a long-term solution to the problem. Instead, EPA should assist states and municipalities in developing credible local efforts that ultimately lead to relative financial independence.

II. GRANTS FOR CONSTRUCTION OF TREATMENT WORKS

A major part of Title II of the Clean Water Act calls for federal financial assistance to states for the construction of POTWs. Amendments in 1981 reduced the federal share of grants to states and tightened up the eligibility requirements.

Recommendations:

1. Continue to gradually reduce the federal share of dollars earmarked for the construction of POTWs over the next several years with a scheduled phase-out in seven to ten years.

2. Encourage and assist states and local governments in developing self-sustaining mechanisms to ensure treatment works construction maintenance, expansion, and replacement without reliance on federal grants.

Rationale: For reasons stated earlier, NEHA believes that the massive infusion of federal dollars for the construction of municipal treatment works has proven to be largely inefficient and ineffective. This does not imply that municipal wastewater treatment is not important. NEHA clearly recognizes the relationship of improperly treated municipal wastes to disease transmission and adamantly supports the high level treatment of wastewater effluents. We object, however, to what is widely recognized as a short-term solution to an on-going problem. As an alternative, NEHA urges Congress to support amendments that encourage financing mechanisms not dependent on shrinking federal dollars.

We also presume that along with an increase in local financial responsibility we will witness a corresponding decrease in federal bureaucratic obstacles that have hindered local water pollution control efforts. Our hope is to see effective local programs that get this job done.

III. INNOVATIVE AND ALTERNATIVE TECHNOLOGY

The Act in its 1977 amendments clearly sought to encourage the use of innovative and alternative methods of wastewater treatment. To this end, various financial incentives were provided. However, in many states funds went unused because of an unclear concept of what constituted innovative technology and because of the perceived risks involved in the development of unproven methods.

Recommendations:

1. Clarify the definition of innovative technology and provide guidelines for its development.

2. Give states more flexibility in determining the priority assigned to innovative and alternative projects in relation to more conventional treatment technologies.

   Rationale: NEHA encourages the development of technologies that conserve resources and reduce costs as long as the public health implications of such technologies have been adequately studied and monitored. States should not encourage the development of systems that have been inadequately evaluated.

IV. NONPOINT SOURCE POLLUTION

Section 208 of the Act deals with the control of nonpoint sources of water pollution as part of an overall management approach to areawide pollution abatement. In many ways, Section 208 is the very backbone of the Act tying together the various provisions.

Recommendations:

1. Continue to support the implementation 208 plans at a level consistent with their importance to the overall water pollution control effort.

2. Increase support for the development of techniques to control nonpoint sources of water pollution, including rigorous enforcement of "best management practices."

   Rationale: Implementation of 208 planning recommendations has been sluggish. Nevertheless, these plans are central to a coordinated, long-term approach to regional water pollution control. NEHA encourages the development of incentives and the provision of technical assistance to promote the implementation of 208 plans. NEHA also recognizes that nonpoint sources of pollution may contribute up to 50 per cent or more of the pollution in a body of water. Therefore, if the objectives of the Act are to be fully realized, NEHA believes nonpoint source pollution control must be emphasized to a point equal to that applied to municipal and industrial point source discharges

V. COMPLIANCE DEADLINES

Section 301 of the Act sets compliance deadlines for municipal and industrial dischargers as a step toward achieving the Act's objectives.

Recommendations:

1. Extend the deadline for achievement of BAT and BCT by industries to three years following the establishment of an applicable effluent guideline but no later than July 1, 1987. (EPA is thus expected to have all pre-treatment standards promulgated by July 1, 1984 to provide industry with sufficient lead time to meet compliance deadlines.)

2. Maintain the current standards for municipal dischargers but allow waivers on a case-by-case basis where substantial proof can be shown that achievement of a compliance deadline could not be met due to circumstances beyond the control of the municipal facility.

   Rationale: NEHA believes that compliance deadlines are legally binding and must be met if the Act is to achieve its goals. At the same time, we understand that deadlines sometimes cannot be met due to circumstances beyond the control of the affected parties. Such is the case for municipalities that did not receive promised federal funds to complete projects that would upgrade their facilities or industries where no toxic limitations have been promulgated despite advancing compliance deadlines. Penalties in these situations are not constructive and do not advance the attainment of the overall goals of this important public health legislation.

VI EFFLUENT STANDARDS VS. WATER-QUALITY STANDARDS

The Clean Water Act like its predecessor, the Federal Water Pollution Control Act Amendments of 1972, emphasizes an "effluent standards" approach to water pollution control over a "water-quality standards" approach. Many critics of the Act have suggested that the "water-quality standards" approach should be emphasized.

Recommendations:

1. Preserve the importance and dominance of the technology-based effluent standards as the primary approach to water pollution control.

2. Continue to see water quality standards in a contextual but supportive role.

   Rationale: Pre-1972 water quality legislation emphasized a water-quality standards approach to pollution control. This legislation was largely ineffective because of the difficulty of proving a particular discharger caused an adverse impact. Water quality standards make sense conceptually and philosophically but are difficult to enforce. Post-1972 water pollution legislation has emphasized technology-based effluent standards. NEHA believes these standards are more readily enforced and tend to promote cost effective technological solutions to water pollution control. Our second recommendation however, is just as important. Treatment for treatment's sake does nothing for the Act but does bring about unnecessary costs that cannot be justified. Thus, NEHA supports maintaining a water quality dimension to the nation's control approach. Accordingly if a discharger can demonstrate that water quality objectives will be achieved with treatment levels less stringent than those applicable, the discharger should be regarded as having met his obligation under this law.

VII TOXICS AND PRETREATMENT

Section 307 of the Clean Water Act requires EPA to develop effluent limitations for those toxic pollutants mandated by the 1976 NRDC Consent Decree. It also requires that pretreatment standards be set for pollutants discharged into POTW.

Recommendations:

1. Maintain current emphasis on developing toxic pollutant effluent limitations in accordance with Section 307.

2. Allow municipalities to develop local pretreatment programs in lieu of enforcing federal categorical standards if the POTW meets all applicable permit requirements, has an in-place monitoring program to detect incoming pollutants, and has the resources to carry out the program.

Rationale: NEHA believes that toxic pollutants constitute a major health hazard and should be carefully controlled to prevent accumulation in ecosystems and man. It does not recommend easing of the 1976 Consent Decree as adopted in the 1977 amendments.

NEHA agrees with critics that the controversial pretreatment program has generally been unworkable, complex, confusing and costly. We believe that a large part of the problem can be traced to the attempt to apply national categorical standards to local situations. Thus (consistent with our recommendation regarding local financing and control of POTWs.) NEHA supports giving the local jurisdiction authority to promulgate and manage pre-treatment programs so long as the above noted conditions are met. Presumably so long as permit stipulations are met, the local POTW should be allowed to do what has to be done to insure that influents to the plant are of an acceptable nature.

VIII NPDES PERMITS

The heart of the regulatory program for point source pollution control is the National Pollutant Discharge Elimination System mandated in Section 402 of the Clean Water Act.

Recommendations:

1. Extend the NPDES permit term from five to ten years.

2. Delegate partial program approval for issuance of NPDES permits to qualified states.

3. Upgrade data collection and processing procedures.

Rationale: Critics have charged that the NPDES program is near a state of collapse. While not as pessimistic, NEHA believes that a ten year renewal cycle for permits, delegation of partial NPDES program approval to states, and efforts to streamline data analysis will ease the burden of NPDES program management by EPA. Moreover, it should result in a more effective and credible pollution control program.

IX WETLANDS PROTECTION

Section 404 of the Clean Water ACt has been heralded as a wetlands protection measure. This important section has been the center of controversy, however, ever since the 1972 amendments were passed.

Recommendations:

1. Assign responsibility for overall administration of the dredge and fill materials permit program to EPA.

2. Assign increased responsibility for enforcement to the states.

   Rationale: Many of the problems with implementation and enforcement of Section 404 stem from the Army Corps of Engineers' administration of the program. NEHA believes that the program could be better administered by EPA because of the Corps' conflicting interests in water resources development. NEHA also feels that wherever feasible states should be delegated responsibilities for enforcement of this program to ease burdens on the EPA.

GENERAL RECOMMENDATIONS

To further enhance the effectiveness of the Act's implementation and enforcement by EPA, NEHA makes the following general recommendations:

1. Institute a system of assessing civil penalties of up to $10,000 per day for clear and well documented violations of the Act.

2. Provide stiff criminal penalties, including imprisonment, for individuals or corporations that knowingly and willfully violate regulations so as to threaten the public's health.

3. Delegate authority for implementation of the Act's provisions to the states wherever feasible but only after the states have satisfied EPA that they have the resources and commitment to follow through.

4. Provide sufficient funding to EPA, the states, and local government commensurate with implementation and enforcement responsibilities.

5. Where applicable, the appropriate linkages with other important environmental legislation such as the Safe Drinking Water Act and the Resource Conservation Recovery Act should be constructed so as to avoid potential regulatory conflict.

House Public Works & Transportation Committee
Washington, D.C. 20515

Dear Mr. Chairman:

Enclosed, for the hearing record on the Clean Water Act, are comments prepared by Armco Inc.

I would appreciate your making them part of this record.

With warm best wishes.

Sincerely,

Jim

James L. Oberstar
Member of Congress

COMMENTS FOR THE HEARING RECORD
ON THE CLEAN WATER ACT
BEFORE THE
WATER RESOURCES SUBCOMMITTEE
OF THE
HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

Prepared By

Bruce A. Steiner
Manager - Environmental Engineering
Armco Inc.

October 17, 1983

Armco Inc. is a major steel manufacturer with nine large steel plants located across the country from Baltimore to Los Angeles. As a basic steel producer, Armco uses large quantities of water and generates large volumes of wastewater which must be treated prior to discharge. The cost to build and operate the necessary waste treatment facilities is a significant part of the cost of steel manufacturing. Armco is, therefore, most interested in the Clean Water Act (CWA) and its amendments. Of particular concern are the compliance deadlines, pretreatment, and Water Quality Standards (WQS).

Compliance Deadlines

The Act currently requires compliance with Best Available Treatment (BAT) by July 1, 1984, about nine months from now. This deadline is clearly inadequate and must be extended. The 1984 deadline was established on the premise that BAT effluent guidelines limitations (ELGs) would be promulgated in mid-1980. On that basis industry would have had 48 months from establishment of the guidelines to compliance with ELGs. In Armco's experience it typically takes 36 months to design and build a major water pollution control facility. Design cannot begin, however, until an NPDES permit is issued. The original 12 months allowed for permit issuance was not unrealistic. There is a widely held perception that ELGs, when promulgated, constitute a precise road map detailing what is required of a company to move from existing levels of control to compliance with BAT ELGs. In the steel industry this perception could not be more wrong. The steel industry guidelines are very complex and difficult to apply, requiring the permit writer to make site specific judgments and engineering interpretations for literally hundreds of variables not specifically addressed by the ELGs. As a result of the difficulty in applying steel guidelines, steel permits often take an extended period to develop. In addition it is not uncommon for state agencies to delay consideration of steel permits because of the manpower required for their development.

Eight of Armco's nine major steel plants require NPDES permits. The ninth plant discharges all wastewater to a POTW. Even though the steel industry guidelines were promulgated in May of 1982, none of these plants have received revised NPDES permits that reflect these guidelines. One permit is out for public notice and should be issued in October. One permit will be public noticed in October and should be issued before the end of the year. The EPA and the states have not begun to develop permits for the remaining six plants. Although Armco has no control over the timing of these six permits, we do not expect any of them to be issued before mid-1984, over two years from promulgation of guidelines.

If timing of permit issuance was the only problem, it would be possible for a company to develop its own effluent limitations from the guidelines and design and build the necessary facilities within 36 months of promulgation. Unfortunately, the complexity of the steel ELGs prevents unilateral development of effluent limitations. For example, one of Armco's plants in Zanesville, Ohio, is presently involved with permit negotiations. At this particular location there are three parties involved: Ohio EPA, U.S. EPA, and Armco. Often there are even more participants in these negotiations. At Zanesville when each of the three parties independently applied the ELGs three different and widely varying effluent limitations were developed. The controls required to comply with these different limitations varied from no additional control in one case,

to EPA's BAT technology in another case, to control which went far beyond EPA's BAT technology. When the permit is issued it is probable that limitations somewhere in the middle of the range, but different than any of the original proposals, will be adopted. From Armco's experience it is essential to wait until the state and EPA develop a permit before the design and construction of controls begin. Because the company has no control over when these permits are developed, Armco recommends that the deadlines in Section 301 be amended to require compliance within 36 months of permit issuance.

Pretreatment

Another section of the Clean Water Act Armco believes should be amended deals with programs for pretreatment of industrial wastewaters. We believe it quite appropriate that the pretreatment portions of the law be reexamined and amended significantly to provide a more workable, practical system of pretreatment permitting. Armco has concerns about pretreatment deadlines similar to those described above. Currently compliance with Categorical Pretreatment Standards is required within three years of promulgation. In the steel industry that is July 10, 1985. Armco has six major discharges to POTWs. Currently (14 months after promulgation) none of these discharges have pretreatment limits established by the local POTW, the state, or EPA. In fact, proper limitations cannot be established at any of these locations until the necessary information on removal credits is developed. In 1977, the Congress amended the Clean Water Act specifically to provide for the granting of removal credits by a Publicly Owned Treatment Works (POTW). EPA's implementation of the removal credit program has resulted in regulations that are so complex and administratively difficult that they tend to discourage rather than encourage cost effective joint treatment of industrial and municipal wastes. EPA's pretreatment program is based on establishing uniformly applicable categorical pretreatment standards and a removal credit system that would allow modification of the categorical standards consistent with removals achieved at the Public Owned Treatment Works (POTW). Where removal credits are not available, the combined cost of pretreatment plus sewer service charges often exceeds the discharger's cost of providing BAT treatment and discharging directly into the receiving waters. Under the present regulations removal credits will not be available for most sources. Several large municipalities have criticized the system as unworkable and do not plan to implement removal credits. Most municipalities are unable to comply with the very restrictive provisions of the removal credit system. Even those few municipalities who are willing and able to establish a removal credit system cannot obtain the necessary approvals in time to help industries with pretreatment standards promulgated in 1983 or before. In addition, a report by the House of Representatives Subcommittee on Oversight and Review of the Committee on Public Works and Transportation in the 96th Congress concluded that the removal credit provisions are unworkable.

Armco currently has several facilities that utilize Publicly Owned Treatment Works (POTW) for co-treatment of industrial process wastes. Examples of problems with the removal credit provisions at three of those facilities are as follow:

(1) Middletown Coke Plant (Middletown, Ohio): This facility currently discharges partially treated Coke Plant flushing liquor into the Middletown, Ohio, POTW. The pretreatment system is currently not meeting the Categorical Pretreatment Standards. Preliminary data on POTW removal efficiency suggest that the combined removal achieved by pretreatment and the POTW is equal to or greater than Categorical Standards. If the POTW receives authority to grant removal credits of 82% for phenol and about 70% for ammonia, the Middletown Works will not be required to provide expensive additional pretreatment facilities. However, should the POTW not receive removal credit authority, Armco must spend several million dollars for a phenol removal system and substantially increase current operating costs to remove additional ammonia.

The City of Middletown is currently in the process of applying for approval to grant removal credits for phenol and ammonia. Based on the historical operating data, it is probable that the City will be granted the authority to give removal credits in the range of those outlined above. Based on the probability that removal credits will be granted, Armco has delayed installation of additional pretreatment facilities. If, however, the credits are denied or delayed in the administrative procedure outlined in 40 CFR 403, then the Coke Plant will be unable to comply with the Categorical Pretreatment Standards by the specified date of July 10, 1985.

(2) Union Wire Rope Wire Mill (Kansas City, Missouri): This plant currently discharges partially treated pickle rinse water and galvanizing quench water to the Kansas City, Missouri, POTW. Union Wire Rope (UWR) is not in compliance with the Categorical Pretreatment Standards and will be required to install additional pretreatment by July 10, 1985. The problem faced by Armco is what type of treatment system should be installed. The treatment technology envisioned by EPA in the development of Categorical Pretreatment Standards included neutralization and gravity settling. Bench scale work at Armco indicates the EPA technology is inadequate to meet the Zinc Standard at Union Wire Rope. Additional solids removal by post-filtration appears to be necessary to achieve the Categorical Standards. If removal credits for zinc are granted, the expensive post-filtration step could be eliminated. The dilemma is whether or not to assume zinc removal credits will be available. We cannot wait for a decision on removal credits because to meet the July 10, 1985, deadline design and installation of the required facilities must begin immediately.

(3) Baltimore Wire Mill (Baltimore, Maryland): The Baltimore Wire Mill currently discharges partially treated Kolene quench water, pickle rinse water, and coating rinse water into the Baltimore Back River POTW. Baltimore Works is currently not achieving the Categorical Pretreatment Standards and must install additional pretreatment in the form of clarification and sludge dewatering. Preliminary treatability studies indicated the need to install post-filtration to remove approximately one pound of nickel and chromium per day. If removal credits were available, there would be no need for post-filtration. Unfortunately, to meet the July 10, 1985, deadline Armco cannot wait for a final determination on removal credits. A decision on what to build must be made immediately. We are again faced with the dilemma of whether or not to assume removal credits will be available.

One solution to this removal credit dilema is to amend Sec. 307(b) to establish a removal credit program and allow EPA to extend pretreatment compliance deadlines on a case-by-case basis where preliminary evidence suggests removal credits are appropriate. Conceptually the removal credit program would consist of a preliminary application by the POTW for removal credits to be submitted within 3 or 4 months of enactment. Approval of the preliminary application would be contingent upon EPA's assessment of the POTW's removal capability. If approved the POTW would be given 24 to 30 months to assemble the detailed treatment and analytical data necessary to fully demonstrate removal capabilities. In those cases where the POTW's preliminary application provides evidence that removal credits will ultimately be approved, EPA has the authority to extend the pretreatment compliance deadlines for industrial users. The extension would be limited to the time required for the POTW to make the necessary demonstration.

Water Quality Standards

In addition to the above sections of the Act, Armco is interested in the outcome of the recent controversy over Water Quality Standards (WQS). On October 29, 1982, the U.S.EPA proposed changes to its WQS Regulations. This proposal was perceived by some as a major relaxation of WQS requirements. As a result, amendments to the Act have been introduced that would block the effects of these regulations.

Armco supports the flexibility the proposed regulations would give to the states. We believe that the proposed regulations are required to prevent unnecessary expenditures to meet some WQS, such as those which are not physically nor economically attainable or those with attainment costs that have no reasonable relationship to benefits.

Since passage of the Clean Water Act, water quality standards have seemingly suffered from "benign neglect" by the EPA and more especially the states. This is because it is clear from the language of the Act and its Congressional history that a nationwide "technology-based" system of environmental controls were intended. In 1972 the reasons for this type of approach seemed clear. The previous state-controlled approach to pollution control, with limited assistance from the federal government, was not meeting the expectations of the people (as reflected in Congress). Pollution control was not consistent nationwide because the motivation of the states involved and the data upon which decisions were based varied. Water quality standards were viewed as a good idea that was not working because of a lack of data on which to base decisions and a lack of commitment on the part of the states. Sufficient data to make water quality decisions took a long time to develop and immediate results were desired in 1972. The technology-based system that was enacted had the potential for fast results.

This system has improved water quality in the nation's waterways significantly. In its March 1976 report, the National Commission on Water Quality stated that "... application of the 1977 requirements (BPT) will restore a large portion of the nation's presently polluted waters to a level of physical and chemical quality sufficient to provide for achievement of the interim goal." Significant progress has indeed occurred. For example, the Ohio River Valley Sanitation Commission (ORSANCO) has reported steadily improving conditions in the main stem of the Ohio River and its major tributaries. The following

excerpt is from ORSANCO's report entitled "Fishes of the Ohio River: A Testimony to Clean Water":

> The relative abundance of various classes of fish since 1968 has shown steady movement toward greater proportions of the more 'valuable' species. This is an indication of improved water quality since fishes known to be relatively intolerant of pollution are increasing in number.

This improvement is primarily a result of BPT application for industrial dischargers and secondary level treatment for municipal sewage plants.

We apparently now have come full circle and rightly so. Armco endorses the emphasis on attaining appropriate water quality standards with technology applied as needed. This approach is the only practical alternative to making water bodies, wherever possible, "fishable and swimmable" as required by the Act, without needless expenditure. We believe that the existing legislative language and EPA regulations are adequate to achieve the goals of the Act. However, to avoid unnecessary hardship and needless expenditures in the pursuit of these goals, Armco strongly supports EPA's proposed WQS regulations.

Legislation designed to block this proposal could have a profound adverse impact on some of Armco's operations. We may be forced to go beyond BAT controls with no appreciable improvement or benefit to anyone. Three examples of these problems are as follow:

(1) Middletown Works (Middletown, Ohio)

The Middletown Works, Armco's largest operation, is a fully integrated steel plant, with an annual production of about 2.2 million tons. It produces cold rolled, hot rolled, and coated steel strip. Pollution control facilities include some of the latest technology available. Wastewaters from the blast furnace, open hearth, B.O.F., and hot forming are all treated in complete recycle systems. Other process waters used on a once-through basis are given extensive treatment before discharge. In fact, the EPA used data gathered from its own studies of the Middletown Works to develop steel industry (BAT) effluent limitation guidelines (ELG).

The Middletown Works discharges to Dicks Creek, a very small stream tributary to the Great Miami River. Data from Armco's studies indicate that plant discharges contribute 50 to essentially 100 percent of the flow to the creek during low flow periods. Even with this high percentage of treated industrial waste, the creek supports a number of fish species including minnows and blue gill. However, because of its very low flow, its narrow and shallow cross-section, and lack of good tree cover for a large part of its length, Dicks Creek is not capable of supporting a balanced population of fish and aquatic life. Regardless of these physical constraints, the use classification currently applicable to Dicks Creek is Warm Water Habitat - the same use and the same WQS established for the Great Miami River and the Ohio River to support a balanced population of fish and aquatic life. This use designation was established in the 1970's when the State of Ohio, in an effort to comply with the CWA, established Warm Water Habitat as a use to be achieved in all waters of the state unless noted otherwise. Dicks Creek was not among those streams which received an

exception from the general classification. At that time, there was insufficient data available to evaluate the attainability or impact of this designation on every stream and stream segment. There was essentially no data available for Dicks Creek. In the past few year Armco has developed substantial data concerning stream flows and quality, and the impact of Armco discharges. We believe that this new data supports a change in the current use designation. This change is not possible, however, without modifications in water quality regulations similar to those proposed by EPA.

If the use designation in Dicks Creek is not changed, Armco will be required to provide additional treatment beyond BAT. It is estimated that this additional treatment will cost $5 to $10 million, an expenditure which is not likely to improve the creek's current ability to support fish and aquatic life.

(2) Hamilton Plant (New Miami, Ohio)

The Hamilton plant is located about 11 miles southwest of the Middletown Works. Its two blast furnaces furnish supplemental pig iron to the steel-making facilities at Middletown. Wastewater from both furnaces is treated in a common recirculation system. All process water discharges through a common outfall to the Great Miami River.

This Armco plant is located along a stretch of the river whose flow has been altered. A hydraulic canal which originates about 2.8 miles upstream of the outfall diverts water away from the main stem to a municipal power plant. This canal bypasses the Armco plant and rejoins the river about 1.4 miles downstream of the outfall. Historical data suggest that during low flow conditions, approximately 80% of the total river flow is diverted through the canal bypassing the Armco plant. State law permits the power plant operator (City of Hamilton, Ohio) to divert all of the river flow through the canal when necessary. In total, this canal bypasses water around 4.2 miles of the natural channel of the Great Miami River.

Despite this fact, the use designation for this river segment (Warm Water Habitat) is the same as the remainder of the Great Miami River. At the extremely low flows experienced in this 4.2 mile segment, it is doubtful that the Warm Water Habitat use could be achieved even in the absence of waste discharges. Nevertheless, without a mechanism to change this designation, Armco is locked into one which is overly restrictive and does not recognize the physical reality of the stream. The current use designation may require Armco to provide expensive controls which go well beyond the BAT level of treatment. Even with these controls it is doubtful that the segment will ever achieve the Warm Water Habitat use designation.

(3) Butler Works (Butler, Pennsylvania)

The Butler Works is a large specialty steel plant with an annual production of about 1.0 million tons. It produces silicon and stainless steel strip.

All wastewater from the works is discharged to Connoquenessing Creek. The most restrictive use designations for Connoquenessing Creek are Warm Water Habitat and public water supply. With the exception of fluoride, the current WQS can be achieved by compliance with BAT effluent limitations. The fluoride originates from the use of hydrofluoric acid to clean specialty steel products.

After considerable study over the past two years, Armco has concluded that the current Pennsylvania Fluoride Standards are inappropriate in two important respects. First, fluoride does not need to be limited for the protection of fish and aquatic life. This conclusion was reached by Dr. Jan Sykora, an aquatic biologist at the University of Pittsburgh, as a result of a recent literature search on the toxicity of fluoride. To Armco's knowledge Pennsylvania is the only regulatory authority that limits fluoride for protection of fish and aquatic life.

Second, Pennsylvania limits fluoride for public water supplies at all locations in the stream whether or not a public water supply currently exists or is planned for the future. The closest use of Connoquenessing Creek as a public water supply is Zelienople's emergency water supply, 20 miles downstream of Butler Works. Because stream flows increase downstream, current fluoride discharges at Butler meet WQS at Zelienople even though they exceed the standards near the Butler discharges.

Armco is currently in the process of petitioning the State of Pennsylvania to modify its fluoride limitations. If EPA regulations or the CWA will not allow this modification, Armco will be exposed to several million dollars in pollution control costs beyond what is required for BAT limitations.

We thank you for the opportunity to present these comments on the Clean Water Act. We will be happy to provide the Subcommittee with any further information you require.

The Honorable Robert A. Roe
Chairman
Subcommittee on Water Resources
Committee on Public Works and Transportation
U.S. House of Representatives
Washington, D.C. 20515

Dear Mr. Chairman:

On behalf of the National Association of Home Builders, I would like to submit this statement for the record of the Subcommittee on Water Resources' hearings on amendments to the Clean Water Act. Specifically, I wish to address H.R. 4037, introduced by Representative James Oberstar, which would add a new Section 319, entitled "Non-point Source Control Implementation Plans," to the Clean Water Act. NAHB's 112,000 members include thousands of land developers and homebuilders whose businesses would be affected by enactment of a non-point source pollution control program.

This year the homebuilding industry has begun to recover from its worst recession since World War II. If interest rates continue to decline, we will be able to continue to lead this nation's economic recovery. The cost of financing homes has made us doubly concerned with the affordability of the homes we build.

Housing affordability is one factor that prompts our interest in non-point source pollution controls. Our members have considerable experience using these controls, which I would like to explain briefly before commenting on the proposal of Representative Oberstar.

Non-Point Source Pollution and Homebuilding

Our members prepare land for construction and build houses and other structures. We build everything from one single family detached house to apartments to subdivisions. We construct office complexes, shopping centers, schools, industrial facilities and many other structures. The size of our members' projects ranges from additions onto houses to entire planned communities. Our land developer members prepare land for construction by paving roads, installing sewers and utilities, landscaping, and subdividing parcels into buildable lots.

During development and construction, we temporarily remove ground cover from construction sites. Runoff from those construction sites can introduce sediment into waterways for a short period. Local governments often require builders and developers to reduce the amount and rate of sediment runoff in order to protect waterways. Many builders voluntarily reduce erosion in order to preserve valuable topsoil or trees that contribute to the site's value. The most common practices include:

1. The maintenance of vegetative cover. The smallest area needed for construction is cleared, trees retained, and the topsoil conserved by stockpiling, mulching, reseeding and sodding.

2. The use of hay bales, silt fence and brush barriers to trap sediment on site.

3. Sediment basins that catch runoff to allow sediment to settle out and release the treated runoff.

4. Earthen diversion berms with pipes or chutes to direct runoff to basins. These are especially useful on steep slopes.

Builders also take measures to reduce runoff from finished sites. Natural or structural measures may be used, with widely varying impacts on costs. Flexible zoning ordinances that allow cluster housing or planned unit developments can increase open space, thereby increasing rainwater infiltration and improving stormwater management. Subdivision ordinances can actually reduce development costs while reducing non-point source pollution. Narrower streets, fewer sidewalks and porous pavement reduce impervious surfaces and, as a result, the volume of runoff.

Unfortunately, most control measures impose additional costs which are passed on to the consumer. They must be chosen to fit the site and to keep costs at a minimum. The typical control measures on finished sites include:

1. Vegetative cover to slow the velocity of stormwater runoff and to filter particles from the runoff.

2. Infiltration systems that direct the flow of surface runoff into the ground. Proper soil conditions are necessary. Runoff storage facilities are often necessary when infiltration rates are slow. These systems include dutch drains, which are gravel filled ditches that trap runoff and hold it while it seeps into the ground. Also used are grassed swales, which are depressions in the earth used to slow and hold runoff, and porous pavement, used to absorb street runoff.

3. Surface retention that uses permanent impoundments to hold stormwater on a long-term basis.

4. Surface detention ponds that reduce the rate of runoff by temporarily storing stormwater.

Detention measures in particular require maintenance, so the costs and responsibility of long term upkeep should be considered when selecting such measures. Actual costs are site specific, so cost figures are difficult to compare. However, in every case the costs should be weighed carefully against the effectiveness of the measures being considered.

NAHB Actions

NAHB has for years provided technical advice to our members on land development, including erosion, sediment control, and stormwater management. In 1978 we co-authored a booklet with the U.S. Environmental Protection Agency on non-point source controls in the homebuilding industry. Later, in 1979, we launched a major educational program among our members designed to inform them about the impact of water quality laws on the homebuilding industry. Through speeches, publications, seminars and technical advice, we educated our members on non-point source pollution laws and control practices.

Our affiliated state home builder associations also take initiatives with respect to non-point source pollution. The Kansas Home Builders Association has completed two years of work with the Kansas Department of Health and Environment on a study of erosion control measures. At the request of the Kansas Department of Health and Environment, a Kansas homebuilder chaired the study's task force. The final report concluded, as had the 208 plan, that construction is not a significant non-point source pollution problem in Kansas.

The State of Kentucky and the Home Builders Association of Kentucky have jointly developed a voluntary program of education and technical assistance to reduce non-point source pollution from construction sites. Together they have produced video and written materials aimed at builders and developers. Distribution of the materials has been under the auspices of the Home Builders Association, which has taken the initiative to persuade its members that voluntary use of management practices for non-point source pollutant reduction is in their interests as well as that of their communities. In this and other ways our members are working with state and local governments to ensure that non-point source measures are carried out only where necessary and only in the most sensible manner possible.

Federal Non-Point Source Pollution Program

Our experience with non-point source pollution control programs has persuaded us that several principles should guide the establishment of a federally initiated program.

(1) Information available through the 208 areawide planning process and other sources should be the basis for the state planning process. A tremendous amount of effort was put into the 208 planning process. To the extent that the information generated is germane to the non-point source pollution question, it should be used. Another round of planning is not necessary in most states.

(2) All pollution sources should be addressed. Exemptions should not be given to major sources of pollutants solely because of expense, although the management measures selected must be cost effective. Construction activitiy has localized impacts but is a relatively small part of the total non-point source pollution problem. To place constraints on construction sites while exempting agricultural lands from management practices would make the efforts undertaken by developers futile in terms of the overall improvement of the quality of the waterways.

(3) Decisions on which type of management practices to use should be made at the lowest feasible level of government. Proximity to the problem makes for better decisions as to how to handle the problems. Communities especially need flexibility in dealing with non-point source pollution because of the variety of pollutants and sources.

(4) Voluntary incentives to clean up are preferable to regulatory programs. To regulate the extraordinary number of sources of non-point pollutants would require the expansion of state and federal bureaucracies. A voluntary approach will achieve general compliance without the administrative complexity and expense of more regulations, review procedures, enforcement mechanisms, consultative bodies, and government personnel.

H.R. 4037, Non-Point Source Control Implementation Plans

Representative Oberstar has introduced H.R. 4037, a bill that would require state plans to reduce non-point source pollution. Under the Oberstar proposal, states would use existing data where available. They would produce plans that explain which waters need to be cleaned up, which pollutants and pollutant sources are involved, and when and how the state and local governments propose to reduce the pollutant runoff. The proposal further calls for coordination with Federal programs and the use of local agencies wherever practicable. EPA would approve the state plans and offer 50-50 matching grants to the states from an annual authorization of $150 million. Disputes among states would be resolved by interstate conferences.

The Oberstar proposal takes the approach of offering incentives to the state to address the non-point source pollution problem. We believe that the approach is positive and that the plan format allows the states sufficient flexibility to tailor their responses to the problems they encounter. The proposal also requires local involvement, which we believe is the best way to ensure that the solutions fit the problems.

We also are pleased that Rep. Oberstar's proposal would let states use 208 plans and other existing data and calls for state identification of and planning for pollutant reductions from all sources. It is also quite significant that the bill would oblige the states to identify the costs of management practices when they prepare their plans. That is particularly desirable in the case of land development and construction because the costs vary widely. Some management practices such as detention ponds are very expensive and require regular maintenance.

Other management practices such as hay bales and contouring have minimal costs. Still other management practices such as reduced sidewalk and road requirements can actually lower development costs. The choice of management practices in light of costs is an important one.

While we agree with the general direction of H.R. 4037, we would like to recommend four changes to improve the bill. Subsection (e)(2) of the bill authorizes the U.S. Environmental Protection Agency to approve a state non-point source plan if (a) the state has legal authority to carry out the plan, (b) the implementation schedule is expeditious, and (c) the measures outlined will fulfill the objectives of the section or reduce the pollutant loads from non-point sources. This third requirement creates a potential problem because it allows EPA to substitute its judgment for the state's as to what is appropriate for non-point source cleanup in the state. For example, if a state instituted a voluntary educational and technical assistance program for construction site non-point source pollution control, as is being done in Kentucky, under this section, EPA could determine that the program is inadequate and require the state to develop a strict regulatory program that requires construction site plans and permits. That may not be the intent of the sponsor of the provision, but a literal reading of the amendment language would permit that outcome.

We recommend that the requirement for EPA approval be modified to one of EPA certification that the state has met the requirements of Section (b)(2), which sets out all of the components of the plan. These include the requirements for legal authority and an expeditious schedule. Such an approach would be in keeping with the incentives approach that the bill takes overall. The approach we recommend would also guarantee that the state, and not EPA, decides what should be done to reduce non-point source pollution within that state.

A second change we recommend pertains to administrative efficiency. The proposal requires the state to submit to EPA three documents. A data report would have to be submitted and updated annually. An implementation plan would have to be submitted and updated annually. The state would also submit a report of federal programs that might carry out actions inconsistent with the plan and recommend corrections. We recommend that these three documents be combined into one. One submission and one update of the appropriate parts of the implementation plan to demonstrate annual progress should suffice to inform EPA. It would also streamline the process and reduce the paperwork involved.

Another means of streamlining the process in the proposal concerns the provision in Subsection (c) on federal agency consistency. This provision obliges EPA to compile state recommendations on federal actions and forward them to the federal agencies for appropriate action. As an alternative that uses an existing consultation structure, we recommend that the proposal have state-identified federal assistance programs submit their designated actions to the state for review via the advisory procedure set up under Executive Order 12372. The procedure is ideal for this type of federal-state consultation.

The changes we recommend would improve the positive and well-conceived approach taken by Representative Oberstar in H.R. 3407.

Conclusion

Progress has been made in controlling non-point source pollution. State and local governments should continue to have chief responsibility for the development and implementation of non-point source controls. They should have complete flexibility in developing their programs, so they can devise solutions that are most appropriate for the conditions they face.

The federal government's role should be that of promoting non-point source programs. It can do so through demonstrations, limited financial assistance, education and other means of encouragement. We strongly urge the Subcommittee to focus on positive incentives rather than regulatory programs or sanctions because we believe that a positive approach will be the best in the long run to reduce non-point source pollution.

I appreciate the opportunity to present our views. For further information on our views, please contact NAHB Senior Staff Vice President Robert D Bannister at 822-0470.

Sincerely,

Harry Pryde

The Honorable Robert A. Roe
Chairman
Water Resources Subcommittee
Public Works and Transportation Committee
U.S. House of Representatives
Washington, D.C. 20515

Dear Mr. Chairman:

Atlantic Richfield Company appreciates this opportunity to present its views on the reauthorization of the Clean Water Act. We request that the attached statement, setting forth this Company's position on the significant provisions of the Clean Water Act, be included in the hearing record of the Water Resources Subcommittee of the House Public Works and Transportation Committee.

It is important to recognize that much has been accomplished since the Clean Water Act was written in 1972, and amended in 1977. The Act has been very successful in reversing the problem of water pollution in the United States. The cost of success, however, has been high. The experience of the past decade has turned up some problems that this Company believes could be solved by making certain changes to the statute. These are described in the attached statement.

We hope our recommendations will be of use to the Subcommittee as it considers this important environmental law.

Thank you for your consideration of our views on the reauthorization of the Clean Water Act. My staff stands ready to assist in any way that would be helpful.

Sincerely,

O. G. Simpson

STATEMENT OF ATLANTIC RICHFIELD COMPANY

Submitted for the Hearing Record

Subcommittee on

Water Resources

of the

House Public Works and Transportation Committee

Hearings on the

CLEAN WATER ACT REAUTHORIZATION

October 24, 1983

Atlantic Richfield Company appreciates this opportunity to present its views to the Water Resources Subcommittee on the reauthorization of the Clean Water Act. As a Company involved in a number of diverse activities ranging from resource extraction to manufacture of finished goods, Atlantic Richfield has broad experience with many aspects of this important environmental statute. This Company, therefore, is keenly interested in the outcome of Congressional activity on the Clean Water Act and wishes to be a constructive participant in these deliberations.

This statement identifies changes Atlantic Richfield Company believes are needed in the major provisions of the Clean Water Act, including effluent limitations and deadlines, water quality standards and criteria, water quality based effluent limitations, discharge permits, ocean discharges and dredged or fill permits.

Atlantic Richfield Company believes the changes highlighted below will ensure protection of the nation's waters while improving the effectiveness of the regulatory program.

Effluent Limitations and Deadlines

The Clean Water Act requires industries to comply with a series of technology-based discharge limits by the following deadlines:

- "Best practicable control technology currently available" (BPT) was to be used to comply with the first level of technology-based limits by July 1977.
- "Best available control technology economically achievable" (BAT) is to be used to meet limits for toxic pollutants by July 1, 1984.
- "Best conventional control technology" (BCT) is to be used to meet limits for so-called conventional pollutants by July 1, 1984.
- BAT is to be used to meet limits set for so-called "nonconventional" pollutants by July 1, 1987. Nonconventional pollutants are all those that are neither conventional - suspended solids, coliform bacteria, and the like - nor toxic as defined in Section 307 of the law.

While industry was largely successful in meeting the BPT deadlines, the 1984 and 1987 deadlines will be impossible to meet simply because EPA has not issued the applicable limits and guidelines for the majority of industrial categories.

In the case of toxic pollutants, the difficulty in meeting the 1984 BAT deadline was heightened by the 1977 amendments to the law.

In 1977, Congress enlarged the scope of the BAT requirements for toxic pollutants by requiring that the 65 pollutants covered in the NRDC v. Train consent decree be listed as toxic and that BAT effluent limitations for discharges of those pollutants be promulgated. The 1977 amendments laid out criteria for establishing effluent limitations and for revising the list of toxic pollutants. However, the amendments established no formal procedure for listing or delisting toxic pollutants. Further, the amendments provided no means to determine the priority for acting on the 65 consent decree pollutants.

The toxics requirements were imposed because of the concern that the broad array of chemical discharges to water could have toxic effects on aquatic organisms and could ultimately endanger public health. But the progress made since 1977 in monitoring and assessing the toxic effects of chemical discharges has resulted in findings that many such discharges pose less of a threat to health and the environment than originally feared.

Given these new findings, the Clean Water Act's toxic pollution control requirement that BAT be implemented in every case is overly stringent and could result in unnecessary treatment.

In the case of nonconventional pollutants, the concept of moving from BPT to the more stringent and costly BAT was based on the concern that BPT alone could not meet the law's goals and policies. But assessments made since 1977 show that, for many industries, compliance with BPT is sufficient. And while moving to BAT often provides no significantly greater protection, it does impose significantly greater capital and operating costs.

Consequently, Atlantic Richfield Company recommends the following:

1. Eliminate BAT for nonconventional pollutants.

   Requirements more stringent than BPT for nonconventional pollutant discharges should be set only when required to protect particularly sensitive stream segments from harmful concentrations of such pollutants. Repeal of the BAT requirement would also mean repeal of the 1987 deadline for meeting the requirement. Instead, dischargers should be required to comply, on a case-by-case basis, within three years after guidelines and standards are issued in final form.

2. Extend the deadline.

   The 1984 deadlines for conventional and toxic pollutants should be extended to 1987 or three years after promulgation of categorical regulations, whichever is earlier.

3. Extend the review period.

   Review of effluent limitations should be required every ten years, rather than every five years as now mandated. As a means of providing for emergency situations, review prior to the ten-year limit would be allowed if significant, unforeseen risks arose.

4. Establish listing priorities for toxic pollutants.

   As a means of ensuring that the most important of the 65 consent decree pollutants are addressed first, Congress should require EPA to establish priorities for considering the substances. These priorities should be based on prevalence, relative potency and type of toxicity, adequacy of BPT to control the pollutant, and feasibility and environmental effects of going beyond BPT.

5. Establish listing, delisting procedures.

The Act should provide a more detailed procedure for revising the list of toxic pollutants. That procedure should include provisions for considering petitions from the public to list and delist substances when substantial new evidence shows that action is warranted.

6. Limit applicability of toxic standards.

BAT toxic limitations should be set only for those industrial categories and subcategories that are shown to discharge listed toxic pollutants in toxic amounts and for those categories and subcategories that require more than BPT to eliminate toxic discharges in toxic amounts.

7. Allow modifications of BAT limits for toxics.

The administrator of EPA should be allowed to grant case-by-case modifications of BAT toxic limitations for sources than can demonstrate that such modifications will not result in the discharge of toxic pollutants in toxic amounts.

Water Quality Standards and Criteria

The Clean Water Act directs the states to establish water quality standards for intrastate streams to protect public health and enhance water quality, taking into account the streams' uses and values. The standards are to be based on criteria issued by EPA. Congress intended the standards to be used to set effluent limitations more stringent than BPT or BAT if necessary to protect a particular water course's designated uses.

However, in the spirit of optimism that imbued states' water pollution control efforts after the 1972 amendments, most stream segments were designated as "fishable, swimmable"--not because they had previously enjoyed such uses but in the expectation that implementation of the water act would result in great improvements in water quality. In addition, EPA's water quality criteria were focused solely on achievement of fishable, swimmable water quality.

Actual experience with water pollution control demonstrated that, in many instances, optimism outpaced reality. It was realized that some stream segments, even with the most stringent water pollution control, would never attain fishable, swimmable status. Some states moved to downgrade water quality standards, but EPA's regulations made such revisions virtually impossible.

EPA went even further in tying the states' hands by declaring that federal water quality criteria were "presumptively applicable," and that the burden of proof was on a state to demonstrate why less stringent criteria could be used. However, in November 1980, EPA withdrew its "presumptively applicable" approach. Subsequently, the agency has proposed revisions to its regulations

governing standards and criteria to conform to the law's mandate that standards "consist of the designated uses of the navigable water involved and the water quality criteria for such waters based upon such uses." The agency indicated that it will issue criteria for attainment of uses other than fishable, swimmable which states must take into account in setting standards, viz.: public water supplies, agricultural, industrial, and other uses.

In reauthorizing the Clean Water Act, Congress should:

1. Reaffirm the concepts of multiple use and state primacy in the setting of water quality standards to ensure that EPA continues on its present course.

2. Require EPA to subject proposed water quality criteria to review by an independent advisory committee as a means of providing oversight and ensuring scientific accuracy.

Water Quality Based Effluent Limitations

Although the Clean Water Act places primary emphasis on technology-based limitations, it recognizes that in some instances these technology requirements may not be rigorous enough to protect water quality in a specific stream segment. Therefore, the Act empowers the administrator of EPA to require more stringent effluent limits on a case-by-case basis if technology limitations are insufficient and if the water quality-related limitations are economically and socially justified. Atlantic Richfield agrees that some provision must be made for going beyond technology-based limitations under certain rare circumstances. However, the current process for setting related limitations denies a discharger adequate time to respond to a finding by EPA that such limitations are necessary. Further, the authority given the administrator to require water quality-related limitations empowers the agency in these instances to preempt states that have been delegated authority to run their own discharge permit programs. Such preemption is inconsistent with the law's policy of recognizing, preserving and protecting the primacy of states in water pollution control.

Atlantic Richfield Company recommends that the Act be amended to:

1. Require that more stringent effluent limitations shall be established only by formal rulemaking procedures allowing for adequate notice, comment and review.

2. Prescribe that background documents describing proven technology capable of meeting these limitations shall be made part of the rulemaking process.

3. Provide that determinations on the need for water quality related limitations be made by states when the state has been delegated discharge permitting authority.

Pretreatment

The Clean Water Act requires EPA to establish pretreatment standards for industrial discharges to publicly owned treatment works (POTWs) if it is determined that the discharges are not susceptible to treatment by the POTW or would interfere with the operation of the POTW. The section further provides that for toxic pollutants, the owner or operator of the treatment plant may revise pretreatment requirements if the treatment plant removes all or any of the toxic pollutants without violating its discharge permit or contaminating its sludge.

Experience has shown that in many instances treatment plants do indeed provide adequate levels of toxic pollution control.

However, the pretreatment regulations issued by EPA have made it practically impossible for indirect dischargers to receive credits for removal by the POTW. This situation results in redundant treatment of toxic pollutants by industry and the POTW, a circumstance that is clearly uneconomic and not in conformance with the law's intent to simplify procedures and delegate responsibility to non-federal entities.

Therefore, Atlantic Richfield Company recommends amending the Act to:

1. Place the pretreatment program solely in the hands of the POTW operator. The local operator is best equipped to make determinations on the ability of the treatment works to handle indirect industrial discharges while meeting the requirements of its discharge permit and can best design pretreatment requirements that give full credit for pollutant removal by the POTW.

2. Require EPA to provide technical assistance when requested by the POTW or the permittee as a means of ensuring permit compliance.

Discharge Permits

Section 402 of the Clean Water Act provides that the administrator of EPA may issue permits for the discharge of pollutants into navigable waters if discharges meet the law's other applicable requirements.

In practice, however, numerous problems have appeared, including:

- Delays in issuing permits.
- Imposition of unnecessary and redundant requirements.
- Erection of unjustifiable barriers to use of the law's credits for pollutants in intake waters.
- Extension of technology-based point source requirements to storm water diversion facilities and other structures whose discharges are not amenable to treatment.

- Lack of consideration for de minimis sources of conventional water pollutants.

- Regulatory interpretations that preclude the flexible application of "bubbling" to permitted facilities.

- EPA's use of "informal," but binding, guidance that is not subject to normal public review and comment or to judicial review.

- EPA's broad exercise of veto powers over NPDES permits issued by states with primary permitting authority.

These problems can be remedied without interfering with the need to protect the nation's waters. Therefore, Atlantic Richfield recommends the following changes in the NPDES permitting process:

1. Issue permits for ten years.

   Currently, NPDES permits are issued for five years and may be terminated or modified at any time for a number of reasons. Atlantic Richfield believes that NPDES permits should be valid for ten years and should not be reopened by EPA except in certain specific instances. Those instances would include listing of a new toxic pollutant; issuance of a new BAT guideline; or making a showing that reopening the permit is necessary to prevent imminent harm to health or welfare. Such changes would reduce the amount of time industry spends in obtaining permits and would create an environment of certainty once a permit is received.

2. Mandate general permits.

   Although the Clean Water Act is silent on general NPDES permits for operations that are similar in nature, EPA has interpreted its authority to allow issuance of such permits. EPA has granted general NPDES permits for separate storm sewers, categories of other point sources that meet certain criteria, and for offshore drilling rigs in the Gulf of Mexico and off California.

   EPA's general permitting authority should be specifically provided in the Clean Water Act for those activities that:

   - Are similar in nature.
   - Cause only minimal environmental effects when performed separately.
   - Will have only minimal cumulative adverse effects on the environment.

   Atlantic Richfield also believes that certain categories of regional or general NPDES permits can be granted without adversely affecting water quality. Therefore, the Company

recommends that the law specifically require issuance of general or regional permits for offshore oil and gas operations, storage tanks and surrounding diked areas, pipelines, exploration drilling activities and mobile drilling rigs.

Because of the frequency of occurrance of offshore oil and gas activities and the similarity of environmental conditions in individual OCS areas, general permits should be granted in virtually all areas off the U.S. coast. The basis for issuing these general permits can be found in numerous existing studies concerning the impact of discharges in similar areas offshore. The studies provide substantial information regarding the environmental consequences of proposed discharges and show that the consequences vary little from place to place within those similar areas. Only in those areas which the Bureau of Land Management or EPA has designated as unique and environmentally sensitive should an applicant be required to complete the full NPDES permitting review process. Further, insuring that general NPDES permits in OCS lease sale areas are available and are effective by the date of a particular sale greatly reduces delays and provides certainty for industry operations.

3. Repeal Application of NEPA for New Source NPDES permits.

Section 511 currently requires that NEPA be applied to new source NPDES permit applications. This is a potentially time-consuming and costly requirement that Atlantic Richfield Company believes is redundant given the other requirements which must be met to receive a permit under Section 402.

4. Provide credits for intakes.

The Clean Water Act defines "discharge of a pollutant" as "any addition of any pollutant to the navigable waters..." Such a definition clearly indicates that a discharger should be given a treatment credit for any pollutant in his intake waters. However, as currently implemented, numerous restrictions imposed by EPA on the granting of "net" effluent limitations have made it virtually impossible for a discharger to take advantage of the "pollutant intake" provision. Congress should specify that discharge permits should require control of "net," as opposed to "gross," levels of pollutants in effluents. This change would merely underscore the intent of the law that dischargers should treat pollutants added to the water.

5. Set a deadline for action on permit applications.

Applicants for NPDES permits routinely encounter delays in final decisions on applications. To ensure timely agency action on NPDES applications, the process for issuing a permit should be expedited by requiring the agency to notify an applicant within 30 days of receipt whether an application is complete. When EPA

20-955 O—84——227

finds that an application is incomplete, the agency should be required to specify what further information is necessary. The agency should be required to conclude final action within six months of receiving a complete permit application.

6. Provide exemptions from point source definition.

No technology exists or is likely to be developed for control of discharges, to specific effluent limits, from storm water diversion structures and the like. Furthermore, such structures, which merely regulate stream flow, frequently account for no net increases in the pollutant levels of receiving waters. Consequently, the definition of point source should be amended to exempt surface water diversions; shallow groundwater diversions; discharges from dams, ponds, and other structures that serve only to control streamflow; and storm water runoff and other non-point sources.

7. Authorize de minimis exemptions.

Unlike the Clean Air Act and other pollution control statutes, the Clean Water Act makes no allowance in its permit requirements for small point source dischargers of conventional pollutants. This lack of consideration imposes unnecessary control requirements on insignificant dischargers and prevents full concentration of resources on control of more important sources of pollution. The Clean Water Act should be amended to allow EPA to establish de minimis classes of point source dischargers of conventional pollutants. A de minimis discharger would be required to file a request for exemption and appropriate documentation relative to the proposed discharge with EPA or the state, as the case may be; if the permitting authority took no action on the request within 30 days, the exemption would be approved automatically.

8. Permit "bubbling."

Current EPA regulations require separate effluent limitations for each outfall at a facility, precluding the use of alternative effluent limitations, commonly called "bubbles," to achieve overall point source control in a potentially more economic and equally protective manner.

This stand has been taken even though the agency's own experience with bubbling under the Clean Air Act has shown that the measure can provide more cost-effective, yet environmentally sound, pollution control. The Clean Water Act should be amended to authorize bubbling that allows for tradeoffs between outfalls within a facility discharging the same or different pollutants so long as the overall effluent limitations for that facility are met.

9. Restrict EPA intervention in state programs.

Despite Congress' stated intent that EPA should exercise minimal authority in states that have assumed primary authority for NPDES permitting, the agency continues to reserve the right to object to individual state-issued permits under a wide variety of conditions. Congress should amend the law to state clearly that EPA may block issuance of a state NPDES permit only if it does not ensure compliance with effluent limitations, guidelines and standards promulgated under Title III of the Act.

10. Subject "unofficial" guidance to public and judicial scrutiny.

Over the years, EPA has issued a series of technical manuals and guidance documents that permit writers are required to consult in setting limits for point sources. However, this "unofficial guidance" has not been subjected to formal public comment and review. Similarly, this guidance has escaped judicial review because of EPA's assertion that the documents amount to mere policy guidance. However, the guidance documents have a major effect on the nature of requirements in individual discharge permits. Congress should amend the Act to require that EPA may issue manuals, guidance and other documents considered in writing NPDES permits only after notice to the public and opportunity for comments in accordance with the Administrative Procedure Act. Similarly, Congress should amend the Act to require that such guidance documents are subject to review in United States district courts.

Ocean Discharges

The Act currently requires that no NPDES permit may be issued for operations discharging into the territorial sea, waters of the contiguous zone, or the oceans until it is determined how the discharge will affect the receiving waters.

For the permit applicant, determination of effects means the performance of bioassays, analyses of the proposed discharge's chemical constitutents and of potentially affected biological communities, and an evaluation of available alternatives to the proposed discharge, among other things.

Atlantic Richfield believes such requirements are redundant in many cases. In the case of offshore oil and natural gas operations in federal waters, consideration of impacts on the marine environment are weighed under provisions of the National Environmental Policy Act at the time a tract is leased. In state waters, similar consideration is required under corresponding state law. In addition, in many areas, particularly the Gulf of Mexico, a multitude of studies of the marine environment already have been conducted and the potential impact of offshore activities is well known.

Therefore, Atlantic Richfield recommends the following changes in the ocean discharge requirements of the Act:

1. Take into account NEPA reviews.

   Compliance with the ocean discharge provisions should be required only in cases where a federal or state environmental impact statement (EIS) or its equivalent has not been prepared.

2. Take into account NPDES requirements.

   For cases where a federal or state EIS or its equivalent has not been prepared, compliance with the ocean discharge provisions should be required only for those aspects of ocean degradation that cannot be addressed by meeting NPDES discharge permit requirements.

3. Eliminate redundant studies.

   For those proposals subject to review under the ocean discharge requirements, maximum use should be made of prior studies of similar activities in the marine environment to avoid needless duplication of data.

Dredged or Fill Permits

Section 404 of the Clean Water Act requires permits issued by the Corps of Engineers for disposal of dredged or fill material in the waters of the United States.

The 404 program originally was designed to ensure that dredged or fill material discharges did no damage to surface water quality. As knowledge increased, it became obvious that the adjacent wetlands from which our surface waters flow also must be protected from indiscriminate dumping if water quality is to be maintained. However, efforts to protect those areas have resulted in judicial interpretations and regulatory decisions that have unnecessarily expanded the scope and complexity of the 404 program far beyond streams and rivers and the adjacent wetlands recognized to be important to water quality.

The corps' reluctance to issue general 404 permits under Section 404(e) has increased delays and resulted in redundant review of similar activities, frustrating the intent of the law.

Further, the corps' failure to assert its decision-making authority has also resulted in the imposition of permit conditions that are often unwarranted and unnecessarily expensive. Rather than face the delay inherent in negotiating unreasonable conditions with reviewing agencies, permit applicants have accepted stipulations that are unsubstantiated, produce no apparent environmental benefits, and are not cost effective.

Thus, while Atlantic Richfield supports the protection of the nation's navigable waters, major tributaries and adjacent wetlands from the adverse impact of dredged or fill material disposal, the Company believes the following changes in the statute are essential to provide a more reasonable and effective permitting program:

1. Increase use of general permits

Section 404 (e)(1) should be written to require the Secretary to issue categorical general permits on a State, regional or nationwide basis if the Secretary determines that the activities, or the impacts of the activities, are similar in nature, and their individual and cumulative impacts on the environment are minimal in absolute terms or when compared to the impacts of such activities when individually permitted. In making the determination whether to issue a general permit the Secretary shall consider and balance those factors which, in his opinion, affect the public interest.

This section should also state that the Secretary is required to issue general permits if it is determined that the use of a general permit would avoid unnecessary duplication of the regulatory control exercised by another federal, state or local authority, provided that the activities, or impacts of the activities, are similar in nature and their individual and cumulative effects on the environment are minimal, or will not increase as a function of the issuance of the general permit. In making the decision whether to issue a general permit the Secretary shall consider and balance those factors which, in his opinion, affect the public interest.

2. Encourage state primacy

Section 404(g) should be rewritten to require the federal government to delegate primary responsibility for the dredged or fill permit program to any state which submits for review a program meeting the statutory requirements of Section 404 of the Clean Water Act. The law should provide that a state with an approved program has primary jurisdiction over those waters defined in the law as subject to Section 404. At the state's discretion, the law should provide for the state to administer the program in all geographic regions of the states, in certain specific regions only, or for certain specified activities for which its program meets the statutory criteria of Section 404. In the event a state chooses not to administer a program fulfilling the statutory requirements of Section 404 within a specific geographic region or for particular specified activities, the administration of the law in these regions or for these activities would remain the responsibility of the Corps of Engineers.

The law should state clearly that the federal government's role in a state with an approved program is limited to one of oversight and that federal review is limited to water related aspects of the state's program, not individual activities. The federal government should be provided the authority to revoke a state's primary responsibility if it can be demonstrated that the state is not carrying out its statutory responsibilities and after a state has been notified of the federal governmeht's intentions and has been provided a reasonable opportunity to correct any deficiencies.

3. Expedite permit processing

Section 404(m) should be rewritten to require that within 45 days of submission of a complete application, all federal agencies must submit their comments on the application.

Additionally, 404(q) should be amended to require that within 90 days of receipt of a complete application a decision on the application must be made, unless the applicant and the agency agree, at the time of application, that ninety days is inadequate for reaching a decision on a permit. In such an instance, the applicant and the agency shall mutually agree upon an extended deadline. In the event the applicant and the agency are unable to reach an agreement regarding a deadline extension, the issue should be taken before the Chief of Engineers who will establish a new, extended deadline for that particular application, taking into consideration the concerns of both the applicant and the agency.

4. Substantiate permit stipulations

Section 404(m) should be amended to require reviewing agencies, when submitting comments on permit applications, to provide succinct justifications for any suggested permit stipulations. Such justifications should specifically delineate the anticipated adverse environmental effects that the proposed conditions are designed to prevent.

Section 404(m) should require that stipulations must be shown to mitigate verifiable adverse environmental effects of the proposed activities. Such changes in the law would ensure that any required modifications to permitted projects provide the maximum protection for water quality and other primary environmental concerns at a minimum of extra expense.

Additionally, the law should require the corps and reviewing agencies to demonstrate that the suggested permit stipulations are directly related to protection of values with a direct relationship to water quality or hydrology and other primary environmental concerns (such as those covered by the National Environmental Policy Act or the Endangered Species Act, as applicable) resulting from a change in water quality or hydrology.

This section should be further amended to require the corps to take into consideration the economic impact of its proposed permit stipulations. In the event the corps proposes a stipulation be placed on a permit that is of greater expense than alternatives proposed by the applicant, the corps should be required to justify its decision.

Washington, DC 20515

Dear Bob:

I am enclosing a copy of a letter that I have received from Florida Governor Bob Graham concerning proposed amendments to the regulations on Section 404 of the Clean Water Act.

While Governor Graham supports regulatory reform, he expresses some serious concerns with the changes in the Corps 404 program. He feels that these amendments would devastate the regulatory program designed to protect wetlands and would seriously erode the rights of states to exercise their own environmental protection authority.

I understand that your Subcommittee will be holding hearings on this matter. To assure that Governor Graham's views are taken into consideration, I would appreciate your making his comments part of the public record on these hearings.

With best wishes, I am

Very truly yours,

LAWRENCE J. SMITH
Member of Congress

STATE OF FLORIDA

OFFICE OF GOVERNOR BOB GRAHAM

July 26, 1983

Honorable Lawrence J. Smith, M.C.
Sixteenth Florida District
113 Cannon House Office Building
Washington, D.C. 20515

Dear Larry:

Enclosed for your information are the State of Florida's comments on the Corps of Engineers' proposed amendments to its permit regulations for controlling activities in waters of the United States as proposed in the Federal Register, Volume 48, Number 93, May 12, 1983. We are very disturbed by these proposals and feel that they seriously weaken the effectiveness of the regulations in meeting the goals of the Clean Water Act.

While Florida continues to support responsible regulatory reform, we maintain our opposition to any major change in the scope of the Corps 404 program, which we feel these proposed regulations would affect. The Corps' intent to simplify its regulations fails for two reasons.

- In an attempt to deregulate activities which have minimal environmental effects, the Corps has included activities which will have major adverse environmental consequences.

- The proposed regulations do not recognize the existence of an independent regulatory program in Florida and would, therefore, only cause confusion in Florida and other states with regulatory programs. The Corps' amendments furthermore ignore the rights of the states to protect their own waters.

We do not relish the adversary role which the foreseeable effects of these proposals have caused Florida to take. However, looking at these rule changes, in conjunction with amendments to the Clean Water Act proposed by the Administration and Congress over the past year, we are greatly concerned about what appears to be a major administrative and legislative effort to dismantle the 404 program.

RECEIVED

The deadline for commenting on these proposed regulations has been extended from July 1 to August 31, 1983. If you have any questions on our comments, please contact Secretary Victoria Tschinkel, Department of Environmental Regulation, or her staff at (904) 488-4805.

With warm regards,

Sincerely,

Bob

Governor

CMA

CHEMICAL MANUFACTURERS ASSOCIATION

WILLIAM M. STOVER
Vice President
Government Relations

December 22, 1983

The Honorable Robert A. Roe
Chairman
Subcommittee on Water Resources
Committee on Public Works and Transportation
U.S. House of Representatives
Washington, D.C. 20515

Re: Hearings on Possible Amendments to the Clean Water Act

Dear Mr. Chairman:

On November 3, 1983, testimony was presented to the Water Resources Subcommittee on behalf of the Chemical Manufacturers Association. CMA is submitting the attached statement to comment on the testimony of EPA Administrator William D. Ruckelshaus, which was presented subsequently on November 15, 1983. Our submission focuses on the FDF procedure, pretreatment, and civil and criminal enforcement. It also notes our support of EPA's specific proposal on extending the term of NPDES permits to ten years, and our agreement with EPA on the lack of justification for post-BAT water quality amendments.

CMA agrees with Administrator Ruckelshaus that Congress should clarify EPA's authority to continue to use the "undamentally different factors (FDF) procedure. CMA also agrees with the Administrator that the application of categorical pretreatment standards should be avoided where they are not needed. However, we believe that an alternate mechanism to assure necessary pretreatment can be developed without the delays and difficulties of concern to EPA. Finally, CMA believes that the new criminal sanctions and administrative civil penalties proposed by EPA are unnecessary and poorly conceived.

We request that the attached statement be included in the hearing record.

Very truly yours,

WMStover

SUPPLEMENTAL STATEMENT OF THE
CHEMICAL MANUFACTURERS ASSOCIATION
BEFORE THE SUBCOMMITTEE ON WATER RESOURCES
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
DECEMBER 22, 1983

The Chemical Manufacturers Association submitted testimony to this Committee on November 3, 1983, concerning possible amendments to the Clean Water Act. CMA is a non-profit trade association whose company members represent more than 90 percent of the production capacity of basic industrial chemicals in this country. CMA is submitting this statement to comment on the November 15, 1983, testimony of EPA Administrator William D. Ruckelshaus.

CMA is in agreement with the Agency on a number of the issues discussed by Administrator Ruckelshaus. We agree that the industrial compliance deadlines under the Clean Water Act should be extended, and that it is time to focus attention on discharges from non-point sources. We also agree that legislation is not needed to address water quality standards and the establishment of additional controls beyond best available technology (BAT), if necessary. Finally, CMA supports amendment of Section 402 of the Act to extend the term of NPDES permits from five to ten years, as specifically proposed by the Administration. Our views on the FDF procedure, pretreatment, and civil and criminal enforcement are set forth below.

The FDF Procedure

In his testimony, Administrator Ruckelshaus requested that Congress clarify EPA's authority to con-

tinue to use the fundamentally different factors (FDF) procedure. We believe that this important procedure is clearly authorized by the Clean Water Act, but agree that Congress should clarify the Agency's authority in this area.

The FDF procedure has been a key feature of the national effluent guidelines program since its inception.[1/] The availability of an FDF determination is essential to allow EPA to develop national guidelines for typical facilities while allowing the consideration of plants with atypical features to be addressed separately. A recent decision of the Third Circuit Court of Appeals has held this procedure unlawful for toxic pollutants as it relates to indirect dischargers, and we believe this decision to be unsound as a matter of law and policy.[2/]

When EPA develops effluent limitations guidelines and standards, the Agency attempts to apply the statutory factors to typical and representative plants, with appropriate subcategorization to ensure that similar plants are treated similarly. However, given the complexity of American industry, it is not surprising that in establishing such national guidelines EPA will often not have the time, data, or resources to examine plants which may not be able to meet the national standards due to particular circum-

---

1/ See E.I. duPont de Nemours & Co. v. Train, 430 U.S. 112, 128 (1977); 40 C.F.R. §§ 125.30, 403.13.

2/ National Ass'n. of Metal Finishers v. EPA, 19 ERC 1785, 1798-1801 (3d Cir. 1983).

stances. The FDF mechanism is a device to allow EPA to proceed in an expeditious fashion to develop the national guidelines applicable to most plants in an industry category or subcategory, while deferring consideration of problems raised by unique or atypical plants to a subsequent proceeding.

To obtain an FDF variance, a facility must show that it is different from those considered in establishing the national regulations, and that compliance with the national regulations would result in excessive costs or adverse non-water quality impacts. The plant that receives an FDF variance from a BAT-level standard is not "exempt" from BAT, but will be given an individual BAT limit based on the statutory factors in Section 304(b) of the Act. This is a limited safety-valve analogous to the Agency's use of best professional judgment permit determinations under Section 402(a)(1) of the Act for industrial facilities whose national effluent guidelines have not been issued. The FDF determination is not a modification procedure which is precluded for toxics under Section 301(l) of the Act, but instead is an alternate procedure for determining the applicable technology-based limitations for a facility.

EPA could consider atypical plants in the guideline process itself, by establishing additional subcategories or by entertaining rulemaking petitions regarding individual plants, but we share EPA's concern that this approach would add unnecessary complications to a guideline process

that has been behind schedule. EPA should have the flexibility to determine whether to proceed to deal with atypical plants by regulation or through the FDF procedure.

The Pretreatment Program

This subcommittee has received considerable testimony concerning the need for local control of the pretreatment program. The concept of local control has been broadly supported by groups such as the National Association of Manufacturers, the U.S. Chamber of Commerce, the Business Roundtable, the Association of Metropolitan Sewerage Agencies, the Association of State and Interstate Water Pollution Control Administrators, and the Water Pollution Control Federation. In his testimony, EPA Administrator Ruckelshaus testified that "where possible, we must avoid the application of categorical pretreatment standards where they are not needed."

EPA apparently has come to the conclusion that it is not feasible to administer a scheme under which local pretreatment programs would be allowed in lieu of categorical standards. In his testimony, Administrator Ruckelshaus states that such a new approach would involve a delay of two to three years in the program because the prerequisites of a national effort in this area are missing. In particular, the implementation of water quality standards and sludge disposal requirements and pretreatment standards are cited as being behind schedule.

We are not persuaded that the difficulties noted by Administrator Ruckelshaus are grounds for missing the opportunity to address the serious problems that have been identified in the pretreatment program. Municipal treatment works will have to comply with water quality and sludge disposal requirements with or without alternative local programs. We believe that the pretreatment program can be strengthened by directing the attention of municipal authorities to water quality and sludge disposal issues through local programs. As new federal requirements are established for water quality and sludge disposal, local programs should be revised as appropriate to reflect those requirements. We believe that providing for local control of the pretreatment program is timely and will not delay the implementation of the program.

Proposed Felony Sanctions

The Administration proposes to increase the criminal penalties under the Clean Water Act, and create new criminal offenses. It is our understanding that the Administration is particularly concerned with "midnight dumpers" into POTW sewer systems. CMA supports the imposition of criminal penalties for midnight dumpers. However, the felony sanction provisions in the Administration proposal go far beyond the circumstances that it intends to reach. Apart from this problem, CMA submits that the existing penalty provisions are more than adequate to deal with offenses under the

Act, especially in light of the high level of compliance by industry with the Act's requirements.

Penalties for Discharges to Sewer Systems. Section 8 of the Administration proposal would make it a criminal offense to discharge negligently or knowingly into a publicly owned treatment works or sewer system pollutants or hazardous substances which cause or may reasonably be anticipated to cause personal injury, property damage, or a violation of the POTW's NPDES permit. Although CMA supports the imposition of criminal penalties for midnight dumpers, the language of the Administration proposal is unnecessarily vague and goes far beyond the circumstances that it was intended to reach.

The fundamental difficulty with this new criminal violation is that it does not fit the existing regulatory scheme, consisting of federal categorical standards, prohibited discharges and state and local pretreatment programs.[1/] The proposal creates a criminal violation with no "civil" analogue and provides no clear definition of the prohibited conduct.

1/ Section 307(b) of the Act authorizes EPA to establish standards to prevent interference with the operation of a POTW. EPA has prohibited interference in its general pretreatment regulations and, as construed by the courts, has defined interference so that the industrial user will have a basis for knowing in advance what conduct is lawful. The Administration proposal would in contrast go far beyond midnight dumping and could make unlawful routine industrial discharges that are otherwise in compliance with federal and local requirements.

First, the phrase "may reasonably be anticipated to cause" personal injury or property damage is vague. Second, the Administration proposal fails to define what is meant by a sewer system, creating even more ambiguity in the statute. Does the offense include discharges to a plant's own internal sewer system?[1/] Moreover, mere negligent behavior should not justify criminal sanctions except perhaps in extraordinary circumstances involving reckless disregard of substantial risk of serious harm.

As to the vagueness issue, to prohibit conduct which "may" cause a particular result sets no standard by which the regulated entity can judge the legality of its actions. The only course it can follow to be certain of complying with the law is to refrain from discharging anything into a sewer.[2/] As a general rule a criminal statute must be drafted so as to give those whose conduct is to be regulated

---

1/ CMA is also concerned with the definition of a "hazardous substance" in the Administration proposal. The definition is redundant since the term "pollutant" is already broadly defined by the Act. There is also great potential here for overlapping enforcement authority under the various statutes to which the definition refers. We believe the definition should be deleted as unnecessary.

2/ In a case which deals with a similar question, the Supreme Court has struck down on vagueness grounds a Pennsylvania statute requiring doctors performing abortions to follow certain procedures where there is "sufficient reason to believe that the fetus may be viable." Colautti v. Franklin, 439 U.S. 380 (1979). The Court there found and quoted language ambiguous for the very reason that it could have been read to subject the doctor to criminal penalties on the basis of the after-the-fact judgment of third parties.

fair notice of what is prohibited and to keep within reasonable bounds the discretion afforded the government in enforcing the statute. The fair notice requirement is satisfied only if the law is clear to "men of common intelligence," Connally v. General Constr. Co., 269 U.S. 385 (1926), or, if the statute would normally suggest the need for legal advice, its meaning can reasonably be determined through such advice. Where a criminal law is so vague as to fail this test, it is void under the due process clause of the Fifth Amendment. Id.

The Administration proposal would place on the regulated entity the burden of determining whether the discharge of a pollutant or hazardous substance, otherwise permitted, is nonetheless illegal because at some later date the Administrator and a federal prosecutor may determine that it had the potential for causing harm. This shifts the burden and subjects the defendant's decision to retrospective judgment in the absence of any actual harm, which violates the fair notice standard.[1/] Moreover, it opens up a virtually uncontrollable area of discretion for law enforce-

---

1/ Although the proposal creates an affirmative defense where the discharge of pollutants into a POTW was in compliance with all applicable requirements governing the discharge, it is not clear whether the defense would be available in many typical situations. For example, is the discharge of a pollutant that is not regulated by a national or local standard a discharge that complies with applicable requirements? Does the offense apply even to negligible or de minimis releases? We submit that the offense should exclude such trace discharges, as is the case in Section 311 of the Act.

20-955 O—84——228

ment with the concomitant risk that enforcement will be arbitrary and capricious.

If a "midnight dumping" problem exists, Congress should adopt a more carefully drawn provision which addresses that particular concern. Congress should not enact a broad, ill-defined provision that would unwittingly emcompass other activities that do not warrant criminal sanctions.

Violations of Pretreatment Programs. Section 8 of the Administration proposal would also make it a felony to violate "any requirement imposed in a pretreatment program approved under Section 402(b)(8)" of the Act. It is unclear what is intended by this provision. Section 402(b) of the Act contains NPDES permit requirements applicable to POTWs, and subsection 402(b)(8) requires permits for POTWs to include a program to assure compliance with pretreatment standards. If the felony provision is intended only to cover federal categorical standards, it is redundant since violations of Section 307(b) of the Act are already punishable. If the proposal intends to make it a federal crime to violate local pretreatment requirements, this is inappropriate. Congress expressly made local controls the province of the POTW, and rejected suggestions that there be a federal permit program for industrial users of POTWs. Local pretreatment requirements should be enforced by state and municipal authorities and not by the federal government. This provision would also create a broad new category of criminal liability with no federal civil counterpart.

First Offenses Punishable As Felonies. The Administration proposal, unlike other environmental statutes such as the Clean Air Act, would make first knowing violations of the Clean Water Act into felonies. We have heard no valid explanation for increasing the penalties for first offenses, particularly for violations of a complex technical statute such as the Clean Water Act. Because of the extensive and frequent monitoring that EPA requires, many violations of the Act will be "knowing." Many of these offenses will be minor exceedances of effluent limitations or other technical violations. For example, EPA's effluent limitations guidelines are designed by the Agency to be achievable only 99 percent of the time. Thus, the Agency expects a certain number of violations to occur. Such technical violations should be dealt with on a voluntary, informal basis. Even if criminally prosecuted, the first conviction for such minor or technical violations should not be a felony, even though the violation may have been "knowing."

The "Section by Section Analysis" accompanying the Administration proposal (at 3) states that the proposed amendment is designed "to address intentional violations of the Act occurring on a regular basis over an extended period of time that result in significant harm to public health or the environment . . . ." The summary states that the proposal is not "intended to apply to isolated instances of . . . discharges exceeding permit limitations." However,

the language of the Administration proposal is not limited to intentional, repeated and harmful violations.

We are particularly troubled by the change in the standard of conduct required from "willfully or negligently" to "knowingly." The present law requires either a disregard for the law or negligence. Under the Administration proposal, all that is required is that the violator be aware of the nature of his conduct -- there is no requirement that the conduct be negligent or that a violation of the law be known or intended. There is no sound explanation for increasing the penalties under the Act while lowering the standard of conduct.

Administrative Civil Penalties

CMA opposes the Administration proposal to add to the Clean Water Act a new regime of administrative penalties. There is no demonstrated need for such penalties. Indeed, the record of industry compliance under the Act has been very good. Consequently, it is unclear what purposes, if any, would be served by such penalties.

The proposed administrative penalties raise substantial questions of fairness. The penalties would not be imposed by an impartial fact-finder. It is entirely unclear what procedures and protections, if any, an alleged violator would have under the Administration proposal.[1/]

1/ The proposal provides that the alleged violator shall be given notice and an opportunity for a hearing, but the

(footnote cont'd.)

Violations of the Clean Water Act are likely to be technical in nature and often are unavoidable.[1/] Under the existing enforcement provision of the Act, monetary penalties for such violations may be imposed only by a court.[2/] This requires enforcement personnel to consider carefully the merits of any particular case, and to make judgments about which alleged violations are sufficiently serious to pursue.[3/] When penalties can be assessed like traffic tickets, the incentive to exercise discretion and judgment is lost.

CMA remains willing to discuss these issues in a constructive manner with the Congress.

(footnote cont'd.)

hearing, if allowed, will not be subject to the procedural protections of the Administrative Procedure Act. Although subsection (6) of the Administration proposal gives EPA the authority to issue subpoenas for such hearings, the alleged violator is provided with no means for having such a subpoena issued to compel the production of witnesses or documents.

1/ See page 10 above.

2/ EPA has not been reluctant to use its enforcement authority under Section 309 of the Act. As for administrative convenience, many of these Section 309 actions are settled without need for lengthy proceedings.

3/ The "Section by Section Analysis" states that this provision is intended to apply to "clear and well-documented violations." However, the language of the proposal is not so limited.

Washington, D.C. 20460

January 14, 1983

Dear Mr. Sabock:

TCONR made a brief statement at the November 30 meeting in Dallas regarding the proposed Water Quality Standards Regulations. Since then, we have more fully reviewed them and have the following comments:

COMMENTS ON PROPOSED WATER QUALITY STANDARDS REGULATIONS

131.4 -- EPA Authority

EPA review should also involve a determination that all requirements of the Clean Water Act are met, and that the State has complied with all applicable EPA regulations, including 40 CFR, Part 25. Since EPA may disapprove a proposed revision only on the basis of the requirements of the Clean Water Act, as described in 131.21 (EPA review and approval of water quality standards), this section should refer explicitly to the Act's public participation requirements. Otherwise, States could downgrade standards without any public involvement, and EPA would have no regulatory basis for stopping that.

131.20(b) -- Public Participation

This paragraph is vague. It says, "The State shall provide for public participation in selecting priority areas..." Does this mean the requirements of Part 25 must be met? Section 25.4 (Information, notification, and consultation responsibilities) is directly applicable.

The last sentence in this paragraph is either redundant or insufficient. Part 25, referenced in the previous sentence, has specific requirements for public hearings; these pertain to notification about the hearing and dissemination of information. The WQS regulation should specify that the cost/benefit analysis used by the State must be made available to the public 30 days before the hearing.

If a cost/benefit analysis is a key decision tool, this analysis should be required to be made available for public study. All assumptions should be made explicit, and all numbers assigned to "intangible" costs and benefits should be revealed. The discount rate, used to figure the present worth of future costs and benefits, should be given. All this, including the cost/benefit methodology, should be made available to the public at least 30 days before the hearing.

131.13(c) -- Variances

The proposed regulations would allow States to grant variances to dischargers who claim they can not afford to meet existing standards. While there are some restrictions, these are not likely to interfere with a State's granting variances to any politically effective discharger. Subparagraph (3)

> "The variance will not eliminate existing uses or preclude eventual attainment of the designated uses not being attained."

would allow legal downgrading of water quality if States relaxed criteria necessary to protect designated uses or dropped a designated use on the grounds that attaining the use would be unreasonably costly. The discharger's claims of economic hardship could be used to justify either downgrading the standard or granting a variance. This is not fair to dischargers who have already paid to improve their effluent and who did not resort to claims of special hardship.

Any cost/benefit study used in this context should be required to acknowledge that the costs of granting a variance are borne by the public, are difficult to identify specifically, and are not readily quantified in dollar terms. The benefits, on the other hand, accrue primarily to the discharger (and its stockholders if it an industrial or utility plant), may be specifically identified, and are readily presented in dollar terms -- presented by the discharger to maximize the apparent reasonableness of a variance.

131.10(h)(6) -- Designation of uses

Since States would be allowed under this part to downgrade "if the State determines that attaining the use is not feasible because benefits of attaining the use do not bear a reasonable relationship to the costs," the regulations should have some requirement for public comment, adequate public access to supporting documents, and standards regarding the merits of economic-hardship arguments. Since the public welfare and environmental protection are entrusted to EPA, the Agency should have strict standards to guard against betraying its public responsibility. Allowing public waters to be downgraded, or polluted beyond what is clearly legal, would be betraying EPA's public responsibility if such decisions are based on (a) discharger claims of economic hardship, (b) discharger estimates of abatement costs, and (c) apathetic identification and evaluation of damage to the general public welfare.

If "reasonable relationship" is to be an allowable criterion for downgrading, it should be properly defined to address these potential abuses. Allowing "flexibility" to the States on this is purely abandoning EPA's statutory responsibility to restore and maintain the chemical, physical, and biological integrity of our water. It also flauts the statutory goal "wherever attainable, an interim goal of water quality which provides for the protection and propagation of fish, shellfish, and wildlife, and provides for recreation in and on the water." (101(a)). "Wherever attainable" does not mean "wherever dischargers choose to clean up."

131.10(d) -- Designation of Uses

It is possible that a stream may not meet criteria for a designated use because (1) dischargers are exceeding permit limits, (2) permit limits are looser than current technology and/or the law make feasible, or (3) nonpoint source pollution degrades the water. Under this part, uses would be deemed attainable if they can be achieved by imposition of effluent limits appropriate under 301(b)(1) and (2) or 301(c), or by imposition of reasonable cost-effective nonpoint source BMP's. There should be a requirement for the States to prove that enforcement of permits has been strong and that non-attainment of criteria is not caused or abetted by permit violations. The burden of proof should be on those who wish to downgrade. There should also be a requirement that States present for public comment an analysis comparing the costs of implementing adequate nonpoint source BMP's versus the costs of downgrading stream standards. Any downgrading should be justified by balancing costs to the public from downgrading, versus benefits to landowners excused from implementing BMP's.

Very few States have adopted regulatory BMP's because there is no incentive for them to face the political heat that would result. It is much easier now, and especially under the proposed regulations, to abdicate protection of water quality and claim that nonpoint source BMP's are not cost-effective or reasonable. Who's to object, and on what grounds? The proposed regulations allow for extensive abuse here.

If State agencies comment favorably on these proposed regulations, their comments should be weighed against the consideration that the States will not be receiving appreciable federal money to assume these new responsibilities, and they are more vulnerable to industry and political pressure than EPA is. The fact that they may be incapable of paying for necessary research has not deterred them from asking for greater authority. A state agency that publicly admitted political vulnerability or budgetary restrictions on its ability to accept these responsibilities would probably find itself severely "reorganized."

So much discretion ("flexibility") is given to the States that the public interest, as opposed to industry interests, is no longer protected by EPA regulations, and there is little recourse for appeal if the public disagrees with the decisions made by its State agency.

Unless uniform water quality standards are adopted nationwide, industries will look for States with looser environmental protection standards, and State governments and agencies will face intense pressure to make exceptions for industries that promise jobs.

What happened to the idea that as abatement technology improves, effluent limits would get tighter? The proposed regulations would halt progress towards cleaner streams by dropping requirements for state-of-the-art technology and reverting to a "water quality" based standard, which is itself subject to attrition on technology-limit or economic grounds.

Finally, public notice about this proposed change has been abysmal. Few people read the Federal Register except lawyers paid to do so by industry. In Region 6, no environmental groups knew anything about it until two weeks before the public meeting. Some mail notices were received from the Regional office, but some groups had to learn about it from other environmental groups. In any case, the background information was not readily available until the day of the meeting, and there certainly was not enough time allowed for reasonable study of the materials. It seems as if EPA were attempting to prevent intelligent criticism of its proposals by surprising potential critics and denying adequate review time. The Regional offices should maintain current mailing lists of people and organizations interested in their activities. Public information offices are responsible for just that, and a few press releases defending agency actions do not fulfill that responsibility.

TCONR appreciates this opportunity to comment on EPA proposals. We will be interested in EPA's response.

Sincerely,

Beth Johnson

April 6, 1983

Honorable Robert A. Roe, Chairman
Subcommittee on Water Resources
Committee on Public Works and Transportation
United States House of Representatives
Washington, D.C. 20515

Dear Mr. Chairman:

Again this year we are writing to request an amendment which would provide for more reasonable conflict-of-interest provisions for members of state water regulatory board.

The Federal Clean Water Act currently being reviewed by your Subcommittee includes in Section 304 (i) (2) (D) limitations for membership on state boards in states which are approved to implement the NPDES permit program. Subsection D provides that the administrator shall promulgate guidelines for state programs, including:

> "funding, personnel qualifications, and manpower requirements (including a requirement that no board or body which approves permit applications or portions thereof shall include, as a member, any person who receive, or has during the previous two years received, a significant portion of his income directly or indirectly from permit holders or applicants for a permit)."

California's program has been approved by the administrator, but the impact of the two-year limitation has been to drastically limit the field of qualified candidates for board membership. Since the state and the regional boards have many functions in addition to

administration of the federal pollution discharge permit programs, it is important to select members who are qualified. The provision in practice excludes many people who have training and background in the boards' responsibilities and, therefore, prevents appointment of those who would be qualified and interested in serving.

The provision is broadly worded. A person falling within the limitation may not serve on a board and disqualify himself on issues affecting any former employers. As an example of the exclusionary effect of this two-year requirement, no employee of the County of Los Angeles, which has 71,000 employees, would qualify for such an appointment. Local governmental entities and industrial, agricultural and commercial enterprises have had to secure federal permits, thus preventing their employees from accepting board positions.

At the same time this Clean Water Act provision was adopted by Congress, the Clean Air Act was amended to include conflict-of-interest standards for state boards applying a different test, but still setting stringent requirements to protect the public interest. The provision reads:

> "Sec. 128. (a) Not later than the date one year after the date of the enactment of this section, each applicable implementation plan shall contain requirements that--
>
> > "(1) any board or body which approves permits or enforcement orders under this Act shall have at least a majority of members who represent the public interest and do not derive any significant portion of their income from persons subject to permits or enforcement orders under this Act, and
> >
> > "(2) any potential conflicts-of-interest by members of such board or body or the head of an executive agency with similar powers be adequately disclosed.
>
> "A state may adopt any requirements respecting conflicts-of-interest for such boards or bodies or heads of executive agencies, or any other entities which are more stringent than the requirements of paragraph (1) and (2), and the administrator shall approve any such more stringent requirements submitted as part of an implementation plan."

This conflict-of-interest limitation has proven workable, permitted appointment of knowledgeable members and yet assured that the members will act without bias.

There is no question that a person receiving income from an applicant or permittee under the NPDES procedure should not act upon matters affecting his employer or clients. California law presently requires full public disclosure of economic interest in any organization affected by the individual's official duties and complete exclusion from any step of the process, including voting, leading to action on the organization's issue.

We, therefore, ask your subcommittee to consider amendment of Sec. 304 (i) (2) (D) to eliminate the two-year limitation. This would greatly enlarge the field of candidates for these positions and assure the public of highly competent decision makers in this important area.

Sincerely,

NATIONAL SOCIETY OF PROFESSIONAL ENGINEERS

NSPE

October 26, 1983

The Honorable Robert A. Roe, Chairman
Subcommittee on Water Resources
Committee on Public Works and Transportation
U. S. House of Representatives
B-376 Rayburn House Office Building
Washington, D. C. 20515

Dear Mr. Chairman:

I am writing to provide clarification regarding the recent statements provided by the National Society of Professional Engineers and a member of the West Virginia Society of Professional Engineers/West Virginia Utility Contractors Association on successive days before the Subcommittee on Water Resources. I realize the appearance of a member of one of our state societies presenting differing views to NSPE's testimony may have caused some confusion to you and the subcommittee.

First, let me confirm that the statement given by Kermit Prime, P.E., Chairman of NSPE's Legislative and Government Affairs Committee, represents the official views of our national organization. That position has gone through the proper channels in NSPE and has been formally approved by the Society. While we welcome and will continue a dialogue with all of our individual members, the positions advocated by the member from West Virginia clearly represent a small minority of opinion within our national organization.

Second, it is important to point out that NSPE is a federation of state societies. We encourage our state societies to be active in legislative affairs on the state level and to work with our national organization in Washington regarding federal issues. While we do not exercise veto power over pronouncements of individual members or state societies on national legislation and have no desire to do so, we do request to be notified by our state organizations regarding their activities relating to the Federal Government and make every effort to minimize inconsistencies. In the case in question, our national staff was not aware of Mr. Hart's testimony until the morning of the hearing. As a result, we had no opportunity to reach accommodation with those of our West Virginia members who may have endorsed Mr. Hart's testimony.

Third, I would like to comment on the points raised in Mr. Hart's statement. Regarding collection systems, we certainly recognize that this is a special problem, expecially for states like West Virginia. You will note that we did not discuss collector systems in our prepared testimony, although we are anxious to bring in our members from around the nation who can speak to that problem to the subcommittee. Mr. Hart's other major

point concerning a proposed return to a 75 percent federal share for the grants program is clearly at odds with NSPE's position. We had not had an opportunity to explore NSPE's proposals for alternative financing with Mr. Hart, and trust we can resolve that discrepancy.

Finally, I was delighted to learn that you and other members of the subcommittee expressed an interest in continuing a dialogue with NSPE on alternative financing, ocean discharge, combined sewers, pretreatment, and non-point source pollution. I am confident that our Society can make an important contribution on each of these issues, and we look forward to bringing in our members from around the nation who can address these problems in depth. We fully understand that you are seeking detailed, technical information rather than broad policy statements.

In closing, while I realize that the subcommittee was well served to hear about the particular problems in West Virginia, I did want to take this opportunity to clarify this situation. The members and staff of the National Society of Professional Engineers look forward to a continuing dialogue with you and the subcommittee on amendments to the Clean Water Act.

Sincerely,

Donald G. Weinert, P.E.
Executive Director

SPECIAL NSPE PANEL TESTIFIES
ON ALTERNATIVES TO CONSTRUCTION GRANTS PROGRAM

WASHINGTON, D.C., NOVEMBER 17, 1983--Congress should thoroughly explore low-interest loans as alternatives to the Environmental Protection Agency's controversial construction grants program for wastewater treatment facilities, according to Kermit Prime, P.E. Prime, representing the National Society of Professional Engineers (NSPE), testified today on amendments to the Federal Water Pollution Control Act. Prime and a special NSPE panel were invited to reappear before the House Subcommittee on Water Resources after his October 19th testimony to that same Subcommittee.

"We propose the grants program be phased out....Basically we are advocating no new starts under the grants program after fiscal 1984," Prime told the Subcommittee. The NSPE panel said the grants program discourages community initiative and causes delays because many municipalities are reluctant to go forward with new construction now "as long as there is a prospect of receiving grants in the future....Proposals to rapidly expand funding levels exacerbate this problem." The program's procedural requirements also cause delays, the panel added.

Prime maintained that "a loan program can be utilized to replace the grants program, and can be implemented without placing unreasonable burdens on ratepayers." He presented an NSPE analysis which compared low-interest loans covering 100 percent of project costs with the current grants program, and pointed out that "with an interest

NOTE: Founded in 1934, the National Society of Professional Engineers (NSPE) is a three-level organization serving over 80,000 members through more than 500 local chapters in 54 states and territories. NSPE is the only society representing every field in the engineering profession.

5 1/

rate somewhere between zero and 6 percent, the loan program can be comparable to the grants program as far as the ratepayer is concerned." Prime explained that under the grants program, communicies receive grants for only a portion of project costs, and usually must borrow at market rates to finance the local share. Therefore, low-interest loans covering all project costs may be more desirable for communities.

The NSPE panel emphasized that the Society is not suggesting any set interest rate but stressed rates must be low enough in comparison with market rates to make them attractive to borrowers. The panel did not suggest what types of construction should or should not be covered by the loans nor who should administer the loan program. The panel also pointed out that direct loans might not even be necessary, saying the Federal government could achieve comparable results by guaranteeing bonds and loans made by the private sector and subsidizing the interest rates.

In addition to their comments on financing, panel members covered:

privatization: They urged Congress to retain those provisions of the tax code that encourage new construction of water and sewage treatment and resource recovery facilities through public/private partnerships.

nonpoint source pollution: "Given the localized nature of the solutions to nonpoint source pollution, an effective federal/state/local partnership must be urged. We believe Congressman Oberstar's bill, H.R. 4037, is a step in the right direction."

The panel also discussed pretreatment and ocean discharge waivers.

Prime is a principal engineer with the Boyle Engineering Corporation, Orlando, Florida. Appearing on the special panel with Prime were: NSPE members Louis Guy, Jr., P.E., a partner in the Burke, Virginia, firm of Guy and Davis; Robert J. Haefeli, P.E., with Havens and Emerson Inc., Saddle Brook, New Jersey; and David McDowell, P.E., with Buchart-Horn, Inc., Lewisburg, Pennsylvania.

1854

FRIENDS OF THE EARTH

RECEIVED
MAR 7 1983
PUBLIC WORKS AND TRANSPORTATION COMMITTEE

28 February 1983

James J. Howard, Chairman
Committee on Public Works and Transportation
U.S. House of Representatives
Room 2165 Rayburn House Office Building
Washington, DC 20515

Dear Congressman Howard:

Subj: Subcommittee on Water Resources Meeting on 23 and 24 February 1983.

It has come to our attention that the Subcommittee on Water Resources was to have met in Washington, DC on 23 and 24 February 1983 to receive testimony on the proposal by the U.S. Environmental Protection Agency (EPA) to change its regulations for the establishment of water quality standards. We regret that it was not possible to send a representative to the meeting to present testimony in person; however, we hope that it will be possible to submit limited written testimony at this time. We feel that the importance of this topic is such that we must at least make a statement for the record.

There have been a number of proposals by the EPA in the past two years to reduce the level of environmental protection in this country. We believe that the current proposal is one of the same type. As you know, if the EPA is successful in changing its regulations to make them more lenient the impact will last far beyond the current administration.

One of the kinds of things the EPA is attempting to do is illustrated in the enclosed copies of three pages from the briefing book prepared by the Northwest Federal Regional Council for Governor Sheffield of Alaska as he was taking office in December 1982. For a number of years placer mining has been one of the most damaging sources of water pollution in Alaska. Nevertheless, the EPA has failed to act to enforce the Clean Water Act by issuing National Pollutant Discharge Elimination System (NPDES) permits which specify best practicable treatment (BPT) as was to have been in place by 1977 and has failed to require compliance with Alaska water quality standards. The EPA is now attempting to write what may end up being a lenient permit and is hoping to be able to make it more lenient by getting the state to change its water quality standards so that streams on which placer mines are in operation will be reclassified for industrial use only. EPA Region X Regional Administrator John R. Spencer has personal friendships with people influential in the Alaska Miners Association and may have encouraged them to petition for these changes. If this ploy is successful, the EPA will have succeeeded in reducing water quality standards on a large number of streams in Alaska, many of which were once productive fish streams. We believe this would be clearly illegal under the Clean Water Act and would violate the existing anti-degradation policy incorporated into EPA regulations. However, it appears to be precisely the kind of thing the EPA is attempting to accomplish in its proposal to change the regulations.

Northwest office, 4512 University Way NE, Seattle, Washington 98105, (206)633-1661

Also enclosed is a copy of the comments which I submitted to the EPA in January 1983 regarding the proposed regulation changes. As indicated therein, it appears that the EPA is resurrecting a controversy that occurred some 15 years ago and which it was thought Secretary of the Interior Udall had disposed of at that time. We need to go forward in protecting our resources in this country not, as the EPA now proposes to do, backward.

Thank you for your consideration. Please keep us informed of developments on this topic if possible. We'd particularly appreciate a copy of the hearing record in this matter and a copy of any relevant documents indicating action taken by your committee with regard to it. We are encouraged that the U.S. House of Representatives is attempting to perform its vital oversight function in this and other similar matters bearing on environmental protection (including protection of human health). It's a shame that the EPA cannot be relied upon to perform its statutory functions otherwise.

Sincerely,

G.M. Zemansky

Alaska

Briefing Book for

Governor Sheffield

Prepared By

Northwest Federal Regional Council

NPDES PROGRAM (Enforcement)

The National Pollutant Discharge Elimination System (NPDES)--i.e., the wastewater discharge permit program--is currently administered in Alaska by EPA. This permitting program is intended to prevent the discharge of harmful pollutants to waters of the United States by insuring compliance with EPA national guidelines and State water quality standards. Major categories of activities permitted include: seafood processing, placer mining, oil and gas activities, and municipal wastewater discharges. In order to run an effective program as Congress intended, EPA will be involved in enforcement actions against significant permit violators.

It is EPA's hope that the State will choose to take over the Federal permitting responsibility. Feasibility studies have been completed, but, to this date, the Alaska Department of Environmental Conservation has shown little interest in assuming EPA's role.

While EPA has the program, the State certifies the individual permits which are issued. The State inspects the permitted facilities and provides advice to EPA on potential enforcement actions against violators. The State has a parallel permit program but usually defers to EPA and the Federal permitting system.

If the State were to take on the program, legislative and regulatory changes would be needed: primarily to stiffen penalties, to gain authority over federal facilities and to be able to issue permits based on national guidelines.

PLACER MINING - WATER QUALITY STANDARDS REVISIONS

Since Alaska has not assumed responsibility for issuing water discharge permits required by the Clean Water Act, it is up to EPA to issue them. EPA is currently developing one general permit (as opposed to single permits for each individual mining operation) that will apply, in time for the 1983 mining season, to all 800 or so Alaska placer miners.

Any discharge permit issued may be restrictive because the Clean Water Act requires the permits to be consistent with State Water Quality Standards. In Alaska's case, the streams to which the placer miners discharge are classified for use as drinking water sources. If the use classification is changed the water quality standards could allow EPA to make corresponding adjustments in its discharge permit. Certain mining districts are expected to petition for a change in the standards.

The State needs to evaluate its water quality standards and determine whether any use classifications should be changed. If a change is appropriate, the revision needs to occur quickly so that the new standards are in place for the 1983 mining season. Further, the State needs to provide comments to EPA on the language of the proposed general permit. EPA Region 10 will get EPA Headquarters concurrence on a general permit and issue it before the 1983 season starts.

On a related matter, EPA needs the States help in developing a strategy for dealing with those miners operating in 1982 who didn't comply with conditions of the EPA issued administrative orders.

ORE MINING

Environmental impact statements and wastewater discharge permits must be completed in a timely and effective manner in order for new mining developments to proceed on schedule. The impact statements are being prepared by Federal agencies. The discharge permits will be issued by EPA.

Three major ore mining projects need permitting actions in 1983:

1. U.S. Borax - Quartz Hill (molybdenum)
2. Noranda - Green Creek (zinc, lead, silver gold)
3. Cominco - Red Dog Mine (zinc and lead)

Environmental Impact Statements are underway for all three projects. Effluent guidelines which recently promulgated by EPA require no discharges from the milling process for new sources. U.S. Borax has been excluded from this requirement pending the results of the Environmental Review Process. Noranda exploration is not affected by the no-discharge limit since construction of the project began before the limitation was proposed. The Cominco project, which is just getting started, will be subject to the no-discharge restriction. It is anticipated that these projects represent the beginning of increased activity in the ore mining industry in Alaska.

The State is expected to make timely and substantive comments on the impact statements.

EPA will be a major participant in the preparation of the impact statements and, after certification by the State, will issue the necessary discharge permits.

OFFSHORE EXPLORATION

The Federal Clean Water Act requires oil companies to submit waste discharge permit applications to EPA for oil and gas exploration, development and production wells. Section 403(c) of the Act requires a thorough environmental analysis before issuing permits.

Given recent and proposed offshore oil and gas lease sales, EPA's role in permitting these activities will be increasing. In order to provide a timely permitting process, Region 10 is developing "general permits" for discharges resulting from exploration activities. This is intended to replace previously required individual permits before permitting an activity in a given geographical area. General permits for oil and gas exploration in the Beaufort Sea and Norton Sound should be issued in early 1983. Others will follow soon thereafter.

David K. Sabock, Chief
Criteria Branch, Office of Water Regulations and Standards
EPA
401 M St., SW
Washington, DC 20460

Dear Mr. Sabock:

Subj: Proposed Changes to Water Quality Standards (WQS) Regulations.

Ref: (a) Federal Register, Vol. 47, No. 210, p. 9234 (29 Oct.'82).

In accordance with reference (a), these comments are submitted with regard to this subject. Whereas there may be some need for a carefully considered review and possibly revision of regulations applicable to water quality standards in order to upgrade them to better achieve the objectives of the Clean Water Act, the proposal of reference (a) appears instead to be a blatant attempt to weaken the regulations from what currently exists. Furthermore, what is being proposed is in some cases in direct contradiction to statutory provisions of the Clean Water Act. The EPA does not have the authority to change the law and in attempting to do so is usurping the U.S. Congress.

What is proposed with regard to antidegradation is exemplary. EPA apparently wants to turn the clock back 15 years to the controversy that developed in late 1967 with regard to initial promulgation of water quality standards under the Water Quality Act of 1965. The genesis of the current regulation is Interior Secretary Udall's compromise decision in February 1968 to allow a loophole based on "necessary economic or social development" in an otherwise absolute provision that degradation was simply not to be allowed because that's what the law said. When the loophole was applicable existing uses were still to be maintained. EPA would, in essence, now make the loophole the general case and do away with the real antidegradation provision. This is contrary to the requirements of the Clean Water Act which have so far been upheld in court. The antidegradation policy as specified currently in regulations should either remain as is or be upgraded by doing away with any loopholes whatsoever. Allowing degradation to the bottom of a beneficial use classification ignores the reality of biology and allows degradation. It also presumes that we know more about appropriate establishment of water quality criteria for beneficial uses than we really do. Furthermore, it should be clearly specified that any consideration of allowing a variance to the antidegradation policy (in the event that the current policy is retained intact) should undergo full and complete public participation as required under Section 101(e) of the Clean Water Act.

The review of standards within agencies may in practice result in prioritization and more of a continuous than a 3 year cycle discrete process; however, I do not believe that the Clean Water Act allows the EPA to change its regulations and process to what is proposed. Your attention to Section 303(c)(1) of the Clean Water Act is requested. That calls for a 3 year cycle discrete process with public participation including a public hearing. Many states have done a poor job of adhereing to that requirement and the EPA has been willing to overlook long gaps in compliance (for example, refer to the case in Alaska). Shifting to a continuous process leaves the WQS more vulnerable to subtle attack when the general public is unaware and uninvolved and appears to be designed to allow industry, in concert with state agencies and the EPA to short circuit

the process. It should also be recognized that having stable standards for a 3 year period is beneficial to both industry and the public to the degree that it establishes a known yardstick against which performance can be judged that everyone is aware of. If it can change at any time, with enough exercise of political power, industry doesn't know what standard it may have to comply with (and may in fact bank on getting a standard changed for its benefit rather than planning to comply) and the public doesn't know what level of protection it will be getting.

The proposed changes with regard to use attainability appear to be an effort to go backward and to reward recalcitrant polluters at the same time. Reference to agricultural or industrial uses as the "best uses" rather than aquatic habitat appear to be efforts calculated at obtaining reclassification of streams to become industrial sewers. Paricularly where a stream has been so polluted that beneficial uses (such as for fish habitat) assigned have not been obtained, this approach would reward recalcitrant polluters who have so far failed to comply with the Clean Water Act. Neither is the concept of benefit-cost analysis applicable to this kind of environmental regulation or allowed under law. The Clean Water Act requires the application of technology to achieve the objectives of the law and, as the courts have agreed, this may result in the closing down of marginal plants that generally cannot compete for other reasons anyway. The net effect on the economy and the environment being positive in both cases.

The present EPA procedures for developing water quality criteria in general and site-specific criteria in particular are flawed and need to be upgraded in order to achieve the objectives of the Clean Water Act. Furthermore, they assume a scientific capability and information base which simply doesn't exist. In this regard, it is greatly disappointing that the EPA went so far backward with its "redbook" of water quality criteria in 1976, as compared to the "bluebook" written by the National Academy of Sciences and National Academy of Engineering in 1972. The criteria for some of the priority pollutants of October 1980 brings some improvement back, but there are still many holes and great reliance is still placed on the faulty and incomplete "redbook".

The proposal at 131.13(c) to allow variances to WQS is in direct contradiction to the Clean Water Act. There is no foundation whatsoever in law for it and it would undoubtedly lead to great abuses if adopted that would be counterproductive to implementation of the Clean Water Act.

In summary, the proposal of reference (a) is so badly flawed and so counterproductive to achieving the objectives of the Clean Water Act that it should be completely shelved. The current regulations are adequate for the time being. Any need for changes should be carefully considered from a fresh perspective. Furthermore, unlike the present process, full and complete public participation from the earliest stages with full information should be incorporated. In this case, there was considerable public notice, distribution of information, and public meetings late in the process after the EPA had already achieved a position it had a stake in. Your attention is directed to 40 CFR §25, 33 USC §1251(e), and the EPA's public participation policy.

Thank you for this opportunity to comment. Please inform me of the outcome of this process.

Sincerely,

M Zemansky

Dear Mr. Chairman:

I understand your Subcommittee will be looking at the need to amend the Clean Water Act sometime within the next few months.

I am enclosing a copy of the American Die Casting Institute comments relating to the Clean Water Act and the EPA Effluent Limitations Guidelines. I would appreciate your making them a part of the congressional hearing record when the hearings on the Clean Water Act amendments are held.

Very truly yours,

Henry J. Hyde

I. INTRODUCTION

The American Die Casting Institute ("ADCI") welcomes this opportunity to comment on the Effluent Limitations Guidelines for the Metal Molding and Casting Point Source Category proposed by EPA on November 15, 1982, and the supporting technical Development Document and the Economic Impact Analysis for the proposed standards and limitations published and distributed in December 1982 by EPA. ADCI was founded in 1928 and is the trade association of the die casting industry representing more than 190 custom and captive die casting plants which employ more than 25,000 people.

As a whole, the total die casting industry's sales, based on ADCI's estimates for 1981, are as follows: custom die casting sales were $1,659,000,000 and captive die casting plant sales were $2,078,000,000. This total sales volume of $3.7 billion excludes the value of tools, dies, electroplating and finishing treatments. By comparison, the production by ADCI members represents 54 percent of total custom die casting sales and 25 percent of combined custom and captive die casting sales.

The industry operates die casting machinery which use non-ferrous metals (mostly aluminum and zinc, and to a lesser extent magnesium, copper, and tin) to produce precision parts. Most industry plants are small.

The regulations proposed by EPA, if enacted, would have a major adverse impact on the industry and will result in a substantial and unacceptably large number of plant closures and job losses.

At this time, the die casting industry is facing critical economic times. Our member companies, mostly small independent businesses, make die cast component parts for a number of other industries, including automobiles, appliances, computers, farm machinery, toys, military gear, communications equipment, etc. Therefore, not only are our members affected by general economic conditions, but also by conditions in nearly every other industry relying upon die casting production and sales.

ADCI shares EPA's desire to control pollution in accordance with the pertinent laws and regulations. Cognizant of EPA's mandate to consider the economic impact of its rules, and because of our long-standing concern that EPA's regulations under the Clean Water Act might have a substantial adverse impact on our members, the Institute has actively followed the development of these regulations. Over the past few years, the ADCI has met with personnel from EPA's Effluent Guidelines Division in Washington, D.C., and submitted information regarding the die casting industry. Most recently the President of the Institute, Peter A.R. Findlay and, William T. Andresen, its Technical Director, presented oral comments on the proposed pretreatment

standards at the public hearing held by EPA on January 10, 1983 in Washington, D.C. These written comments submitted today are intended to supplement the information previously submitted by ADCI to EPA. For the reasons explained in detail below, the American Die Casting Institute believes that many of the provisions of the proposed regulations are unwarranted and unjustified and should be revised.

II. SUMMARY OF POSITION

EPA's determination of BPT, BAT, and PSES for die casting processes is based upon assumptions and general data on the much broader foundry industry which are totally inaccurate with respect to die casting plants. Die casting processes should be exempted from the proposed effluent limitation guidelines for the Metal Molding and Casting Point Source Category. At the very least, all small die casting plants should be given a complete exemption and limitations for remaining plants utilizing die casting process segments should be revised. Furthermore, the timetable for compliance with the PSES should be extended to three years from date of promulgation.

Because of significant flaws in the underlying data collected and relied upon by EPA, ADCI believes it is imperative that additional studies be undertaken before promulgation of final rules. ADCI requests EPA to extend its proposed schedule for issuance of effluent limitation guidelines for the die

casting industry to allow time to undertake a special EPA-industry study of the best available technology.

Upon completion of this study and evaluation of the results, EPA should exempt or re-propose rules for the die casting industry.

III. DIE CASTERS SHOULD BE EXCLUDED FROM THE PART 464 REGULATIONS

A. The Proposed Rules Fail to Recognize the Distinct Differences Between Die Casters and Foundries

A major flaw in the technical Development Document and Economic Analysis supporting the proposed regulations is the failure to properly distinguish die casting processes from other processes included in the proposed regulated category such as sand castings and traditional foundry operations. The nature of the die casting industry, with its inherent high-speed production techniques, demonstrates that it should be regarded as a manufacturing process, totally separate from the foundry industry and the connotations that are associated with the term "foundry."

In brief, the broader foundry industry comprises, sand, permanent mold, and low pressure (which relate more to the traditional foundry process), plus die casting which is a distinctive manufacturing technique for mass-producing identical parts at high rates of production, using highly sophisticated die casting machines, tooling, and ancillary mechanization equipment.

Die casting plants range in size from less than one million dollars of sales per year, to several million dollars of

sales. However, the industry's overall structure clearly falls into the small business category.

EPA's failure to make an appropriate distinction is not surprising given the approach which has been taken in the past by the Office of Federal Statistical Policy and Standards of the U.S. Department of Commerce, which administers the Standard Industrial Classification (SIC). For many years, it has been evident that die casting is inappropriately included with non-ferrous foundries under SIC Group No. 336. Currently, segments of the die casting industry, i.e., aluminum, copper, magnesium and zinc alloys,all fall under this category and are reflected within the four-digit industry Nos. 3361, 3362 and 3369. For the past two years, ADCI has been seeking a revision to the SIC which would recognize the unique nature of the die casting process and establish separate SIC classification numbers for die casters. We were hopeful that appropriate changes would be made by now, but on February 4, 1982 the Department of Commerce announced that because of "budget limitations" the revision of the SIC Manual, which had been proposed for publication in 1982, would be postponed (See 46 Fed. Reg. 10123 and 47 Fed. Reg. 5385).

Of course, we recognize that a separate SIC classification alone may not by itself justify a separate category, subcategory, or exemption from effluent limitation guidelines under the Clean Water Act. At the same time, however, the current SIC classification system fosters regulatory activities which seek to

regulate die casters as foundries without making important distinctions which we believe are vital to the establishment of well-informed and reasonable regulatory requirements. Like porpoises in a fishing net, our small industry continues to be "caught up" with foundries which we contend is a separate and distinct group.

B. The Proposed Limitations Constitute a "Major Rule" for Die Casters and EPA Must Comply with the Requirements of Executive Order 12291 and the Regulatory Flexibility Act.

One of the first actions undertaken by President Reagan following his inauguration was the issuance of Executive Order No. 12291 establishing special requirements for federal agencies designed to reduce the burdens of future regulations (46 Fed. Reg. 13193, February 19, 1981). This Executive Order, which applies to EPA, provides in pertinent part that to the extent permitted by law, all agencies shall not undertake regulatory action unless the potential benefits to society from the regulation outweigh the potential costs to society, taking into account the condition of the particular industries affected by regulations, the condition of the national economy, and other regulatory actions contemplated for the future.

Because section 304 of the Clean Water Act clearly contemplates consideration of costs in establishing nationwide effluent limitation guidelines, there is no justification for failing to carry out the full mandate of Executive Order

No. 12291. Nonetheless, it appears EPA has attempted to avoid the full impact of Executive Order No. 12291 by concluding that the proposed regulation for the Metal Molding and Casting Point Source Category is not a "major rule." EPA's determination that this is not a major rule is incorrect.

The term "major rule" is defined by the Executive Order to mean any regulation that is likely to result in an annual effect on the economy of $100 million or more. ADCI believes the overall economic impact of the proposed rule will exceed this $100 million figure. ADCI asserts that the $100 million test is not the only prerequisite for a determination that a rule is major. Section 1(b)(2) and (3) states that a rule is major if it is likely to result in "a major increase in costs or prices for ...individual industries...or significant adverse effects on ...employment, investment, productivity..."

In the preamble discussion to the proposed regulation, EPA admits that the rule is likely to have a substantial impact on individual companies and employment. According to EPA, "as a result of compliance with this regulation, 25 plant closures (10 direct dischargers and 15 indirect dischargers) with total unemployment of approximately 484 workers result. (47 Fed. Reg. 51525). This projection of more than two dozen plant closures (which we believe significantly understates the maghitude of losses) and several hundred additional people waiting in unemployment lines is especially large when compared with the

projections of no plant shutdowns EPA has made in connection with other categories. The significance of these closures were noted in the remarks presented at the public hearing by ADCI President Peter A.R. Findlay. As explained more fully in these comments, at page 43, ADCI estimates that these proposed rules would reduce the total number of die casting plants by approximately 20 percent. Because of the relatively small number of non-ferrous die casting plants, any shutdown is significant. With the present poor state of the economy, EPA should avoid any action which will lead to further unemployment.

For example, in the proposed effluent limitations guidelines for aluminum forming plants published on November 22, 1982, EPA explained:

> The initial analysis indicated that five of the 18 small dischargers were potential closures if subject to the regulation, all of them indirect dischargers in the extrusion and drawing subcategories. Accordingly, EPA proposes that indirect discharges in the extrusion subcategory producing less than three million pounds per year and indirect dischargers in the drawing with emulsions or soaps producing less than one million pounds per year should be excluded from these requirements. If these small plants are excluded, no plants are expected to close as a result of the regulation. (47 Fed. Reg. 52626 at 52638).

The proposed Effluent Limitation Guidelines for the Battery Manufacturing Point Source Category, published just five days before the Metal Molding and Casting Point Source Limitations, will cause no plant closures, according to EPA predictions. (47

Fed. Reg. 51052, 51056, November 10, 1982). Likewise, in proposing Effluent Limitations Guidelines for Copper Forming on November 12, 1982, EPA projected no plant closures or job losses (47 Fed. Reg. 51278, 51285).

Given EPA's admission of the large number of plant shutdowns and job losses associated with the Metal Molding and Casting Point Source Category, in sharp contrast to its projections of no plant closures with other regulations issued in November, it is clear that the proposed rule affecting die casters is a "major rule" subject to the full review requirements of Executive Order No. 12291.

The Regulatory Flexibility Act (Public Law 96-354) imposes additional special requirements on EPA to consider the impact of the proposed rules on small businesses. The Regulatory Flexibility Act opens with an express Congressional declaration that "uniform federal regulatory...requirements have in numerous instances imposed unnecessary and disproportionately burdensome demands ... upon small businesses." (section 2(a)(3)). As explained in more detail in these comments, the Regulatory Flexibility Act requires EPA to avoid imposing uniform requirements throughout the nation which have a significant adverse effect on small businesses without a corresponding benefit. The Act specifically allows EPA to grant small businesses additional time to achieve compliance and even complete exemption from coverage of a rule, or any part thereof. (See section 603(c)).

Executive Order No. 12291 and the Regulatory Flexibility Act in juxtaposition with the evidence of substantial adverse impacts the proposed rule will have on non-ferrous die casting plants without corresponding environmental benefits provides a substantial basis for granting a complete exclusion from the nationwide effluent limitations for this industry, which constitutes an extremely small segment of the group covered by the proposed Metal Molding and Casting Point Source Category regulations.

C. Die Casting Plants, Adequately Controlled By Existing NPDES Permit Limits, Water Quality Standards and General Pretreatment Rules, Should Not Be Included in the Categorical Nationwide Effluent Limitations

The non-ferrous die casting industry comprises an extremely small portion of the production by plants which have been arbitrarily grouped within the proposed Metal Molding and Casting Point Source Category. According to EPA's own figures, "ferrous castings have accounted for about 90 percent of the total tons produced annually since 1956." (47 Fed. Reg. 51513). Furthermore, the technological Development Document reports that plants engaged in the molding and casting of iron and steel account for 98 percent of the total direct discharge volume for the category (page 49). Thus non-ferrous die casting accounts for less than two percent of the direct discharge volumes subject to the rules proposed for the Metal Molding and Casting Point Source Category. Many die casting plants are small

operations. Non-ferrous die casting plants do not contribute significant amounts of pollutants to the nation's waterways.

While EPA points heavily to a few isolated plants which supposedly have achieved 100 percent recycle of their wastewaters, and other plants which do not use water, the fact remains that many of our member companies must use a "wet" process to produce the type of high-quality product needed by their customers. Furthermore, contrary to the supposed findings of the technical Development Document, we do not believe that zero discharge of pollutants can be achieved by these wet process plants. In any event, the costs of achieving the proposed limitations for die casting plants, especially small plants with less than 250 employees, are totally disproportionate to the predicted environmental benefits and also totally out of scale in relation to the pollution-control costs imposed upon other industry groups.

For these reasons, a complete exemption from nationwide limitations for small die casting plants is justified and we believe mandated by the requirements of the Regulatory Flexibility Act and Executive Order No. 12291. In making this request, we are not seeking a total exemption from pollution-control laws. Indeed, direct dischargers are already subject to NPDES requirements which assure that sufficient controls are installed to meet water quality standards. Likewise, indirect dischargers must meet applicable pretreatment regulations, both

the general pretreatment regulations established by EPA at 40 C.F.R., Part 403, and more specific requirements established by local municipal treatment works.

There is ample case law and regulatory precedent to grant this exclusion. The Consent Agreement between EPA and the Natural Resources Defense Council, as revised and approved by the United States District Court for the District of Columbia in 1979, specifically provides EPA with discretion to exclude from the nationwide technology-based regulations a category or sub-category where the amount and toxicity of each pollutant in the discharge does not justify developing national regulations. (12 E.R.C. 1833). Non-ferrous die casting plants satisfy this criterion for exclusion.

Even if EPA is hesitant to grant an exclusion for the entire group of non-ferrous die casters, at the very least, pursuant to its authority under the Clean Water Act, the District Court decision, and its mandate under the Regulatory Flexibility Act and Executive Order No. 12291, it should exclude those segments of the die casting industry where the costs are most disproportionate to the benefits. At a minimum, the subgroups which without question warrant exclusion are zinc die casting plants, which with a handful of exceptions, are very small, and all other small non-ferrous die casting plants. It is our understanding that The Castings Effluent Technology Fund has submitted a petition to EPA requesting an exclusion for the zinc

20-955 O—84——230

casting industry. That request should be granted.

Throughout the proposed regulation, EPA requests comments on what rationale may be employed to exempt smaller plants. In addition to the reasons mentioned above, which are elaborated upon further on in these comments, we find additional support for such an exemption in other regulatory actons taken recently by EPA. For example, on November 23, 1982, in promulgating final rules for the Leather Tanning Category, EPA provided an exemption for certain small plants, stating as follows:

> EPA's economic analysis projected that the cost of chromium control would result in disproportionate economic impacts on small plants...no less costly chromium controlled technology options or less stringent standards could be identified for these plants. Therefore, the PSES regulations for chromium do not apply to small plants which process less than...however small plants...would still be subject to comply with general pretreatment regulations. (47 Fed. Reg. 52848, 52857).

The leather tanning industry is not the only place EPA has provided exemptions for small dischargers. As already noted, in proposed regulations for aluminum forming plants, EPA proposed an exemption for small indirect dischargers.

IV. THE PROPOSED REQUIREMENTS ARE NOT TECHNOLOGICALLY ACHIEVABLE AND FAIL TO RECOGNIZE SIGNIFICANT DIFFERENCES AMONG PLANTS

Section 304 of the Clean Water Act specifies several factors EPA must take into account in determining the control measures and practices constituting BPT and BAT. These factors

include "the age of equipment and facilities involved, the process employed, the engineering aspects of the application of various types of control techniques, process changes, [and] non-water quality environmental impact (including energy requirements)...." Our review of the technical Development Document reveals that EPA's approach to assessing these factors is defective for several reasons. First, EPA has relied heavily upon a few plants for a conclusion that certain technologies are available to several hundred other plants. Second, EPA developed and distributed in 1977 an extremely complicated questionnaire to solicit data, the results of which EPA relied upon to project plant capabilities. This questionnaire produced misleading information. Third, EPA erred in its conclusion that most plants do not generate process wastewater and have zero discharge. For these and additional reasons explained more fully below, the regulations applicable to die casting plants should either be deleted from the final rules or substantially revised to more accurately reflect the factors EPA is required by statute to consider in establishing BPT, BAT and pretreament standards.

One additional general comment must be made about the state of the administrative record before addressing specific points. The administrative record consists of a few dozen hastily assembled notebooks in the EPA library whose contents are not indexed. It is difficult if not impossible to determine which data corresponds to a particular plant and how EPA derived

such data. EPA has not helped this situation by steadfastly refusing to respond to the questions we raised at the public hearing in Washington or January 10, 1983. The inadequate record makes the prepreparation of meaningful comments almost impossible. The net result is we have been denied the prior notice and due process of law to which we are entitled under the Administrative Procedure Act and the U.S. Constitituion.

A. The Data Base Relied Upon by EPA is Not Representative of Die Casters

Several procedural, statistical, and apparent factual errors have combined to yield a misleading portrayal of the die casting industry. At the outset, as mentioned earlier, the die casting industry is technically distinct from foundries. The practices employed by foundries, typically large ferrous plants, are not necessarily transferrable to the smaller, non-ferrous die casting plants. Second, EPA relies heavily upon stale data submitted in response to the data collection portfolio of questionnaires distributed in 1977. A close examination of the administrative record, however, reveals that numerous smaller plants had tremendous difficulty completing this questionnaire and many (more than 200 plants) did not return it at all because of its extreme length and complexity. (These letters are included in Volume 464-6.1, book 1 of the administrative record.) Thus, many typical die casting operations may have failed to submit information which would have shown EPA that the

type of BPT, BAT and pretreatment technologies EPA assumes are widely utilized and otherwise available, are not.

The flaws in EPA's selection of so-called representative plants are compounded by the use of a telephone survey. Because few details about the scope of the telephone survey are provided in the technical Development Document, it is difficult for us to evaluate its thoroughness and objectivity. In the absence of information about whom EPA surveyed by telephone at each plant-information which we have not been provided -- it is impossible to determine whether the person surveyed had sufficient knowledge of his company's processes to provide accurate and reliable information. Unless EPA can fully substantiate in independently prepared written documentation the data it gathered by telephone, no telephone data should be included in the record as support for the proposed rules. Given the confusion small die casting companies had with the earlier written questionnaire, we doubt that a telephone survey filled in the gaps. Instead, the telephone survey would tend to simply exaggerate the misinformation already on file with EPA because of the Agency's apparent use of the telephone calls to confirm information from a few isolated plants it believes can achieve zero discharge while ignoring those plants that for a variety of reasons have not. Nothing in the Clean Water Act or the Administrative Procedure Act allows a regulatory agency to proceed in this manner.

B. EPA Has Failed to Recognize and Compensate for the Impact of Old Equipment

Section 304 of the Clean Water Act requires consideration of "the age of equipment and facilities involved" in determining BPT and BAT. EPA has responded to this statutory mandate with the following incredible statement in the technical Development Document:

> The age of a foundry has no bearing on the applicability of installing water pollution control equipment at that facility. Some foundries, which have operated at the same location for over 100 years, replaced melting furnaces as recently as five years ago and sand handling systems as recently as ten years ago. Process wastewater treatment equipment age varies from 30 years for some equipment items to less than one year for the more recent system installations or additions to the old treatment systems...." (Emphasis added)(pp. 50-51.)

Contrary to the assertion in the technical Development Document, the age of a die casting plant may have a tremendous bearing on its ability to install water pollution control equipment, both from a technological and economic standpoint. Many existing facilities, especially those located in cramped quarters in densely populated urban areas, are not easily modified. Given the type of complete retrofitting and plumbing overhaul EPA would seek to have facilities undertake to achieve complete recycle, many existing facilities would have to totally terminate operations and essentially build a new facility. The extremely depressed economic climate of 1983 does not allow these older facilities the luxury of shutting down already marginal plants

and replacing them with costly new equipment. We find no specific identification in the administrative record of the number of plants involved which would be required to undertake expensive retrofitting or completely replace existing equipment. These questions must be addressed more specifically before any final regulations are promulgated.

C. Land Availability Constraints Have Not Been Given Appropriate Consideration

In a brief discussion, the technical Development Document concludes that "the elimination of process wastewater discharges would not be hindered by the limited availability of land reported by plants responding to the information request. In addition, though many plants use settling ponds or lagoons for solids removal, the more space-efficient clarifiers have been included as part of the BPT and BAT model treatment systems." (Pages 51-52.) Contrary to this finding, the truth is many die casting plants are located in densely populated urban areas which lack sufficient land to install the types of additional control equipment which would be needed to even approach the types of treatment efficiencies called for by the proposed regulations.

D. Zero Discharge of Process Wastewater Pollutants is Impossible

EPA is seeking to impose limitations on several die casting operations requiring no discharge of process wastewater pollutants to navigable waters or to a POTW. EPA, relying upon

actual observations at only a handful of die casting plants and the questionable findings of a telephone survey, says that this can be achieved by 100 percent recycle. EPA has incorrectly concluded that 100 percent recycling is the normal practice within this category of point sources.

Recycling all process water is NOT the normal practice within this industry category, at least for non-ferrous die casting plants. EPA's small sample of die casting plants does NOT demonstrate that 100 percent recycle is proven technology. Nothing in the records demonstrates this point. The Agency's refusal to reveal the names of some of those die casting plants it contends achieved 100 percent recycle does not assist one's analysis and such unidentified plants cannot be used to support nationwide rules.

EPA has not demonstrated that 100 percent recycle is practiced in the die casting industry. In the zinc casting subcategory, EPA identified only one melting furnace scrubber which purportedly achieved 100 percent recycle. (technical Development Document, p. 643.) Nonetheless, EPA feels confident in moving forward to require the entire segment of zinc die casting plants using melting furnace scrubbers to achieve zero discharge of pollutants because other scrubbers in this category (i.e., other than zinc die casting plants) have achieved zero recycle. We believe EPA's reliance on technology transferred from other subcategories is misplaced. Indeed, EPA recognized

that 100 percent recycle had not been demonstrated for melting furnace scrubber operations in the aluminum casting subcategory. Furthermore, EPA set BAT at BPT levels for aluminum melting furnace scrubbers explaining "complete recycle is not a viable BAT option because the technology to achieve complete recycle has not been demonstrated by aluminum plants with melting furnace scrubber processes and cannot be readily transferred." (technical Development Document, p. 925; proposed 40 C.F.R. section 464.11(b).)

For similar reasons, we find no basis in this record that 100 percent recycle has been demonstrated for all zinc melting furnace scrubbers and certainly the technology has not been proven to be readily transferred to the zinc die casting operations. Accordingly, the requirement for 100 percent recycle and zero discharge from zinc melting furnace scrubber processes should be withdrawn.

Even if EPA does not withdraw these regulations, nothing in the record supports imposition of zero discharge requirements at the BAT level for zinc die casting melting furnace scrubbers. According to the technical Development Document (p. 939), imposition of a zero discharge BAT limitation over the proposed BPT limitations would reduce toxic pollutant loads by only another 44 kilograms per year nationwide. Both in terms of absolute numbers and comparisons to pollutant reductions achievable at other process segments, this incremental reduction

is entirely insignificant. Given the additional costs involved to approach total recycle, such regulatory action cannot be deemed consistent with the mandates of section 304, the Regulatory Flexibility Act, and Executive Order 12291.

Nothing in the Combined Metals Base ("CMB") provides reliable data for die casting. The CMB shows the results of lime and settle treatment for 55 plants in the following categories: aluminum forming; battery manufacturing; coil coating; copper forming; electroplating and porcelain enameling. None of these are even remotely related to die casting.

While 100 percent recycle may be theoretically possible and is most certainly a desirable objective if it can be achieved at affordable costs without sacrificing quality, the experience of our member companies shows that in practice 100 percent recycle is impossible. Many die casting operations rely upon quench tanks to cool the hot castings and to develop certain properties in the cast metal which are essential to satisfy customer requirements. Nothing other than these quench tanks can achieve these necessary process objectives. Members of the ADCI have tried to increase water reuse and recyling but found that the quality of their product is not maintained. (See, e.g., the letter transmitted to EPA on August 14, 1980 by Richard Strassman, an engineer with Badger Die Casting Corporation of Milwaukee, Wisconsin, a manufacturer of zinc and aluminum alloy die casting since 1919.)

The types of equipment used in non-ferrous die casting preclude achievement of zero discharge. Unlike many other casting operations, die casters inject the raw material metals under extremely high pressures which can reach 20,000 psi. The tendency of equipment to release liquid at these pressures is magnified by the frequent variations in pressure within the machine. For example, a die casting machine may alternate between high pressure and atmospheric pressure 200 times per hour. This type of operation can rapidly cause fatigue stress in hydraulic lines leading to inevitable leaks.

Numerous other technological obstacles stand in the way of achieving 100 percent recycle on a sustained basis. As recycle levels increase, slimes and other bacterial growths develop within the piping system and bacteriacides must be introduced to prevent system blockages.

The buildup of dissolved solids is another factor which bars 100 percent recycle. The intake water used in die casting plants unavoidably contains dissolved minerals and as water is recycled the concentration of these dissolved solids continues to increase because of water evaporation losses. These dissolved solids must be removed from the loop, otherwise the buildup would continue until scaling occurs because the dissolved solids reach their limit of solubility. Industry has traditionally controlled the buildup of total dissolved solids by either periodically or continuously replacing some of the water in the system or remov-

ing sludge with a very low solids content. This material is then discharged from the plant. We believe it is likely that many of the so called zero discharge facilities identified by EPA in fact discharge this residue.

With the assistance of Dr. James Etzel of the Environmental Engineering Department at Purdue University, we have also considered some of the specific technologies EPA declares are supposedly available to us to achieve zero discharge. According to Dr. Etzel, none of these technologies can do the job. Emulsion breaking, for example, runs into the problem discussed above. The addition of acids, bases, or coagulants raises the inorganic total dissolved solids significantly and thus compounds salt accumulation problems. Even though the oil is removed, the emulsifying agent remains soluble and stays in the wastewater effluent. These emulsifying agents will accumulate, if not removed, and will biologically decompose with time. This process will cause piping system fouling, corrosion, and odor problems of major proportions. Any removal of soluble constituents by emulsion breaking would have to be by adsorption on the oil or floc surface and could not be relied upon from day-to-day because of the inability of the process to remove soluble constituents.

Dr. Etzel also criticizes chemical precipitation because the salts used in the process add significantly to the total dissolved solids of the treated wastewater. Furthermore, organics are hardly removed by chemical precipitation and the

levels of heavy metals such as copper, zinc, etc. which remain are above those necessary to meet the proposed EPA limits for BPT and BAT.

Four other major processes identified by EPA to treat the wastewater can remove only suspended solids and do not address the critical soluble constituents. These four processes are: granular bed filtration; pressure filtration; settling and skimming.

Dr. Etzel has also raised serious reservations about the so-called minor technologies presented by EPA. As Dr. Etzel points out, the major processes alone cannot achieve zero recycle and for a plant to even approach zero recycle, it would have to employ these so-called minor technologies. Given their complexity and costs, minor is a misnomer.

Carbon adsorption, for example, will not remove inorganics of any consequence. It removes some organics, but far from all of them. Centrifugation works with only non-colloidal particulates. Because of its cost and complexity, it is a much less attractive approach than settling, skimming, and filtration for removal of particulates.

Evaporation can probably provide a good quality condensate for recycle but the process is extremely expensive in terms of energy consumption and yields a residue of solid waste which may possibly be toxic.

Dr. Etzel also points out that gravity sludge thickening and sludge bed drying are processes of value only for the disposal of removed suspended solids and they will not aid in achieving total recycle. In short, there is no process or processes together which can achieve 100 percent recycle of treated wastewater.

Dr. Etzel recommends EPA consider a biological approach for the treatment of die casting effluent. This approach should be carefully evaluated before EPA proceeds any further with this rulemaking.

E. EPA's Published Data on Several Identified Plants Are Inaccurate and Such Plants Are Not Representative of the Die Casting Industry.

Because of the short time available to review the poorly organized assemblage of data compiled by EPA, we have not had time to conduct as thorough a study as we would wish to analyze the accuracy of this information. Nonetheless, we found numerous errors in EPA's data base in the time we had available for our review. Indeed, we found so many inaccurate references to plants we know about that there is good cause to question the accuracy of data we have not yet had time to review. For this reason, we request EPA to stay further action on die casting limitations for a six month period to allow a joint ADCI-EPA study of the plants EPA believes have achieved zero discharge. This will also allow more time for both EPA and ADCI to study the benefits of a biological treatment approach developed by Professor Etzel.

One example of errors in EPA's data base involves plant No. 29697 (Du Well Products of Dowagiac, Michigan). EPA claims this is a plant producing zinc castings. This is untrue. This plant only produces aluminium castings. (See page 859 of the Technical Development Document). EPA states that this plant is an example of zero discharge for zinc casting and quench operations. The truth is that the pollution control program at this plant consists of a holding tank from which oil and grease are removed when they float to the top. This oil and grease is taken away from the site by a contract hauler. The remaining liquid in the tank is periodically decanted untreated and discharged into a publicly owned treatment works. This is a good and effective method of treating waste water, but it is not zero discharge of pollutants. This discharge of pollutants is insignificant and thus provides further evidence in support of granting a complete exclusion for die casting plants.

Our review of the record reveals that EPA also erred in its conclusion that plant 04809 (Oster, McMinnville, Tennessee) is a typical aluminum die casting plant and that it is achieving zero discharge. The fact is this plant does not achieve zero discharge and is not typical of die casting operations. It is a captive operation with only two aluminum casting machines producing only forty tons per year of pure aluminum rotors. Pure aluminum is not the normal alloy used by most aluminum die casters. As we explained at the public hearing, the flow diagram

provided by EPA in the administrative record for this plant shows that only a normal recycling of non-contact cooling water takes place at the Oster plant. There is no provision for zero discharge of wastewater. (See page 816 of the Technical Development Document and the plant diagram in Book 13 of the administrative record).

EPA has also erred in its conclusions about plant 26767 (Milwaukee Die Casting, Inc., Milwaukee, Wisconsin). Contrary to the reference at page 816 of the Technical Development Document, this plant is not an example of an aluminum die casting plant with zero discharge. Our review of the record reveals that this plant had an actual discharge of 13,896 gallons and 12,886 gallons on two consecutive days (see Book 10 of the administrative record).

Other examples abound in the record of mischaracterizations of plants. Plant No. 05947 (Hardware Division of Emhart Industries, Berlin, Connecticut) is alleged by EPA to be an exemplary zinc cast and quench plant with 100 percent recycle (Technical Development Document, page 859). Contrary to EPA's statement, all this plant does is recycle the non-contact cooling water. (See Book 25 of the administrative record). Furthermore, some of the arithmetic underlying EPA's computations appears to be incorrect. How can 7,200,000 pounds of metal be poured in a year on one production shift requiring 3,500 pounds. (See Book 25, Part II, page 1).

Plant No. 10308 (Consolidated Die Casting Division of Sealed Power Corporation, Dowagiac, Michigan) is another example of EPA's mischaracterizations. EPA improperly characterizes this plant as achieving 100 percent recycle. According to what we read in the Technical Development Document at page 131 and 859, this plant actually discharges 50,000 gallons twice each month from batch treatments.

Plant 20147 (Outboard Marine Corporation, Waukegan, Illinois) is alleged by EPA to be an exemplary plant with zero discharge of die lubricant. This is not true. This plant even tried reverse osmosis and ultra filtration systems, both of which had to be discarded when the filters plugged up (See Technical Development Document, page 854 and administrative record Book 21).

These discrepancies and inconsistencies which run throughout EPA's data collection documents are very disturbing and cast substantial doubts about the accuracy of any of EPA's conclusions. We have not yet been able to identify the calculations used by EPA to determine BAT limitations for aluminum die casting. Do such computations exist, if so, where are they published? We requested this information from the EPA and EPA's contractor, NUS Corporation, at the hearing in Chicago on [illegible] 12, 1983. It is our impression that neither EPA nor NUS can supply this information. In the absence of such supporting in-

formation and in the absence of public release of such information, no standards can be promulgated for this subcategory.

We also question EPA's reference to pounds of metal poured to determine allowable discharge amounts. Many die casters do not regularly compute the amount of metal poured. They make rough calculations corresponding to the weight of castings per shift employing a yield factor. Other die casters keep a record of metal melted by the amount purchased and add back a yield factor. Neither method is accurate.

F. The Pretreatment Standards Fail to Properly Consider All Pertinent Factors

The proposed PSES, which for the most part impose zero discharge requirements, warrant careful attention because of the enormous costs involved and projections of numerous plant closures and job losses. To a large extent, EPA's proposed PSES are based upon hypothetical assumptions about what the Agency predicts will be the removal rates if its proposed BAT is used compared with what is actually achieved on an average basis by POTW's nationwide. This approach developed by the Agency to define passthrough lacks the type of sound, scientific analysis mandated by the Clean Water Act and Executive Order No. 12291. Treatment for treatment's sake is clearly inconsistent with the policies established by the Regulatory Flexibility Act.

In establishing pretreatment standards, Congress directed EPA to take into account the treatment capability and

performance of the POTW into which a discharge is made. The Technological Development Document contains removal credit efficiencies determined on an average nationwide basis for seven toxic metals and cyanide. Instead of relying solely upon these figures in a hypothetical calculation to determine "passthrough", we believe the regulations should allow credit for removal by certain major urban POTW's which handle significant quantities of discharges from die casting plants. In the absence of a nationwide rule allowing removal credits, a separate subcategory should be established for each POTW where data submitted to EPA by the POTW and interested die casting plants shows that the POTW can adequately treat and remove the substances discharged by the die casting plant. For example, if not withstanding the facts that discharge from die casting plants are insignificant, EPA decides to promulgate final standards, a separate subcategory should be established for aluminum and zinc die casting plants which discharge to the Metropolitan Chicago Sanitary District. The information compiled by the Metropolitan Chicago Sanitary District (see letter attached as an appendix to our comments) and numerous aluminum and zinc die casting plants which discharge into the POTW shows it is capable of removing all pollutants of concern to EPA without the need for the additional PSES proposed by EPA.

In any event, if the proposed regulations are made final, EPA should clearly provide that the zero discharge PSES

does not bar some discharge of pollutants to the extent allowed by removal credits under the general pretreatment rules.

We also are concerned about the procedures for implementing PSES. How does one determine the allowable discharge under the combined waste stream formula where stormwater enters the system? How can plants commit to achieving the moving compliance target created by EPA which darts up and down depending upon the metal poured. If PSES must be imposed, they should be set in the more familiar concentration format.

V. THE ECONOMIC IMPACT OF THE PROPOSED REGULATIONS ON THE DIE CASTING INDUSTRY IS PROHIBITIVE.

A. EPA Must Avoid Imposing Requirements Which Impose Excessive Costs Without Corresponding Benefits.

In establishing effluent limitations guidelines, EPA must give careful consideration to the costs of the proposed rules on the regulated entities. In establishing BPT limits, section 304(b)(1)(B) specifically states that the EPA "shall include consideration of the total cost of application of technology in relation to the effluent reduction benefits to be achieved from such application." For BAT, this section requires EPA to take into account the cost of achieving such effluent reduction. Executive Order No. 12291 imposes a clear mandate on EPA to insure that the benefits of the regulation exceed the cost.

In the words of the United States Supreme Court, "[u]nder section 304, the Administrator is directed to consider

the benefits of effluent reductions as compared to the costs of pollution control in determining BPT limitations. Thus, every BPT limitation represents a conclusion by the Administrator that the costs imposed on the industry are worth the benefits in pollution reduction that will be gained by meeting those limits." (EPA v. National Crushed Stone Association, 449 U.S. 64, 15 ERC 1209, 1213-1214 (1980)).

Against these considerations there are virtually no benefits to weigh on the other side of the scale. Aluminum die casting plants account for less than two percent of the total wastewater flow in the foundry category. Aluminum die casting plants account for only 0.7 percent of the conventional pollutants and 0.1 percent of the toxics. For all aluminum die casting plants, the total amount of toxics to be removed per day, in the aggregate, under the proposed rule is 4.2 pounds. In terms of aluminum, this would amount to about the size of a golf ball. Because aluminum is one of the most abundant and ubiquitous elements on earth, the removal of these trace amounts for aluminum die casting plant discharge is absurd. The small benefits are not worth the enormous costs.

Where a regulation has a significant impact on a substantial number of small business entities, the Regulatory Flexibility Act (Public Law 96-354) imposes additional special requirements. These requirements include preparation of a Regulatory Flexibility Analysis and the establishment of rules which are consistent with the findings and purposes of the Regulatory

Flexibility Act. In the findings and purposes, clause, Congress declared:

> "Uniform federal regulatory and reporting requirements have in numerous instances imposed unnecessary and disproportionately burdensome demands...upon small businesses."

While EPA prepared a Regulatory Flexibility Analysis for the Metal Molding and Die Casting Point Source Category, the Agency has failed to recognize the significant adverse impact these rules will have on small entities. Indeed, in the preamble to the proposed rules, EPA states: "The Agency has concluded that this regulation will not have a significant impact on a substantial number of small entities." This conclusion is contradicted by the record as EPA finds that least 25 companies will be forced to terminate operations. Furthermore, this finding is inconsistent with the Regulatory Agenda published by EPA on October 28, 1982, pursuant to the Regulatory Flexibility Act. In the Agenda announcement concerning the Metal Molding and Casting Category, EPA said that it would be "likely" the rule would effect small entities. (47 Fed. Reg. 48726, 48737). Finally, EPA has failed to provide the requisite certification to the Small Business Administration.

B. Economic Impacts

The economic impact of the proposed regulations is staggering. The costs involved would be difficult enough to support in good economic times such as the mid 70s. The costs

simply cannot be absorbed now in the depression-like climate of the nation's industrial heartland where most die casting operations lie.

Before turning to specific comments, it is important to make some general observations about EPA's economic analysis. At the outset, it virtually ignores the impact of imports. The largest market for die castings is the automobile industry. As more and more cars are imported from overseas and corresponding reductions in manufacturing take place in the United States, the die casting industry is in a squeeze from which it may never recover. This import situation is not limited to automobiles. It also affects other markets which use die casting parts such as appliances, household products and consumer goods. While we recognize it is difficult to assess the overall impact of die castings that are components of imported products, EPA's failure to properly consider this important factor casts great doubt on the accuracy of its economic analysis.

The die casting industry is capital intensive. For many years it has been unable to generate an acceptable return on investment leading many corporate owners of die casting plants to divest such operations. Considering that capital expenditures for the pollution control equipment sought by EPA (and related major changes to plant plumbing which EPA ignored) will cost from $500,000 to $1,000,000 or more, plus very sizable annual operating costs, it does not take an economic wizard to realize that

many die casting plants will simply close down because of an inability to finance the required new facilities. EPA concedes that possible closure of plants and resultant loss of jobs . . ." represent the most visible and critical factor requiring assessment." Nonetheless, EPA has failed to make a proper assessment and give appropriate weight to this critical factor. Because EPA has significantly understated the financial costs, EPA's estimates of plant closures and job losses are grossly understated. If these rules are made final, the die casting industry as we know it today will be decimated and this nation's capacity to produce vital die cast parts will be critically wounded.

EPA's economic analysis is out of date. The basic study was made in 1977-1978. While in some cases these values have been translated by EPA into 1982 dollars, the economic climate is entirely different today then it was in 1977 and a correction for the value of the dollar alone is insufficient to predict economic impacts. The difference in interest rates between 1977 and today is another major cost factor overlooked by EPA. It will be far more costly to raise capital now than it was in 1977. In any event, because the capital investments and operating costs involved will begin to be incurred in 1984 and beyond, EPA should scale its costs forward. If we assume that EPA's 1977 estimates are indeed correct, which in itself is questionable, we can certainly project that actual capital investment and operating

costs beyond 1984 will be some 50 percent to 75 percent higher, thus adding to the economic burden being placed upon the die casting industry.

The average cost of removing pollutants for the metal molding industry BPT guidelines, according to EPA's documentation, is $5.59 per-pound-per-year of pollutant removed. By comparison, the cost per-pound-per year of removal for the aluminum die casting process, again based on EPA's figures, is about $35.00 per pound per year. This figure is almost seven times the molding industry average! Given the small amount of pollutants to be removed per year and multi-million dollar capital investments required by EPA's proposed rules, the costs are totally disproportionate to the benefits. For the battery manufacturing industry, EPA estimates the cost of BPT will be $0.59 per pound of pollutant removed per year. Compared to this, the cost of BPT for aluminum die casting is sixty times greater. How does EPA justify this?

According to EPA's own guidelines under the Regulatory Flexibility Act, these facts compel a finding that this rule is significant and that an exemption should be provided for die casters. In a memorandum dated April 14, 1982, Joseph A Cannon, Associate Administrator for Policy and Resource Management announced that Administrator Gorsuch had approved a memorandum dated February 9, 1982 on EPA's Implementation of the Regulatory

Flexibility Act. Page 7 of the guidelines identifies a regulatory impact as significant when annual compliance costs increase production costs by more than 5 percent or when the regulatory requirements are likely to result in closures of small plants. These circumstances exist for die casters.

We turn now to more specific comments on particular portions of the Economic Analysis Document (EPA-440/2-82-016).

1. Page I-3, Closure Tests - Jobber Debt/Equity Test

EPA does not identify the quantitative values used for this test (other than the amplification provided on pages III-27 to -31, inclusive). The inference is that if the difference between debt and equity is more than the amount of the loan requested, a bank will then approve a loan. This is an oversimplistic and impractical proposition.

Fixed Charge Coverage Test

If a company's pretax/pre-interest earnings were only two (2.0) times the total proforma interest expense, then that company would be generating so little profit that, for all practical purposes, it would have inadequate financial resources for operating on a continuous day-to-day basis, i.e., bankruptcy is just around the corner.

Cost Absorption Test

The choice of 5 percent minimum return on net worth is arbitrary and highly arguable. First, did EPA use 5 percent pretax or 5 percent after tax? Secondly, is it reasonable to contend that 5 percent is an acceptable minimum? Did EPA consider recent revisions to the tax code decreasing deductions relating to pollution control equipment? Current experience indicates that a die casting plant, operating within a corporate entity, must significantly exceed a 5 percent after-tax return on net worth; if it doesn't, it will likely be sold. Twenty percent after-tax return on net worth is a more realistic criteria, to allow for shareholder earnings, reserves, modernization and expansion, etc. The die casting industry is recognized as a capital-intensive industry which, for many years, has been unable to generate acceptable profit levels and return on investment, as viewed by many potential corporate purchasers. For this reason, many corporate owners of die casting plants have divested themselves of their die casting operations, unless other non-financial considerations represented more important reasons for retention (e.g., captive facilities, production control, etc.).

In conclusion, the tests conducted by EPA, separately or collectively, are unrealistic for establishing those companies that are likely to be closed down due to the impact of the proposed EPA regulations. Generally, the criteria used are quantitatively too low; averaging of data is used, which is

misleading; and some of the measuring devices (e.g., tonnage produced, number of employees, etc.) are inappropriate.

The tests chosen by EPA for this economic evaluation clearly indicate EPA's lack of understanding of the range of basic factors that should appropriately be used for evaluating the financial strength of a business operation. Therefore, the conclusions made by EPA regarding the economic impact of the proposed regulations are unrealistic and unjustified.

2. Page I-4, Closure Test - Captive Price Pass-Through Test

Similar arguments to the foregoing for jobbers (item No. 1), also apply to captive operations. The 5 percent maximum pass-through of cost increases, chosen by EPA, is completely arbitrary (notwithstanding further clarification provided on pages III-43 and-44). EPA disegards the effects of the ratio of period costs to direct costs; the effects of variable sales volume; and the need for a captive operation to provide an adequate return on investment and assets; etc. In short, EPA's criteria are overly simplistic, impractical; and arbitrary. Therefore, the conclusions made by EPA regarding the impact of the proposed regulations on captive plants are unrealistic and unjustified.

3. Page I-6, Plant Closure and Employment Loss Impacts

EPA concedes that possible closure of foundries and resultant loss of jobs . . . "represent the most visible and

critical factor requiring assessment." EPA proceeds to estimate the number of companies that would be forced to close down as a result of the proposed regulations. In view of EPA's financial assumptions, we contend that EPA's estimates are grossly understated.

4. Page II-2, Structure of Foundry Industry Overview

The last paragraph, last sentence, states: "In contrast, non-ferrous castings accounted for only 9 percent of the tonnage and 36 percent of its value, but they represented 51 percent of the establishments."

This statement clearly indicates that the economic impact of the proposed EPA regulations will fall upon a multiplicity of smaller companies who are least equipped financially to cope with the substantial capital investment and operating costs involved.

The die casting industry falls within the "non-ferrous castings" category referred to, which substantiates our viewpoint that the die casting industry will be decimated.

5. Page II-59 to -69, Aluminum Foundries

This section constitutes an overall profile of aluminum foundries. Although aluminum die casting represents 65 percent of total tonnage quoted (page II-60), we submit that "tonnage" is only one criteria of measurement. The die casting process is substantially different from other cast processes (i.e., sand and

permanent mold). Therefore, the statistics presented by EPA within this industry profile, regarding unemployment distribution, sales and financial data, cannot be regarded as typical for the die casting industry. Even if the profile was developed exclusively for aluminum die casting, there are substantial differences between custom and captive plants, and further substantial differences within both the custom and captive sectors, that preclude drawing general conclusions.

On page II-68, last paragraph, EPA recognizes that aluminum die casting operations yield minimal return on investment..."one quarter of the larger foundries had no profits at all." This further substantiates our opinion that the die casting industry cannot economically afford the cost of compliance with the proposed EPA regulations.

These comments further support ADCI's long-standing contention that die casting is a separate manufacturing process from other casting processes; that die casting is not perceived to be a foundry process; that separate SIC classifications should be provided for the die casting industry (as was proposed in 1982--but subsequently deferred due to federal budget restrictions); and finally, that the die casting industry should be exempted from the proposed EPA regulations on the grounds that its contribution to pollution of the environment is minimal, that alternative pollution control regulations prevail to adequately control any pollution effects from the industry, and that the

costs of compliance with the proposed EPA regulations cannot be economically justified.

6. Pages II-80 to -89, Zinc Foundries

This section constitutes an overall profile of zinc foundries. Comments made in the previous item regarding the combination of aluminum die casting and other casting processes similarly apply to this zinc foundry profile. In addition, EPA recognizes (see page II-81, Operational Structure) that 70 percent of the 341 foundries specializing in zinc casting have fewer than 50 employees, with very low profit margins and return on investment. The economic comments made for "aluminum" also apply for "zinc."

7. Pages V-1, -2, and -3, Regulatory Flexibility Analysis

EPA discusses criteria used for small, medium, and large businesses, and concludes (page V-2, paragraph 3) that ..."50 employees is a realistic delineator of maximum size for a small foundry." This conclusion, EPA alleges, is based on subjective, qualitative terminology used by foundry managers and trade groups. Relative to the die casting industry, we would disagree. As mentioned by EPA on page V-1 (last paragraph), the Small Business Act specifies "that the maximum employee size for 'small' foundries ranges from 500 for ferrous foundries...." The definition provided by the Small Business Act is an appropriate reference to determine what is a small plant.

8. Page VI-1 (et al), Analysis of Economic Impacts

This section of the Economic Analysis summarizes the situation. The remarks contained in this commentary have been primarily directed towards the effects upon aluminum and zinc die casters, as this represents the two major metals used in the die casting industry. It is recognized that the proposed EPA regulations will also apply to die casters of magnesium, copper-base and lead alloys. It is important to note that, on pages VI-25 to 30, comments and data specific to aluminum indicate that the economic impact on the aluminum die casting industry (which represents approximately 74 percent of all die castings produced) would indeed be very significant--more so than is conveyed by the earlier sections of the Economic Analysis.

Based on extrapolation of confidental and proprietary data available to ADCI from its members, we estimate that, within 5 years, 32 ADCI companies will be forced to close their operations, resulting in the layoff of 824 employees (an average of 25.75 employees per company). If this data is extrapolated to the total custom die casting industry (estimated at 498 plants), this will reduce the number of custom die casting establishments by 95 plants (approximately a twenty percent reduction), and the number of employees that will lose their jobs will be 2,400 (a ten percent reduction).

C. EPA Has Failed to Properly Consider the Additional Solid Waste Disposal Costs

Section 304 of the Clean Water Act requires EPA to consider non-water quality environmental impacts. It is undisputed that one of the major impacts of water pollution control is the generation of sludges and other solid wastes which will require land disposal. In the discussion accompanying the proposed rules, EPA states the estimated average costs of disposal of the sludges is $5.00/ton on the basis of July 1978 dollars and the cost of waste oil disposal was determined to average seven cents per gallon, again based on 1978 dollars. EPA states these sludge disposal costs agree with the median sludge disposal costs of $4.70/ton determined on the basis of the EPA phone survey conducted in 1981. Apparently these costs were based on 1980 dollars and assume that the sludges were not hazardous. We believe these cost figures are substantially understated, especially if the sludges are found to be hazardous under the EP Toxicity Extraction Procedure.

D. An Exemption Is Clearly Warranted for Small Plants

Section 603(c) of the Regulatory Flexibility Act requires EPA to include in each initial Regulatory Flexibility Analysis "a description of any significant alternatives to the proposed rule which accomplish the stated objectives of applicable statutes and which minimize any significant economic impact of the proposed rule on small entities. Consistent with the

stated objectives of applicable statutes, the analysis shall discuss significant alternatives such as (1) the establishing of differing compliance or reporting requirements or timetables which take into account the resources available to small entities...; and (4) an exemption from coverage of the rule, or any part thereof, for such small entities." This authority should be utilized to grant the requested exemption for small plants.

The remaining question for discussion is the size plant that should be selected as an appropriate cut-off level for exclusion. EPA discusses criteria used for small, medium, and large businesses, and concludes in its Economic impact Statement (page V-2, paragraph 3) that ... "50 employees is a realistic delineator of maximum size for a small foundry." This conclusion, EPA alleges, is based on subjective, qualitive terminology used by foundry managers and trade groups. Relative to the die casting industry, we disagree. EPA's own regulations have for years deferred to the Small Business Administration for a definition of a "small" plant (40 C.F.R., Section 21.2). As mentioned by EPA in its Economic Impact Statement (Page V-1, last paragraph), the Small Business Act specifies "that the maximum employee size for "small" foundries ranges from 500 for ferrous foundries ..." This number is the number used by SBA for a definition of a small firm that is bidding on a contract for Government procurement. 13 CFR 121.3-8(b)(3).

Another term used for definition of a small business by the SBA is found in the definition of small business for SBA loans (13 CFR 121.3-10). Under that section any manufacturing concern is classified as small if it is primarily engaged in an industry [where] its number of employees does not exceed 250 persons. (13 CFR 121.3-10(b)(2)).

EPA has developed an alternative guideline to determine whether the effect of regulation on small business is significant pursuant to the April 14, 1982 Memorandum from Joseph A. Cannon, EPA Associate Administrator, regarding the Regulatory Flexibility Act. As mentioned earlier in these comments, the EPA memorandum states there is a significant impact upon small entities if a regulation is likely to result in closures of small entities. EPA thus recognizes that the proposed effluent limitation guidelines are likely to shut down numerous small plants and EPA seeks to identify a suitable means to exclude small plants from regulation. In its Proposal for Rulemaking EPA has stated that it has suggested a 50 employees cutoff for a small plant exclusion in order to minimize plant closing.

The EPA proposal is certainly a step in the proper direction but does not go far enough. This absolute number of 50 employees does not meet EPA's own desire to protect small entities as plants with 56 or 130 may also be small and will be thrown at a competitive disadvantage with plants with 50 persons and under. The die casting industry is highly competitive, and

there is also great variance in the size and shape of products based upon metal or metals directly poured. Plants differ greatly in the number of "peripheral" employees such as secretaries, salespeople, shipping personnel etc. Thus if employees is chosen as the basis for identifying small plants, to promote a more uniform basis for comparison, production area employees should be the criteria selected to define "small business." "Production area employees" should be defined in a manner to eliminate clerical and sales personnel not essential to the production of the casting in order to accurately determine plant employee size.

Another suitable indication of small plant size, if EPA must use absolute number of employees, appears in EPA's proposal at 47 Fed. Reg. 51,526 where EPA urges "small foundry operations to use Small Business Administration financing as needed for pollution control equipment." Since 250 is the number required for this definition by SBA (and thus supported by EPA), EPA must and should use this 250 employee definition for the number of total employees for exemption under the Rules.

VI. THE COMPLIANCE DATE FOR PSES SHOULD BE THREE YEARS AND THE DEADLINE FOR BAT SHOULD BE EXTENDED

If, notwithstanding the reasons mentioned previously in these comments for providing a total exemption for the die casting industry, EPA decides that some or all segments of the die

casting industry must be subject to effluent limitation guidelines, EPA should provide greater flexibility in the timetable to achieve compliance for indirect dischargers into publicly owned treatment works. The proposed regulations provide only two years for existing facilities to achieve compliance with the pretreatment standards. (Section 464.04). This tight deadline is out of line with the final regulations for Leather Tanning that allow existing sources three years to achieve compliance (See 40 C.F.R. section 425.05, 47 Fed. Reg. 52848 (November 23, 1982)). Furthermore, the proposed regulations for Battery Manufacturing allow three years for compliance for PSES (section 461.04) as do the proposed regulations for Copper Forming (40 C.F.R. section 468.04). No reason is given in the proposals for limiting the Metal Molding and Casting Point Source Category to only two years while allowing others three years to achieve compliance.

The request for additional time is founded not simply on seeking an equitable result with other industry groups. Many existing die casting plants are decades old and will require substantial modification. To even approach the 100 percent recycle rate EPA believes is possible will require enormous replumbing projects. Many facilities are located in urban areas and lack unoccupied land on which to construct treatment facilities and they will be particularly hard pressed to restructure existing operations to effect greater pollution reduction efficiencies.

Allowing three years to achieve compliance with the PSES for the die casting industry is authorized by the Clean Water Act and would assist EPA to fulfill its mandate under the Regulatory Flexibility Act to consider the special needs of small businesses. Specifically, the Regulatory Flexibility Act authorizes and requires the EPA to consider "the establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities." (section 603(c)(1)).

Accordingly, given the special needs of the die casting industry, which consists mostly of small companies, the EPA's decisions to allow other industry groups three years to achieve the PSES, and the statutory authorization to extend compliance dates for small business entities, EPA should revise proposed section 464.04 to allow three years after promulgation of the regulation for compliance with the PSES.

Likewise, it is impossible for our industry to meet the July 1, 1984 deadline to BAT. When the Clean Water Act was enacted, the Congress contemplated extended periods of time between rulemaking and the BAT deadlines. This obviously is no longer the case and EPA should ensure measures are taken to allow our industry sufficient time to respond to new requirements.

VII. CONCLUSION

For the reasons set forth above, the American Die Casting Institute believes that serious flaws exist in the technological and economic analyses developed and utilized by EPA in support of its proposed regulations to establish effluent limitation guidelines for die casting plants. Based upon the information presented by ADCI, EPA should grant a complete exclusion to die casting plants from the proposed nationwide regulations. In the alternative, ADCI respectfully requests EPA to defer further action in proposing regulations for die casting plants until a joint EPA-ADCI study can be undertaken to examine more closely the performance of the so-called exemplary plants. In this regard, ADCI would work with EPA and an acknowledged third party consultant, such as Professor James Etzel of Purdue University, to evaluate the actual degree of recycle being practiced by exemplary plants. ADCI further proposes that upon completion of these studies and analysis of the results, EPA would then re-propose effluent limitation guidelines for the die casting industry.

Pending completion of this study of the so-called exemplary plants, ADCI would work with EPA to support a special effort to study the technological and economic benefits of utilizing a biological treatment approach to waste water discharges from die casting plants.

ADCI submits that the Die Casting Industry constitutes only 2 percent of the Metal Molding and Casting Point Source Category. Moreover, the Die Casting Industry, in terms of requirements for pollutants removed, accounts for only 0.72 percent of the conventional pollutants and 0.15 percent of the toxic pollutants. Thus ADCI urges that based upon these infinitesimal amounts of pollutants involved that total exemption is justified.

In closing, we are hopeful that EPA appreciates the enormous financial impact these rules, if made final, would have on our industry. Given the mandate of the Clean Water Act to consider costs, the special requirements of the Regulatory Act Flexibility and Executive Order 12291, we believe it would be arbitrary and capricious, an abuse of discretion, and contrary to statutory mandate for EPA to move forward with its proposal without making the changes requested here.

Sincerely yours,

Peter A. R. Findlay
President
American Die
Casting Institute

Subject: Proposed Pretreatment Regulations

Dear Mr. Enlund:

Pursuant to the request from Mr. James Harrington, Chairman of your Subcommittee on Pretreatment, for information concerning the District's position on the United States Environmental Protection Agency's General Pretreatment Regulations for Existing and New Sources (40CFR403), please be advised of the following:

1. Presently, the District is expending 3.5 million dollars per year in support of its industrial waste pretreatment program. In the event that the proposed 40CFR403 regulations are imposed, we estimate that our cost of complying with the more stringent requirements for sampling, surveillance and enforcement of industrial waste discharges, as set forth in 40CFR403, would be approximately 7.0 million dollars.

2. Since September, 1969, the District has been actively enforcing its Sewage and Waste Control Ordinance. This ordinance requires pretreatment, by industries, of their industrial waste discharges into the District's sanitary sewerage system and waterways. Rigorous enforcement of this ordinance has enabled the District, in 1980, to achieve a 99.6 percent compliance level with the limitations contained in the NPDES permits for the District's seven wastewater treatment plants.

   It is important to note at this point, that the 0.4 percent of non-compliance is due mostly to fecal coliform violations. Fecal coliform is a pollutant leading

related primarily to domestic waste and storm water runoff in the combined sewer system, rather than the discharge of industrial wastes. At present, the Illinois Pollution Control Board is deliberating on a proposal that will relax the disinfection requirement. If such relief is granted, the District will no longer be required to meet fecal coliform limitations, and our number of NPDES violations should therefore decrease.

In the event that 40CFR403 regulations are implemented as proposed, the only benefit that the District anticipates from this program will be a slight reduction of some pollutants in the influent raw sewage at our treatment plants. This reduction would be of negligible value and the effect on our effluent quality and compliance performance mentioned above would not be quantifiable.

3. The District will not be able to grant to industries the removal credits which are provided in 40CFR403. This is due to the fact that we will be unable to comply with the stringent prerequisites which must be met in order to grant these credits. The concept of removal credits was included in the regulations, to allow POTW's who demonstrate incidental removal of pollutants to make allowance for this incidental removal, and therefore relax the categorical standards placed on industries. However, so many stringent requirements were placed on POTW's who wish to grant removal credits, that the allowance is simply not workable or practicable in large POTW systems with large industrial communities.

An alternative approach, which is favored by most large POTW systems, would be to set aside the categorical standards and allow large POTW's to prescribe their own standards on industrial waste dischargers, based on the POTW's ability to meet their own NPDES permit limitations. Such local POTW industrial waste standards would be able to take into consideration such unique local conditions as the type of industries present, their relative total POTW loading, type of sewer system, etc.

Following this approach, the difficult and practically insurmountable problems presented by the removal credit restrictions will be averted; and the nation's waterways will be protected by the NPDES permit system, backed up by the technical and managerial competence of the nation's large POTW systems.

4. The District has special concern regarding the categorical standards for the iron- and steel-making industry. Since 1969, the District has required that the five major steel-making facilities, located in its jurisdiction, cease discharging their industrial waste effluent to the receiving waterways. As a result, these five facilities have constructed industrial waste treatment plants that have eliminated all process discharges to the receiving waterways, as shown on the attached Table 1. Each constructed treatment plant combines many process waste streams and provides a central treatment plant for each steel-making facility. These central treatment plants discharge a treated effluent blow-down to the District's Calumet Sewage Treatment Plant. The blow-down discharge is in compliance with the requirements of the District's Sewage and Waste Control Ordinance.

If the 40CFR403 regulations are implemented along with the proposed categorical standards for the iron- and steel-making industries, these central industrial treatment plants, which were built at great expense over the past several years, and which are in compliance with the District's Sewage and Waste Control Ordinance, will be incapable of meeting the proposed requirements for individual process streams. Numerous new treatment plants would have to be built; each one treating individual waste streams. The collective cost for construction and for operation and maintenance for these individual treatment plants would greatly exceed the cost of the existing central treatment plants. The new plants would not result in any improvement in receiving water quality.

In closing, we wish to reemphasize the alternative approach, mentioned above, which is favored by most large POTW systems. This alternative approach would provide an effective and workable methodology by which POTW systems are responsible for setting industrial waste discharge limitations and managing their own enforcement programs. The POTW systems would be held accountable for their pretreatment program performance through the NPDES permits governing POTW discharges to the receiving waterway.

Very truly yours,

Cecil Lue-Hing, D.Sc., P.E.
